HAM'MOCK (*hamac: Fr.*), a bed used at sea. It contains the mattress, pillow, &c., and consists of a piece of hempen cloth, six feet long and three feet wide, at each end of which are fastened several small lines meeting in an iron ring, and forming *clews*. It is hoisted to its place by small ropes termed *lanyards*, between two battens or screws in the beams of the deck.

HAM'STER, the common name of rodent animals belonging to the genus *Cricetus*, and the family of rats. The *C. vulgaris* abounds in the sandy regions extending from the north of Germany to Siberia, burrows out apartments of great extent, and stores in them great quantities of grain. To effect this, nature has provided it with cheek pouches, which it fills in the cultivated grounds, and empties in its hole by pressing its two fore paws against them. They are torpid during the severity of winter. The pole-cat is their great enemy.

HAN'APER (*hanaperium*, a hamper: *Mod. Lat.*), a common-law office in the court of chancery, which has been abolished and its duties transferred elsewhere. Writs relating to the subject were anciently deposited there in hampers or wicker baskets: hence the name. Those relating to the crown were kept in the *petty* or *little bag*, whence the name of another office.

HAND (*Ger.*), in Anatomy, a member of the human body, which is composed of 27 bones, viz. the eight bones of the CARPUS or wrist, the five bones of the METACARPUS forming the palm, and the fourteen bones or **Phalanges** of the fingers. The characteristic feature of the hand as distinguished from the paw of a quadruped is, that the thumb is opposable to the other fingers. The hand of the quadrumana has also this characteristic.——**Hand**, in the manège, a measure of four inches, by which the height of a horse is computed. Also the parts of a horse, as the *fore hand*, for the head, neck, and fore quarters; the *hind hand*, which includes the rest. It also denotes the horseman's hand; as the *spur-hand*, which is his right hand; and the *bridle-hand*, which is his left hand.——**Hand**, in Heraldry, is termed either *dexter* (right) or *sinister* (left); and when borne in the escutcheon, is supposed to symbolize power, equity, fidelity, and friendship.

HAND'ICAP, in the language of the turf, a race in which the horses carry weights in proportion to their ages and previous performances.

HAND'LING, a technical expression amongst painters referring to the mechanical execution of a picture. The handling may be broad and free, as in Rembrandt's paintings, or delicate and laboured, as in Leonardo da Vinci's, or finical, as Carlo Dolce's, and so on.

HAND'PLANT, a Mexican shrub, the *Cheirostemon platanoides* of botanists, nat. ord. *Sterculiaceæ*. It has no corolla: the calyx resembles a bathing cap, and in the middle there is a column bearing five curved anthers surrounding a curved style. These cause the flower to have some resemblance to a hand with long claws. The Mexicans have some superstitious notions connected with the plant.

HAND'SPIKE, a strong wooden bar, used as a lever to move the windlass and capstan in heaving up the anchor, or raising any weight on board a ship.

HANSEAT'IC (*hanse*, an association: *Teut.*), pertaining to the Hanse towns or to their confederacy. The Hanse towns in Germany were certain commercial cities which associated for the protection of commerce as early as the 12th century. To this confederacy acceded certain commercial cities in Holland, England, France, Spain, and Italy, until they amounted, at one time, to eighty-five, and for centuries it commanded the respect and defied the power of kings. Its power, though still very formidable, began to decline from the middle of the 15th century. This, however, was not owing to any misconduct on the part of its leaders, but to the progress of that improvement which it had done so much to promote. The civilization which had been at first confined to the cities, gradually extended over the contiguous country, and feudal anarchy was everywhere superseded by a system of subordination and the progress of the arts. At present it only consists of the cities of Hamburg, Lubeck, and Bremen

HAR'BOUR (*herberg*: *Dut.*), a port, haven, or inlet of the sea, in which ships can moor, and be sheltered from the fury of winds and a heavy sea.

HARD-A-LEE, in seamen's language, an order to put the helm close to the lee side of the ship, to tack or keep her head to the wind.——**Hard-a-weather**, an order to put the helm close to the weather or windward side of the ship.——**Hard-a-port**, an order to put the helm close to the larboard side.——**Hard-a-starboard**, an order to put the helm close to the starboard side.

HARD'NESS (*heard*, firm: *Sax.*), one of the characters by which minerals are described and identified. The term, however, does not refer to the tenacity by which the parts are held together when struck by a hard substance, but to the power of scratching others, or the liability to be scratched. Thus, the diamond scratches all other minerals, but is scratched by none. It therefore is placed at the head of the scale of hardness, whilst talc, being so soft that it is scratched by almost every other mineral that has any tenacity at all, is placed at the bottom of the scale.

HARD'WARE, small instruments and utensils manufactured from metals: comprising iron, brass, steel, and copper articles of all descriptions. Birmingham and Sheffield are the principal seats of the British hardware manufacture; and from these places knives, razors, scissors, firearms, gilt and plated goods, &c., are supplied to an extent almost incredible. The aggregate value of the hardware manufacture of England and Scotland is estimated at 17,500,000*l.* a year; and it gives employment to 360,000 persons.

HARE (*hara*: *Sax.*), a well-known genus of rodent mammalia, containing the *Lepus timidus*, or common hare. It is a beast of chase, and is sometimes pursued by greyhounds in open ground, which is called *coursing*; and sometimes by harriers or hare-hounds, which is called *hare hunting*. It subsists on a great variety of vegetables, especially those which possess milky qualities; the bark of young trees and their tender shoots are likewise often taken by them for food. The hare produces generally three young ones at a time, and breeds at least three times in a year. Its fleetness is such as to give it the advantage over many of its numerous adversaries. Its quickness of hearing and extent of vision, by which last it receives the impression of objects on almost every side, are also important means of its protection.

HA'REBELL, or **HAIR-BELL**, a small herbaceous plant, with monopetalous blue flowers, the *Campanula rotundifolia* of botanists.

HA'RELIP, a fissure of the upper lip, by which it is divided into two parts, and thus resembles the lip of the hare. Sometimes there are two fissures. It is a great deformity, but, fortunately, is generally curable by certain surgical operations.

HA'REM (*Turk.*), the apartments in Turkish houses appropriated to the women. In that of the sultan, the women are waited on by female slaves and guarded by black eunuchs: the head of the latter is called *Kizlar-aga*. There are two kizlar-agas, one of the old, the other of the new palace, each of which has its harem. The one harem is occupied by the women of former sultans, and those who have incurred the displeasure of the reigning prince: the other by such as still enjoy his favour. The lady who first presents him with a male heir is styled the *sultana*, by way of eminence. She must then retire into the old palace; but if her son ascends the throne, she returns to the new palace, and has the title of *sultana valide*. She is the only woman who is allowed to appear without a veil: none of the others, even when sick, are permitted to lay aside the veil in the presence of any one except the sultan. The women of other Turks enjoy the society of their friends at the baths, or at each other's houses, appear in public accompanied by slaves and eunuchs, and are allowed a degree of liberty which increases as they descend in rank. But those of the sultan have none of these privileges. It is, of course, only the richer Moslems who can maintain harems, the poorer classes have generally but one wife.

HA'RE'S-EAR, a name given to some plants of the umbelliferous genus *Bupleurum*, and to the *Erysimum austriacum*, a cruciferous plant.

HAR'LEQUIN (*arlequin: Fr.*), the principal male character in a pantomime. He is clad in a parti-coloured dress, with a half mask, and is perpetually dancing, leaping, or performing tricks with his wonder-working wand. This character was first introduced into Italian comedy, where he united extravagant buffoonery with great corporeal agility.

HARMAT'TAN, the name given to a prevailing wind on the coast of Africa, which is of a peculiarly dry and parching character.

HARMON'ICA or **ARMON'ICA** (*harmonikos*, harmonical: *Gr.*), a musical instrument, in which the sound is produced from glass goblets, resembling finger-glasses, tuned by filling them more or less with water. It is played with the end of a finger damped, and the effect is produced in the same way as in the common experiment with a drinking glass and water. The less the quantity of water in one of these glasses, the lower the tone. It is difficult to bring out the tones instantaneously, but a touch of the finger will stop the vibration and prevent a confusion of sound. The tones are very sweet, but suited only to soft and plaintive airs

HARMON'ICAL PROPOR'TION, in Arithmetic, is that in which the first term is to the third as the difference of the first and second is to the difference of the second and third: thus, 2, 3, 6, are in harmonical proportion, because 2 : 6 : : 1 : 3. In four terms, the first is to the fourth as the difference of the first and second is to the difference of the third and fourth: that is, 9, 12, 16, 24, are in harmonical proportion, because 9 : 24 : : 3 : 8. To find an harmonical mean between two terms, divide double their product by their sum.

HARMON'ICS (next), that branch of music which considers the differences and proportions of sound, with respect to *acute* and *grave*.

HAR'MONY (*harmonia: Gr.*), in Music, the agreeable combination of several musical sounds heard at the same time. *Natural harmony* consists of the harmonic triad or common chord. *Artificial harmony* is a mixture of concords and discords. *Figured harmony* is that in which, for the purpose of melody, one or more of the parts of a composition move, during the continuance of a chord, through certain notes which do not form any of the constituent parts of that chord——**HARMONY OF THE SPHERES**, a favourite hypothesis of Pythagoras, and many other ancient philosophers, according to which celestial music, imperceptible to the ears of mortals, was supposed to be produced by the sweetly-tuned motions of the stars and planets.

HAR'MOTOME (*harmos*, a joint; and *tomē*, a cutting: *Gr.*), in Mineralogy, a curious substance, called also *Cross-stone*, on account of the cruciform figure of its crystals. It chiefly occurs in metalliferous veins: its prevailing colour is white; it is translucent or semi-transparent, and hard enough to scratch glass

HARP (*harfe*: *Ger.*), a musical stringed instrument, of a triangular figure It stands erect, and, when used, is placed at the feet of the performer, who produces its tones by the action of the thumb and fingers of both hands on the strings. Its origin is very variously described, but whatever it may have been, its invention is manifestly very ancient, for it appears to have been in use (under various forms) with the Egyptians, Hebrews, Greeks, and Romans. The Anglo-Saxons excelled in playing on the harp. The Irish, Scotch, and Welsh also made much use of this instrument; and with the Anglo-Normans it was equally popular. By the Welsh laws, a knowledge of the harp was one of the things required to characterize a freeman or gentleman: and none could pretend to this rank unless he had a harp and was able to play upon it. This instrument has been latterly much improved by pedals, &c. But the pianoforte, which is as it were a harp laid on its side, and played by intermediate mechanism instead of directly by the fingers, is a far more perfect and convenient instrument.

HAR'PIES (*harpuiai*, from *harpazo*, I snatch away: *Gr.*), in Mythology, three rapacious winged monsters, supposed to be the goddesses of storms. They were sisters, the daughters of Pontus (the sea), and Terra (the earth), and were called Aëllo, Ocypete, and Celæno. They had the faces of women, the bodies of vultures, and claws on their fingers and toes.

HARPOO'N (*harpon: Fr.*), an iron instrument, formed at one end like the head of an arrow, and having a rope at the other, for the purpose of spearing the whale. As soon as the boat has been rowed sufficiently near to the whale, the harpooner launches his instrument; and the fish, being wounded, immediately descends with amazing rapidity, carrying the harpoon along with it, and a considerable length of the line, which is purposely let out, to give it room to dive. Being soon exhausted with fatigue and loss of blood, it re-ascends, in order to breathe, but soon expires, and floats upon the surface of the water.——**HARPOON**

GUN, an instrument for discharging harpoons at whales more effectively than by hand.

HARP'SICHORD (*Fr.*), a musical instrument with strings of wire, played by means of keys. It may be considered as an early, but very imperfect form of the *pianoforte*. The sounds were produced by small pieces of quill, which, when forced past the strings, caused them to vibrate. Its jingling sound was far inferior to that of the pianoforte.

HAR'PY, or Imperial Eagle, the *Harpyia destructor* of ornithologists, a powerful bird of prey, which frequents the forests of Central America. It is three feet and a half long, and has a crest of feathers on its head. It belongs to the short-winged section of the eagle family.

HAR'RIER, a small hound, with an acute sense of smell, kept for hunting hares. Also, a name given to some birds of prey belonging to the Falcon family, and to the genus *Circus* of ornithologists.

HAR'ROW, in Agriculture, a rectangular frame with a number of spikes inserted in one side. This very useful instrument is employed to prepare ploughed land for the seed, and to mix the seed with the soil after it has been sown.

HARTS'HORN, SPIRITS OF, an impure solution of carbonate of ammonia, obtained by the destructive distillation of hart's-horn, bone, &c. An impure solid carbonate of ammonia, called *salt of hartshorn*, is formed at the same time. Water, holding ammonia in solution, was called by the older chemists, and is still called by the vulgar, *spirits of hartshorn*.

HARUS'PICE (*haruspex*: from *hara*, an intestine; and *specio*, I look at: *Lat.*), in Roman History, a person who pretended to foretell events by inspecting the entrails of beasts sacrificed, or watching the circumstances attending their slaughter, or their manner of burning, and the ascent of the smoke.

HAR'VEST-MOON, a term applied to the moon when, in the autumnal months, it rises, on successive nights, soon after sunset. In harvest, the moon is in Pisces and Aries; these signs then being opposite to the sun. And when her orbit is in the plane of the ecliptic, that is, when these signs correspond to her nodes, her time of rising will not differ more than an hour and forty minutes in seven days; while at other times, though she is in these signs, it may differ three hours and a half. As the nodes go backwards through the whole ecliptic in nearly nineteen years, the harvest-moons will, in that period, go through a whole course of most and least beneficial states, with respect to the farmers.

HA'SHISH (*Arab.*), a narcotic preparation of hemp, used by the Turks and other Eastern peoples to produce a species of intoxication.

HASTA'TI (*Lat.*, from *hasta*, a spear), among the Romans, soldiers armed with spears, who were always drawn up in the first line of battle. These were picked out in the flower of life. There were two other divisions called *Principes* and *Triarii*, to which were added, at the siege of Capua, B.C. 211, the *Velites* or *light troops*, then first formed into a corps.

HATCH'ETINE, in Mineralogy, a waxlike substance, found sometimes in nodules of ironstone, and named after Hatchett. It is usually considered a bitumen.

HATCH'ING (*hecken*, to hatch: *Ger.*). [See INCUBATION.]

HATCH'MENT, in Heraldry, an armorial escutcheon, which is usually placed over the door of a person of distinction, deceased, and points out the sex, conjugal connection, and dignity. These circumstances are denoted by the form and accompaniments of the field, and the *colour of the ground* of the hatchment.

HATCH'WAY, in ships, a large square or oblong opening in the deck, affording a passage into the hold, &c. There are the fore, main, and after hatchways.

HA'TTI-SHERIFF, in Turkish polity, an order which comes immediately from the Grand Signior, who subscribes it usually with these words: 'Let my order be executed according to its form and import.' These words are generally edged with gold, or otherwise ornamented; and an order given in this way is irrevocable.

HAU'BERK (*usbergo*: *Ital.*) or HAB'ERGEON, armour very common in the 12th century. It consisted of a jacket or tunic with wide sleeves, reaching a little below the elbow, and a hood, all in one piece, covered with chain or ringed mail. In France, it was the armour of a knight: and only persons of a certain property were allowed to wear it. Esquires might use a simple coat of mail, without hood and hose

HAU'TBOY or O'BOE (*haut*, high: and *bois*, wood: *Fr.*), a musical wind instrument, shaped somewhat like the flute, but spreading and widening at the bottom, and producing sound by a reed. Its ancient name was *wayght*, whence originated the word *wait*, by which the hautboy was known until the beginning of the present century.

HAUYNE, a mineral, so named in honour of the celebrated Abbé Hauy. It is blue, occurs in small granular or spherical masses, and is generally found in basalt or lava. It is composed of silica, alumina, and potash.

HAV'ERSACK (*havresac*: *Fr.*), a kind of bag of strong coarse linen, used to carry bread and provisions on a march.

HAVER'SIAN CANALS; these are longitudinal canals, which have been discovered by the microscope in bone, through which they transmit blood-vessels. The bone is arranged concentrically around these canals.

HAW'FINCH, the *Coccothraustes vulgaris* of ornithologists, a species of grosbeak, which feeds on haws and cherries. It breeds in this country, but is a very shy bird.

HAWK (*hafoc*: *Sax.*), the name of some birds of prey belonging to the falcon family. There are two species in this country, the sparrowhawk and the goshawk, both used formerly in falconry. They are very rapacious, feeding on birds and small animals; but the sparrowhawk is the boldest and most pertinacious of all in pursuit of its prey

HAWK'ERS, persons travelling from town to town with goods for sale: they are required to take out licenses.

HAWK'ING. [See Falconry.]

HAWK'WEED, the name of the species of *Hieracium*, a genus of *Compositæ*.

HAWSE, the part of the bows of a ship close to the cable. When the ship has two anchors down, and the cables diverge, the hawse is said to be clear; when they are crossed by the ship's turning half round, there is a *cross* in the hawse; another cross makes an *elbow;* and another, a *round turn;* and, in the latter two cases, the hawse is *foul.* Disengaging the cables is *clearing the hawse.*——**Hawse-hole**, a cylindrical hole in the bow of a ship, through which a cable passes.——**Hawser**, a rope, in size between a cable and a tow-line.

HAW'THORN or **WHITE THORN**, the *Cratægus oxyacantha* of botanists, nat ord *Rosaceæ*, the common shrub, which bears the red fruit called the *haw.*

HAY'WARD (*haie*, a hedge; and *garder*, to preserve. *Fr*), an officer anciently charged with the care of the cattle in a manor, so that they should not injure the hedges

HA'ZEL (*hæsel: A. Sax*), the *Corylus avellana* of botanists, a well-known shrub which has the male flowers in catkins, growing separately from the female flowers

HEAD, that part of the body of vertebrate animals which contains the brain and the organs of seeing, hearing, smelling, and tasting. [See Cranium]

HEAD'LAND, a point of land lying further out to sea than the rest.——**Headland**, in Husbandry, the upper part of land left for the turning of the plough——**Head-lines**, in a ship, those ropes of all sails which are next to the yards, and by which the sails are made fast to the yards——**Head-sails**, those which belong to the foremast and bowsprit.——**Head sea**, a great wave or billow of the sea coming right ahead of the ship as she is in her course——**Head-stall**, that part of a bridle that goes about the head; also, a kind of halter.——**Head-quarters**, the quarters or place of residence of the commander-in chief of an army.

HEAR'ING (*hören*, to hear: *Ger.*), one of the five senses, of which the ear is the organ. See Ear.——**Hearing Trumpet**, an instrument for concentrating sound and conveying it to the ear. It should be so constructed that the whole of the vibrations will be concentrated, by reflection, into a focus at the smaller end; but the precise form is not very important, as the chief advantage is derived from confining the sound by continual reflection, and preventing it from spreading laterally.

HEART (*herz: Ger.*), in Anatomy, a hollow muscular organ, the function of which is to maintain the circulation of the blood. The human heart is formed of a firm thick muscular tissue, composed of fibres interlacing with each other, and is supplied with nerves and vessels, which are termed *coronary.* Its coronary arteries branch off from the aorta, and the coronary veins return the blood in the right auricle. Its nerves are branches of the eighth and great intercostal pairs. It is divided in the middle by a strong partition, and on each side by two cavities, called *ventricles*, one the right or pulmonic, and the other the left or systemic. Attached to the base of the heart are two *auricles*, so called from their resemblance to an ear. In the right auricle there are four apertures: two of the *venæ cavæ*, one of the coronary vein, and one an opening into the right ventricle. There are five apertures in the left auricle: one into the left ventricle, and those of the four pulmonary veins. Each ventricle has two orifices: one from the auricle, and another into the artery. The ventricles are supplied with valves: those at the arterial opening being, from their form, called *semilunar*, those at the orifice of the right auricle, *tricuspid;* and those at the orifice of the left auricle, *mitral.* The valve at the termination of the *vena cava inferior*, just within the auricle, is called the *valve of Eustachius.* The blood is returned from the various parts of the body by the venæ cavæ into the right auricle, whence it is forced into the right ventricle, from this it passes, by the pulmonary artery, into the lungs; it returns from the lungs, by the pulmonary veins, into the left auricle; it passes from the left auricle into the left ventricle; and thence, by the aorta, through the general circulation The dilatation of the heart is called *diastole;* its contraction, *systole.* The alternate contraction and dilatation of the heart are entirely involuntary, and dependent on the nervous system. It has been calculated that the daily work of an ordinary human heart, in propelling the blood, is equal to the lifting 124 tons a foot high.

HEAT was formerly supposed to be a subtle form of matter It is now believed to be a peculiar motion of the particles of matter; and the laws of its communication are considered to be the same as those of the communication of motion. It has a definite mechanical value, and it may be converted into mechanical effect, whilst mechanical effect may be converted into heat. This is termed the dynamical theory of heat, which has only been experimentally established of late years The result of Dr. Joule's experiments is, that each Fahrenheit degree of temperature is equivalent to the lifting of 772 lbs one foot high, and these amounts of heat and power are capable of being reciprocally converted into one another. The unit of measurement is styled a foot-pound. The immediate consequence of heating a body is to increase its bulk, as if each molecule was endowed with a repulsive force, so that solids become fluids, and fluids, by a further increase of temperature, become gases The only exception to this law appears to be on the conversion of ice into water, the liquid in this case occupying less bulk than the solid. The principle of thermometers and pyrometers depends on the dilatation of bodies by heat. Bodies conduct heat on very different degrees; gold and silver for example being good conductors, and atmospheric air a bad conductor. It has also been found that in the same body its conductivity diminishes as its tem perature increases. The diffusion of heat amongst the particles of fluids and gases has been termed convection As it was found that different bodies required very different quantities of heat to raise them to the same temperature (water for example requiring twice as much heat to raise it to a given temperature as an equal weight of mercury), it was said that they had different *capacities* for heat, and the ratio of the capacity of any body to that of another, assumed as a standard, was termed the specific heat of that body The term *latent heat* was applied to that heat which was lost to the thermometer when a solid body was liquefied, or a liquid body converted into a gas. It was thought that this heat remained combined in some mysterious way with the molecules. But it is now considered that the heat which disappears under the circumstances referred to is exhausted in the work of tearing the molecules apart. Heat is also radiated, that is, it moves through space like light, in all directions. Bodies possess this power of radiation in different degrees; and it appears that the more highly polished the surface the less is the radiation. The sun is the great source of heat on our globe; but it is well known that friction and percussion also generate heat. It has been found by experiment that the quantity of heat produced by friction is always proportional to the quantity of work expended, and this applies both to solids and liquids. Chemical action, electrical action, and vital action, also produce heat. In these cases it probably arises from the clashing together of the particles of matter under the influence of chemical affinity

HEATH, the common name of plants belonging to the genus *Erica*, nat. ord. *Ericaceæ*, of which more than 250 species are known. Some of them are natives of Europe, but the greater part are found in South Africa, and are greatly admired on account of their lasting verdure, their light foliage, and the elegance of their flowers.

HEAV'Y SPAR, native sulphate of baryta, a mineral common in mining districts

HEBDOM'ADARY (*hebdomas*, a week: *Gr*), a member of a chapter or convent, whose duty it is to officiate in the choir, rehearse the anthems and prayers, and perform other services during the week, which, on extraordinary occasions, are performed by the superiors.

HEB'RAISM, an idiom or manner of speaking peculiar to the Hebrew language.

HE'BREW, the language spoken by the ancient Jews. The books of the Old Testament are the only remains of the ancient Hebrew, with an admixture, however, of Chaldaic, &c.——EPISTLE TO THE HEBREWS, a canonical book of the New Testament, attributed to St. Paul. It was addressed to the Christian Jews of Palestine.

HEC'ATOMB (*hekatombē*: from *hekaton*, a hundred; and *bous*, an ox: *Gr.*), amongst the Greeks, a sacrifice consisting of a hundred oxen offered upon some very extraordinary occasion.

HEC'TARE, a French superficial measure, containing 100 ares, and equal to 2·47 English statute acres.

HEC'TIC FE'VER (*hexis*, habit: *Gr.*), in Medicine, a continued fever, accompanied by debility, a small quick pulse, paleness, loss of appetite, excessive perspiration and emaciation. It is, in some degree, intermittent, but the sweating is not followed by the relief it brings in other febrile attacks. It very often accompanies consumption.

HEC'TOGRAMME (*hekaton*, a hundred: *Gr.*; and *gramme*), a French weight, containing 100 grammes or 1543·4 grains troy.

HEC'TOLITRE (*hekaton*, a hundred: *Gr.*; and *litre*), a French measure of capacity for liquids, containing 100 litres or 6102·8 cubic inches, that is, rather less than our *quart*.

HEC'TOMETRE (*hekaton*, a hundred: *Gr.*; and *mètre*), a French measure, equal to 100 mètres or 3937·0091 English inches.

HEDENBERG'ITE, in Mineralogy, a silicate of lime and iron, occurring in masses, composed of shining plates, which break into rhombic fragments. It was first analyzed by Hedenberg, in Sweden.

HED'ERA (ivy: *Lat*), in Botany, a genus of shrubby climbing plants, nat ord *Araliaceæ*, comprising the different kinds of ivy.

HED'GEHOG, the *Erinaceus Europæus*, a small harmless nocturnal animal which feeds on worms, insects, &c. It belongs to the family of moles, and is remarkable for the power of rolling itself into a globe, protected externally by its own prickles, when in danger. It is often kept in houses for the purpose of destroying cockroaches. Its popular name 'urchin' is probably a corruption of the Latin word 'erinaceus.'

HÉGI'RA (the flight: *Arab.*), the epoch of the flight of Mahomet from Mecca, July 16, A D 622, whence eastern nations date their year of 354 days.

HEIGHTS, MEASUREMENT OF. [See HYPSOMETRY.]

HEIR-AT-LAW (*hæres*: *Lat.*), the person to whom the real estate of an intestate descends. According to the law of England, if there are several children, the eldest son will take the real estate on the death of his father intestate. If there are no sons, but several daughters, the property will be divided amongst them equally. [See DESCENT.]——HEIR-APPARENT and HEIR-PRESUMPTIVE, terms applied to the possible successor to a crown or a dignity. The heir-apparent can only be deprived of the succession by his own death; the heir-presumptive may lose his right to succeed by a nearer heir coming into existence. Thus, the eldest son of a king of Great Britain is the heir-apparent to the crown; the next brother of an unmarried king is the heir-presumptive, whose right would be displaced if the king married and had a child

HEIR'LOOM, any personal chattel, such as a picture or a piece of plate, which, under a will or settlement, is directed to pass along with an estate. Heirlooms are only protected in the hands of tenants for life. They belong absolutely to the first person who has a vested estate of inherit ance, on whose death intestate they go to his executor.

HELI'ACAL (*hēliakos*, relating to the sun; from *hēlios*, the sun: *Gr.*), in Ancient Astronomy, an epithet applied to the rising or setting of the stars, or, more strictly speaking, to their emersion out of and immersion into the rays and superior splendour of the sun. A star rises heliacally when, after it has been in conjunction with the sun, and on that account invisible, it gets at such a distance from that luminary as to be seen in the morning before its rising. [See COSMICAL.]

HELIAN'THUS (*hēlios*, the sun; and *anthos*, a flower: *Gr.*), in Botany, a genus of plants, nat. ord. *Compositæ;* containing the Jerusalem artichoke and the garden sunflowers.

HELIOCEN'TRIC (*hēlios*, the sun; and *kentron*, a centre: *Gr.*). In Astronomy, the *heliocentric longitude* of a planet is the angle at the sun's centre, formed by the projection of its radius vector on the ecliptic, and a straight line drawn from the centre of the sun to the first point of Aries. The *heliocentric latitude* of a planet is the inclination of a line drawn between the centre of the sun and the centre of a planet to the plane of the ecliptic.——*Heliocentric place* of a planet, the place of the ecliptic in which the planet would appear to a spectator placed at the centre of the sun. [See GEOCENTRIC.]

HELIOG'RAPHY (*hēlios*, the sun; and *graphē*, a picture: *Gr.*), a method of giving permanency to images produced by the chemical effects of light. [See PHOTOGRAPHY.]

HELIOM'ETER (*hēlios*, the sun; and *metron*, a measure: *Gr.*), an instrument for measuring the diameter of the heavenly bodies.

HE'LIOSCOPE (*hēlios*, the sun; and *skopeo*, I examine: *Gr.*), in Optics, a sort of telescope, peculiarly fitted for viewing the sun without pain or injury to the eyes.

HE'LIOSTAT (*hēlios*, the sun; and *statos*, standing: *Gr.*), an instrument employed in surveying for reflecting a sunbeam from one spot to another.

HE'LIOTROPE (*hēlios*, the sun; and *tropē*, a turning round: *Gr.*), in Mineralogy, a sub-species of rhomboidal quartz, of a deep green colour. It is usually variegated with blood-red or yellowish dots, and is more or less translucent.——Also, the name of some sweet-scented shrubs, belonging to the genus *Heliotropium*, nat. ord. *Boraginaceæ.*

HELISPHER'ICAL (*helix*, a spiral; and *sphaira*, a sphere: *Gr.*), spiral. The *helispherical line* is the rhomb line in navigation; so called because on the globe it winds round the pole spirally, coming nearer and nearer to it, but never terminating in it.

HE'LIX (a spiral: *Gr.*), in Anatomy, the whole circuit of the auricle, or external border of the ear.——In Architecture, a spiral line, or something that winds; as, a winding staircase, or a small volute under the flowers of the Corinthian capital.——In Zoology, a very large genus of gasteropod molluscs, bearing shells. [See SNAIL.]

HEL'LEBORE (*helleboros: Gr.*), the *Helleborus niger*, or Christmas rose, an exotic plant, belonging to the nat. ord. *Melanthaceæ*, the medical properties of which depend on a peculiar alkaloid called veratrin. A minute quantity applied to the nose excites violent sneezing. The ancients esteemed it as a powerful remedy in maniacal cases; at present it is exhibited principally as an alterative; and it is recommended in dropsies and some cutaneous diseases. There is also the white hellebore, a poisonous plant, of the genus *Veratrum.*

HEL'LENIC, a division of the Indo-European family of languages, embracing ancient and modern Greek.

HEL'LENISM (*Hellēnes*, the Greeks: *Gr.*), a phrase peculiar to the Greek tongue.

HELLENIS'TIC (same *deriv.*), a name given to that dialect of the Greeks used by Jewish writers. Its peculiarity consisted in the introduction of foreign words, but little disguised, and of exotic metaphors and idioms; but they used the ordinary Greek inflections in great number.

HELM (*Ger.*), an instrument suspended along the hind part of a ship's stern-post, where it turns upon hinges to the right or left, serving to direct the course of a vessel, as the tail of a fish guides its body. The helm is usually composed of three parts, the rudder, the tiller, and the wheel; except in small vessels, in which the wheel is unnecessary. There are several phrases in nautical language relating to the helm: as, *up the helm*, put the tiller to the *weather* side; *down the helm*, put it to the *lee* side, *helm amidships*, or *right the helm*, put it even with the middle of the ship; *port the helm*, put it to the *left* side; *starboard the helm*, put it to the *right* side.

HEL'MET or **HELM** (*helmt* or *helm: Ger.*), defensive armour for the head, which was also called a *headpiece* and a *casque*. An *open* helmet left the face unguarded, but sometimes had bars from the forehead to the chin. A *closed* helmet covered the head, face, and neck, having slits for seeing objects, and perforations to admit air; its *visor* (*viser*, to take aim: *Fr.*), lifted up by means of pivots over the ears. A *beaver* (*buveur*, a drinker: *Fr.*), covered the mouth and chin, and either lifted up by revolving on the same pivots as the visor, or let down by other pivots near the jaws; it enabled the wearer to eat and drink with his helmet on. The helmets of the Greeks and Romans were open. The modern cavalry generally wear helmets.——The helmet is used in Heraldry, by way of crest over the shield or coat of arms, and expresses the different degrees of nobility by the different manner in which it is borne.

HELMINTHOL'OGY (*helmins*, a worm; and *logos*, a discourse: *Gr.*), the natural history of worms. [See ENTOZOA.]

HE'LOTS (*Heilōtes: Gr.*), certain slaves in Sparta, who, it is said, were originally inhabitants of the town of Helos, but were carried off and reduced to slavery by the Heraclidæ, about 1000 B.C. They differed from other Greek slaves in not belonging individually to separate masters; but being the property of the state, which alone had the disposal of their lives and freedom. Other accounts of their origin have been given.

HELVET'IC, an epithet designating what pertains to the *Helvetii*, the ancient inhabitants of Switzerland, or to the modern states and inhabitants of the Alpine regions; as, the *Helvetic* confederacy, &c

HEM'ACHATE or HÆM'ACHATE (*haima*, blood; and *achatēs*, agate *Gr*), in Mineralogy, a species of agate, of a blood colour.

HEM'ATINE or HÆM'ATINE (*haima*, blood: *Gr.*), in Chemistry, the colouring principle of logwood it is of a pale red, and a bitterish taste.

HEM'ATITE [See HÆMATITE.]

HEMERALO'PIA (*hemera*, the day; and *opsis*, vision: *Gr.*), in Medicine, nocturnal blindness; a disease which consists in inability to see in the evening, though the sight is perfect enough in the day-time. At sunset, objects appear to persons afflicted with this complaint as if covered with an ash coloured veil, that gradually changes into a dense cloud, which appears to intervene between the eyes and surrounding objects. When brought into a room faintly lighted by a candle, where others can see tolerably well, they can scarcely discern any object; and by moonlight their sight is still worse

HEMEROCAL'LIS (*hēmera*, a day; and *kallos*, beautiful: *Gr.*), in Botany, a genus of bulbous-rooted plants, nat ord. *Liliaceæ*, including the day lily of our gardens

HEM'I, a Greek word used in the composition of several terms borrowed from that language. It signifies *half*, being the same as *semi* and *demi*: thus, *hemiplegia* is a paralysis of one *half* of the body; *hemistich*, *half* a verse; *hemicycle*, a *semi*-circle.

HEMICRA'NIA (*hēmikrania* from *hēmi*, half; and *kranion*, the skull. *Gr.*), in Medicine, a species of headache, which affects only one half or side of the head.

HEMIOP'SIA (*hēmi*, half; and *ōps*, the eye: *Gr.*), in Medicine, a defect of vision, in which the person sees half, but not the whole of an object

HEMIPLE'GIA (*hēmiplēxia* · from *hēmi*, half; and *plēgē*, a stroke. *Gr.*), in Medicine, a paralytic affection of one side of the body.

HEMIP'TERA (*hēmi*, half; and *pteron*, a wing *Gr.*), in Entomology, an order of sucking insects; characterized by having a horny beak and four wings, of which the uppermost are thick at the base, with thinner extremities that lie flat and cross each other on the top of the back, or are of uniform thickness throughout, and slope at the sides like a roof. The young undergo an incomplete metamorphosis, the larvæ having the same form as the adult except as to the wings. The *bed-bug* and *water-boatman* (*Notonecta*) are examples of this order The species are numerous, and often beautifully coloured; but the odour is, in many, very disagreeable.

HEM'ISPHERE (*hēmisphairion*: from *hēmi*, half; and *sphaira*, a sphere: *Gr.*), in Astronomy, one half of the sphere. The equator divides the sphere into two parts, called the *northern* and the *southern hemispheres*. The horizon also divides the sphere into two parts, called the *upper* and *lower hemispheres*. The term hemisphere is also used for a map or projection of half the terrestrial globe, or half the celestial sphere, on a plane; and is then often called *planisphere*

HEMISPHEROI'DAL (same *deriv.*), in Geometry, an appellation given to whatever approaches to the figure of a hemisphere, but is not exactly one.

HEM'ISTICH (*hēmistichion*: from *hēmi*, half; and *stichos*, a verse: *Gr.*), in Poetry, half a verse, or a verse not completed. In reading common English verse, a short pause is required at the end of each hemistich

HEM'LOCK, the name of plants belonging to the umbelliferous genus *Conium*. *C. maculatum*, the greater hemlock, is poisonous; the alkaloid *Conia* employed in medicine is extracted from it. In Canada, the *Abies canadensis*, a coniferous tree, which attains the height of eighty feet with a diameter of three feet, is called *Hemlock*. It is an elegant tree with drooping branches. The bark is much used in tanning

HEMP (*hanf*: *Ger.*), the fibres of the inner bark of the *Cannabis sativa*. It is prepared for spinning in the same way as flax, and is made into strands or yarn for ropes The plant is supposed to be a native of India, but has long been naturalized in Europe, in many parts of which it is grown extensively. Only the coarser kinds of hemp are employed in making cordage; the finer being used for cloth, which, though incapable of receiving the delicacy of linen, is incomparably stronger, equally susceptible of bleaching, and possessed of the property of improving in colour by wear. The English hemp is much superior in strength to that which grows in any other country. Next to this is the Russian, from which sacking is usually made. A large quantity of Russian sheeting, coarser at the price than any other foreign cloth, is imported into England on account of its strength.

HEN'BANE, the name of plants belonging to the genus *Hyoscyamus*, nat. ord *Solanaceæ*. The *H. niger* is a wild British plant. The roots, leaves, and seeds are poisonous; but, from its narcotic qualities, it is occasionally serviceable in medicine. Its active principle, *hyoscyamine*, like belladonna, has the property of remarkably dilating the pupil, which causes so many rays to enter that vision becomes painful and imperfect.

HENDEC'AGON (*hendeka*, eleven; and *gōnia*, an angle: *Gr.*), in Fortification, a place defended by eleven bastions.——In Geometry, a figure of eleven sides and angles.

HENDECASYL'LABLE (*hendeka*, eleven; and *sullabē*, a syllable: *Gr.*), in poetical composition, a verse of eleven syllables Among the ancients it was particularly used by Catullus, and was well adapted fo elegant trifles.

HEN'NA, a dye obtained in Egypt from a plant, the *Lawsonia inermis*, nat. ord. *Lythraceæ*. The women stain their fingers and feet an orange colour with it. It is also used for dyeing skins and textile fabrics.

HEPAT'IC (*hēpatikos*, belonging to the liver: *Gr.*), in Medicine, an epithet for whatever belongs to the liver.——HEPATIC ARTERY, the artery which nourishes the substance of the liver.——HEPATIC DUCT, the trunk of the biliary pores. It runs from the sinus of the liver towards the duodenum, and is joined by the cystic duct.

HEPAT'IC AIR (same *deriv.*), the sulphuretted hydrogen or sulphide of hydrogen of modern chemistry.

HEP'ATITE (*hēpatitēs*, belonging to the liver: *Gr.*), a name given to the fœtid sulphide of barium. It sometimes occurs in globular masses, and is either compact or of a foliated structure. By friction or the application of heat, it exhales a fœtid odour like that of sulphide of hydrogen.

HEPATI'TIS (same *deriv.*), in Medicine, inflammation of the liver, of which there are two kinds, the *acute* and *chronic*. Both require attentive medical treatment. In warm climates, the liver is more likely to be affected with inflammation than perhaps any other part of the body, from the additional work thrown upon it. *Hepatic* respiration is intended as an auxiliary to *pulmonic*; but when any portion of the body is subjected to unusual exertion, its size is increased: hence the arm of the blacksmith is larger than if his employment were of a less energetic character. From its position, the liver cannot be augmented in size without inconvenience.

HEP'TACHORD (*hepta*, seven; and *chordē*, a string: *Gr.*), in ancient Poetry, verses accompanied by music played on seven chords producing different notes. The word was applied to the lyre when it had seven strings.

HEP'TAGON (*hepta*, seven; and *gōnia*, an angle: *Gr.*), in Geometry, a figure of seven sides and angles. The area of a regular heptagon is equal to the square of one of its sides multiplied by 3·6339124.——In Fortification, a place that has seven bastions for its defence.

HEPTAG'ONAL NUM'BERS (same *deriv.*), in Arithmetic, a kind of polygonal numbers, in which the difference of the terms of the corresponding arithmetical progression is 5. Thus:

Arithmeticals, 1, 6, 11, 16, 21, &c.
Heptagonals, 1, 7, 18, 34, 55, &c.

Each term of the latter is found by adding the corresponding arithmetical term to its preceding term. One of the properties of these numbers is, that if they are multiplied by 40, and 9 is added to the product, the sum is a square number.

HEPTAN'DRIA (*hepta*, seven; and *anēr*, a male: *Gr.*), the seventh class of the Linnæan system of plants, containing those which have seven stamens.

HEP'TARCHY (*hepta*, seven; and *archo*, I govern: *Gr.*), a government exercised by seven persons: or a nation divided into seven governments.——SAXON HEPTARCHY, the seven kingdoms existing in England between the fifth and ninth centuries. These kingdoms were severally named, 1. Kent; 2. Sussex; 3. Wessex; 4. Essex; 5. Northumberland; 6. East-Anglia; and 7. Mercia. The *heptarchy* was formed by degrees; but it may be said to have commenced in 449, when Hengist arrived on the island. In 827 Egbert was enabled, by a combination of circumstances, to assume the title of King of England; but, in reality, three of the kingdoms, Northumberland, East Anglia, and Mercia, were still governed by their own kings, though those kings were his vassals and tributaries. The kingdoms he actually governed were Kent, Sussex, Wessex, and Essex.

HERACLI'DÆ (the descendants of Hercules, in *Gr. Hēraclēs*). *The return of the Heraclidæ into Peloponnesus* is said to have taken place in the year of the world 2682, a hundred years after they were expelled, and eighty after the destruction of Troy.

HER'ALD (*héraut*: *Fr.*), the title of an officer, whose duty was, in former times, to declare war, to challenge in battle and combat, to proclaim peace, and to bear messages in war; but is, at present, to conduct royal processions, the creations of nobility, and the ceremonies of knighthood; to publish declarations of war, not to the enemy, but at home, to proclaim peace; to record and blazon armorial bearings; and to rectify abuses in arms, under the authority of the earl-marshal, by whom he is created. The heralds were formed into a college by Richard III. The three chief are called kings-at-arms; the principal of these is *Garter*; the next is *Clarencieux*, and the third *Norroy*; the last two are called provincial kings. Besides these there are six heralds, viz. York, Lancaster, Somerset, Richmond, Chester, and Windsor. Below these are four pursuivants, viz. Bluemantle, Rouge Dragon, Rougecroix, and Portcullis. Heralds, amongst the ancient Greeks and Romans, were held in great estimation, and looked upon as sacred. Those of Greece carried in their hands a rod of laurel, round which two serpents, without crests, were twisted as emblems of peace.

HER'ALDRY (same *deriv.*), the body of rules relating to armorial bearings, teaching how to blazon or describe them in proper terms, and how to marshal or dispose the different arms in an escutcheon or shield. The introduction of armorial bearings, in place of the images and statues of the Romans (the right to which was known among them by the term *jus imaginum*), is to be ascribed to the northern tribes who overran Europe on the decline and fall of the empire. Although at first strictly military, and intended to afford a means of recognizing the knight who, cased in complete armour, was unseen, yet, by being transmitted to his posterity, they became badges of civil rank and honour; and, in course of time, other circumstances gave rise to bearings which were not purely military. Thus, on the establishment of the feudal system, the tenants of the king, or the great lords, represented on their shields the services they owed to their superiors, by way of an acknowledgment of their fidelity, whence originated roses, cinquefoils, spur-rowels, bows and arrows, hunting-horns, ships, &c. When, inspired with religious enthusiasm, the martial youth of almost all Europe left their homes, about the end of the 11th century, to conquer the Holy Land, the use of coats of arms became more general and necessary. In order to distinguish nations, armies, and families, the princes and commanders chose their symbols, sometimes in commemoration of the exploits and events of the campaign, or of the dignity of the commander, and sometimes from the cause in which they were engaged. This probably introduced, or at least made more common, the figure of the cross, which is borne in a diversity of forms. In like manner, when tournaments were invented, they are supposed to have given rise to the fesse, pale, bend, and other ordinaries, which represented the fillets or lists of different kinds which were worn by the combatants and those who attended. And it was from the practice of a herald's describing and recording the names, arms, and proofs of nobility, of the knights at tournaments, that the science took its name. In heraldic science, arms are said to be of *pretension* or *dominion*. That is, *national*, or of *community*, as those of episcopal sees, cities, &c.; of *concession*, that is, augmentation of honour, being granted by sovereigns; of *alliance*, being derived from the union of families. And of *assumption*, being adopted according to the caprice of individuals. In times of chivalry, arms were chiefly displayed on the shield or escutcheon, and on the pennon or banner; also on sword-hilts, and on the mantle or surcoat—which gave rise to the term *coat of arms*. The East seems to have contributed most of the singular devices of heraldry. The Normans and French assiduously cultivated heraldry, and reduced it to a system. In the reign of Henry III. of England, the vocabulary of heraldry was nearly such as it is at present. [For its chief terms see their proper places.]

HERB (*herba: Lat.*), a plant with a soft or succulent not woody stalk or stem.

HER'BAL (same *deriv.*), a book giving an account of the names, nature, and uses of plants, their classes, genera, and species.

HERBA'RIUM (*herba*, an herb: *Lat.*) or HORTUS SICCUS (a dry garden: *Lat.*), a collection of specimens of plants carefully dried and preserved. The plants should be placed between sheets of porous paper as soon as possible after being gathered, and subjected to pressure. The paper should be repeatedly changed until the plants are quite dry. They should then be mounted on sheets of stout paper, either by means of a strong solution of gum, or of slips of gummed paper. If well prepared, an herbarium is exceedingly useful to the botanist. The name of the genus and species of plant should be written down, the place where it was found, the nature of the soil, and the season of the year at which it was procured. The specimens may be collected into orders and classes, and titled and preserved in a portfolio or cabinet.

HER'BORIZE (same *deriv.*), a botanical term, signifying to search for plants in their native places with a view to their examination.

HER'CULES, an old constellation in the northern hemisphere.

HEREDIT'AMENTS (*hæreditas*, an inheritance: *Lat.*), in Law, lands, tenements, and whatever a person may have to himself and his heirs, by way of inheritance; and which, if not otherwise bequeathed, descend to the heir, and not to the executor. *Corporeal* hereditaments are such as affect the senses. *Incorporeal* hereditaments are descendible rights upon or over corporeal hereditaments, as a right of pasture, advowsons, &c.

HER'ESY (*hairesis*, a choice: *Gr.*), an error in some fundamental doctrine of religion, or a private opinion different from that of the orthodox church. Roman Catholics hold all errors to be voluntary, which are known deviations from the judgment of the Roman Catholic church. A diversity of opinion has always existed on certain points, and always will exist. How unreasonable that, on speculative matters, men should be hated and persecuted for holding those opinions which, after much careful examination, they feel convinced are true, by those who, perhaps, scarcely understand the nature of what they would so tyrannically force upon others, and who have, in many cases, never troubled themselves about the foundations (if any) upon which it rests. Nothing can be more absurd than to demand what is not, even if we would, in our power to grant—an assent to a doctrine as true which our mind tells us is false. The adoption of any particular form of religion should be due to a conviction of its truth, ascertained by careful inquiry. If a religion be divine, the more it is examined the more satisfactory it will appear.

HER'IOT, in Law, the fine paid to the lord of the manor by copyholders on the death of the tenant. It is, usually, the best beast of which the tenant dies possessed.

HER'ISSON (a hedgehog: *Fr.*), in Fortification, a beam or bar armed with iron spikes pointing outwards, and turning on a pivot; used to block up a passage.

HERMAPH'RODITE (*Hermaphroditos*, from the mythological fable of *Hermes* and *Aphrodite*, that is, Mercury and Venus), in Zoology, a term used to designate the union of the two sexes in the same individual, as in many of the lower animals.——In Botany, a flower that contains both anthers and pistils.— In Zoology, hermaphroditism is the exception; in Botany, it is the rule.

HERMENEU'TICS (*hermeneutikos*, skilled in interpreting: *Gr.*), the art of finding the meaning of an author's words and phrases, and of explaining it to others. The word is seldom used except in reference to theological subjects.

HERMET'ICAL SEAL'ING (*hermétique*, hermetical: *Fr.*), among Chemists, formerly signified the method of closing vessels, &c., with the materials of which they are made; thus, glass with glass, and metal with metal. The barometer tube is *hermeti-*

cally sealed at one end, by melting the glass, and causing it to run together, so as completely to close the aperture. The phrase is now employed to signify such a closing of a vessel as prevents access of air to the interior

HER'MIT (*erēmitēs*, from *erēmos*, a desert: *Gr.*), a person who passes his time in total seclusion from the world The term is usually applied to one who lives in solitude for the purpose of religious contemplation and devotion. In the early ages of Christianity hermits were very numerous; and they still abound amongst Mahommedans and Buddhists

HER'MIT CRABS, marine crustaceans belonging to the family *Paguridæ* The thorax is covered with a hard crust, but the abdomen has only a soft skin, and these animals therefore protect themselves by taking up their abode in the cast-off univalve shells of molluscs, which are quitted for others as they grow larger. These they drag about with them when they are in search of food. From the red colour of some species they are frequently called soldier crabs.

HER'NIA (*Lat.;* from *hernos*, a sprout: *Gr*), in Surgery, a *rupture:* a tumour formed by the displacement of part of the intestines or omentum, which protrudes by a natural or accidental opening from the cavity in which it is contained. When the parts cannot be reduced, or returned into the abdominal cavity, the hernia is said to be *strangulated;* in that case, the passage through the intestines is interrupted, and, unless the gut can be replaced by an operation, death will soon ensue As soon as any person perceives that he is affected with a hernia, he should have recourse to medical advice, for the disease is then in the state most favourable for treatment. When the hernia is reduced, it must be subjected to a constant compression, which is effected by means of a truss.

HE'RO, in Pagan Mythology, an illustrious mortal, supposed to partake of immortality, and after his death to be placed among the gods There is no trace of hero-worship in Homer: it seems to have begun after his time; and those who fell at Marathon were the last to whom such honours were paid.——HERO, in a poem or romance, the principal personage, or the one who has the principal share in the actions related; as, Achilles in the Iliad, Ulysses in the Odyssey, &c ——HEROIC AGE, that age or period of the world in which the heroes or demigods are supposed to have lived. The heroic coincides with the fabulous age.——HEROIC VERSE, hexameter verse, so called because it is used by poets in their heroic poems.

HER'ON (*Fr.*), a name given to wading birds of the genus *Ardea*. They are allied to the crane and stork, but are distinguished by the middle claw on each foot being serrated. The best known species with us is the *Ardea cinerea*, an inhabitant of heronries which were formerly more numerous than at present, when falconry has gone out of fashion. Herons are very expert fishers, and take prey either by wading after it where the water is shallow, or by diving from the air when the object of their pursuit appears near the surface. They digest an enormous quantity of food in a short time.

HER'PES (*Gr.;* from *herpo*, I creep on) in Medicine, a term applied to several cutaneous eruptions, from their tendency to spread or creep from one part of the skin to another. One species is called *tetters;* another, *shingles;* and another, the *ringworm*, from its spreading in concentric circles They are generally seen in small distinct clustres, accompanied with itching, and terminating in scurfy scales. This disease takes various names, according to its form or the part affected. These eruptions differ from *erysipelas* by an absence of tumefaction, and by the natural appearance of the skin between the crops of eruption; and they are distinguished from other similar eruptions by the vesicular form of the cuticular elevations at their first appearance by their regular progress, and limited duration.

HERPETOL'OGY (*herpeton*, a reptile; and *logos*, a discourse: *Gr.*), that part of Natural History which treats of reptiles; a division of the sub-kingdom Vertebrata. This class of animals is distinguished by having the heart so constructed as to transmit only a *part* of the blood to the lungs, the remainder being sent back through the body unpurified: the animal heat and muscular activity are therefore lower with the *Reptilia* than the *Mammalia*. They are naked, that is to say without hair or feathers, being clothed only with scales or hard bony plates. Reptiles are, with few exceptions, *oviparous*, and do not incubate. They are destitute of the teats which are characteristic of mammals. Excluding the amphibia (frogs, toads, &c), which are now formed into a separate class, reptiles are divided into five orders:—1. *Sauria*, LIZARDS. 2 *Ophidia*, SNAKES 3. *Chelonia*, TURTLES and TORTOISES. 4. *Emydosauri*, CROCODILES and ALLIGATORS 5. *Amphisbœnia*. Fossil remains of some very large or curious forms of reptiles have been found. [See ICHTHYOSAURUS, PTERODACTYLE.]

HER'RING (*hering*, from *heer*, an army: *Ger.*, on account of their vast numbers), the *Clupea Harengus*, a malacopterygious fish. A grand shoal of many millions, divided into columns of five or six miles in length, and about four in breadth, appears at the Shetland Isles in June, where they branch off in all directions. Their progress is marked by the number of birds which follow them to prey upon them. Those which arrive at the British coasts are to be found in the greatest number off Yarmouth, the mart for herrings. Their migration is not from one latitude into another, but from a deeper to a shallower part of the ocean, where the ova may be deposited, and receive the proper amount of heat, light, and oxygen. [See FISHERIES]

HERSE or HERSILL'ON (*herse*, a harrow: *Fr.*), in Fortification, a portcullis armed with spikes, to block up a gateway or impede the march of an enemy.

HES'PERUS or VES'PER, in Astronomy,

the evening star; an appellation given to the planet Venus when it sets after the sun.

HET'EROCLITE (*heteroklitos*: from *heteros*, otherwise; and *klino*, I inflect: *Gr.*), in Grammar, a word which is irregular or anomalous, either in declension or conjugation, or which deviates from the forms of inflection usual with words of a like kind.

HET'ERODOX (*heterodoxos*: from *heteros*, different; and *doxa*, opinion: *Gr.*), the opposite of *orthodox*; a milder term than *heretical*, but of similar import.

HETEROG'AMOUS (*heteros*, different: and *gamos*, marriage: *Gr.*), in Botany a term applied to the flowers of the *compositæ*, when some of the florets of a capitulum are both staminiferous and pistilliferous, whilst others are only pistilliferous, or have neither stamens nor pistils.

HETEROG'ENEOUS (*heteros*, another; *genos*, kind: *Gr.*), that which is composed of unlike parts, opposed to *homogeneous*.

HETEROPHYL'LOUS (*heteros*, different; and *phullon*, a leaf: *Gr.*), in Botany, producing leaves of several forms.

HEX'AGON (*hex*, six; and *gōnia*, an angle: *Gr.*), in Geometry, a figure of six sides and angles. Its area is the square of one of the equal sides multiplied by 2·598076.

HEXAGYN'IA (*hex*, six; and *gunē*, a female: *Gr.*), in Botany, an order of plants in the Linnæan system, comprehending those with six pistils in the flower.

HEXAHE'DRON (*hex*, six; and *hedra*, a base: *Gr.*), in Geometry, one of the five regular solids; the cube. The other four are, the tetrahedron or pyramid, the octahedron, the dodecahedron, and the icosahedron.

HEXAM'ETER (*hexametros*: from *hex*, six; and *metron*, a measure: *Gr.*), in ancient poetry, a verse consisting of six feet, the first four of which may be either dactyls or spondees, the fifth must regularly be a dactyl, and the sixth always a spondee. The poems of Homer and Virgil are in this verse.

HEXAN'DRIA (*hex*, six: and *anēr*, a male: *Gr.*), in Botany, one of the Linnæan classes, comprehending those plants which have six stamens in each flower.

HEX'ASTYLE (*hexastulos*: from *hex*, six; and *stulos*, a column: *Gr.*), in Architecture, a building with six columns in front.

HIA'TUS (*Lat.*), an unpleasant opening of the mouth, when vowels end and begin words; also any deficiency in a manuscript which destroys the connection.

HI'BERNACLE (*hibernaculum*, winter quarters: *Lat.*), Linnæus's name for a bulb or a bud, in which the embryo of a future plant is enclosed by a scaly covering, and protected from injuries during winter.

HIBERNA'TION. [See DORMANT.]

HIBIS'CUS, a genus of plants, nat. ord. *Malvaceæ*, containing many species that are cultivated on account of their handsome flowers. The mutable rose (*H. rosa-sinensis*) and the Syrian hibiscus (*H. syriacus*) are examples.

HICK'ORY, the name of some North American trees, belonging to the nat. ord. *Juglandaceæ*, and therefore allied to the walnut. The common or shell bark hickory (*Carya alba*) and the smooth bark hickory (*C. glabra*) are tall and slender forest trees, having an average height of more than 100 feet. The wood is heavy and much used where strength is required. It is much prized for heating purposes, and it contains a considerable quantity of potash. The kernel of the nut of *C. alba* is eaten, but that of the other species is very bitter. The Pekkan nut, another North American tree, is *Carya olivæformis*.

HIDAL'GO (son of something: *Span.*), a term in Spain for a person of gentle birth. *Fidalgo* is the equivalent term in Portugal.

HIDE, a word formerly used in land-measure, for such a space as might be ploughed with one plough; or as much as would maintain a family.

HI'DEBOUND, in Farriery, a term for a disease in horses and cattle in which the skin cleaves to the side.——Also a term in Botany; a tree being said to be *hidebound*, when the bark is so close or firm as to impede the growth.

HI'ERARCHY (*hierarchia*: from *hiereus*, a priest, and *archo*, I govern: *Gr.*), a term applied sometimes to the supposed polity, or social constitution, among angels. Also ecclesiastical government, or the subordination of rank among the different orders of the clergy.

HIEROGLYPH'ICS (*hierogluphikos*: from *hieros*, sacred; and *glupho*, I engrave: *Gr.*), the expression of ideas by representations of visible objects; a word specially applied to the sculptured writings of the ancient Egyptians. These were wholly undecipherable for many ages, but Dr. Young discovered the track, and Champollion pursued it with perseverance and ingenuity. They are supposed to have consisted of three different characters:—1. The *hieroglyphics*, properly so called, which were representations of the objects themselves, either entire or abridged; and were divided into the *figurative proper*, *figurative conventional*, and *figurative abridged*. 2. Characters representing ideas by visible objects used as symbols, thus, a tumult, by a man throwing arrows, &c. Sometimes the connection between the type and antitype is obvious; in others it cannot be traced. These characters have been called *symbolical*: the Greeks termed them hieroglyphics. 3. Characters representing sounds, and termed *phonetic*. It is supposed they were likenesses of animals or objects whose names began with the letters or sounds; writers were not confined to the use of one representative for each letter. Besides hieroglyphics, the Egyptians used *hieratic* and *demotic* characters, which were conversions of the hieroglyphics into a current hand, the latter nearly alphabetical. The Mexicans, when the Spaniards invaded their country, used hieroglyphic or picture writing, but they had no alphabet.

HIEROGRAM'MATISTS (*hierogrammateus*: from *hieros*, sacred; and *grammateus*, a scribe: *Gr.*), in Antiquity, priests amongst the Egyptians who presided over learning and religion. Their duty was to take care of the hieroglyphics, and expound religious mysteries and opinions. They were also skilled in divination, and were honoured with many exemptions from civil duties and taxes.

HIERONI'CES (*hieronikēs*: from *hieros*, sacred; and *nikē*, victory: *Gr.*), in Antiquity, a conqueror at the Olympic, Pythian, Isthmian, and Nemæan games.

HIEROPHAN'TES (*hierophantēs*: from *hieros*, sacred; and *phaino*, I show: *Gr.*), the priest who initiated candidates at the Eleusinian mysteries. He was required to be a citizen of Athens; and held the office, which was of considerable importance, for life.

HI'GHNESS, a title of honour given first to bishops, then to princes. The kings of England, before James I., were not addressed with the title of 'majesty,' but that of highness only. At present the children of crowned heads are generally styled *royal highness*, a title first assumed by the Duke of Orleans, brother to Louis XIII. Those of the emperors of Austria and Russia are styled *imperial highness*. All other princes are addressed as *serene highness*.

HIGH-PRIEST, the head of the Jewish priesthood. Moses conferred this dignity upon his brother Aaron, in whose family it descended without interruption. After the subjugation of the Jews by the Seleucidæ, the Ptolemies, and the Romans, it was often arbitrarily conferred by their foreign masters. The importance of the high-priest's office is indicated by the splendour and costliness of his garment, which was among the most beautiful works of ancient art.

HI'LUM (a trifle: *Lat.*), in Botany, the part by which the ovule is united to the cord that attaches it to the placenta. In many ripe seeds the hilum is marked by a scar.

HINDOO'S, the Aryan inhabitants of the East Indies; a people distinguished for their humanity, gentleness, industry, and knowledge of the polite arts, at a time when most of their Asiatic neighbours were yet only in the first stages of civilization, when the Greeks were in obscurity, and the nations of Europe were in a state of barbarism. In earlier times, before they were oppressed by a foreign yoke, they had reached a high degree of civilization; and their country has been considered as the cradle of the arts and sciences. [See BRAHMINISM and CASTE.]

HIPPOCEN'TAUR (*hippokentauros*: from *hippos*, a horse; and *kentauros*, a centaur: *Gr.*), in ancient fable, a monster, half man and half horse. The *hippocentaur* differed from the *centaur* in this, that the latter rode on an ox, and the former on a horse, as the name imports.

HIP'POCRAS, a medicinal drink, composed of wine with an infusion of spices and other ingredients; used as a cordial.

HIPPOC'RATES' SLEEVE, in old Pharmacy, a conical bag, made of a square piece of flannel, and used for straining syrups and decoctions.

HIP'PODROME (*hippodromos*: from *hippos*, a horse; and *dromos*, a course: *Gr.*), in Antiquity, a course for chariot and horse races. The most celebrated was that at Olympia, finished by Constantine, and one which still fills with astonishment the traveller who visits the Turkish capital.

HIP'POGRIFF (*hippogriffe*: *Fr.*), a fabulous monster, compounded of a horse and a griffin. In Ariosto's 'Orlando Furioso,' the Knight Ruggiero is sent on a hippogriff to the moon.

HIPPOPOT'AMUS or **RIVER HORSE** (*hippopotamos*: from *hippos*, a horse, and *potamos*, a river: *Gr.*), a gigantic pachydermatous quadruped, equal to the rhinoceros in strength, and inferior only to the elephant in size, being from 12 to 20 feet long. It is supposed to be the *Behemoth* of Job. The head is very large, the legs are short and thick, and the short tusks are harder and whiter than those of the elephant. Its hide is so thick that it is bullet proof. It lives chiefly in water, and walks at the bottom, raising its head occasionally for respiration. It feeds on grain and vegetables, and, unless attacked or ill-treated, is perfectly harmless. There is only one living species, and that frequents the rivers of Africa. It is sometimes seen in salt water. The fossil remains of several extinct species have been found.

HIPPU'RIS (*hippouris*: from *hippos*, a horse; and *oura*, a tail: *Gr.*), in Botany, a genus of plants, nat. ord. *Haloragaceæ*. They grow in damp places, have very simple flowers, consisting only of a calyx with one stamen and one pistil, and are known as *mare's tails*. They must not be confounded with the horse tails, which are cryptogamic plants.

HIPS (*heopa*: *Sax.*), in Botany, the ripe fruit of the *dog-rose*, which is often made into a sweetmeat.

HIRU'DO (*Lat.*), the *Leech*, a genus of red-blooded worms, of aquatic habits, provided with a sucker at both ends of the body. The medicinal leech (*Hirudo medicalis*) has the oral aperture transverse, triradiate, and surrounded with three cartilaginous jaws, each armed with two rows of very fine teeth. This apparatus enables it to penetrate the skin, and insures a ready flow of blood, without causing a dangerous wound. The extent of the leech trade may be understood from the fact that four of the principal dealers in London annually import 7,200,000.

HIRUN'DO (a swallow: *Lat.*), in Ornithology, a genus of fissirostral or wide-gaping passerine birds, of which there are three species in Britain, the chimney swallow (*H. rustica*), the martin (*H. urbica*), and the sand martin (*H. riparia*). Africa seems the chief resort of the British swallow during winter. Some have supposed that they do not migrate, but pass the winter under water in a torpid state. But no warm-blooded animal can hybernate under water.——The nests of the *Hirundo esculenta* are reckoned a most exquisite delicacy among the Chinese, who make them into soups and use them in their most delicate dishes. They consist of a gelatinous substance, secreted by the bird to form the abode of its young. These nests have the form of a saucer, and the width of a tumbler. Those taken before the bird has laid its eggs are the most valuable: these are of a red colour, and nearly transparent, closely resembling isinglass, only more brittle. The best kind is sold in China at the rate of 9*s.* an ounce. They are dissolved in water, and made into a tasteless soup. The collection of the nests is said to be attended with difficulty and danger, as the birds construct them in caverns in sea cliffs.

HISTOL'OGY (*histos*, a web; *logos*, a discourse: *Gr.*), the study of the formation and growth of animal and vegetable tissues. It is prosecuted by the aid of the microscope.

HISTOR'ICAL PAINT'ING, that department of the art which 'treats of events, actions, and characters (says Mrs. Jameson) of high and general importance. It may be sacred or profane. It is termed sacred when the subjects are taken from the Holy Scriptures, or the legendary lives of saints; profane, when the subjects are borrowed from classical or modern history, or from the fables of ancient mythology.'

HISTORIOG'RAPHER (*historia*, history; and *grapho*, I write: *Gr.*), a professed writer of history.

HISTORY (*historia*, from *historeo*, I inquire: *Gr.*), a word which seems to have been first used by Herodotus. In strictness it is applied only to the civil history of man; though, when qualified, it is used to indicate other branches of investigation: thus *natural history*, &c. As to the class of events which it relates, civil history has been divided into ecclesiastical, political, and literary; as to extent, into universal and particular. The whole body of history has been classed under five heads:—1. That of the Jews. 2. That of empires and states illustrated by classical and Jewish writers, viz. Assyria, Persia, Egypt, Phœnicia, and Carthage. 3. Classical history, being that of the Greeks and Romans. 4. That of nations possessing annals of their own, viz. China, India, Modern Persia, Arabia, and the Mohammedan conquests. 5. Modern European history, including the colonies and conquests of Europeans. An historian should have the rare quality of being free from every prejudice, whether of country or of religion. The student of history should have the same, to profit by it as much as he may. [See TRADITION.]

HISTRION'IC ART (*histrionicus*, from *histrio*, an actor, and chiefly a pantomimist: *Lat.*), the art which teaches how to bear a part in dramatic representations.

HITCH, among seamen, a sort of knot or noose for fastening a rope to anything. Hitches are distinguished by the names of a *half-hitch*, a *clove-hitch*, a *rolling-hitch*, &c., according to the nature of the knot.

HOAR'-FROST (*har*, white: *Sax.*), the white particles of ice formed by the congelation of dew.

HOAR'HOUND, the name of several plants of different genera. The common hoarhound is the *Marrubium vulgare*, nat. ord. *Labiatæ*. It has a bitter taste, and is used as an attenuant.

HOCK'DAY or **HOKE'DAY**, a day of feasting and mirth, formerly observed in England the second Tuesday after Easter, to commemorate the destruction of the Danes in the time of Ethelred II., A.D. 1002.

HOG (*hwch*: *Wel.*), in Zoology, a well known and valuable quadruped, belonging to the genus *Sus*, which forms a link between the cloven-footed, the whole-footed, and the digitated quadrupeds. The domesticated varieties of the hog are exceedingly numerous. The generic characters are, four or six incisors in the upper jaw, converging; six in the lower jaw, projecting; two canines in the upper, and two in the lower jaw, very long; fourteen molars in each jaw; the snout prominent, truncate, and containing a peculiar bone; feet cloven. In their taste, hogs manifest a strange degree of caprice; for whilst they are singularly delicate in their choice of herbs, they will devour with voracity the most nauseous and putrid carrion.——The wild boar, from which all of our domestic varieties are derived, is found in most parts of Europe and Asia, and is by no means so filthy or stupid an animal as the tame hog. His snout is longer, his ears shorter; he roots up the ground in a different manner, ploughing it up in furrows; his tusks are larger, being, in some instances, ten inches long; they are bent circularly, and are exceedingly sharp at the points. Hunting this animal has always been a favourite amusement. When he is roused, he goes slowly and uniformly forward, frequently stopping and facing his pursuers, and inflicting severe or even mortal wounds.

HOGS'HEAD, a measure of capacity, containing 52½ imperial gallons. It is equal to half a pipe.

HOLD (*healdan*: *Sax.*), in ships, the whole interior or cavity of a vessel, which contains the ballast, water, coals, wood, provisions, and cargo. It is divided into the *after-hold*, the *fore-hold*, and the *main-hold*, by bulkheads.

HO'LINESS (*heilig*, holy: *Ger.*), a title given to the pope, who is styled 'your holiness,' or 'most holy father:' in Latin, *sanctissime* or *beatissime pater*.

HOL'LY (*holeyn*: *Sax.*), the name of some evergreen trees belonging to the genus *Ilex*, nat. ord. *Aquifoliaceæ*. The common holly (*Ilex aquifolium*) is well known for its polished prickly leaves and red fruit. It grows to a height of from 20 to 30 feet. The wood is very hard and is employed by inlayers and turners.——KNEE-HOLLY, a plant, the butcher's broom, of the genus *Ruscus*.——SEA-HOLLY, a plant, of the genus *Eryngium*.

HOL'LYHOCK, the *Althea rosea* of botanists, nat. ord. *Malvaceæ*. It is much cultivated in English gardens, but it is a native of the east.

HOL'OCAUST (*holokauston*: from *holos*, the whole; and *kaio*, I burn: *Gr.*), a burnt offering, or sacrifice wholly consumed by fire; of this kind was the daily sacrifice in the Jewish church. It was intended as an acknowledgment that the person offering, and all that belonged to him, were a proof of the divine bounty. The pagan nations, who also offered holocausts, probably considered them in the same light.

HOL'OGRAPH (*holographos*: from *holos*, the whole; and *grapho*, I write: *Gr.*), a writing wholly by the hand of the person whose instrument it is.

HO'LY ALLI'ANCE. A religious feeling had long prevailed among the nations of the Continent that their preceding sufferings, arising from the horrors of war and invasion, were the direct consequences of the French revolution, which they looked upon as a punishment inflicted upon the world for its impiety. After the fall of Napoleon, this feeling still remained strong in their minds, and they were induced to believe that religion might be made the basis of international politics. Participating in this spirit, and desirous of becoming the pacificator of Europe, the emperor Alexander of Russia applied to the emperor of Austria and the king of Prussia to join him in establishing an alliance for the promotion of this glorious object. To his request these monarchs readily acceded. The document which Alexander had drawn up, and sent to them in his own handwriting, was signed by the emperor of Austria and the king of Prussia. It was stipulated that the three sovereigns should invite others to become members of the Holy Alliance; and, in the sequel, all the European sovereigns, except the pope, joined it. Since the secession of England and France it can scarcely be said to exist.

HO'LY-ROOD DAY, a festival observed by Roman Catholics on the 14th of September, in memory of the exaltation of the Cross.

HO'LY THURS'DAY, in the Roman Catholic church, the Thursday before Easter Sunday.

HO'LY-WATER, in the Roman Catholic and Greek churches, water which has been consecrated by prayers and other ceremonies, and is used for sprinkling the faithful and things required for the church. It is contained in a particular kind of vases, at the doors of churches, and also within them at certain places; and from them the worshippers sprinkle themselves before prayer. The ancient Greeks and Romans used *lustral* water, when entering their temples; and employed it on other occasions also, to sprinkle and purify the people.

HO'LY WEEK, the week before Easter Sunday.

HOM'AGE (*hommage: Fr.*), in Law, the oath of submission and loyalty, which the inferior or tenant, under the feudal system, used to take to his lord when first admitted to his possessions or land.

HOM'ICIDE (*homicidium*: from *homo*, a human being; and *cædo*, I kill: *Lat.*), in Law, the killing of one human being by another. It is of three kinds, *justifiable*, *excusable*, and *felonious*; *justifiable*, when it proceeds from unavoidable necessity, without an intention to kill, and without negligence; *excusable*, when it happens from misadventure, or in self-defence; *felonious*, when it proceeds from malice, or is done in the prosecution of some unlawful act or in a sudden passion. Homicide committed with premeditated malice is *murder;* without it, *manslaughter*. Suicide, or self-murder, is also felonious homicide. [See FELO-DE-SE.] The lines of distinction between felonious and excusable or justifiable homicide, and between manslaughter and murder, are, in many cases, difficult to define with precision. But, in general, the accused has the advantage of any uncertainty or obscurity that may hang over his case, since the presumptions of law are usually in his favour.

HOM'ILY (*homilia*, an assembly: *Gr.*), a sermon or discourse upon some point of religion, delivered in a plain manner, so as to be easily understood by the common people. In the primitive church, homily meant rather a conference or conversation by way of question and answer, which made part of the office of a bishop till the fifth century, when the learned priests were allowed to preach, catechize, &c., in the same manner as the bishops used to do. There are still extant several fine homilies, composed by the ancient fathers.——HOMILETIC THEOLOGY, a branch of practical theology, which teaches the manner in which ministers of the gospel should adapt their discourses to the capacities of their hearers; and points out the best methods of instructing, both by their doctrines and examples.

HOMŒOP'ATHY (*homoios*, like; and *pathos*, feeling: *Gr.*), a medical practice which had its commencement in the beginning of the present century. The fundamental principles are that every medicine has a specific power of inducing a certain diseased state of the system; and that if such medicine be given to a patient suffering under the disease, it disappears. Medicines, therefore, are administered to an extent just sufficient to induce an action superior to that of the disease; but still in *infinitesimal* quantities, the millionth of a grain being often too much. Medical men do not generally admit any reality in this system; they attribute the cures which it seems to effect to regimen and habits beneficial to the patient, and which they themselves in many cases would prefer to the administering of medicines.

HOMOGE'NEOUS (*homoios*, like; and *genos*, kind: *Gr.*), a term given to substances when they consist throughout of an aggregation of similar particles, in opposition to *heterogeneous*.

HOMOL'OGY. Those parts of organized beings which correspond in structure and origin, but not in office, are termed homologous; those parts which are only alike in function are said to be analogous. Thus, the wings of birds and the wings of insects are analogous, not homologous; the air-bladder of fishes is homologous with, but not analogous to, the lungs of the higher vertebrates; whilst the wings of birds and the pectoral fins of fishes are both homologous and analogous, that is, they have not only the same office, but the same structural origin. 'No group of organic beings,' says Darwin, 'can be well understood until their homologies are made out; that is, until the general pattern, or, as it is often called, the ideal type, of the several members of the group is intelligible. No one member may now exist exhibiting the full pattern; but this does not make the subject less important to the naturalist, probably makes it more important for the full understanding of the group. The homologies of any being, or group of beings, can be most surely made out by tracing their embryological development when that is possible; or by the discovery of organs in a rudimentary condition; or by tracing through a long series of beings a close gradation from one part to another, until the two parts or organs employed for widely different functions, and most unlike each other, can be joined by a succession of short links. No instance is known of a close gradation between two organs, unless they be homologically one and the same organ. The importance of the science of homology rests on its giving us the key-note of the possible amount of difference in plan within any group; it allows us to class under proper heads the most diversified organs; it shows us gradations which would otherwise have been overlooked, and thus aids us in our classification; it explains many monstrosities; it leads to the detection of obscure and hidden parts, or mere vestiges of parts, and shows us the meaning of rudiments.'

HOM'OPHONE SIGNS (*homos*, like; *phōne*, a sound: *Gr.*); in Philology, when different signs stand for the same sound they are said to be homophone.

HOMO'PTERA (*homos*, like; *pteron*, a wing: *Gr.*), a sub-order of insects with four membraneous wings, of which the first pair are larger, and do not lap over each other when the insects are in a state of repose. The coccus, the cuckoo-spit insect, the LANTHORN FLY, the CICADA, and plant-lice (APHIDES), belong to this order. The metamorphosis of the homoptera is incomplete. This sub-order is a division of the order *Rhyncota* or *Hemiptera*.

HON'EY (*honig*: *Ger.*), a sweet viscid liquor, secreted in the nectaries of flowers, collected by the working bees, and deposited in the cells of the combs. *Virgin honey* is that which is obtained from the hive of bees that have never swarmed; also, that which runs out of the comb of itself. Honey appears to be merely gathered by the bees; for it consists only of vegetable products, such as the sugars of grape, gum and manna, along with mucilage extractive matter, a little wax, and acid Narbonne honey owes its peculiar excellence to the flowers on which the bees feed. Trebizond honey is remarkable for its intoxicating properties. Many instances of poisonous honey have been recorded. Honey contains a crystallizable sugar, and an uncrystallizable in the liquid state.

HON'EYCOMB, a waxen substance, of a firm, close, texture, formed by bees into hexagonal cells, in which they deposit their honey and eggs. These cells are arranged in two layers, placed end to end, the openings of the different layers being in opposite directions. The comb is placed vertically, the cells being therefore horizontal; and it is strengthened, where possible, by additional supports, the parts being fastened to one another and to the sides of the hive. The interval between the different cakes of comb is sufficient readily to allow the passage of two bees; and passages which are pierced here and there afford a communication between all parts of the hive. The sides of the cells are all much thinner than the finest paper; and yet they are so strengthened by their arrangement that they are able to resist all the motions of the bee within them. In fact, the construction of the cells is such as to allow the greatest possible number in a given space, with the least possible expenditure of material.

HON'EY-DEW, a sort of saccharine substance ejected on plants by certain *aphides*.

HON'EY LO'CUST, a leguminous deciduous tree belonging to the genus *Gleditschia*, so named after Gleditsch, a Berlin botanist. Most of the species are natives of China or North America and have acacia-like leaves and large branching thorns.

HON'EY STONE or MELLITE, a mineral found in lignite deposits. It has a yellowish or reddish colour and crystallizes in octahedrons with a square base. It is a combination of alumina and mellitic acid, a peculiar compound of carbon, oxygen, and water.

HON'EYSUCKLE or WOODBINE, well-known plants with fragrant flowers, species of the genus *Lonicera* in the nat. ord. *Caprifoliaceæ*.

HONG, the Chinese name for a European factory. The *Hong merchants*, of whom there are about a dozen, reside at Canton, and are responsible for the conduct of the Europeans with whom they deal

HON'OUR (*honor*: *Lat.*), in Law, a superior seigniory, to which other lordships and manors owe suit and service, and which, itself, holds of the king only.——HONOURS OF WAR, honourable terms granted to a vanquished enemy, when he is permitted to march out of a town with drums beating, colours flying, &c., and all the insignia of military pomp.——LAWS OF HONOUR, among persons of fashion, signify certain rules by which their social intercourse is regulated, and which are founded on a regard to reputation. These laws require a punctilious attention to decorum in external deportment, but often lead to the most flagrant violations of moral duty.——COURT OF HONOUR, an ancient court of civil and criminal jurisdiction, having power to redress injuries of honour, and to hold pleas respecting matters of arms and deeds of war.

HON'OURABLE (*honorabilis*: *Lat.*), a title, given by courtesy, to the younger sons of earls, and to all the children of viscounts and barons; to persons enjoying certain places of trust and honour; collectively, to the House of Commons, to the East India Company, and to each of the Inns of Court. Also, an epithet of respect or distinction given by members of the House of Commons, when speaking of other members, as, 'the honourable gentleman.'

HOOP'ING-COUGH (*houpper*, to shout: *Fr.*; if spelled *whooping*-cough, *wopgan*, to shout: *Goth.* The French word is derived from this), a disease marked by a convulsive strangulating cough, in which the patient whoops, with a deep inspiration of the breath. Children are most commonly subject to it, and it seems to depend on a specific contagion, which affects them but once in their life.

HOO'POE, an African bird which sometimes visits England; remarkable for the crest of feathers on its head. It is the *Upupa epops* of ornithologists, who place it along with the wrens and the nuthatch, in the family of *Certhiadæ*.

HOP (*hoppan: Ang. Sax.*), the *Humulus lupulus* of botanists, a climbing plant, belonging to the order of *Urticaceæ*. The female flowers are used for the purpose of imparting an agreeable aromatic bitter flavour to malt liquors, and to preserve them from fermentation. Hops are said to have been introduced into England from the Netherlands in the 16th century; and their cultivation is especially attended to in the counties of Kent, Surrey, Sussex, Worcester, and Hereford. The best method of drying hops is on a kiln over a charcoal fire; as soon as the stalks are brittle, and the top leaves easily fall off, the process is complete. When taken from the kiln they should be laid by for three weeks or a month before they are bagged. The whole process, from the time of planting to the preparation for the purposes of commerce, requires much experience and many precautions. When hops are to be kept two or three years, they must be powerfully compressed, and put into closer canvass bags than when they are to be sent immediately to market; and they must be preserved in airy lofts, neither too hot nor too cold. The produce is excessively variable, often in a tenfold proportion in different seasons and situations, being very liable to be injured by insects, by cold and continued rains, and by thunderstorms: so that a full crop is not obtained oftener than about once in five years. One of the most active constituents of the hop is a narcotic essential oil, which gives the flower its peculiar smell: its narcotic qualities were at one time so highly esteemed that a pillow of hops was commonly recommended to procure sleep when all other remedies had failed. The other important elements of the hop are a yellow resin, and a bitter principle possessed of peculiar medicinal qualities, which chemists call *lupulin*.

HOPLI'TES (*hoplitai*, from *hoplon*, arms: *Gr.*), among the Greeks, heavy-armed soldiers, who were of the first and principal class.

HOP'PER, a kind of basket in which seed corn is carried at the time of sowing. Also, the wooden trough in a mill, into which the corn to be ground is put.

HO'RARY CIR'CLES (*horarius*, hourly: *Lat.*), on globes, are hour lines or circles, marking the hours, and drawn on the equator at the distance of 15° from each other. They are meridians.——HORARY MOTION OF THE EARTH, the arc it describes in an hour, which is nearly 15 degrees. Hence, in reducing motion into time, if 15° is equal to 1 hour, 1° is equal to 4′. And the clocks at places 15° east of London are an hour faster than those in London; but the clocks at places 15° west of London are one hour later than those in London: and in proportion for any other number of degrees.

HORDE, a collective name for those migratory tribes which, like the Tartars, exist not by pasture or agriculture, but by plunder and rapine.

HORI'ZON (*horizōn*, from *horizo*, I terminate: *Gr.*), in popular language, the line where the sky meets the sea, or a plain. Astronomers distinguish between the sensible and rational horizons: the *sensible* horizon is a plane tangential to the earth's surface at the place of the spectator, extending on all sides until it is bounded by the sky. The *rational* horizon is a plane parallel to the former, but passing through the centre of the earth. It is clear that a spectator whose eye is not level with, but at any distance whatever above, the sensible horizon, can see stars, &c., that are actually below it, independently of refraction, which causes their apparent positions to be higher than those they really occupy.——ARTIFICIAL HORIZON, an instrument in which mercury is employed to form a reflecting plane, which is of course parallel with the plane of the horizon of that place. It is used in surveying and measuring heights.——HORIZON, in Painting. In every picture, the *artificial eye, or point of sight*, is conceived to be at the same height from the base line as the eye of a person supposed to be standing there. To this point everything in the picture tends, as everything in a *real* view tends to the *natural* eye. The picture then, as far as this circumstance is concerned, is perfect if the *artificial eye* and the *artificial horizon* go together; for these always bear the same relation to each other, wherever the picture may be placed.

HORN. Horn is susceptible of being cut into a great variety of forms; its properties render it an article of considerable value in the hands of the turner and other manufacturers, for combs, snuff-boxes, knife-handles, lanterns, &c. Immense quantities are annually imported from all parts of the world. With reference to structure, horns may be divided into three classes. 1. Antlers, which have the structure of bone. 2. The horns of the rhinoceros and buffalo, which consist of epidermic formations: and 3. Hollow horns like those of oxen, in which the horny matter is disposed in concentric layers round a centre of true bone.

HORN'BILL, a name given to a genus of conirostral birds, the *Buceros* of ornithologists, on account of there being a large horny protuberance on the upper mandible near the base. The species are natives of Africa and Asia.

HORN'BLENDE (called by Haüy *Amphibole*), in Mineralogy, a name given to minerals of very different external appearance. They are composed of silica, alumina, magnesia, lime, and oxide of iron. Hornblende is usually of a greenish or blackish-green colour, and forms the bases of rocks of the basaltic series. Augite is near akin to it.

HOR'NET (*hyrnette*, from *horn*, a horn: *Sax.*, on account of its horns), a strong and stinging insect, a species of the genus *Vespa*, to which the wasps belong. It constructs a nest, often as large as a man's hat, in hollow trees, thatch, &c., of the bark of the ash tree, or decayed wood gnawed in pieces, and formed, by a viscous fluid which it emits, into a kind of pasteboard.

HORN'SILVER or *Luna cornea*, names given by the alchemists to fused chloride of silver, from its resembling horn in appearance: a similar reason induced them to use the term *horn lead*. It is found abundantly in Peru, Mexico, and other parts of South America, mixed with veins of metallic silver.

HORN'STONE, in Mineralogy, a siliceous stone, having a semi-transparency resembling that of horn: it is a sub species of quartz. Its geological locality is remarkable, for it occurs in both ancient and recent formations. The hornstone found in secondary limestone is called *chert* by the English miners.

HORN'WORK, in Fortification, an outwork, which advances towards the field, and is composed of two demi-bastions, like horns, joined by a curtain.

HOROL'OGY (*hōra*, an hour; and *logos*, a discourse: *Gr.*), the principles on which the art of making clocks and watches is founded

HOROM'ETRY (*hōra*, an hour; and *metron*, a measure: *Gr.*), the art or practice of measuring time, by hours and subordinate divisions

HOR'OSCOPE (*hōra*, an hour; and *skopeo*, I examine: *Gr.*), in Astrology, a representation of the appearance of the heavens, and positions of the celestial bodies, drawn at a certain time—for instance, at the moment of a person's birth: it was supposed to indicate his future destiny.

HORSE (*hors: Sax.*), the *Equus Caballus*, a domestic quadruped that excels all others in beauty and usefulness. It is characterized by having six erect and parallel fore-teeth in the upper jaw, and six somewhat prominent in the under jaw; the dog-teeth are solitary; the molars are four on each side of each jaw until the fifth year, when a fifth grinder makes its appearance, and the displacement of the first set and the protrusion of the permanent set of teeth commence. Like all the quadrupeds of the genus *Equus*, it has an undivided hoof on each foot. The most esteemed breeds of horses are, the Barbary or Arabian, remarkable for their fleetness; the English racehorse and hunter, which combine beauty with swiftness; and the English draught-horses, which are distinguished for their size and strength, &c. In Africa, horses still maintain their original independence, and range at pleasure in herds of several hundreds, having always one or more as an advanced guard, to give an alarm at the approach of danger. This is expressed by a sudden snorting, at which the main body gallops off with the most surprising swiftness. In South America there are wild horses, the descendants of those introduced by the Spaniards and Portuguese. In Arabia, almost every man possesses his horse, which lives in the same apartment with himself and family, and is considered as constituting an important part of it. It is fed with the most regular attention, is cleaned with an incessant assiduity, and is never, on any account, ill-treated. An Arab occasionally appears to carry on a conversational intercourse with his horse, and his attachment to the animal excites in return a corresponding affection. In no country of the globe, however, has the breed of horses been more attended to than in Great Britain, nor are British horses excelled in swiftness or beauty by the coursers of Barbary or Arabia; and in supporting fatigue, they are much superior to either. But by the absurd practice of running our racehorses at two or three years old, working others long before their limbs are knit or their strength established, and cruelly exacting from them services far beyond their powers, their usefulness is soon destroyed, and their lives materially shortened. The age of a horse under eight years old is generally to be known by his teeth. The black marks, or cavities denoting the age, are to be found in the corner front teeth adjoining the tushes. At four years and a half old, the mark teeth are just visible above the gum, and the cavity is distinctly to be seen. At five, the remaining colt's teeth are shed, and the tushes appear. At six, the tushes are up, and appear white, small, and sharp, with a small circle of flesh growing near them; the horse's mouth is then completed, the corner teeth being filled up. At eight, the black marks disappear.——HORSE, in Military affairs, a body of cavalry.——In Naval affairs, a rope extending from the middle of a yard to its arms, for supporting the sailors' feet while they furl the sails; also, a rod or rope, along which the edge or corner of the sail traverses by means of hanks.——HORSE, in Printing, the sloping bench standing on the *bank*, or table, on which the pressmen set the heaps of paper before each sheet is placed on that part of the press called the *tympan*.

HORSE LAT'ITUDES, a name given by sailors to a zone of calms in each hemisphere, one on the north border of the north-east trades, and the other on the south border of the south-east trades. They move a little up and down, following the declination of the sun.

HORSE-POWER. A horse draws to the greatest advantage when the line of draught inclines a little upwards. Desaguliers and Smeaton consider the force of one horse equal to that of five men, but writers differ on this subject. The measure of a horse's power as the standard of that of machinery given by Watt is, that it can raise a weight of 33,000 pounds to the height of one foot in a minute. Its capability of draught or carriage of course diminishes as its velocity increases, and it is supposed to do most work when its speed is 2¼ miles per hour, which *happens* to be the most useful speed for the piston of a steam-engine. The nominal is very different from the effective power of a steam-engine: the latter being equal to the former, diminished by the deduction to be made on account of friction, the resistance of the air, &c., and which varies not only with different engines, but with the same engine at different times, since the overtightening of a single screw may seriously increase the amount of friction. The *nominal horse-power* is found by multiplying together the pressure in pounds on each square inch of the piston (which is less than the pressure within the boiler), the number of square inches on the surface of the piston, the number of feet traversed by the piston in its backward and forward motion, and the number of revolutions made by the crank or fly-wheel per minute, and then dividing the resulting product by 33,000. The *real* or *effective horse-power* is ascertained by means of an *indicator*, or some similar contrivance.

HORSE'-RACING, a diversion more used in England than in any other country in the world. Horse-races were common amongst the Greeks and Romans, and the place where they ran or exercised their coursers was called the *Hippodrome*, which see.

HOR'SESHOE, in Fortification, a small work of a round or oval figure, enclosed with a parapet: sometimes raised in the moat or ditch, or in low grounds; and sometimes used to cover a gate, or to serve as a lodgment for soldiers.

HOR'SE-TAIL, a cryptogamic plant, with a hollow stem, growing in wet ground, and belonging to the genus *Equisetum*.

HOR'TICULTURE (*hortus*, a garden; and *cultura*, tillage: *Lat.*), the art of cultivating a garden and rearing the finest kinds of plants. It differs from *agriculture* chiefly in being performed altogether by manual labour, and being confined within a limited space.

HOR'TUS SIC'CUS (a dry garden: *Lat.*). [See HERBARIUM.]

HOSAN'NA (save now: *Heb*.), an exclamation of joy, found only once in the Old Testament, viz Ps cxviii. 25. It was used by those who conducted Christ into Jerusalem: Matt. xxi., Mark xi., and John xii. It has been commonly adopted by the church.

HOSE (*Ger.*), among mariners, a leathern pipe for conveying water from the main-deck into the casks. Also, a leathern pipe, used with fire-engines, for conveying water to extinguish fires.

HOSE'A, a canonical book of the Old Testament, and the first of the minor prophets. The prophecies of Hosea are chiefly directed to the ten tribes before their captivity: threatening them with destruction in case of disobedience, but comforting the pious with the promise of the Messiah: and describing the happy state of the church in the latter days.

HOS'PITAL GAN'GRENE, an ulcerating gangrene, of a particularly infectious nature, which attacks wounds or ulcers in crowded hospitals.

HOS'PITALLERS, an order of religious knights, instituted about A.D. 1092, who built an hospital at Jerusalem for pilgrims. They were first styled knights of *St. John of Jerusalem*, then *Knights of Rhodes*, and finally *Knights of Malta*, these islands having been successively conferred on them. From Rhodes they were expelled by the Turks in 1522, when Charles V. granted Malta to them. A branch of them settled early in England. In London they acquired the property now known as the Temple, and the ancient gate of St. John, Clerkenwell, is a relique of another establishment.

HOSPI'TIUM (*Lat.*), a term used in old writers either for an inn or a monastery built for the reception of strangers and travellers. In the more early ages of the world, before public inns were thought of, persons who travelled lodged in private houses, and were obliged, if an opportunity presented itself, to return the favour to those that entertained them. This led to the most intimate friendship betwixt the parties, insomuch that they treated one another as relations. Hence the word *hospitium*, which properly signifies lodging or entertainment at the house of another, is used for friendship, founded upon the basis of hospitality. The word, in modern times, has been almost wholly restricted to the celebrated establishments on the St. Bernard and St. Gothard in Switzerland, intended for the preservation of travellers, or recovery of their bodies, when lost in the terrible snow-storms which often occur in those elevated and dangerous regions.

HOS'PODAR or WOIWODE, a title borne by the princes of Wallachia and Moldavia, who receive the investiture of their principalities from the grand seignior. He gives them a vest and standard; they are under his protection, and obliged to serve him, and he has even sometimes deposed them, but in other respects they are absolute sovereigns within their own dominions.

HOST (*hostia*, a victim: *Lat.*), the consecrated *wafer*, supposed by the Roman Catholics to be changed into the body and blood of Christ. The *elevation of the host* is a ceremony during the mass, &c., in which the wafer is raised aloft and worshipped; it had its rise in the 12th century. The wafer is termed a *host*, because supposed to be a *daily sacrifice* or *victim*, offered up for a propitiation.

HOS'TAGE (*otage*: *Fr.*; from *hostis*, an enemy: *Lat.*), a person given up to an enemy as a security for the performance of the articles of a treaty, and released on their fulfilment.

HOTCH'POT, a quaint legal phrase employed when it is directed in a settlement or will that any member of a class shall divide property which he may acquire with the rest of that class; this is called bringing it into hotchpot.

HOT'HOUSE, a building for the rearing of exotic plants that require heat, as well as for the early ripening of fruit.——HOT-BED, a bed of earth with horse-dung, or other manure, covered with glass: intended to raise early plants, or afford heat to such as will not thrive in the open air.

HOT'TENTOTS, natives of the southern extremity of Africa, a mild inoffensive race, both mentally and physically inferior to the Caffres. They live in filthy huts shaped like a beehive, made of mats spread over a frame of sticks. These are easily removed from place to place. A collection of them is called a kraal.

HOUND (*hund*: *Ger.*), a dog used in the chase. English hounds excel those of all other countries, not only from the climate being congenial to them, but also from the great attention paid to their breeding and management.——HOUNDS, in Naval Architecture, the sides of the mast near its head, which, like shoulders, support the rigging, &c.

HOUR (*hora: Lat.*), in its ordinary acceptation, the twenty-fourth part of a mean solar day. The Italians count twenty-four hours from sunset to sunset; astronomers, twenty-four hours from midday to midday.

HOUR'GLASS, an instrument that measures time by the running of sand from one part to another through a small aperture.

HOU'RIS (*hûr al oyûn*, black-eyed: *Arab.*), virgins in Mahomet's paradise, who, according to the description of them in the Koran, surpass in voluptuous beauty all that the imagination of mortals can conceive. They are accordingly destined to be one of the rewards of the blest

HOURS, CANON'ICAL. The seven hours of prayer to which monks and ecclesiastics in the Roman Catholic church are bound. Except in monasteries, they are said at almost any period of the day, either in parts or all together. The seven canonical hours are—*Matins*, and *Lauds*, which may be recited the afternoon or evening before, *Prime*, *Terce*, *Sext*, *None*, *Vespers*, and *Complin*. These hours must be *said*, and not *read* in the ordinary way.

HOUSE, in its primary sense, any building or edifice designed or appropriated for the habitation of man.——Among the ancient Greeks, Romans, and Jews, the houses usually enclosed a quadrangular court, open to the sky, and called the *impluvium* (*in*; and *pluvia*, rain: *Lat*), or *cavædium* (*cavus*, hollow; and *ædes*, a house: *Lat*); it was provided with channels to carry off the rain.

—HOUSE, in Astrology, the twelfth part of the heavens The division of the heavens into houses was founded upon the pretended influence of the stars, when meeting in them, on all sublunary bodies. These influences were supposed to be either good or bad, and to each of these houses particular virtues were assigned, on which astrologers prepared and formed a judgment of their horoscopes. The horizon and meridian are two circles of the celestial houses, which divide the heavens into four equal parts, each containing three houses; six of which are above the horizon, and six below it. Six of these are called eastern, and six western houses ——HOUSE, among genealogists, a noble family, or an illustrious race, descended from the same stock; as, the house of Austria, the house of Hanover.

HOU'SEBREAKING In Law, the breaking open and entering of a house by daylight, with the intent to steal, is a felony: if no theft is actually committed, it is a *misdemeanor*. The same crime committed at night is denominated a *burglary*.

HOU'SEHOLD, the whole of a family considered collectively, including the mistress, children, and servants. But the household of a sovereign prince includes only the officers and domestics belonging to his palace.——HOUSEHOLD OF THE KING. The chief officers of the royal household are:—1. The lord-chamberlain, under whom are the vice-chamberlain, groom of the stole, lords of the bedchamber, gentlemen of the privy chamber, gentlemen ushers, master of the ceremonies, gentlemen at arms, &c. 2. The lord-steward, in whose office are the treasurer and controller of the household, yeomen of the guard, &c. 3. The master of the horse, under whom are the equerries. 4 The lord high almoner. 5. The dean of the chapel royal. When there is a queen, as at present, there is a suitable modification in the subordinate offices: for example, a mistress of the robes takes the place of the groom of the stole.

HOU'SELEEK, the *Sempervivum Tectorum* of botanists, a plant with a perennial root, that grows on the roofs of houses or the tops of walls, and belongs to the *Crassulaceæ*.

HOW'ITZER (*haubitze*, from *häufen*, to fill up: *Ger.*), a kind of mortar, mounted upon a carriage like a gun. Howitzers are used to throw grenades, case-shot, and sometimes fire-balls: their principal use, however, is in the discharge of grenades.

HOW'LING MO'NKIES. These inhabit the forests of South America, and are so called from the horrible cries they utter, with which it is supposed they intimidate their enemies. The sound, 'a hollow cavernous roar,' is produced with little muscular exertion, by a drum-shaped expansion of the larynx. These monkies are untameable. They have long prehensile tails, which aid them in climbing. They form the genus *Mycetes* of naturalists.

HOY (*heu: Ger*), a small vessel for carrying passengers from one place to another.

HUE AND CRY, in Law, the common law process of pursuing a felon. The original signification of the phrase evidently was, that the offender should be pursued with a loud outcry, in order that all might hear and be induced to join in the pursuit.

HU'GUENOT (*eidgnoten*, confederates: *low Germ.*), a French word used after the year 1560 as an appellation for a Protestant. Its origin, and consequently its *literal* meaning, has received various explanations. The history of the Huguenots forms an important feature in the annals of persecution; but a detail of the sanguinary scenes would be altogether incompatible with the plan of this volume; we shall, therefore, merely remark that the religious prejudices of the people were kept alive by contending political factions, till France was nearly desolated by what were termed 'religious wars;' and at length a dreadful massacre of the Huguenots took place on St. Bartholomew's day, 1572. Henry IV., 1598, protected them by the edict of Nantes; but Louis XIV, 1685, revoked this edict, in consequence of which 500,000 Huguenots fled to Switzerland, Germany, Holland, and England, where their industry and wealth found a welcome reception.

HUIS'SIERS (*Fr.*: from the old word *huis*, a door; whence our *usher*), civil officers in France, whose attendance is necessary at every judicial tribunal, from that of a justice of the peace to the court of cassation. They answer in some respects to the clerks and criers of our courts.

HULK (*hulke*, a ship: *Ger.*), in Naval Architecture, the body of a vessel, or that part which is, in truth, the vessel itself; the masts, sails, and cordage, composing only the apparatus for its navigation. Convicts were confined in the hulks near Woolwich before being sent out of the country.

HUMAN'ITIES (*humanitas*, liberal education: *Lat.*), a term used in the Scotch schools and colleges, to signify polite literature, or grammar, rhetoric, and poetry, including the study of the ancient classics.

HUM'BLE-BEE. [See BEE.]

HUM'BOLDITE, a variety of *Datholite*, named in honour of Humboldt. It is a borosilicate of lime, and occurs in small and nearly colourless crystals, irregularly aggregated.

HU'MERUS (the shoulder: *Lat.*), in Anatomy, the upper part of the arm, between the scapula and elbow. The *os humeri* or *brachii*, as it is called, is articulated at one end to the scapula, and at the other to the ulna and radius. As to the motion of the *os humeri*, it is more free and extensive than that of any bone in the human body, being furnished with several flexor and extensor muscles.

HU'MIC ACID (*humus*, the earth: *Lat.*), or ULMIC ACID, an indefinite substance, produced by the action of powerful chemical agents on sugar, lignin, &c., or by the putrefaction of vegetable fibre.

HU'MITE, a mineral which is colourless, or of a yellow or brown colour, and a shining lustre, and is crystallized in octahedrons. It scratches glass readily: heated under the blowpipe, it becomes opaque, but does not melt: it gives, with borax, a transparent glass. It has been found at Somma, in Italy.

HUM'MING-BIRDS, a family of small birds, remarkable for the brilliant colours of their plumage. The numerous genera and species are divisible into two groups. 1. *Phæthorninæ*, which live entirely in forests, and feed chiefly on insects, being seldom seen at flowers. 2. *Trochilinæ*, which prefer open sunny places, entering the forest only when a tree is in blossom, or descending into a glade where there are flowers. 'The motions of humming-birds,' says H. W. Bates, 'are unlike those of all other birds. They dart to and fro so swiftly that the eye can scarcely follow them, and when they stop before a flower it is only for a few moments. They poise themselves in an unsteady manner, their wings moving with inconceivable rapidity, probe the flower, and then shoot off to another part of the tree. They do not proceed in that methodical manner which bees follow, taking the flowers seriatim, but skip about from one part to another in the most capricious way. Sometimes two males close with each other and fight, mounting upwards in the struggle as insects are often seen to do when similarly engaged, and then separating hastily and darting back to their work. Now and then they stop to rest, perching on leafless twigs, when they may be sometimes seen probing, from the place where they sit, the flowers within their reach. The brilliant colours with which they are adorned cannot be seen whilst they are fluttering about.'

HUM'MOCK, a name given by mariners to a hillock or small eminence of land, resembling a cone, and appearing on the seacoast of a country; also, to a sheet of ice which presents a surface generally level, but here and there diversified by projections arising from the ice having been thrown up by some pressure or force to which it has been subjected.

HU'MORAL (next), in Medicine, an epithet for whatever relates to the humours or fluids of the system.——HUMORAL PATHOLOGY is that which attributes all morbid phenomena to the disordered condition of the fluids or humours. It is opposed to the *nervous pathology*, which refers everything to the nervous energy resident in the solids, and considers diseases as arising from irregularities in the action of the nerves.

HU'MOUR (*humor*, moisture: *Lat.*), in Medicine, a word much used to express the moisture or fluids of animal bodies, or a fluid in its morbid or vitiated state.——*Aqueous humour of the eye*, a transparent fluid, occupying the space between the crystalline lens and the cornea, both before and behind the pupil.——*Crystalline humour* or *lens*, a small transparent solid body, occupying a middle position in the eye; it is the principal instrument in refracting the rays of light, so as to form an image on the retina.——*Vitreous humour*, a fluid contained in the minute cells of a transparent membrane, occupying the greater part of the cavity of the eye, and all the space between the crystalline lens and the retina.——HUMOUR, that quality of the mind which creates ludicrous images or representations. *Humour* does not possess the brilliancy and poignancy of wit. Although it is usually employed to raise mirth and render conversation pleasant, it is also often made a vehicle for satire.

HUN'DRED (*hundert*: *Ger.*), a part or division of a county, which was anciently so called from its containing a hundred families, or from its furnishing a hundred able men for the wars of the sovereign. After Alfred divided this kingdom into counties, and gave the government of each to a sheriff, they were subdivided into hundreds, of which the constable was the chief officer. By various statutes, hundreds are liable to actions for injuries sustained by the riots, robberies, malicious mischiefs, &c., committed within them.

HUNT'ING (*huntian*, to hunt; from *hund*, a dog: *Sax.*), the act or diversion of pursuing wild animals. In a rude state of society, it is one of the most important employments of mankind: in a more advanced state, it becomes an agreeable amusement, and is practised in a great variety of ways, according to the country and the description of the game. In England, the fox, the stag, and the hare, are the principal objects of the chase; on the continent of Europe, the wild boar and the wolf are added to the list. Dionysius, who lived 50 B.C., says that the inhabitants of the northern part of this island tilled no ground, but lived in great part upon the food they procured by hunting. Strabo, who was nearly contemporary with him, also says, that the dogs bred in Britain were highly esteemed upon the continent, on account of their excellent qualities for hunting. As early as the 9th century, it formed an essential part of the education of a young nobleman. Alfred the Great was an expert and successful hunter before he was twelve years of age. Among the tributes imposed by Athelstan after a victory over Constantine, king of Wales, were, 'hawks and sharp-scented dogs, fit for hunting of wild beasts.' Edward the Confessor took the greatest delight in following a pack of swift hounds in pursuit of game, and cheering them with his voice. To the passion for hunting which animated the feudal kings and nobles of Europe, the vast tracts of land which were afforested bear fearful testimony; and the writers of the time give a strong picture of the sufferings of the oppressed commonalty under the tyrannical privileges of sport which were claimed by their masters. In the reign of Edward II., hunting was reduced to a perfect science, and rules were established for its practice; these were afterwards extended by the *master of the game* belonging to Henry IV., and drawn up for the use of his son Henry, prince of Wales, in two tracts, which are extant. Edward III., according to Froissart, while at war with France, and resident there, had with him sixty couples of stag-hounds, and as many hare hounds, and every day hunted or hawked. Gaston, earl of Foix, a foreign nobleman, contemporary with Edward, also kept 600 dogs in his castle for hunting. The bishops and abbots of the middle ages hunted with great state, and some of them were skilful sportsmen. One of these ecclesiastics, an archbishop of York, in 1321, carried with him a train of 200 persons, who were maintained at the expense of the abbeys on his road, and who hunted with a pack of hounds from parish to parish.

HU'ON PINE, a lofty coniferous tree, growing in Tasmania, and known to botanists as *Microcachrys tetragona*.

HUR'RICANE (*huracan : Span.*, from the Indian *ouragan*), a most violent storm, generally accompanied with thunder and lightning. Hurricanes are most common in the West Indies, the Isle of France, and the kingdoms of Siam and China. The velocity of the wind is terrible; corn, vines, sugar-canes, trees, houses, everything is swept away. The hurricane of the temperate zone moves with a velocity of about sixty feet in a second: those of the torrid zone, from 150 to 300 feet in the same time. They appear to have an electric origin, and begin in various ways; sometimes a little black cloud rolls down the mountains, suddenly unfolds itself, and covers the whole horizon; at others, the storm comes on in the shape of a fiery cloud, which appears in a calm and serene sky. A hurricane is generally preceded by an awful stillness of the elements, and a closeness and a mistiness in the atmosphere, which makes the sun look red, and the stars larger than usual.

HUS'BANDRY, the practical part of the science of agriculture, or the business of cultivating the earth and rearing animals. Husbandry is the proper term for that which is commonly called farming. It includes tillage, breeding, grazing, the management of the dairy, and every other occupation by which riches may be drawn from the superficial products of the earth. [See AGRICULTURE.]

HUSSARS' (*husz*, twenty; and *ar*, pay: *Hung.*), the name by which certain cavalry regiments are distinguished. It was originally given to the cavalry of Hungary, raised in 1458, when Matthias I. ordered the prelates and nobles to assemble with their cavalry in his camp. Every twenty houses were obliged to furnish a man; and hence the name. In the British army, there are thirteen regiments of hussars. Their equipments are light and elegant: their arms are a sabre, a carbine, and a pair of pistols

HUS'SITES, the disciples of John Huss, a Bohemian, and curate of the chapel of Bethlehem at Prague, who, about the year 1414, embraced and defended the opinions of Wickliffe of England; for which he was cited before the council of Constance, and, refusing to renounce his supposed errors, condemned to be burnt alive, which sentence was accordingly executed upon him at Constance This gave rise to a rebellion of the Hussites, who avenged his death by one of the fiercest and most terrible civil wars ever known. The pope and cardinals, with a pretended unwillingness to shed human blood, handed him over to 'the secular arm,' and earnestly pressed for his execution, though he had come to the council furnished with a safe-conduct from the emperor Sigismund, which that monarch had the baseness to violate It was most explicit, stating 'that he was to go, stop, remain, and return in safety.'

HUS'TINGS (*hus*, a house; and *ting*, judgment: *Sax.*), the principal court of the city of London, held before the lord mayor and aldermen. No actions which are merely personal can be brought in this court.—— Also, in common language, the booth or elevated place, where candidates at a parliamentary election are proposed and address their constituents

HUTCHINSO'NIANS, the defenders of the philosophy of John Hutchinson, who was born in the year 1674. Hutchinson disapproved of Newton's doctrine of gravity. He considered the Old Testament to embrace a complete system of natural philosophy as well as religion.

HY'ACINTH (*huakinthos*: *Gr.*), the common name of some bulbous rooted plants belonging to the genus *Hyacinthus*, nat. ord. *Liliaceæ*. In Holland, the fondness for the *H. orientalis* at one time amounted to a complete mania.—— HYACINTH, in Mineralogy, one of the names given to the yellow or brown crystals of *zircon*, which are found in the beds of streams and rivers, particularly in Ceylon. Its most usual form, as a crystal, is a four-sided prism, terminated by four rhombic planes.

HY'ADES (*uein*, to rain: *Gr.*), a cluster of stars, in the forehead of the bull, five of which, arranged in the figure of a V, are seen by the naked eye. In Greek mythology the Hyades were the five daughters of Atlas, king of Mauritania, who died of grief when their brother Hyas was killed by a wild boar, when they were changed into stars. The ancients connected the rising and setting of these stars with rain, whence the name.

HYÆ'NA or Hyena (*huaina: Gr.*), a genus of digitigrade and carnivorous quadrupeds, characterized by having no tuberculous teeth or small teeth behind the carnivorous. The neck of this animal is very thick, and covered with a kind of bristles instead of hairs, which naturally stand erect, and give it a very formidable appearance; the body is bulky and rounded, and the shape not unlike that of a hog; the legs are moderately long and very strong; and the general colour is a very dusky olive. It inhabits Turkey, Syria, Persia, and Barbary, living in caverns and rocky places, and prowling about at night to feed on the remains of dead animals. Naturalists have described three species of the hyæna, the most common being the *striped* hyæna, or *hyæna vulgaris*. It is not very swift, but continually lies in wait for other animals, and scarce anything that comes in its way escapes it.

HY'BRID (*hybrida: Lat.*), the produce of a female plant or animal which has been fecundated by a male of a different species or genus.

HYDAR'THRUS (*hudor*, water; and *arthron*, a joint: *Gr.*), a peculiar and dreadful disease of the joints, commonly termed the white swelling. The knee, ankle, wrist, and elbow are the joints most subject to it; but the skin is not at all altered in colour. It is distinguished from a *rheumatic* swelling, by a fixed and wearing pain preceding the tumefaction, often for a considerable period; also, by the general state of the health.

HY'DATID (*hudatis*, a watery vesicle: *Gr.*), a vesicle or bladder, distended with an aqueous fluid, which is found in the bodies of animals. They vary in size from the dimensions of a pea to that of a child's head. They have been considered to be formed by young entozoa, but Professor Owen says that the hydatid ought rather to be considered as an abnormal organic cell than as a species of animal, even of the simplest kind.

HY'DRA (*Hudra: Gr.*), a fabulous monster with many heads, said to have infested the lake of Lerna, in the Peloponnesus. According to the fable, when one of the heads was cut off, it was immediately succeeded by another, unless the wound was cauterized. But Hercules killed this monster by applying firebrands to the wounds as he cut off the heads.——Hydra, in Natural History, a genus of freshwater polypes, of which there are several species, some of which are found in this country; of these, the principal is *Hydra viridis*, having about ten tentacles shorter than the body. It inhabits stagnant waters, and is found on the surface of plants. In the quiescent state, it appears, at first sight, like a little transparent green jelly; but when expanded, it is a linear body, fixed at one end, and surrounded at the other by tentacles or arms placed in a circle round the mouth. It generally produces its young from the sides: these, at first, seem small papillæ, increasing in length till they assume the form of the parent, and then drop off. The whole tribe has a most wonderful faculty of reproducing parts which have been destroyed; and if cut or divided in any direction, each separate part becomes a perfect polype, as slips of certain plants become the same plants in perfect form.——Hydra, in Ancient Astronomy, a southern constellation, representing a water-serpent.

HY'DRAGOGUE (*hudragōgia*: from *hudōr*, water; and *ago*, I carry off: *Gr.*), a medicine that possesses the property of promoting the discharge of watery humours.

HYDRAN'GEA (*hudōr*, water: and *angos*, a vessel: *Gr.*), in Botany, a genus of plants, nat. ord. *Saxifragaceæ*. The commonest species, *H. hortensis*, has fine corymbs of light rose-coloured flowers, which retain their freshness for a long time, and succeed each other until late in the autumn.

HYDRAR'GYRUM (*hudrarguros*: from *hudōr*, water; and *arguros*, silver: *Gr.*), a name given to quicksilver, or mercury, on account of its liquid state and great mobility. [See Mercury.]

HY'DRATE (*hudōr*, water: *Gr.*), in Chemistry, a solid which contains water in a fixed state, as slaked lime, &c.

HYDRAU'LIC LIME, a lime formed from the poorer sorts of limestone, containing from 8 to 25 per cent. foreign matter, as silica, alumina, magnesia, &c. All water limestones are of a bluish-grey or brown colour, communicated to them by oxide of iron. They are generally termed *stone lime*, but improperly so, since their hardness or softness has nothing to do with their properties. After being calcined, they do not *slake* when moistened; but, if pulverized, they absorb water without swelling up, or heating, like *fat* lime, and afford a paste which, in the air, never acquires much solidity, but becomes hard under water in a few days. The silex and alumina are essential, but the oxides of iron and manganese are rather prejudicial ingredients.

HYDRAU'LIC PRESS, a machine which affords an enormous power of compression. It consists, essentially, of two strong cylinders of metal, communicating by a pipe, and having, each of them, a solid piston working water-tight in it. When water is forced into the larger by the smaller, which is, in effect, a *force-pump*, the larger piston is driven up with a pressure as much greater than the power applied to the smaller, as a cross section of the former is greater than a cross section of the latter. Let the diameter of the larger piston be 8 inches, and that of the smaller one-fourth of an inch: a cross section of the larger will be 896 times as great as a cross section of the smaller; and a force of 1 cwt. exerted on the smaller will produce a pressure of 896 cwt., or nearly 45 tons, on the larger. Some presses are constructed capable of exerting a pressure of hundreds of tons. To save time, a larger force-pump is used at first, and then, when extreme pressure is required, the smaller one.

HYDRAU'LIC RAM (*hudōr*, water; and *aulos*, a pipe; *Gr.*), a machine for raising water, depending on the difference between the momenta of water at rest and in motion. Water, running down an inclined pipe, acquires a momentum, which enables it to close, by a loaded valve, the aperture through which it escaped, and open another valve so as to ascend a vertical pipe. The very stoppage of the water from running off immediately destroys its momentum, and the valves fall back—one of them closing, so as to prevent the water which had been thrown up into the vertical pipe from flowing back; and the other opening, so as to allow the water to flow away again, and thus produce a new momentum which repeats the process. Every new impulse throws water up the vertical pipe, and a very low *head* of water is capable of elevating the fluid to a considerable height. A small stream, with this contrivance, will supply fountains, cisterns at the top of a house, &c.

HYDRAU'LICS, that branch of hydrostatics which teaches to estimate the velocity of moving inelastic fluids. It is this important science that furnishes the principles upon which the engines are constructed by which water is raised. It treats of pumps, fountains, and a variety of useful machines, by which the force of fluids is applied to practical purposes.——The Romans displayed their acquaintance with the art of conveying water, in their famous aqueducts. It is, however, only within the last three centuries that this subject has attracted any particular notice.

HYDRIOD'IC A'CID, a gaseous compound, consisting of hydrogen and iodine. It is rapidly absorbed by water; and is instantly decomposed by chlorine, iodine being set free.

HYDROBRO'MIC A'CID, a gaseous compound, consisting of hydrogen and bromine.

HYDROCAR'BON, a compound of hydrogen and carbon. These elements unite in a variety of definite proportions, forming several interesting gaseous, liquid, and solid compounds, usually called *hydrocarburets* or *hydrocarbons*. Among these are *light carburetted hydrogen* or *fire damp olefiant gas*, *spirit of turpentine*, *paraffine*, *naphtha*, and *petroline*.

HYDROCAR'DIA (*hudōr*, water; and *kardia*, the heart: *Gr.*), in Medicine, dropsy of the heart.

HYDROCEPH'ALUS (*hudrokephalon*: from *hudōr*, water; and *kephalē*, the head: *Gr.*), in Surgery, dropsy of the brain, or water in the head. The acute form of this disease is almost confined to childhood. The ventricles of the brain are the principal seat of the watery accumulation, which is indicated by febrile symptoms, pain in the head, and, in very young children, enlargement of it. The eyes, which are not closed entirely in sleep, are irregularly directed, and have their pupils dilated. There is delirium, and often coma, convulsions, and paralysis.

HYDROCHLO'RATE, in Chemistry, a compound of hydrochloric acid, or muriatic acid gas, with a base.

HYDROCHLO'RIC A'CID, a gaseous compound of hydrogen and chlorine, evolved when sulphuric acid is added to common salt. It has a very strong affinity for water, the absorption of the vapour of which from the atmosphere produces the fumes perceived when it escapes into it. A solution of the gas in water forms the muriatic acid of the shops. Common salt is a muriate of soda. Hydrochloric acid is styled chlorhydric acid by the French chemists.

HYDROCYAN'IC A'CID (*hudōr*, water; and *kuanos*, blue: *Gr.*), *Prussic acid*, a compound of hydrogen and cyanogen. It is a most deadly poison. Even the prussic acid of the shops, which is a weak solution of the acid in water, is extremely dangerous, unless used with great caution. Its fatal effects are so rapid, that it is impossible to prevent them by any antidote. The smallest quantity of the pure acid applied to the eye of a cat, &c., causes instantaneous death. If there is the least hope of saving one who has swallowed it, a solution of chlorine, which decomposes it, should be administered; also ammonia, which both combines with it and acts as a stimulant. It is a narcotic; and, given with great caution, it may be used as a powerful sedative and anti-irritant, especially in whooping-cough. It is contained in the leaves of the cherry-laurel, in bitter almonds, in the kernels of plums and peaches, and the seeds of the apple, which derive their peculiar odour from it. It was originally obtained from Prussian blue (which see); hence its popular name.

HYDRODYNAM'ICS (*hudōr*, water; and *dunamis*, power: *Gr.*), the science which treats of the forces of liquids in motion. It comprehends *hydraulics*. [See HYDROSTATICS.]

HYDROFLUOR'IC A'CID, in Chemistry, a gaseous substance obtained from fluor spar, which is a fluoride of calcium. It is of a corrosive nature, and will dissolve glass, for which reason it is used for etching on glass. This acid, which consists of fluorine and hydrogen, readily combines with water; and when it is dropped into that fluid, a hissing noise is produced, with the evolution of considerable heat. Its odour is very penetrating, and its vapour dangerous to inspire. When applied to the skin, it instantly disorganizes it, and produces the most painful wounds. It is sometimes, but very rarely, called *fluoric acid*.

HY'DROGEN (*hudōr*, water; and *gennao*, I produce: *Gr.*), in Chemistry, one of the gaseous elements and a constituent of water. Whatever process decomposes water will produce hydrogen gas, provided the oxygen of the water be absorbed by any other substance, as is seen in the following experiments. If water is dropped gradually through a gun-barrel, or iron pipe, made red-hot in the middle, the water will be decomposed; the oxygen will form an oxide or rust with the iron, and the hydrogen will come out pure from the opposite end. If a red-hot iron is plunged into water, the hydrogen rises with the vapour, and is known by a peculiar smell. This gas is fourteen times lighter than common air, its specific gravity being about 0·0692; hence it has been applied to the filling of balloons. It is also highly inflammable under certain circumstances; hence it was formerly known by the name of *inflammable air*. It is incapable of supporting respiration or combustion, burning only in consequence of its strong attraction for oxygen. It may be obtained by putting a few pieces of zinc, or a few small iron nails, into a mixture of equal parts sulphuric acid and water. The oxygen of the water combines with the zinc, and this compound is attacked by the acid whilst the hydrogen is set free. Mixed with three or four times its volume of air, it is highly explosive, and hence must not be set on fire as it issues from the bottle in which it is evolved, until all the common air has been expelled by it. When quite pure it is tasteless, colourless, and without smell. It combines with sulphur, phosphorus, &c. The gas employed to illuminate our streets is a combination of hydrogen and carbon

HYDROG'RAPHY (*hudōr*, water; and *graphē*, a description: *Gr.*), the art of measuring and describing rivers, bays, lakes, gulfs, channels, and other collections of water.

HY'DROLITE (*hudōr*, water; and *lithos*, a stone: *Gr.*), in Mineralogy, a silicate of alumina, iron, and potash, containing nearly 80 per cent of *water*.

HYDROL'OGY (*hudōr*, water; and *logos*, a discourse: *Gr.*), that department of philosophy which treats of and explains the nature and properties of waters in general.

HY'DROMEL (*hudōr*, water; and *meli*, honey: *Gr.*), a liquor consisting of honey diluted with water. Before fermentation, it is called *simple hydromel*; after fermentation, *vinous hydromel*, or *mead*.

HYDROM'ETER (*hudōr*, water; and *metron*, a measure: *Gr.*), an instrument for measuring the specific gravities of liquids, and thence the strength of spirituous liquors, these being inversely as their specific gravities. The hydrometer is sometimes of brass, at others, when for fluids which would act upon the metals, of glass. It has a bulb about an inch and a quarter in diameter; from this project upwards a longer stem, which is graduated, and downwards a shorter, which is terminated below by a small heavy bulb, intended by its weight to keep the instrument vertical when immersed in fluid. The lighter the fluid the deeper the immersion, the amount of which is shown by the graduated stem. Syke's hydrometer, used by the excise regulations for taking the specific gravity of spirituous liquors, has several small weights which may be placed on the lower bulb. The same graduated stem is, therefore, equivalent to several, since its indications have different values, according to the weight placed on the lower part of the instrument. In making experiments with the hydrometer, temperature must be carefully taken into account, since the higher the temperature of a liquid the less dense it is. The use of the hydrometer depends on the following propositions:—1. It will sink in different fluids in an inverse proportion to the density of the fluids; 2. The weight required to sink it equally far in different fluids will be directly as the densities of the fluids.

HYDROP'ATHY (*hudōr*, water; and *pathos*, disease: *Gr.*), a term applied to a treatment of disease generally called the *cold-water cure*. It was suggested in 1826, by Vincent Priessnitz, of Graefenberg in Silesia, and consists in the internal and external administration of cold water, accompanied by air and exercise, early hours, and strict attention to diet. Such a mode of treatment, rationally pursued, must be obviously useful to persons residing in populous towns, eating and drinking too much, and keeping bad hours.

HY'DROPHANE (*hudōr*, water; and *phaino*, I make to appear: *Gr.*), in Mineralogy, a variety of the opal, which is rendered transparent by immersion in water.

HYDROPHO'BIA (*hudōr*, water; and *phobeomai*, I fear: *Gr.*), a symptom of canine madness, or the disease itself. This name was given to the disease because persons bitten by a rabid dog or cat dread the sight of water. According to the generally received opinion of medical practitioners, there is no known cure for this terrible disease; and the only preventive to be relied upon is the complete excision of the bitten part, which should be performed as soon as possible; and caustics, of which nitric acid is considered to be the best, should be applied to the wound. Unfortunately, the first symptoms of madness in a dog are not very well defined; the animal is generally observed to be dull and unsociable, refuses food, hangs his head, appears drowsy, flies at strangers, and hardly recognizes his master. At some indefinite period after the bite, and long after the wound has healed, there is itching and pain in the part; heaviness, great restlessness and uneasiness, with mental alarm, followed by pains about the neck, sense of choking and great horror at any attempt to drink, though solid food may be swallowed. These symptoms are followed by fever, difficult respiration, convulsions, sometimes delirium, and finally death.

HYDROPHTHAL'MIA (*hudōr*, water; and *ophthalmos*, the eye: *Gr.*), in Medicine, dropsy of the eye.

HY'DROPS (*hudrōps*: *Gr.*), in Medicine, the dropsy, a preternatural collection of serous or watery fluid in the cellular substance, or different cavities of the body. It receives various appellations, according to the particular situations in which the fluid is lodged; as *hydrocephalus*, *hydrothorax*, &c.

HY'DROSCOPE (*hudōr*, water; and *skopeo*, I examine: *Gr.*), an instrument formerly used for measuring time. It was a kind of water-clock, consisting of a cylindrical tube conical at the bottom; the cylinder was graduated, or marked with divisions; and as the surface of the water, which trickled out at the point of the cone, successively sank to these several divisions, it pointed out the hour.

HYDROSTAT'IC BAL'ANCE, a kind of balance contrived for finding the specific gravities of bodies, solid as well as fluid.

HYDROSTAT'IC BEL'LOWS, a machine for showing that fluids transmit pressure equally in every direction. It consists of two flat boards united water-tight with leather, &c., and having the appearance of a bellows; a tube three or four feet long with a funnel at its upper end, communicates with the space between the boards. When water is poured in through the tube, the upper board will rise, and will sustain a weight equal to that of a column of water having a base equal to that of the bellows, and a height equal to that of the tube. A person standing on the upper board and blowing into the tube may easily lift himself up.

HYDROSTAT'IC PAR'ADOX, a term employed to designate that principle in hydrostatics by which any quantity of water, however small, may be made apparently to balance another however great. The small quantity does not in reality balance the larger; for the extra pressure is borne by the sides of the vessel in which it is placed. But, from the nature of fluids, a given pressure exerted by a smaller quantity of fluid may be made to produce a very great pressure in a larger quantity with which it communicates.

HYDROSTAT'IC PRESS, a name sometimes given to the *hydraulic press*, which see.

HYDROSTAT'ICS (*hudōr*, water; and *stao*, I stand: *Gr.*), that branch of science which treats of the equilibrium of fluids. *Hydrodynamics* treats of fluids in motion, and *hydraulics* of machines having a reference to fluids. The science is founded on the fact that 'when a liquid mass is in equilibrium, every one of its molecules sustains and imparts an equal pressure in all directions.' Hence water will rise to the same level in any number of open vessels which communicate. The pressure on a surface depends, not on the absolute amount of fluid, but on the extent of the surface, and the mean height of the columns of fluid above it—supposing all of them to reach to an imaginary horizontal plane just touched by the highest. That is the pressure on any surface will be equal to that surface multiplied by the depth of its centre of gravity below the upper surface of the fluid. The base of any vessel will sustain the same pressure, whether the vessel is conical, cylindrical, or otherwise, so long as its surface, and the height of the highest column of fluid resting upon or in connection with it, continue the same. There will be much less fluid in the cone than in a cylinder of the same base and height, yet the pressures on their bases will be equal. Hence the presure on the base of a vessel may be greater, to any amount, than the weight of the water which produces it—in the case, for example, of a vessel formed of two horizontal plates, having an extremely thin water-tight space between them, and communicating with a vertical pipe of very small bore. Let this very thin space, for example, be 4 square feet in extent, and let the height of the tube which communicates with it be 33 feet: the pressure on the upper and under interior surfaces of the vessel will each be equal to the weight of a column of water having a base of 4 square feet and a height of 33 feet; that is, 576, the number of square inches multiplied into 15 lbs., or 8640 lbs., equal to 432 tons; and yet the water may not weigh more than a few ounces. This enables us to understand the danger of thin crevices behind the walls or under the banks of canals, &c. A strong cask may easily be burst if, when it has been filled with water, a long vertical tube, no matter how slender, is screwed into it, and also filled with that liquid. When a body is placed in a fluid of less specific gravity than itself, it displaces a quantity of the fluid equal to it in weight, but not in bulk; when in a fluid of greater specific gravity, it displaces a quantity equal to it in bulk, but not in weight; and when in a fluid of the same specific gravity, it displaces a quantity equal to it, both in weight and bulk, and it will remain at rest wherever it is placed.

HYDROSUL'PHURET, in Chemistry, a combination of hydrosulphuric acid, or sulphuretted hydrogen.

HYDROTHO'RAX (*hudōr*, water; and *thōrax*, the trunk of the body: *Gr.*), in Medicine, dropsy of the chest. The symptoms are, difficult breathing when in a recumbent position, paleness, cough, thirst, swelling in the legs and feet, quick, often irregular, and intermitting pulse.

HY'GIENE (*hugieia*, health: *Gr.*), that branch of medicine which relates to the means of preserving public health.

HYGROM'ETER (*hugros*, moist; and *metron*, a measure: *Gr.*), an instrument which shows the presence of water in the air, and its variation in quantity, and affords data for calculating the actual quantity existing in a given bulk of air at any given time. There are many kinds of hygrometers; for whatever body either swells or shrinks, by dryness or moisture, is capable of being formed into one. The higher the temperature of air, the larger the quantity of vapour it is capable of holding in solution. That point of temperature at which the quantity of moisture it contains would just saturate it, is called its *dew point*; if it be cooled ever so little below this point, it will begin to deposit moisture in the form of dew The hygrometric condition of the air is now usually deduced from an observation of the *dew point*, and this may be ascertained either by the use of instruments such as Daniell's hygrometer, which gives the dew point by direct observation, or by means of the wet and dry bulb thermometers, which afford data for its calculation.

HYLOBA'TES (*hulobates*, a wood-walker: *Gr.*), a genus of long armed apes, natives of India. They have neither tails nor cheek pouches. When domesticated, their manners are gentle. The Gibbon (*H. lar*) belongs to this genus. When this ungainly animal is standing upright its fingers reach to the ankles. The hands and feet are white and there is a white circle round the face, the rest of the body being black. It lives in trees and swings by its arms with great agility from branch to branch. The *wow wow* or *oungha*, so called from its cry, is the *H. agilis* of zoologists.

HYMENOP'TERA (*humēn*, a membrane; and *pteron*, a wing: *Gr.*), an order of insects having four naked membranous wings, with a few nervures. The posterior pair are much smaller than the front pair. During flight the wings on each side are linked together by means of a series of small hooks on the front edge of the hinder wing, which catch hold of the hindmost vein of the fore wing. During repose the wings are laid over each other on the back. The abdomen of the female is terminated by an ovipostor. Bees and wasps belong to this order.

HYOSCYA'MIA (*hyoscyamos*, henbane: *Gr.*), in Chemistry, the active principle or alkaloid of henbane.

HYPAL'LAGE (*hupallagē*, an exchange: *Gr.*), in Grammar and Rhetoric, a figure consisting of a mutual change of cases: thus, *gladium vaginâ vacuum*, 'the sword empty of the scabbard.'

HY'PER (*huper*), a Greek word signifying *over*, which is used in English composition to denote excess, or something *over* or beyond what is found in other circumstances. Thus, in Chemistry, *hypersulphuric acid*, an acid which contains more oxygen than sulphuric.

HYPER'BATON (*huperbaton*, a transposition: *Gr.*), in Grammar a figurative construction, inverting the natural and proper order of words and sentences. The species are the *anastrophe*, *hypallage*, *husteron-proteron*, &c.; but the proper hyperbaton is a long retention of the verb which completes the sentence.

HYPER'BOLA (*huperbolē*, an excess: *Gr.*,—because the angle which its plane forms with the base of the cone is greater than that of the parabola), in Geometry, a curve formed by cutting a cone in such a direction, with regard to its axis, that if the cutting plane were produced, it would cut also the opposite cone—two hyperbolas being produced, the one *opposite* to the other. [See CONIC SECTIONS.]——HYPERBOLIC SPACE, the space or content comprehended between the curve of the hyperbola and the whole ordinate.

HYPER'BOLE (same *deriv.*), in Rhetoric, a representation of anything carried beyond the bounds of truth or even probability: as, 'he ran swifter than the wind:' 'he went slower than a tortoise,' &c. Aristotle observes, that the hyperbole is the favourite figure of young authors, who love excess and exaggeration; but that philosophers should not use it without a great deal of caution.

HYPER'BOLOID *huperbolē*, an hyperbola; and *eidos*, form: *Gr.*), in Geometry, a solid generated by the revolution of an hyperbola about its axis.

HYPERBO'REANS (*Huperboreioi*: from *huper*, beyond, and *Boreas*, the north wind: *Gr.*), the name given by the ancients to the unknown inhabitants of the most northern regions of the globe, who were believed always to enjoy a delightful climate, on account of being situated beyond the domain of Boreas, or the north wind. They were, in fact, the Laplanders, the Samoiedes and the most northern of the Russians.

HYPERCATALEC'TIC (*huperkatalēktikos*: from *huper*, above; and *katalēktikos*, deficient: *Gr.*), in Greek and Latin poetry, a verse which has a syllable or two beyond the regular and just measure.

HYPERCRIT'IC (*huper*, signifying excess; and *kritikos*, critical: *Gr.*), one who is critical beyond measure or reason; animadverting on faults with unjust severity, and shutting his eyes to the merits of a performance.

HYPER'METER (*huper*, beyond; and *metron*, a measure: *Gr.*), a verse containing a syllable more than the ordinary measure. When this is the case, the following line begins with a vowel, and the redundant syllable of the former line blends with the first of the following.

HY'PERSTHENE, in Mineralogy, Labrador hornblende, a ferrosilicate of magnesia, with traces of alumina and lime. It occurs both crystalline and massive, is resplendent and of a grey-green or reddish hue.——*Hypersthene Rock*, an igneous rock composed of pale red, white or greenish felspar and hornblende either in large crystals or small concretionary masses.

HYPER'TROPHY (*huper*, beyond; and *trophē*, nourishment: *Gr.*), a morbid increase in any organ without change in the nature of its substances.

HY'PHEN (*huphen*, literally, into one *Gr.*), a mark or character implying that two words are to be connected; as *pre-established*, *five-leaved*, &c. Hyphens also serve to show the connection of such words as are divided by one or more of the syllables coming at the end of a line.

HYPNOT'IC (*hupnos*, sleep: *Gr.*), an epithet applied to such medicines as have the quality of producing sleep.

HYPOB'OLE (*hupobolē*, a suggesting: *Gr.*), in Rhetoric, a figure in which several things are mentioned that seem to be in favour of the opposite side, and each of them is refuted in order.

HYPOCHON'DRIA (*hupochondria*: from *hupo*, under; and *chondros*, the cartilage of the breast-bone: *Gr.*), in Anatomy, the sides of the belly covered by the inferior ribs and their cartilages: it is distinguished into the *right* and *left hypochondria*.

HYPOCHONDRI'ASIS (same *deriv.*), in Medicine, an affection characterized by dyspepsia, languor and want of energy, by sadness, and fear, arising from uncertain causes, and by a melancholic temperament. The principal causes are sorrow, fear or excess of any of the passions; too long continued watching; and irregular diet. *Hypochondriacs* are continually apprehending future evils; and in respect to their feelings and fears, however groundless, there is usually the most obstinate belief and persuasion.

HY'POCIST (*hypociste*: *Fr.*; *hupokistis*: from *hupo*, under; and *kistos*, the cistus: *Gr.*), or *Succus hypocistidis*, in Pharmacy, the inspissated juice of the *Cytinus hypocistis*, a parasitical plant found on the roots of several kinds of *cistus* in the south of Europe.

HYPOCRATER'IFORM (*hupo*, under; *kratēr*, a cup; *Gr.;* and *forma*, a shape; *Lat.*), in Botany, a tubular corolla, but suddenly expanding into a flat border above: as in the flower of the *Phlox*.

HYPOGÆ'OUS (*hupogaios:* from *hupo*, under; and *gē*, the earth: *Gr.*), in Botany, a term used to denote all parts of the plant which grow under the surface of the earth.

HYPOGAS'TRIC (*hupogastrion*, the hypogastrium: from *hupo*, under; and *gastēr*, the belly: *Gr.*), in Medicine, relating to the *hypogastrium*, or middle part of the lower region of the belly. Also, an appellation given to the internal branch of the iliac artery.

HYPOGAS'TROCELE (*hupogastrion*, the hypogastrium; and *kēlē*, a hernia: *Gr.*), in Surgery, a *hernia*, or rupture, of the lower belly.

HY'POGENE ROCKS (*hupo*, under; and *ginomai* to be born: *Gr.*), those rocks which have not assumed their present form and structure at the surface, but were thrust up from below: as granite, gneiss, and other crystalline formations. This term, which includes both the plutonic and metamorphic rocks, is substituted for *primary*, because granitic and gneissic rocks have been found amongst rocks of the secondary and tertiary periods.

HYPOGE'UM (*hupo*, under; and *gē*, the earth: *Gr.*), a name given by ancient architects to all the parts of a building which were under ground; as the cellar, &c.

HYPOG'YNOUS (*hupo*, under; and *gunē*, a female: Gr.), in Botany, a term applied to stamens that spring from below the base of the ovarium.

HYPONI'TROUS A'CID, in Chemistry, a combination of nitrogen and oxygen, intermediate between nitric oxide and hyponitric acid. It contains one atom of nitrogen and three atoms of oxygen. Its salts are termed *hyponitrites*.

HYPOPHOS'PHOROUS A'CID, in Chemistry, an acid containing two atoms of phosphorus and one atom of oxygen. Its salts are termed *hypophosphites*.

HYPOS'TASIS (*hupostasis:* from *hupo*, under; and *istēmi*, I stand; *Gr.*), in Theology, a term used to denote the subsistence of the Father, Son, and Holy Spirit, in the Godhead, called by the Greek Christians, three *hypostases*. The Latins more generally used *persona*, and this is the modern practice: hence we say, the Godhead consists of three *persons*.

HYPOSULPHU'RIC A'CID, in Chemistry, an acid intermediate between the sulphurous and sulphuric acids; it contains two atoms of sulphur and five of oxygen. Its salts are termed *hyposulphates*.

HYPOSUL'PHUROUS A'CID, in Chemistry, an acid consisting of an equal number of atoms of sulphur and oxygen. Its salts are termed *hyposulphites*.

HYPOTH'ENUSE or HYPOT'ENUSE (*hupo*, under; and *teino*, I stretch: *Gr.*), in Geometry, the subtense or longest side of a right-angled triangle, or the line that subtends the right angle.

HYPOTH'ESIS (*hupothēsis:* from *hupo*, under; and *tithēmi*, I place: *Gr.*), a principle taken for granted, in order to draw from it a conclusion for the proof of a point in question. Also, a system or theory imagined or assumed to account for what is not understood.

HYPOTRACHE'LIUM (*hupotrachelion:* from *hupo*, under; and *trachēlos*, the neck: *Gr.*), in Architecture, the slenderest part of the column; being that immediately below the neck of the capital.

HYPOTYPO'SIS (*hupotupōsis*, a sketch: *Gr.*), in Rhetoric, the use of descriptive language, highly enriched with rhetorical figures.

HYPSO'METRY (*hupsos*, height: *metron*, measure: *Gr.*), the art of measuring altitudes. Various methods are adopted:—1. By triangulation, the theodolite or some equivalent instrument being employed. 2. By the mercurial barometer. As the pressure of the atmosphere decreases the higher we ascend, the mercury will fall in its tube in proportion to the height to which the instrument is carried. When possible, two corresponding barometers should be simultaneously observed, one at the level of the sea or at the foot of the height to be measured, and the other on the summit. The difference of the readings affords a datum for calculations in which the temperature of the two stations and some other circumstances must be taken into consideration. 3 By the Aneroid barometer, by which differences of atmospheric pressure are measured by means of metallic springs. 4. By observation of the boiling point of water. At the level of the sea, water boils at the temperature of 212° F., but as we ascend, the lessened pressure allows ebullition to take place at a lower temperature, and hence we obtain materials for calculation.

HYS'SOP (*hussōpos: Gr.*), a genus of labiate plants, one species of which is cultivated for use. The leaves have an aromatic smell and a warm pungent taste.

HYSTER'ICS or HYSTE'RIA (*husterikos:* from *hustera*, the womb: *Gr.*—because the disease is supposed to be connected with it), in Medicine, a malady that attacks in paroxysms or fits, which are readily excited in those who are subject to them, by passions of the mind, and by every considerable emotion, especially when brought on by surprise: hence, sudden joy, grief, fear, &c, are very likely to occasion them.

HYS'TERON PROT'ERON or HUS'TERON PROT'ERON, two Greek words, meaning *the last first:* hence it is used, in rhetoric, to designate the figure in which that word which should follow is used first: as, *Valet atque vivit* (he is well and lives).

I

I, the ninth letter in the alphabet, and the third vowel. Its sound varies; in some words it is long, as *high*, *mind*, *pine*; in some it is short, as *bid*, *kid*; and in others it is pronounced like *y*, as *collier*, *onion*, &c. In a few words its sound approaches to the *ee* in *beef*, as in *machine*, which is the sound of the long *i* in all European languages except the English. When two *i*'s came together, the Latins contracted them into one; as *Dii* into *Di*. In all Latin words of Latin origin, *i* preceding a vowel (unless it follows another vowel) is a consonant, as *Ianus* (*Janus*), *conicio* (*conjicio*); but in words of Greek origin it is a vowel, as *iambus*, *iaspis*. No English word ends with *i*, but when the sound of the letter occurs at the end of a word, it is expressed by *y*. It is sometimes used as an abbreviation, as E I.C *East India Company*, I H.S. *Jesus Hominum Salvator* (Jesus the Saviour of men), &c. I, used as a numeral, signifies no more than one, and it stands for as many units as there are repetitions of it: thus, II stands for 2, III for 3. When put before a higher numeral, it is to be subtracted from the latter: as IV, 4. And when set after it it is to be added to it: as XII, 12.

IAM'BIC or **IAM'BUS** (*iambos*: *Gr.*), in Poetry, a foot consisting of two syllables, the first short and the last long, as in *declare*, *adorn*. Verses composed of short and long syllables alternately are termed *iambics*; as,

If ty- | rant fac- | tion dare | assail | her throne,
A peo- | ple's love | shall make | her cause | their own.

I'BEX (a wild goat: *Lat.*), or *Steinbock*, the *Capra Ibex* of zoologists, a species of goat. It has extremely long horns, which bend backwards, are of a blackish colour, and annulated on the surface. The body is of a dusky yellowish brown colour, and is less in proportion to the height than that of the common goat; it has, indeed, a great resemblance to the deer kind; the legs are also perfectly like those of the deer, straight, elegant and slender. The hair is harsh, and the male is furnished with a black beard. These animals inhabit the chain of mountains extending from Mount Taurus, between Eastern Tartary and Siberia; they are also to be met with in the most precipitous and inaccessible parts of the Alps, the Pyrenees, and the Carpathians. They are remarkably swift, and display amazing dexterity and agility in leaping; so that the ibex hunter is constantly in imminent peril, from the fear of losing his footing when scaling tremendous precipices, and from the animal when closely pursued turning suddenly on his enemy. Their cry is a sharp short whistle, not unlike that of the chamois, but of shorter duration; sometimes, especially when irritated, they make a snorting noise.——The name has been given also to a species of antelope.

I'BIS (*Gr.*), in Ornithology, a genus of birds, closely resembling the storks, and found chiefly in warm climates, more particularly in Egypt. The bill is long and curved, the legs are long, and the feet have four toes, the front webbed at the base, and all provided with claws. These birds are capable of a powerful and elevated flight, extending their neck and legs, and uttering a hoarse croak. The white ibis (*Ibis æthiopica*) arrives in Egypt about the time that the inundation of the Nile commences, and migrates about the end of June, at which period it is first noticed in Ethiopia. The scarlet ibis (*Ibis rubra*), a splendid bird, is found in the hottest parts of America, in large flocks; the plumage is scarlet; beak naked; part of the cheeks, legs, and feet, pale red. Other species are found in India, Madagascar, the Cape of Good Hope, and Mexico. One species, the glossy ibis, has been occasionally killed in England. The ibis was venerated by the ancient Egyptians; and ibis mummies have been found in great numbers in Egypt.

ICE (*eis*: *Ger.*), water congealed. If water is exposed to a temperature below 32° Fahr. it assumes a solid state by shooting into crystals which cross each other at angles of 60 degrees. It is lighter than water, on which, therefore, it floats; and its increase of dimensions is acquired with a force sufficient to burst the strongest vessels. [See FREEZING, &c.]

ICE'BERGS (*eis*, ice; and *berg*, a mountain: *Ger.*), masses of ice carried by the winds through the polar seas. They are often of enormous size and height, rising 300 or 400 feet above the water, and sinking four or five times as much below it. Within the arctic circle, the congelation begins about the 1st of August; and a sheet of ice, perhaps an inch in thickness, is formed in a single night. In a short time, the whole extent of the polar seas is covered with a mass several feet thick. As soon as the summer heat commences, it is partially melted, and, with the first swell of the ocean, breaks up.——*Floating Ice.* There are numerous terms for this. A large flat mass extending beyond the reach of sight is called *field-ice*; one of smaller dimensions a *floe*; when a field is much broken up, it is called a *pack*. If a ship can sail freely through the floating pieces of ice, it is called *drift-ice*. A portion of ice rising above the common level is called a *hummock*, being produced by the crowding of one piece over another.

I'CE-BLINK (*blinken*, to glitter: *Ger.*), a name given by seamen to a whitish appearance in the horizon: occasioned by fields of ice, which reflect the light obliquely against the atmosphere.

I'CE-HOUSE, a building contrived to pro serve ice in hot weather; the ice is rammed as close as possible, and at the bottom is a well to drain off the water from any part that melts.

I'CELAND MOSS, *Lichen Islandicus*, *Cetraria Islandica*, a lichen common in the mountainous districts of Europe. It contains a bitter principle, and a large quantity of starch. It is tonic and nutritive

I'CELAND SPAR, in Mineralogy, carbonate of lime forming crystals of the rhombohedral system. It occurs in laminated masses, easily divisible into rhombs. It is highly useful in experiments on double refraction and the polarization of light.

I'CE-MAKING MACHI'NES. The demand for ice both as a luxury in hot weather, and as a remedial agent in many diseases, has led to the invention of several machines for its manufacture on a large scale The principal contrivances that have had a successful result are the following:—1 *Ether Machines*, in which the evaporation of sulphuric ether causes a low degree of cold in a quantity of common brine, and in this brine troughs containing the water to be frozen are immersed. A steam-engine is employed to drive an air-pump which exhausts the vapour from the liquid ether, and also to cause the circulation of the brine surrounding the vessel containing the ether and the troughs with the water to be frozen The ether vapour is liquefied after the operation of cooling the brine has been effected, and is then again ready to perform the same operation. 2. Machines in which *ammoniacal gas*, which has a strong affinity for water, but is easily separated from it by the application of heat so employed. A saturated solution of ammonia is placed in a strong vessel which communicates with another vessel of one-fourth the size by a tube, all being filled with ammoniacal gas. The vessel containing the solution being heated, the gas is driven off from it, and liquefied ammoniacal gas will form in the smaller vessel by reason of the increased tension. Now if the process be reversed, and the vessel containing the liquefied gas be placed in contact with a third vessel containing the water to be frozen, whilst the larger vessel with the watery solution is cooled, the liquid gas will vaporize and rush from the smaller to the larger vessel, to unite once more with the water. The rapid evaporation causes a degree of cold sufficient to freeze the water in the third vessel. When this has been done the process may be repeated again and again, each time freezing another supply of water conveniently placed in the third vessel A steam-engine is here also employed to work the apparatus, when of a large size. 3. *Air Machines*, of which the effect depends upon the alternate condensation and expansion of common air. When air is compressed, its heat is squeezed out of it, and when it is again allowed to expand it absorbs heat from the surrounding medium, and hence causes that medium to fall considerably in temperature. This is the principle of Kirk's machine, which is capable of producing cold sufficient to freeze water for economical purposes.

ICE PLANT, the *Mesembryanthemum crystallinum*, a plant remarkable for the little transparent vesicles which cover its whole surface. The stems are herbaceous and much ramified, and the flowers are white. It is a native of the Cape of Good Hope.

ICH DIEN (*Ger.*), the motto of the Prince of Wales's arms, signifying *I serve*. It was first used by Edward the Black Prince, to show his subjection to his father king Edward III.

ICHNEU'MON (*ichneumōn*, from *ichneuo*, I trace out: *Gr.*), the name of animals belonging to the genus *Herpestes*. They are allied to the civets amongst the *Felidæ* The best known species is the *H. ichneumon*. Its ordinary colour is a chestnut brown; the tail tapers to a point, and the toes are distant from each other. The habits of the ichneumon are very similar to those of the ferret; like that animal, it preys upon poultry, rats, &c.; but it also destroys the most venomous serpents, and seeks the eggs of the crocodile, digging them out of the sand, and eating them with the greatest avidity. In India and Egypt it is domesticated for the purpose of destroying rats and mice The ichneumon of the Nile was one of the sacred animals of the Egyptians.——ICHNEUMON, a genus of hymenopterous insects belonging to a large family the species of which have been denominated parasitical, on account of the very extraordinary manner in which they provide for the future support of their offspring. The fly feeds on the honey of flowers, and, when about to lay eggs, perforates the body of some other insect, or its larvæ, with the sting or instrument at the end of its abdomen, and there deposits them. These eggs in a few days are hatched, and the young nourish themselves with the juices of their foster-parent, which, however, continues to move about and feed till near the time of its change to a chrysalis, when the larvæ of the ichneumon creep out by perforating the skin in various places, and each, spinning itself up in a small oval silken case, changes into a chrysalis, and after a certain period emerges in the state of a complete ichneumon It is as great destroyer of caterpillars, plant-lice, and other insects, as the *Herpestes* is of the eggs and young of the crocodile.

ICHNITES (*ichnos*, a track: *Gr.*), in Geology, the fossil footsteps and tracks of animals, originally made on the sand, or mud of an ancient seashore, or lake margin. They are frequently found in quarries, one slab showing the impressions themselves, and an upper slab a cast of them in relief.

ICHNOG'RAPHY (*ichnographia*: from *ichnos*, a trace; and *grapho*, I draw: *Gr.*), in Architecture, the ground-plan of a building.——In Fortification, a draft of the length and breadth of the works raised about a place.——In Perspective, the view of anything cut off by a plane parallel to the horizon, just at the base of it.

ICHNOL'OGY, a treatise on ichnites.

I'CHOR (*ichōr*: *Gr.*), a thin watery humour, like serum; but the word is sometimes used likewise for a thicker kind, flowing from ulcers, called also *sanies*. The term was applied by the Greeks to the fluid which issued from the wounds of the gods.

ICHTHYI'TES (*ichthus*, a fish: *Gr.*), or ICHTHYOLITES, in Geology, the fossil remains of fishes

ICHTHYOCOL'LA (*ichthuokolla:* from *ichthus*, a fish; and *kolla*, glue: *Gr.*), *Isinglass*, which see.

ICHTHYOL'OGY (*ichthus*, a fish; and *logos*, a discourse: *Gr.*), that part of zoology which treats of fishes, their structure, form, and classification, their habits, uses, &c. Fishes form a distinct class of the vertebrate sub-kingdom. They are cold-blooded aquatic animals, and their red blood is aerated by means of gills. The heart has onlyone auricle and one ventricle. The sexes are distinct, and the young are produced from eggs. These eggs form what is called *roe*, whilst the *milt* is the male fecundating matter which is brought into contact with the eggs after they have been ejected by the female fish. Fishes are remarkable for their fecundity. A cod fish has been found to produce 3,686,000 eggs or spawn; and a ling, 19,248,000. Herrings, weighing from four ounces to five and three-quarters, from 21,000 to 37,000. Mackerel, weighing twenty ounces, 454,000. Soles of five ounces, 38,000 Many fishes possess an internal bladder filled with air, called the swim-bladder, and this is thought to be instrumental in aiding a fish to rise from a great depth to the surface. The skin is sometimes naked, but usually it is clothed with either *Cycloid* or *Ctenoid* scales. Sometimes the fish is protected by *Ganoid*, or *Placoid* plates. When a fish has the full complement of fins, it has one or more dorsal fins, one or more anal fins, two pectoral fins, two ventral fins, and a caudal fin. In some genera, some of these fins are wanting, and occasionally a fish has no fins whatever. The tail and its fin are the principal agents in locomotion, the other fins serving more to balance and steer by than to drive onwards. In some fishes not only do the jaws carry teeth, but every bone inside the mouth is similarly armed. In other fishes there is not a single tooth in the mouth. Some fishes are vegetable feeders, but the majority are carnivorous, it being their lot to eat or be eaten. A fish's head is a complicated structure, and its investigation has often employed naturalists, the object in view being to find what each bone corresponds with, in the heads of other classes of vertebrata. The class has been divided into ten orders, as set forth in the following table:—

Order 1. *Dermopteri*, boneless fishes, including the Lampreys and other genera

Order 2 *Malacopterygianæ*, fishes without spines in the fins; including Eels, Herrings, the Salmon, and Carp families, &c.

Order 3. *Pharyngognathi*, fishes whose lower pharyngeal bones are united; including the Flying-fishes, the Wrasses, &c.

Order 4. *Anacanthini*, including the Cod family, the Turbot family, the Remoras, &c.

Order 5. *Acanthopterygianæ*, fishes with spines in some of the fins, including the Perch, Mullet, Mackerel, Gurnard and many other families.

Order 6. *Plectognathi*, the parts of the upper jaw fixed together, and united to the skull by a suture, including the Globe fishes, the File fishes, &c.

Order 7. *Lophobranchii*, fishes whose gills are in tufts, including the Pipe fishes, the Seahorse, &c.

Order 8. *Ganoidei*, the body covered with hard plates, including the Sturgeon, &c.

Order 9. *Holocephali*, the body covered with placoid granules, including the Chimæras.

Order 10. *Plagiostomi*, fishes with cartilaginous skeletons, and five or more gill openings on each side, including the Sharks and Rays

ICHTHYOSAURUS (*ichthus*, a fish; *saura*, a lizard: *Gr.*), a genus of extinct aquatic reptiles, the remains of which have been found in the trias, the lias, and the lower chalk. Several species have been made out, all carnivorous. One species was more than 30 feet long. In the same individual (says Dr Buckland) the snout of a porpoise was combined with the teeth of a crocodile, the head of a lizard with the vertebræ of a fish, and the sternum of an *Ornithorhynchus* with the paddles of a whale. The general outline of an Ichthyosaurus must have most nearly resembled the modern porpoise and grampus. It had four broad feet or paddles and terminated behind in a long and powerful tail. The dung of these animals has been found fossilized and has received the name of coprolites. The marks upon it have enabled conclusions to be drawn as to the form of the intestinal canal.

ICHTHYO'SIS (*ichthus*, a fish: *Gr.*), in Medicine, a scaly eruption of the skin to which the inhabitants of islands near the equator are subject. It is ascribed to an unsuitable diet

I'CONISM (*eikonismos*, a delineation: *Gr.*), in Rhetoric, a figure of speech which consists in representing a thing to the life.

ICON'OCLASTS (*eikōn*, an image, and *klao*, I break in pieces: *Gr.*), an appellation given to the Constantinopolitan emperors, Leo the Isaurian, and his son Constantine Copronymus, who overthrew images, and extirpated their worship in Christian churches: also to the 338 bishops who attended a council at Constantinople, during the reign of the latter prince, and advocated the same views. The council of Nicæa, in 787, however, restored their use; it was the last council respecting which the Greek and Latin churches coincide. The Greek church allows pictures, but studiously rejects graven images.

ICONOG'RAPHY (*eikonographia:* from *eikōn*, an image; and *grapho*, I describe: *Gr.*), the description of images or ancient statues, busts, semi-busts, paintings in fresco, mosaic works, &c.

ICOSAHE'DRON (*eikosi*, twenty; and *hedra*, a base: *Gr.*), in Geometry, one of the five regular or Platonic bodies, bounded by twenty equilateral and equal triangles. It may be considered as formed by twenty equal and similar triangular pyramids, whose vertices meet in the same point, which is the centre of a circumscribing sphere.

ICTERUS (*ikteros*: *Gr.*, from resembling in colour a bird of that name), in Medicine, the disease which we distinguish by the name of *jaundice*.

IDE'A (*Gr.*, from *idein*, to see). Locke defined ideas to be whatever is the object of the understanding, whatever a man thinks, or whatever it is the mind can be employed about thinking. Plato used the word ideas to signify the archetypes and essences of things, objects that are now generally thought to be beyond the reach of the human intellect. In Kant's system ideas were the forms of the reason's activity, and are independent of experience.

IDE'AL, an imaginary model of perfection.——**Beau Ideal** (ideal beauty), an expression in the Fine Arts, denoting the selection, for a particular object, of the finest parts, from different subjects, so as to form a perfect whole, such as nature does not usually exhibit. It more particularly applies to sculpture and painting.

IDE'ALISM (*idea*, form: *Gr.*), schemes of philosophy which teach that we are concerned only with ideas, and are ignorant of everything else. Bishop Berkeley argued that what our senses convey to us is, not evidence of an external world, but only of our sensations. Further, that we are utterly ignorant, and must ever remain so, of matter itself, and that it is easier to conceive that God directly causes our sensations than that they are conveyed to us through the unknown world of matter.

IDEOGRAPH'IC (*idea*, an idea; and *grapho*, I write: *Gr.*), an epithet given to that kind of writing which expresses the ideas and not the sound. The Chinese characters are ideographic, though the symbols have become merely conventional. Such also were the hieroglyphics of the ancient Egyptians.

IDES (*idus*, supposed to be from the old Etruscan verb *iduo*, I divide: *Lat.*), eight days in each month of the Roman calendar. They began on the 15th of March, May, July, and October; and on the 13th of the other months. The Ides, like the calends and nones, were always reckoned backwards; thus they said viii. Idus, the eighth day before the Ides, vii. Idus, the seventh before the Ides, &c. This method of reckoning is still retained in the chancery of Rome, and in the calendar of the breviary.

ID'IOM (*idios*, peculiar: *Gr.*), in Grammar, a term applied to such phrases as are peculiar to a language, and which, if transferred into another, would have no meaning, or a wholly different one. Idioms can never be literally translated.

IDIOPATH'IC (*idos*, peculiar; and *pathos*, a feeling, *Gr.*), an epithet for any disorder peculiar to a certain part of the body, and not arising from a preceding disease: in which sense it is opposed to *sympathetic*. Thus, an epilepsy is *idiopathic*, when it happens merely through some morbid state of the brain: and *sympathetic*, when it is the consequence of some other disorder.

IDIOSYN'CRASY (*idiosunkrasia*: from *idios*, peculiar; *sun*, with; and *krasis*, a temperament: *Gr.*), a peculiar temperament or organizaton of the body, by which it is rendered more liable to certain disorders than bodies differently constituted usually are.

ID'IOT (*idiōtēs*, an inexperienced person: *Gr.*), in Law, one who has been born totally without understanding. A *lunatic* is one who has lost it by sickness, grief, &c., so as to have no lucid intervals. Commissions are issued upon petition, by the lord-chancellor, to determine whether or not a party be under such imbecility as to require protection in the management of his affairs.

I'DOCRASE (*idea*, form; and *krasis*, mixture: *Gr.*), because a mixture of the forms of other minerals, the *volcanic garnet*, sometimes called volcanic chrysolite or hyacinth. It is found in the ejected masses of Vesuvius and elsewhere, and is of various colours. It is an alumino-silicate of lime, with about one-twentieth oxide of iron.

IDOL'ATRY (*eidōlolatreia*: from *eidōlon*, an image; and *latreia*, service: *Gr.*), in its literal acceptation, denotes the worship paid to idols.

I'DYL (*eidullion*, a *dim.* of *eidos*, form: *Gr.*), a short pastoral poem, exemplified by the Idyls of Theocritus and Gesner.

IGNES'CENT (*ignesco*, I kindle: *Lat.*), in Mineralogy, an epithet applied to a stone or mineral which gives out sparks when struck with steel or iron.

IG'NIS FAT'UUS (vain fire: *Lat.*), a meteor or light that appears in the night over marshy grounds. It is occasioned by an ascent from the earth of phosphuretted hydrogen gas, derived from animal and vegetable remains, and igniting of itself in the air. It is vulgarly called *Will-o'-the wisp*, or *Jack-o'-lantern*.

IG'NIS JUDI'CIUM (the judgment of fire: *Lat.*), in Archæology, the old judicial trial by fire.

IG'NIS SA'CER (holy fire: *Lat.*), in Medicine, the disease vulgarly known by the name of *St. Anthony's fire*.

IGNI'TION (*ignis*, fire: *Lat.*), the act of taking fire; *combustion* is a consequence of ignition. Iron, when red-hot, is ignited; but when plunged into oxygen it undergoes combustion. *Spontaneous ignition* is that which takes place of itself.

IGNORA'MUS (*Lat.*), in Law, the term used by the grand jury when they *ignore* or throw out a bill of indictment. It means, 'We know nothing about it, or have not sufficient evidence respecting it.'

IGUA'NA (*Ind.*), in Zoology, a genus of reptiles, found in the tropical parts of America. They are characterized by a body and long round tail covered with imbricated scales, five toes on each foot, a dewlap under the throat, and a toothed ridge along the back. They feed on fruits, seeds, and leaves. The female deposits her eggs, which are about the size of a pigeon's, in the sand. Some species attain a great size, and are very active; but although formidable in appearance, they are all timid and defenceless.

IGUAN'ODON (*iguana;* and *odous*, a tooth: *Gr.*), an extinct herbivorous reptile of enormous dimensions, the fossil remains of which have been found in the Wealden beds. Its chief distinctive character is the form of the teeth, which have serrated edges, like those of the iguana. From the proportions which the bones of the iguanodon bear to the iguana, this monster of a former world must have been 70 feet from the snout to the tail; and the latter alone must have been 52½ feet in length. The circumference of the body was about 14½ feet, and the snout was armed with a short but strong horn; but its tail must have been its most effective weapon.

IL'EUM (*ilia*, the bowels: *Lat.*), the last portion of the small intestine, terminating at the valve of the cæcum.

I'LEX (*Lat.*), in Botany, a genus of evergreen shrubs, nat. ord. *Aquifoliaceæ*, including the holy.

IL'IAC PAS'SION (*ilia*, the bowels: *Lat.*), a sort of nervous colic, in which bilious and fæcal matter is voided by the mouth, on account of obstructions in the intestinal canal.

IL'IAD (*Ilias*, from *Ilion*, Troy: *Gr.*), the oldest epic poem in existence; generally attributed to Homer. It is in Greek hexameter verse, and is divided into 24 books. Its theme is 'the wrath of Achilles, which brought countless woes upon the Greeks, and hurled many valiant souls down to Hades' at the siege of Troy, when that warrior had quarrelled with Agamemnon, the leader of the Greeks. The siege proceeds, but Achilles withdraws himself; the gods take different sides and assist in the fight; single combats are related between Paris and Menelaus, and Hector and Ajax. Many engagements take place without decisive results. In one of them, Patroclus the friend of Achilles is slain, and this enrages Achilles so much that he returns to the fight, having obtained a new suit of armour and a splendid shield from Vulcan. Hector is slain by Achilles, and the body is dragged along the ground behind the victor's chariot. Priam, his father, however, ransoms the body, the funeral obsequies are duly performed, and so the poem ends. One of the most beautiful passages in this celebrated poem is that which relates the parting of Hector and his wife Andromache. The Iliad is so wanting in continuity, and contains so many inconsistent passages, that it is thought to be the work of several persons. Writers differ as to the date of its composition, but it may be most probably assigned to the 900th century B.C. [See ODYSSEY.]

IL'IUM OS (the bone of the entrails: *Lat.*), in Anatomy, the *haunch-bone.*

IL'LATIVE CONVER'SION (*illatus*, inferred: *Lat.*), in Logic, that in which the truth of the converse follows from the truth of the proposition given. Thus, from the fact that no honourable man is a liar, it follows that no liar is an honourable man.

ILLI'CIUM (*illicio*, I allure: *Lat.*; it is an enticing plant on account of its smell), a genus of evergreen shrub, nat. ord *Winteraceæ.* The species are natives of Japan and Florida.

ILLUMINA'TI (the enlightened: *Lat.*), a secret society formed in Bavaria in 1776. Its professed object was the attainment of a higher degree of virtue and morality than was found in ordinary society. It was suppressed by the Bavarian government in 1784. By some writers, the *Illuminati* are said to have had a powerful influence in promoting the French revolution; and by others the assertion is absolutely denied. ——Among the early Christians, the term *Illuminati* was given to persons who had received baptism; in which ceremony a lighted taper was given to them, as a symbol of the faith and grace they had obtained by that sacrament.

ILLU'MINATING (*illumino*, I make splendid: *Lat.*), the art of laying colours on initial capitals in books, or otherwise embellishing manuscripts, after the manner of the artists formerly called *Illuminators.* Manuscripts, containing portraits, pictures, and emblematic figures, form a valuable part of the riches preserved in the principal libraries in Europe.

IM'AGE (*imago: Lat.*), in Optics, the appearance or picture of an object, formed either by reflection or refraction. With a convex lens, the image is as much less than the object as the square of the distance of the lens from the object is greater than the square of the distance of the lens from the image. In *plane* mirrors, the image is of the same magnitude as the object, and appears as far behind the mirror as the object is before it. In *convex* mirrors, the image is less than the object. In *concave* mirrors, the image is larger or smaller than the object, according as the latter is in that conjugate focus, which is nearer to or further from the mirror. The brightness of an image is proportional to the apparent magnitude of the mirror or lens, as seen from the object, multiplied by the area of the object, and divided by the area of the image. Hence, when, as with the magic lantern, the image is larger than the object, the latter must be strongly illuminated. When the object and its image are only physical points, as in the case of the stars, the brightness of the image is proportional to the magnitude of the lens, or the square of the diameter of the aperture of the telescope. Hence stars, invisible with small telescopes, are rendered visible by larger.—— IMAGE, in Rhetoric, a lively description of anything, in a discourse, which presents a kind of picture to the mind.——IMAGE, in a religious sense, an artificial representation of some person or thing, used either by way of decoration and ornament, or as an object of religious worship and veneration.

IMAG'INARY QUAN'TITIES or **SURDS**, in Algebra, the even roots of negative quantities, being the imaginary results of some impossible operation. Thus, $\sqrt{-x^2}$ is an impossible quantity, since no quantity multiplied by itself can produce $-x^2$.

IMAGINA'TION (*imaginatio: Lat.*), in Metaphysics, that action of the mind by which it combines ideas, and 'bodies forth the forms and images of things.' In many philosophical disquisitions, *imagination* is used almost synonymously with *fancy*. But the object of the latter seems to be to furnish materials which may be used by the former.

IMAGO (*image: Lat.*), in Entomology, the typical or perfect form of a species of insect after undergoing metamorphosis.

IM'AM or IM'AN, an inferior order of ministers of religion in the Turkish empire. The chief imam of each mosque assists at circumcisions, marriages, burials, &c., and presides over the assembly of the faithful: the solemn noon prayer on Friday being superintended by the khatib. The legitimate successor of Mahomet, in whom theoretically the temporal and ecclesiastical government of Islam should reside, is termed *Imam* by pre-eminence; but the Turks are not agreed as to what precisely this dignity is, or who bears it.

IM'BRICATE or IM'BRICATED (*imbricatus*, laid one upon another like tiles: *Lat.*), in Botany, lying one over another, like tiles on a roof; thus, the scales on the cups of some acorns.

IMMER'SION (*immersio*, from *immergo*, I plunge into: *Lat.*), in Astronomy, the disappearance of any celestial object behind another, or its shadow. Thus, in an eclipse of one of Jupiter's satellites, the immersion occurs when the satellite disappears behind the body of the planet, or enters its shadow. The reappearance of the body is called its *emersion*. The immersions and emersions of fixed stars, occulted by the moon, are highly important for the correction of lunar tables.——*Baptism by immersion* seems to have been the most ancient method of administering that sacrament; a triple immersion being used, at least after some time, in honour of the Trinity.

IMMOLA'TION (*immolatio*, a sacrificing: *Lat.*), a ceremony used in the Roman sacrifices; it consisted in throwing upon the head of the victim some sort of corn and frankincense, together with the *mola*, or salt cake, and a little wine.

IM'PACT (*impingo*, I dash against anything: *Lat.*), in Mechanics, the simple or single action of one body upon another. The *point of impact* is the point or place where the body acts.

IMPA'LEMENT, in Heraldry, the division of a shield palewise, when it is said to be *party per pale*. *Impalement per baron et feme* is the division which takes place on marriage, the husband's coat being borne on the dexter side, and the wife's on the sinister.——IMPALEMENT, a species of punishment used by some barbarous nations, and consisting in a stake being thrust up through the body, and the victim being left to die a lingering death.

IMPARISYLLAB'IC (*impar*, unequal; and *syllaba*, a syllable: *Lat.*), in Grammar, an epithet for words not having the same number of syllables.

IMPAR'LANCE (*parler*, to speak: *Fr.*), an old law term for a privilege or license granted, on petitioning the court for time to consider what answer the defendant should make to the plaintiff's declaration.

IMPASTA'TION (*Fr.*, from *pâte*, paste), the baking or binding together with some cement, and the hardening by air or fire, a mixture of various materials of different colours and consistencies, so as to form them into a paste of some kind.

IMPASTO (*Ital.*), a term used by artists with reference to the degree of thickness with which the colours in an oil painting are laid on. In some pictures the *impasto* is so thin that the threads of the canvas may be counted; in others, those of Rembrandt for instance, it is so thick that the paint stands up in lumps.

IMPA'TIENS (*impatient: Lat.*), the name given by Linnæus to the botanical genus which includes the well-known balsams, on account of the elastic force with which the valves of the fruit separate on being touched when near maturity.

IMPEACH'MENT (*empêchement: Fr.*), in Law, the accusation brought against a public officer in parliament, for treason or other crimes and misdemeanors. An impeachment by the House of Commons is of the nature of a presentment to the House of Lords, the supreme court of criminal jurisdiction. The articles of impeachment, found by the Commons, are the same as a bill of indictment, which is to be tried by the Lords.

IMPENETRABIL'ITY (*impenetrabilis*, that cannot be penetrated: *Lat.*), in Philosophy, that quality of matter which prevents two bodies from occupying the same space at the same time.

IMPER'ATIVE (*imperativus*, proceeding from a command: *Lat.*), in Grammar, one of the moods of a verb, used when we would command, exhort, or advise.

IMPERA'TOR (commander: *Lat.*), in Roman Antiquity, a title of honour conferred on victorious generals by their armies, and confirmed by the senate. After the overthrow of the republic, *imperator* became the highest title of the supreme ruler; and, in later times, it had the signification which we attach to the word *emperor*.

IMPER'FECT (*imperfectus*, unfinished: *Lat.*), a tense in grammar, denoting a modification of a verb, which expresses that the action or event of which we speak was, at the time to which we refer, in an unfinished state. In English, it is designated by *was*, with the present participle.

IMPER'SONAL VERB (*impersonalis: Lat.*), in Grammar, a verb used only in the third person singular, with *it* for a nominative in English; as *it rains*. Impersonal verbs, in every language, must refer to some noun; and therefore must, in reality, have some nominative case.

IMPETI'GO (*Lat.*), in Medicine, an eruption of small pustules, sometimes called the *moist-tetter*. Certain trades, in which irritating substances are brought in contact with the skin, often produce it. Cleanliness is a great preventive of it.

IMPETRA'TION (*impetratio*, an obtaining by request: *Lat.*), the obtaining anything by request or prayer; but in our old statutes, it is taken for the pre-obtaining from the court of Rome, of church benefices in this realm, the disposal of which belonged to the king and other lay patrons.

IM'PETUS (*Lat.*), in Mechanics, the force with which one body impels or strikes another.

IM'PORTS AND EX'PORTS (*importo*, I carry into; and *exporto*, I carry away: *Lat.*). Under these appellations are comprised the various commodities brought into this country from abroad; and those home manufactures and products which, through our commercial relations, we sell or barter, and send to other countries.

IMPO'SE (*imposer*, to impose: *Fr.*), in Printing, to put the pages on the *imposing stone*, and fit on the chase, so as to prepare the *form* for the press.

IMPOSI'TION OF HANDS (*impositio*, a laying on: *Lat.*), a religious ceremony in which the bishop lays his hands upon the head of a person, in ordination, confirmation, or in the uttering a blessing. This practice is also generally observed by dissenters at the ordination of their ministers, while a blessing is invoked on the labours of him they are ordaining. Imposition of hands was a Jewish ceremony, introduced not by any divine authority, but by custom; their practice being, whenever they prayed for any person, to lay their hands on his head.

IMPOS'SIBLE (*impossibilis: Lat.*). A thing is said to be *physically impossible*, if it cannot be done by any natural powers, as the resurrection of the dead; and *morally impossible*, if in its own nature it is possible, but is attended with difficulties or circumstances which give it the appearance of being impossible:—*morally impossible* is the same as *extremely improbable*.

IM'POST (*impositus*, laid on: *Lat.*), any tax or tribute imposed by authority, particularly a duty or tax laid by government on goods imported.——In Architecture, that part of a pillar, pier, or pilaster, which receives an arch; and generally any supporting piece.

IMPOS'THUME, in Surgery, an abscess, or gathering of corrupt matter, in any part of the body.

IMPREGNA'TION (applied to animals and plants), the act of fecundating and making fruitful. In Botany, a deposit of the fecundating dust or pollen of the stamens on the pistils of a plant.

IMPRESCRIP'TIBLE RIGHTS (*in*, not; and *præscribo*, I object to: *Lat.*), such rights as a man may use or not at pleasure; those which cannot be lost to him by those claims of another which are founded on prescription.

IMPRES'SION (*impressio: Lat.*), in the Arts, is used to signify the transfer of engravings from a hard to a soft substance, whether by means of the press, as in copper-plate and lithographic printing, or by means of wax, &c., as with copies obtained from medals and engraved gems. The word is used also to denote a single edition of a book.

IMPRIMA'TUR (let it be printed: *Lat.*), the word by which the licenser allows a book to be printed, in countries where the censorship of books is rigorously exercised. The formular is still used in some of our universities, particularly those of Scotland.

IMPRI'MIS (*Lat.*), in the first place; first in order.

IMPROMP'TU (*Fr.*), in Literature, a short and pointed production, supposed to be brought forth without premeditation.

IMPROPRIA'TION (*in*, to; and *proprius*, one's own: *Lat.*), in Law, the ownership of tithes, glebe or other ecclesiastical dues, by a layman. The term *appropriation* is generally used if they are in the hands of ecclesiastical persons. When the religious societies were dissolved at the reformation, the lands, &c., belonging to many benefices which had been in their hands were given to the king, who granted them to lay impropriators.

IMPROVVISATO'RI (*Ital*; from *improviso*, unpremeditatedly: *Lat.*), those who compose and recite verses extemporaneously, either accompanying the voice, or not, with an instrument; as is the practice in Italy. A talent for the extemporaneous recitation of verses seems almost a peculiar characteristic of the Italians. It is no uncommon thing to see two masks that happen to meet during the carnival challenging each other in verse, and answering stanza for stanza with genuine humour and poetic feeling. The talent of an improvvisatore (says Sismondi) is the gift of nature, and a talent which has frequently no relation to the other faculties. When it is manifested in a child it is studiously cultivated, and he receives all the instruction which seems likely to be useful to him in his art. The improvvisatore generally begs from the audience a subject for his verse. The topics usually presented to him are drawn from mythology, religion, history, or some passing event of the day. After having been informed of the subject, he remains a moment in meditation, to view it in its various lights, and to shape out the plan of the little poem which he is about to compose. He then prepares the eight first verses, that his mind during the recitation of them may receive the proper impulse In about seven or eight minutes he is fully prepared, and commences his poem, which often consists of 500 or 600 verses. His eyes wander around him, his features glow, and he struggles with the prophetic spirit which seems to animate him.

INA'LIENABLE (*in*, not: and *alienabilis*, capable of being transferred: *Lat.*), an epithet applied to such things as cannot be legally alienated or made over to another: thus, the dominions of a sovereign, the revenues of the church, the estates of a minor, &c. are *inalienable*, otherwise than with a reserve of the right of redemption.

INAUGURA'TION (*inauguratio*, a beginning: *Lat.*, literally the taking of omens: a practice observed by the Romans at the commencement of every important enterprise), the act of inducting into office with solemnity; as the coronation of an emperor or king, or the consecration of a prelate.

IN'CA, the name or title given by the natives of Peru to their king and to the princes of the blood, before the conquest of that country by the Spaniards.

INCANDES'CENCE (*incandesco*, I grow hot: *Lat.*), the glowing whiteness of a metallic or other body, caused by intense heat.

INCARNA'TION (*in*; and *caro*, flesh: *Lat.*), in Surgery, the process of healing wounds, and replacing morbid with new flesh.

IN'CENSE (*encens*; *Fr.*) [See FRANKINCENSE.] The burning of incense made part of the daily service of the Jewish temple; and in the Roman Catholic church it is the deacon's office to incense the officiating priest or prelate and the choir. In the religious rites of heathen nations, too, spices and fragrant gums were burnt as incense. ——INCENSED, in Heraldry, an epithet for panthers when represented with fire issuing from their mouths and ears.

INCEP'TIVE MAG'NITUDE (*incipio*, I begin: *Lat.*), a first principle having no magnitude itself, but capable of producing it by being enlarged; thus, a *point*.——In Grammar, an *inceptive*, or *inchoative verb*, indicates a commencement of increase in the qualities indicated by the original verb. Thus, *augeo* means 'I increase;' but *augesco*, 'I *begin* to increase.'

IN'CIDENCE, ANGLE OF (*incido*, I fall upon: *Lat.*), the angle formed by a straight line which cuts any other line or surface with the perpendicular to that line or surface drawn through the point of intersection. —— In Optics, when rays of light striking a body are reflected, the angle of incidence and the angle of reflection are equal.

IN'CIDENT (*incidens*, happening: *Lat.*), in Law, something that inseparably belongs to another termed the *principal*: thus, a court baron is incident to a manor.

INCINERA'TION (*in*, into; and *cinis*, ashes: *Lat.*), in Chemistry, the combustion of organic substances, for the purpose of obtaining their incombustible residue.

INCI'SORS (*incido*, I cut through: *Lat.*), the name given to the front teeth in the jaws of vertebrate animals, because they cut the food.

INCLINA'TION (*inclinatio*: *Lat.*), a word frequently used in Geometry and Natural Philosophy, and signifying the mutual approach, tendency, or leaning of two lines or two planes towards each other, so as to make an angle.——INCLINATION of a right line to a plane, the acute angle which that line makes with another right line drawn in the plane through the point where the inclined line intersects it, and through the point where it is also cut by a perpendicular to the plane let down from any point of the inclined line.——INCLINATION of the axis of the earth, the angle which it makes with the axis of the ecliptic, or the angle contained between the planes of the equator and the ecliptic, viz. 23° 28′. *Inclination of the lunar orbit* to the ecliptic, 5° 8′ 48″.——INCLINATION in terrestrial magnetism is the angle which the magnetic needle makes with the plane of the horizon. The dip, as it is frequently termed, varies from the magnetic equator, where it is *nil*, to the magnetic pole, where the needle is at right angles to the plane of the horizon. Lines drawn through points on the earth's surface, where the angles of dip are equal, are termed isoclinal lines.

INCLI'NED PLANE (*inclino*, I incline: *Lat.*), in Mechanics, one of the six mechanical powers, and one of the two to which all are reducible—a plane inclined to the horizon, or making an angle with it. The wedge is a modification of the inclined plane, being formed of two inclined planes placed base to base. The screw is another modification, being, in fact, merely an inclined plane wound round a cylinder. Its common application is to elevate bodies, which are raised perpendicularly while they are moved up the plane. And the mechanical advantage is as the increased distance moved over: that is, as the length of the inclined plane is to the perpendicular height gained. Thus, if the inclined plane is one hundred times as long as it is high, not taking friction into account, it will require only the hundredth of a given weight to raise it along the inclined plane; but in accordance with that invariable law, 'What is gained in power is lost in time,' the power will move one hundred times as far as the perpendicular distance through which the weight is raised, and will take one hundred times as long a time as if the inclined plane were not used with it. The inclined plane, in this case, bears ninety-nine hundredths of the weight of the body.

IN CŒ'NA DOM'INI (at the Lord's supper: *Lat.*), the title of a celebrated papal bull, which enumerates certain rights claimed by the Romish church, and anathematizes those who violate them. All sects of heretics are cursed in it, by their several names. It was formerly read every year on Holy Thursday, whence its name; but latterly on Easter Monday. A copy of it is hung up on the door of St. Peter's, and another on that of St. John Lateran; and all primates, patriarchs, bishops, &c., are required to have it read in their churches once or more every year.

INCOG'NITO (abbreviated to *incog*, unknown: *Ital.*), so disguised as not to be recognized; a mode of travelling without any mark of distinction, which is sometimes adopted by princes and eminent persons who do not wish to be publicly received.

INCOMBUS'TIBLE CLOTH (*in*, not; and *combustibilis*, that may be burned: *Lat.*), a cloth made from a stone termed *Amianthus* or *Asbestos*. The ancients used it for wrapping round the dead bodies consumed on the funeral pyre, that their remains might not mingle with those of the wood, &c., used to consume them.

INCOMMEN'SURABLE (*in*, not; *con*, together; and *mensurabilis*, that can be measured: *Lat.*), a term applied to two lines or quantities which have no common measure by which they can be exactly divided. Quantities are *incommensurable*, when no third quantity can be found that is an aliquot part of each.

INCOMPAT'IBLE (*in*, not; and *compassibilis*, that may be suffered together: *Lat.*), in Chemistry, bodies which cannot be placed together in solution without mutual decomposition; thus the solution of a salt of barytes is incompatible with the solution of a sulphate.——In a Legal sense, that is *incompatible* which cannot be united in the same person without violating the law or constitution.

INCOMPRESSIBIL'ITY (*in*, not; and *compressibilis*, that may be pressed together: *Lat.*), that property of a body which renders a diminution of its volume impossible. No substance is quite incompressible; but fluids are compressible to so slight an extent that in practice they are considered incompressible.

INCORPORA'TION (*incorporo*, I form into a body: *Lat.*), in Chemistry, the mingling the particles of different bodies together into one mass, in such a manner that the different ingredients cannot be distinguished.——In Law, the formation of a legal or political body, with the quality of perpetual existence or succession, unless limited by the act of incorporation or formally put an end to by an act of the law.

INCRAS'SATE (*incrasso*, I make thick: *Lat.*), in Pharmacy, to make fluids thicker by the mixture of other substances less fluid, or by evaporating the thinner parts.——INCRASSATE, in Botany, becoming thicker.

IN'CREMENT (*incrementum*, an increase: *Lat.*), a term employed in Newton's method of fluxions to denote a small but finite increase of a variable quantity. It is the difference between two successive values of a quantity which increases according to a certain law.

INCRES'CENT (*incresco*, I increase: *Lat.*), in Heraldry, an epithet applied to the moon when she is increasing.

INCRYSTALLI'ZABLE, incapable of being formed into crystals.

INCUBA'TION (*incubatio*: *Lat.*), the process of a bird sitting on eggs, and hatching its young. The time required for this varies: domestic fowls sit three weeks; ducks, geese, and turkeys, a month; pigeons, eighteen days, &c. In the large majority of cases the female discharges this office, but in the case of the Australian emu and the Brazilian ostrich, it is the male bird that hatches the eggs. There are some species of which neither male nor female incubates. The eggs of the cassowary are deposited in the sand and left to be hatched by the heat of the sun. All the species of *Megapodius*, a galline genus peculiar to Australia and the large islands of the Indian archipelago, erect mounds of vegetable matter over their eggs, the fermentation of which emits heat sufficient to hatch them. Mounds fifteen feet high and sixty feet in circumference at the base have been erected by the jungle fowl of Australia, a bird no larger than our common fowl. Again, it is well known that our cuckoo lays its eggs in the nests of other birds, by which they are hatched; and there is a genus (*Molothrus*) of Brazilian birds allied to our starling which do precisely the same thing. This habit is connected with a physiological reason. *Artificial incubation* is carried to a high degree of perfection, both in Egypt and in China; and of late it has been tried in London, with success.

IN'CUBUS (*incubo*, I lie upon: *Lat.*), the *nightmare*, a disease which consists in a spasmodic contraction of the muscles of the breast during sleep, attended with a very painful difficulty of respiration and great anxiety. The most obvious symptom is a sensation of some great weight laid upon the breast: hence the name. Sometimes the sufferer finds himself in some inextricable difficulty, endeavouring to escape from a monster, or, perhaps, in imminent danger of falling from a precipice, while his limbs refuse to do their office, until he suddenly awakens himself by starting from his recumbent posture, or by a cry of terror. It is generally owing to repletion and indigestion, and is often superinduced by lying on the back.

INCUM'BENT (*incumbo*, I recline upon: *Lat.*), the person who is in present possession of an ecclesiastical benefice.

INCUNAB'ULA (the age of infancy: *Lat.*), books of the fifteenth century, the cradle days of printing, are so called by bibliographers.

IN'CUS (an anvil: *Lat.*), in Anatomy, the largest and strongest of the bones in the tympanum of the ear, so called from its resembling an anvil in shape.

INDEFE'ASIBLE (*indéfaisible*, that cannot be undone: *Fr.*), in Law, an epithet for an estate, or any right, which cannot be defeated or made void except by the act of the grantee.

INDEF'INITE (*indefinitus*, undetermined: *Lat.*), in Botany, when the stamens exceed twenty in number, or when other parts cannot be easily counted. It always refers to *number*.

INDEM'NITY (*indemnitas*, security from loss: *Lat.*), in Law, a writing to secure one from all damage and danger that may ensue from any act.——ACT OF INDEMNITY, an act passed every session of parliament for the relief of those who have neglected to take the necessary oaths, &c.

INDEN'TED (*in*; and *dentatus*, toothed: *Lat.*), in Heraldry, an epithet for a line which is notched or cut like a saw.

INDENT'URE (same *deriv.*), in Law, a writing containing an agreement or contract made between two or more persons; so called because it was indented or cut scallopwise, so as to correspond with the counterpart. But *indenting* is often neglected, while the writings or counterparts retain the name of *indenture*.

INDEPEN'DENTS (*in*, not; and *dependens*, hanging from: *Lat.*), a sect of Protestant dissenters, distinguished, not by doctrine, but by discipline. They regard every congregation of Christians meeting in one building for the purpose of public worship as a complete church, *independent* of any other religious government; they reject the use of all creeds, as impious substitutes for the letter of the Scripture, and attribute no virtue whatever to the right of ordination. The direction of each church is vested in its elders. The *Independents* arose in the reign of Elizabeth; and during the civil wars of England, in the 17th century, they formed a powerful party. They have had for some time in England more than 1700 chapels; in Scotland, more than 100; in Ireland, more than 30; and no less than 1000 in the United States.

INDETER'MINATE QUAN'TITY (*in*, not; and *determino*, I limit: *Lat.*), in Mathematics, a quantity which has no certain or definite value. Thus, in an ellipse, the values of co-ordinates are indeterminate, while the axes are constant quantities.—INDETERMINATE ANALYSIS, that particular branch of analysis which treats of the solution of *indeterminate problems*, or such problems as admit of an indefinite number of different solutions.

IN'DEX (*Lat.*, from *indico*, I declare), in Arithmetic and Algebra, the number that shows to what power a quantity is to be raised; the *exponent*. Thus in 4^5, 5 is the *index*, and points out how many fours are to be multiplied together, to produce the given quantity. This kind of notation enables us to simplify arithmetical and algebraic operations. Thus we can find at once that the fifth root of 4^5 is 4. Without this notation, 4^5 would be represented by a comparatively large number, 1024; and to find its fifth root we should have recourse to a complicated process. This holds to a still greater extent when there is question of a very large number, and a more difficult root is to be extracted: thus, the eighth root of 1568473^{16} is found with the greatest ease. [See LOGARITHMS.]

IN'DEX EXPURGATO'RIUS. [See EXPURGATORY INDEX.]

IN'DIAN INK, a substance brought from China, and used as a water-colour. It is in rolls or cakes, and is said to consist of lamp-black and animal glue.

IN'DIAN RED, a pigment of a purple russet here employed in water-colour painting. It is a peroxide of iron and is obtained in Bengal.

IN'DIAN RUB'BER. [See CAOUTCHOUC.]

IN'DIAN YEL'LOW, a pigment used by water colourists, brought from India. It is of unknown origin, but is found to be a compound of magnesia and a substance termed purreic acid.

IN'DIANITE, a mineral occurring in granular masses, and associated with garnet, felspar, fibrolite, and hornblende. It will scratch glass, and is of a white or grey colour.

INDIC'ATIVE (*indicativus*: *Lat.*), in Grammar, the first mood, or manner, of conjugating a verb, by which we simply affirm, deny, or indicate something; as, he *writes*, they *run*.

INDIC'TION, CYCLE OF (*indictio*: *Lat*), in Chronology, a mode of computing time by periods of fifteen years. [See CHRONOLOGY, CYCLE, &c.]

INDI'CTMENT (*indico*, I proclaim against: *Lat.*), in Law, a written accusation of one or more persons for a crime or misdemeanor, preferred to, and presented on oath by, a grand jury. In determining whether there is reasonable cause to put the accused upon his trial, the grand jury hear evidence only of the charge; and if twelve of them are satisfied of the truth of the charge, the indictment is then said to be *found*, and is publicly delivered into court, endorsed *true bill*; otherwise, *not found*.

INDIG'ENOUS (*indiges*: *Lat.*), an epithet applied to the native animals and plants of a country, exclusive of those that have been introduced from other countries.

IN'DIGO (*indikon*, literally from *India*: *Gr.*), a most valuable dye, prepared from the leaves and stalks of leguminous plants, chiefly shrubs, belonging to the genus *Indigofera*. These are steeped in water and allowed to ferment. A yellow substance is thus obtained, which becomes blue by exposure to the air. The indigo is drained in bags and dried in boxes. The indigo of commerce is in the form of small square or oblong cakes; it is of a dark blue colour, passing into violet purple, is void of taste and smell; dull in appearance, but, by rubbing with a smooth hard body, it assumes the lustre and hue of copper. Sulphuric acid is the only agent that dissolves indigo without destroying its colour. When it is put into this acid, a yellow solution is at first formed, which, after a few hours, acquires a deep blue colour. If indigo is exposed to the action of certain deoxidizing agents, it forms a green solution with alkalis, from which it is precipitated white by acids. This *white indigo* is termed *Indigogene*; it instantly becomes blue on exposure to the air, forming indigo, which is supposed to be its oxide. The solution of indigo in strong sulphuric acid is known by the name of *Saxon blue*. Bengal is the great mart for indigo, but it is cultivated in other parts of India. The introduction of indigo met with great opposition from the growers of *woad*. Down to a recent period, the dyers of Nuremberg were obliged to take, every year, an oath not to use it; but its excellence as a dye ultimately gained it the victory. There can be no doubt that the *indicum* mentioned by Pliny was indigo, though he was mistaken as to its origin.

INDIG'OLITE (*indikon*, indigo; and *lithos*, a stone: *Gr.*), in Mineralogy, a variety of shorl or tourmaline, of an indigo or blue colour, sometimes tinged with green or azure.

INDIGOT'IC or ANILIC A'CID, in Chemistry, an acid obtained by boiling indigo in nitric acid, diluted with ten parts of water. It forms white or yellowish needles.

INDIVIS'IBLES (*indivisibilis*, not divisible: *Lat.*), in Geometry, those elements or principles into which it may be supposed that any body or figure can be ultimately resolved.

INDORS'ER (*endosseur*: *Fr.*) [See BILL, and EXCHANGE.]

INDUC'TION (*inductio*, a leading into: *Lat.*), the process by which magnetism or electricity is developed in a body by the magnetic or electric action of another body. Thus a bar of soft iron when brought near a magnet will be rendered magnetic, but returns to its former natural state if removed. Again, if a copper wire be coiled round a smaller bar of iron and a current of voltaic electricity be sent through the wire, the bar becomes instantly magnetic, but ceases to be so the moment the current is stopped. Again, if a conducting body be brought into the proximity of another body charged with electricity, the former will at once manifest signs of electrical action, positive electricity being developed on one side, and negative on the other.

INDUCTION, in Law, the introduction of a clergyman into possession of a benefice or living, to which he is collated or presented.

——INDUCTION, in Logic, a process of reasoning, by which we draw a general inference from a number of facts. Applied to physical enquiries, it has been styled generalisation from experience. It consists (says J. S. Mill) in inferring from some individual instances in which a phenomenon is observed to occur, that it occurs in all instances of a certain class; namely in all which *resemble* the former in what are regarded as the material circumstances.

INDUL'GENCE (*indulgentia*, a pardon: *Lat.*), in the Roman Catholic church, a remission of the punishment due to sins, granted by the pope or church, and supposed to save the sinner from purgatory. Clement VI., in his decretal, declares that an infinite treasure of merits was left by Christ, arising from his own sufferings and the good works of the Virgin and the saints; and that the pastors of the church, and more especially the popes, who are the sovereign disposers of this treasure, have authority to apply it to the living, by virtue of the keys, and to the dead, by way of suffrage, so as to discharge them from their respective proportions of punishment by taking just so much merit out of this general treasure as they conceive the debt requires, and offering it to God. The historical origin of indulgences is traced to the public penances and the canonical punishments which the old Christian church imposed on the community, especially on those who did not remain firm unto martyrdom. In the pontificate of Leo X., the flagrant abuse of indulgences became an open scandal, and led to the reformation in Germany.

INDUL'TO (a pardon: *Ital.*), in the church of Rome, a power granted to present to benefices, or to do something contrary to ordinary law.

INER'TIA or VIS INER'TIÆ (inactivity; the effect of inactivity: *Lat.*), in Mechanics, that property of matter which causes it, as it were, to resist a change of state: that is, prevents it from stopping when in motion, and from moving when at rest. But it may be said, that however great the velocity of a moving body, it will always stop at last. This is true: but it does not stop *of itself;* it is stopped by the resistance of the air and by friction. No such agents interfere with the motions of the heavenly bodies, and therefore they continue to obey the impulse they originally received. This seeming resistance of bodies to motion or rest is merely a consequence of the necessity there is for time to elapse while they are receiving or losing motion, which can neither be imparted nor removed instantaneously.

INESCUTCH'EON, in Heraldry, a small escutcheon borne within the shield.

IN ES'SE (*Lat.*), actually existing; distinguished from *in posse*, which denotes that a thing is not, but may be.

IN'FAMY (*infamia: Lat.*), in Law, that total loss of character or public disgrace by which a person was formerly rendered incapable of being a witness or a juror. No person is now excluded, on this account, from being a witness.

IN'FANCY (*infantia*, literally inability to speak: *Lat.*), the period, physically considered, from birth to seven years; and legally till twenty-one, previously to which age no one can inherit, or incur any debt except for necessaries. The contracts of a minor, however, are not void, but voidable; and though they cannot be enforced against him, he may enforce them against another, and may confirm them at the end of his minority. Under seven years of age, he cannot be guilty of felony; between seven and fourteen, there is a presumption that he is *doli incapax* (not capable of guilt); but, if it is shown that he could distinguish between good and evil, he may be condemned even to death.

INFAN'TE and INFAN'TA, appellations given to all the sons and daughters of the kings of Spain and Portugal, except the eldest. The dignity of the title consists in the pre-eminence implied by styling the children of the king *the* children. It was anciently given to all hidalgos. The word *childe* was used in a similar way in England during the middle ages.

IN'FANTRY (*infanterie*: *Fr.*), in Military affairs, the whole body of foot soldiers, as distinguished from *cavalry*. Infantry is divided into *light infantry* and that of *the line*. The latter forms the great mass of the army, which is intended to fight in line. The light infantry serves chiefly in the outposts, furnishes sharpshooters, makes bold expeditions, and harasses the enemy. The excellence of infantry depends on their good order in advancing and retreating, perfect acquaintance with their drill and duties, a just delivery of their fire, and great calmness in all circumstances. In the British army there are 109 regiments of regular infantry.

INFEC'TION (*inficio*, I corrupt: *Lat.*), the morbid effluvia of one animal body affecting the similar organs of another: as small-pox, putridity, &c. It has been questioned whether this effect can be carried from place to place, and whether most diseases, called infectious, are not occasioned by local circumstances which affect certain subjects in the population. Infection is considered to differ from contagion, by being communicated through the air instead of from person to person. The *infection* of the plague and of the yellow fever is imported in ships and conveyed in clothing; persons also take *infection* from the air of apartments where the sick are confined.

INFER'NAL MACHI'NE, a name which has been given on more than one occasion to a terrific engine invented for the purpose of assassination. That which was intended for the destruction of Louis-Philippe, on the 28th July, 1835, and which, though the king and his three sons who were riding with him escaped, killed sixteen and wounded eighteen persons, consisted of a number of gun-barrels, so arranged in a frame as to be fired off in a volley.

IN'FIDEL (*infidelis*, *Lat.*), a term of re proach for any one who rejects the fundamental articles of religious belief of a country. In Turkey the Christians are styled infidels; in Europe, the Mahommedans.

INFILTRATION, the act or process of entering the pores or cavities of a body. [See FILTRATION.]

IN'FINITE (*infinitus*, boundless: *Lat.*). In Mathematics, *infinite quantities* are such as are either greater or less than any assignable ones. An *infinite series* is one in which the terms continue to be produced unceasingly.

INFINITES'IMAL (from a superlative form of *infinitus*, boundless: *Lat.*), a term denoting an indefinitely small quantity.

INFIN'ITIVE (*infinitus*, boundless: *Lat.*), in Grammar, a mood expressing the action of the verb, without affirming or denying it of any subject.

INFIN'ITY (*infinitas: Lat.*), a term applied to the vast and the minute, to distances and spaces too great to be expressed by any number of integers, or too small to be expressed by any fraction; one of the incomprehensible but necessarily existing wonders of the universe.

INFIR'MARY (*infirmus*, weak: *Lat*), a charitable establishment, where the poor may receive medical advice and medicines gratis

INFLAMMA'TION (*inflammatio*, a preternatural heat: *Lat.*), in Pathology, a state of any portion of the animal body, characterized by heat, pain, and redness, attended with more or less of tumefaction and fever. Inflammation is divided into two species, *phlegmonous* and *erysipelatous:* the former is known by its bright red colour, tension, heat, and painful tumefaction; the latter, by its dull red colour, vanishing upon pressure, and its exhibiting scarcely any perceptible swelling. Besides this division, inflammation is either acute or chronic, local or general, simple or complicated with other diseases. In inflammation, the vascular action of the part is increased; and if it does not terminate in *resolution*, it ends by *adhesion*, *suppuration*, and *ulceration*, which, when the action is healthy, follow each other regularly.

INFLECT'ED (*inflecto*, I bend in: *Lat.*), in Botany, an epithet for a leaf that is bent inwards at the end towards the stem; also for a calyx that is bent inwards.

INFLEC'TION (*inflectio*, a turning: *Lat.*), in Optics, the bending or refraction of the rays of light, caused by the unequal thickness of any medium.——INFLECTION, in Grammar, the change which a word undergoes in its termination, to express case, number, gender, mood, tense, &c.——POINT OF INFLECTION, in Geometry, that point in which the direction of a curve changes from concavity to convexity, and *vice versâ*.

INFLORES'CENCE (*infloresco*, I flourish: *Lat.*), in Botany, the manner in which flowers are arranged on the axis, or the branching of the floral axis. It is sometimes termed *Anthotaxis*.

INFLUEN'ZA (influence: *Ital.;* because produced, in the opinion of the ignorant, by the influence of the stars), in Medicine, an epidemic catarrh, usually attended by languor, headache, quick pulse, and febrile symptoms, which are sometimes of a serious character. It assumes a variety of aspects, dependent on the seasons and other causes. It is supposed to arise from the presence in the air of a minute quantity of highly irritating vapour.

IN FORMA PAUPERIS. [See FORMA PAUPERIS.]

INFORMA'TION (*informatio*, a representation: *Lat.*), in Law, an accusation or complaint exhibited against a person for some criminal offence. An information differs from an *indictment*, inasmuch as the latter is laid on the oath of twelve men, but the information is only the allegation of the person who exhibits it. Informations are charges on oath, laid before a justice or justices of the peace, with a view to summary conviction; or a complaint brought by the crown itself. The latter is of two kinds: that which is filed *ex officio* by the attorney-general, in some particular kinds of misdemeanor of a public nature, and calculated to affect the government, and that filed, at the relation of some private person or informer, by the master of the crown office, for certain gross misdemeanors not immediately calculated to disturb the government.

INFORM'ED STARS (*stellæ informes: Lat.*), in Astronomy, stars not included in any constellation.

IN FORO CONSCIENTIÆ (in the court of conscience: *Lat.*), an expression made use of when a man is morally but not legally bound to do something.

INFRALAPSA'RIANS (*infra lapsum*, under the fall: *Lat.*), Presbyterians who hold that God created a certain number of human beings, who must be damned whatever efforts they make to avoid it. They are so called, because they maintain that God formed his decrees after his knowledge of the fall, and in consequence of it. [See SUPRALAPSARIANS]

IN'FULA (*Lat.*), in Roman Antiquity, a kind of fillet, made of white wool, loosely twisted, and tied with a white band. At Roman marriages, the bride carried wool on a distaff in the procession, and fixed it as an infula on the door-case of her future husband. The *infula* was used also as an ornament on festive and solemn occasions

INFUNDIBU'LIFORM (*infundibulum*, a funnel; and *forma*, a form: *Lat*), in Botany, having the shape of a funnel, as, a flower with a conical border rising from a tube.

INFUNDIB'ULUM CER'EBRI (the funnel of the brain: *Lat*), in Anatomy, a cavity of the brain through which serous humours are discharged.

INFU'SION (*infusio*, a pouring upon: *Lat.*), in Pharmacy, a method of obtaining the active constituents of plants, roots, &c., by pouring hot water upon them. Also, the liquor in which the plants, &c, are steeped, and which is impregnated with their peculiar qualities.

INFUSO'RIA (*infusus*, poured upon *Lat.*), animalcules which are so termed because found very abundantly in stale infusions. The name was formerly applied to a heterogeneous assemblage of objects, some vegetable, others animal, but it is now restricted to a tribe of minute animals, destitute of shells, and moving by means of cilia. They are objects of study to microscopists. [See DIATOMACEÆ, POLYCYSTINA, ROTATORIA.]

IN'GOT (*lingot: Fr.*), a small bar of metal made of a certain form and size by casting it in moulds. The term is chiefly applied to the small bars of gold and silver intended either for coining or for exportation to foreign countries.

IN'GRAILED (*in*; and *grêle*, hail: *Fr.*), in Heraldry, an epithet for anything represented with the edges ragged, or notched semicircularly, as if broken by something having fallen upon it, the points being turned outward to the field. When they are turned inwards towards the ordinary, it is *invecked*.

IN'GRESS (*ingressus: Lat.*), in Astronomy, a term applied to the entrance of the moon into the shadow of the earth in eclipses, the sun's entrance into a sign, &c. ——INGRESS, *egress*, and *regress*, in Law, words frequently used in leases of lands, which signify a free entry into, a going out of, and returning to the premises leased.

IN'GUINAL (*inguinalis*, from *inguen*, the groin: *Lat.*), in Anatomy, &c., belonging to the groin. Hence *inguinal hernia*, called by surgeons *bubonocele*, is a hernia in that part.

INHER'ITANCE (*hæreditas: Lat.*), a perpetual right or interest in an estate, vested in a person and his heirs. The inheritances mentioned in our law are either corporeal or incorporeal: the *corporeal* relate to lands, tenements, &c., that may be touched or handled; and the *incorporeal*, to such rights as are annexed to corporeal inheritances, as advowsons, tithes, annuities, offices, &c. There is likewise another inheritance, which is termed *in severalty*: that is, where two or more hold lands or tenements severally, as when two persons hold to them and the heirs of their two bodies; in which case these two have a joint estate during their lives, but their heirs have several inheritances. According to the law of inheritance, the eldest male child is always preferred, in case of intestacy, while sisters take equally where there are no sons. He that is of the whole blood is preferred [see DESCENT] before another that has only a part of the blood of his ancestor. Goods and chattels cannot be made heritable. [See HEIRLOOM.]

INHIBI'TION (*inhibitio*, from *inhibeo*, I restrain: *Lat.*), in Ecclesiastical Law, a writ to forbid a judge's proceeding in a cause that lies before him. This writ generally issues out of a higher court to an inferior, and is of much the same nature as a prohibition.

INJEC'TION (*injicio*, I throw into: *Lat.*), in Anatomy, the act of filling the vessels of a dead subject with any coloured matter, to show their ramifications.——INJECTION, in Surgery, the forcing any liquid into the body by means of a syringe or pipe.

INJUNC'TION (*injunctio*, a command: *Lat.*), in Law, a writ issuing under the seal of a court of equity, where the court thinks fit to interfere with the acts of parties or the course of other jurisdictions. Thus, injunctions are granted to stay proceedings at common law, to prevent the negotiation of notes or other securities, to restrain parties from the commission of waste, to preserve property which is in the course of litigation, &c. Disobedience of an injunction is a contempt of the court from which it issues, punishable by imprisonment.

IN'JURY (*injuria: Lat.*), in a legal sense, any wrong or damage done to another, either in his person, rights, reputation, or goods. Whatever impairs the quality or diminishes the value of goods or property, is an *injury*; so also whatever impairs the health, weakens the mental faculties, or prejudices the character of a person, is an *injury*.

INK (*encre: Fr.*). Tangallate of iron, kept suspended in water by gum-arabic, a little logwood being generally added to improve the colour, constitutes common writing ink. It may be made by boiling six ounces of finely bruised galls in six pints of soft water, and adding to the decoction four ounces of gum-arabic and four ounces of green vitriol. The whole must be well mixed, and then placed in a well-corked bottle, which should be occasionally shaken After two months, the ink is to be poured off from the residue into glass bottles, into each of which a clove or two, or a drop of creosote, has been put, to prevent mouldiness, and well corked. A little sugar gives a gloss; and as it prevents rapid drying, is added to *copying ink*. *Indian ink* is made with very fine lampblack and size *Marking ink* may be made by dissolving one drachm of fused nitrate of silver (lunar caustic) in an ounce of water, which has been previously thickened with sap green. Before writing with it, the linen must be prepared, by the application of a weak solution of carbonate of soda thickened with gum-arabic, and allowed to dry. *Printing ink* is boiled linseed or nut oil, and lampblack. *Red ink* is a solution of alum coloured with Brazil wood. *Sympathetic inks* are of many kinds; they remain invisible until heated, or until some substance is applied to them. Thus, solutions of cobalt become blue or green while heated; lemon-juice turns brown in the same circumstances, and very dilute sulphuric acid blackens. The heat concentrates the acids, and enables them to act on the paper. A writing made with a weak infusion of galls becomes visible if wetted with a weak solution of sulphate of iron; if made with a weak solution of prussiate of potash, it is rendered visible by a solution of sulphate of iron, &c.

IN'LAND BILLS, in Commerce, bills payable in the country where they are drawn.

INLAY'ING, the art of ornamenting furniture, or other similar objects, by letting into them pieces of metal, ivory, or other wood.

IN LIM'INE (on the threshold: *Lat.*) at the outset; before anything is said or done.

IN'NATE IDE'AS (*innatus*, born with us *Lat.*), principles or ideas supposed to be stamped on the mind from the first moment of its existence, and brought into the world with it: a doctrine which has given rise to much discussion, and which the celebrated Locke took great pains to refute.

INN'KEEPERS were formerly liable to make good all losses of property belonging to their guests and brought to the inn. But now by an Act of Parliament passed in 1863, no innkeeper is liable to make good any loss to property brought to his inn (not being a horse or carriage) to a greater amount than 30*l.*, except in two cases: viz. 1, where the innkeeper or his servant has been guilty of wilful neglect; and, 2, where the goods have been deposited with the innkeeper expressly for safe custody.

IN'NOCENTS' DAY, a festival observed by the Christian church on the 28th of December, in memory of the children that were slain by command of Herod.

INNOMINA'TUM (not named: *Lat.*). The bones at each side of the pelvis are called *os innominatum* (an unnamed bone), because the three bones of which it consists in the young subject, viz. the *ischium* or hip-bone, the *ilium* or haunch-bone, and the *pubis* or share-bone, grow together in the adult, so as to form a single bone, which is thus left without a name.

INNS OF COURT, four corporate societies in London. Every candidate for the rank of barrister-at-law must be admitted a member of one of them, and submit to its regulations, as a student. They are, the *Inner Temple*, the *Middle Temple*, *Lincoln's Inn*, and *Gray's Inn*. The government of each of these inns is vested in a body of senior members styled Masters of the Bench, or Benchers, and they alone have the privilege of calling gentlemen to the bar. Each inn has its own hall and library. The Temple Church belongs jointly to the two Temples; the other two inns have their separate chapels.

INOCULA'TION (*inoculatio*, an ingrafting: *Lat.*), in Surgery, the operation of giving the small-pox to persons, by incision. In its more general sense, it includes the insertion of any poisonous or infectious matter. Inoculation for the small-pox was introduced into general notice by Lady Mary Wortley Montagu, about the year 1721, her son having been inoculated at Constantinople during her residence there, and her infant daughter being the first that underwent the operation in this country. It is performed by inserting the point of a lancet, armed with the proper matter, just under the cuticle. The disease is milder when produced in this way than when received naturally. The communication of the cow-pock infection is termed *Vaccination*, which see.——INOCULATION, in Gardening, a kind of grafting in the bud; as when the bud of one fruit-tree is set in the stock or branch of another, so as to make several sorts of fruit grow on the same tree. The time to *inoculate* is when the buds are formed at the extremities of the same year's shoot, indicating that the spring growth for that season is complete.

INOR'DINATE PROPOR'TION (*inordinatus*, out of order: *Lat.*), in Geometry, that in which the order of the terms compared is irregular or disturbed.

INORGAN'IC BOD'IES (*in*, not; and *organicus*, organized: *Lat.*), such as belong neither to the animal kingdom nor to the vegetable.

INOSCULA'TION (*in*; and *osculatio*, a union of blood-vessels, literally a kissing: *Lat.*), in Anatomy, the union of vessels, by conjunction of their extremities; where the ramifications which unite are small or capillary, the vessels are usually said to *anastomose*. [See ANASTOMOSIS.]

IN PARTI'BUS INFIDE'LIUM (in the parts of unbelievers: *Lat.*), a phrase employed with reference to certain vicars apostolic appointed by the Pope, with the titles of ancient and no longer existing dioceses, to dioceses in heretical or heathen lands. They were first appointed for India and other parts of the East.

IN PRO'PRIA PERSO'NA (*Lat.*), in one's own person or character.

IN'QUEST (*inquæsitus*, sought for: *Lat.*), a judicial inquiry. It may either be a jury to decide on the guilt of an accused person, according to fact and law; to examine the weights and measures used by shopkeepers; to decide on the cause of any violent or sudden death; or to examine into accusations before trial.

INQUI'RY (*inquiro*, I search for: *Lat.*) WRIT OF, in Law, a writ that issues out to the sheriff, to summon a jury to inquire what damages a plaintiff has sustained in an action upon the case where judgment goes by default.

INQUISI'TION, OFFICE OF THE (*inquisitio*, a searching for: *Lat.*), an ecclesiastical court founded by Innocent III., who, in 1206, sent Dominic and others to excite the Roman Catholic princes and people to extirpate heretics, to inquire into their number and quality, and to transmit a faithful account of these particulars. From the nature of their office, these agents were called *inquisitors*; and thus arose a tribunal which was received in all Italy, and throughout the dominions of Spain, excepting the kingdom of Naples and the provinces of the Netherlands. The principle of jurisprudence upon which the Inquisition proceeded was that of taking no other proof of a delinquent's guilt than his own confession. He was closely confined in a dark and dismal cell, where he was compelled to sit motionless and silent, and if his feelings found vent in a tone of complaint, the ever-watchful keeper warned him to be silent. He was accused of nothing specific, but was told that his guilt was known, and was required to acknowledge it. If he confessed the crime of which he was accused, he pronounced his own sentence, and his property was confiscated. If he declared himself innocent, contrary to the testimony of his secret accusers, he was put to the torture. When sentence of death was pronounced against him, the *auto-da-fé* was ordered. At daybreak, the solemn sound of the great bell of the cathedral called the faithful to the dreadful spectacle. The condemned appeared barefooted, clothed in the frightful *san benito*, a frock of yellow sackcloth painted with flames, &c., and a conical cap on their heads. The Dominicans, with the banner of the Inquisition, led the way. Then came the penitents, who were to be punished by fines, &c., and after the cross, which was borne behind the penitents, walked the unfortunate wretches who were condemned to be burnt alive. The procession was closed by monks and priests, and the *heretics* were then handed over to the executioner, who finished the horrid spectacle in the presence of the multitudes assembled to witness the agonies of the victims! According to a calculation which may be depended on as moderate, 340,000 persons were punished by the Inquisition, from 1481 to 1808, of whom nearly 32,000 were burnt. The Inquisition had been abolished during the French rule in Spain; it was re-established by Ferdinand VII in 1814; but on the adoption of the constitution of the Cortes, in 1820, it was again abolished. It was established in Portugal in 1557, but was abolished by the Cortes in 1821. There were also branches of the Inquisition in different parts of France, Italy, &c.; but the progress of civilization has left them little power anywhere, and has put an end to their existence in most places.

INQUIS'ITOR (a searcher: *Lat.*), in Law, any officer, as the sheriff and the coroner, having power to inquire into certain matters.——GRAND INQUISITOR, the name given to a judge of the Inquisition.

INRO'LLMENT, in Law, the registering or entering on the rolls of the Court of Chancery or some other Court, any deed, decree, judgment, or other act that the law requires to be inrolled.

INSAN'ITY (*insanitas*: *Lat.*), mental derangement of any degree, from a slight aberration to raving madness. It is, however, rarely used to express the temporary delirium occasioned by fever, &c.

INSCRI'BED FIG'URE (*inscribo*, I write in: *Lat.*), in Geometry, a circle drawn within any figure, and touching all its sides; or a figure drawn within a circle which touches all its angles.

INSCRIP'TI (inscribed: *Lat.*), in Roman Antiquity, a name given to those who were branded with any ignominious mark.

INSCRIP'TION (*inscriptio*: *Lat*), any monumental writing, engraved on or affixed to a thing, to give a more distinct knowledge of it, or to transmit some important fact to posterity. The inscriptions mentioned by Herodotus and Diodorus Siculus sufficiently show that this was the first method of conveying instruction to mankind, and transmitting knowledge to posterity; thus, the ancients engraved upon pillars both the principles of sciences and the history of the world. Pisistratus carved precepts of husbandry on pillars of stone; and the treaties of confederacy between the Romans and Jews were engraved on plates of brass. Antiquarians have accordingly been, at all times, very anxious to examine the inscriptions on ancient ruins, coins, medals, &c.——INSCRIPTION, in Numismatics, words placed in the middle of the reverse side of some coins and medals.

INSEC'TA (*Lat.*, from *inseco*, I cut into), a class of articulate animals. [See ENTOMOLOGY.]

INSECTIV'OROUS (*insecta*, insects; and *voro*, I devour: *Lat.*), an epithet for such animals as feed on insects.

IN SITU, a Latin phrase employed by geologists with reference to a rock which retains its original position in distinction to a fragment which has been moved from its place.

INSOLA'TION (*insolatio*. *Lat.*), a term sometimes made use of to denote that exposure to the sun which is made in order to promote the chemical action of one substance upon another: thus, the *immediate* combination of hydrogen and chlorine, so as to form hydrochloric acid.——INSOLATION or *scorching*, a disease in plants arising from exposure to too bright a light, and due to an excessive evaporation.

INSOL'VENCY (*in*, not; and *solvo*, I pay: *Lat.*), the state of a person who has not property sufficient for the payment of his debts.

INSPIRA'TION (*inspiratio*, a breathing into: *Lat.*), in Physiology, the act of drawing air into the lungs.

INSPISSA'TION (*inspissatus*, thickened: *Lat.*), in Chemistry, the bringing a liquor to a thicker consistence by evaporation.

INSTALLA'TION (*in*; and *stallum*, a stall: *Mod. Lat.*), the ceremony of inducting, or investing with any charge, office, or rank; as, the placing a dean or prebendary in his stall or seat, or the admission of a knight into his order.

INSTAL'MENT (*installer*, to put in possession of a place, &c.: *Fr.*; from *stello*, I send: *Gr.*), in commercial transactions, the payment of a certain portion of a gross sum, which is to be paid at different times, or, as it is said, by *instalments*. In constituting a capital-stock by subscriptions of individuals, it is customary to afford facilities to subscribers by dividing the sum subscribed into instalments, or portions payable at distinct periods. In large contracts, also, it is not unusual to agree that the money shall be paid by instalments.

IN'STANT (*instans*: *Lat.*), the smallest perceptible portion of time; or that in which we perceive no succession. Schoolmen distinguish three kinds of instant: the *temporary*, a portion of time preceding another; the *natural*, which is a mere priority of nature; and the *rational*, which is not a real point, but one which the understanding supposes to have existed before another, from the nature of things, which cause it to be looked on as pre-existing.

INSTAN'TER (*Lat.*), in Law, instantly, without the least delay; as, 'the party was compelled to plead *instanter*.'

IN STA'TU QUO (in the state in which: *Lat.*), a phrase signifying that condition in which things were at a certain former period; as when belligerent parties, in concluding a treaty, agree that their mutual relations shall be *in statu quo fuerunt ante bellum*, or as they were before the commencement of the war.

IN'STINCT (*instinctus*, impulse: *Lat.*), that power of volition or impulse produced by the peculiar nature of an animal, which prompts it to do certain things, independent of all instruction or experience, and without deliberation, not only where such acts are immediately connected with its own individual preservation, or with that of its kind, but often where they are altogether foreign to the apparent wants of the individual, and sometimes, also, extremely complicated. We cannot attribute these actions to intelligence, without supposing a degree of foresight and understanding infinitely superior to what we can admit in the species that perform them. The actions performed by instinct are not the effects of imitation, for the individuals that execute them have often never seen them done by others. They are so much the property of the species, that all the individuals perform them in the same manner, without any modification or improvement. The duckling hastens to the water, the hen remains the proper time on her eggs during incubation, the beaver builds his curious habitation with a skill peculiar to the species, and the bees construct, with mathematical accuracy, their waxen cells. Instinct, then, is a general property of animated matter or a law of organized life in a state of action.

IN'STITUTE or INSTITU'TION (*institutio*, an arrangement: *Lat.*), any society established according to certain laws or regulations, for the furtherance of some particular object; such are colleges or seminaries for the cultivation of the sciences, literary institutes, mechanics' institutes, and others.——The word *institution* is applied also to a body of laws, rites, and ceremonies, which are enjoined by authority as permanent rules of conduct or of government; thus, the institutions of Moses or Lycurgus. And to a society of individuals established for the promotion of any public object; as a charitable or benevolent *institution*.——The term is used likewise for the putting a clerk into possession of a spiritual benefice; his title will, however, become void, unless, within two months after actual possession he publicly read in the church of the benefice upon some Lord's-day, and at one of the appointed times, the morning and evening service according to the Book of Common Prayer, and afterwards publicly declare his assent to such book, and also read the Thirty-nine Articles, and declare his assent to them; and within three months, on some Lord's-day, in the same place, read a declaration, by him subscribed before the ordinary, of conformity to the liturgy.

IN'STRUMENT, MUSICAL (*Fr.*), a machine, artificially constructed, for the production of musical sounds. It is of three kinds, the wind instrument, e. g. the flute, the stringed instrument, e.g. the violin, and the instrument of percussion, e.g. the drum.——INSTRUMENT, in Law, a deed or writing creating or declaring legal rights, and duly executed.

IN'SULATED (*insulatus*, made into an island: *Lat.*), in Architecture, an appellation given to such columns as stand alone, or free from any contiguous wall, &c., like an island in the sea: whence the name.

INSULA'TION (same *deriv.*), in electrical experiments, that state in which the communication of electric fluid is prevented by the interposition of a non-conductor.

INSU'RANCE, in Law and Commerce, the act of providing against a possible loss, by entering into a contract with one who is willing to give *assurance*; that is, to bind himself to make good such possible loss, should it occur. The instrument by which the contract is made is denominated a *policy*, and the stipulated consideration is called the *premium*. Besides policies for protection against losses by fire or risks at sea, there are others on *lives*, by which a party, for a certain premium, agrees to pay a certain sum, if a person, to whose life it relates, shall die within a time specified, or to pay the executors of the insured a certain sum at the time of his death. Such policies, however, usually make an exception in the case of death by suicide. In this way a family may be furnished with means of support in case of the death of its head. According to general practice, a life insurance is seldom made by the payment of a single sum at the time it is effected, but almost always by the payment of an *annual premium* during its continuance. An individual, therefore, who has insured a sum on his life, would forfeit all the advantages of the insurance were he not to continue regularly to make his periodical payments. The insurance of life is now more generally expressed by the word *assurance*.

INTA'GLIOS (*intagliare*, to cut in: *Ital.*), precious stones, on which are engraved the heads of eminent men, inscriptions, &c., and which are usually set in rings, &c. [See GEMS.]

IN'TEGER (*integer*, whole *Lat.*), in Arithmetic, any number which is not a fraction.

IN'TEGRAL CAL'CULUS (same *deriv.*), that branch of mathematical analysis which treats of the processes by which a function may be found, such that its differential shall be a given quantity. [See CALCULUS, DIFFERENTIAL.] When an integral is given, its differential may be obtained by general rules; but when a differential is given, the analyst can only compare the differential expression which is to be integrated with the differentials of known quantities, and, from such comparison, infer the form of the corresponding integral. There is no direct method of returning from the differential to the integral.

IN'TEGRANT PARTS (same *deriv.*), the parts of a body obtained by mechanical division. *Constituent parts* differ from these, in being the result of chemical decomposition.

INTEG'UMENT (*integumentum*: *Lat.*), in Anatomy, a covering or membrane which invests any particular part of an organized body. The skin of a leaf and the shell of a crab, for example, are integuments.

IN'TELLECT (*intellectus*: *Lat.*), that faculty of the human mind which receives or comprehends the ideas communicated to it; otherwise called the *understanding*.

INTEN'DANT (*intendo*, I give my mind

to anything: *Lat.*), a word much used in France, and denoting a person who has the charge, direction, or management of some office or department; as an *intendant* of marine, an *intendant* of finance, &c.

INTERCAL'ARY (*intercalarius*, that is to be inserted: *Lat.*), in Chronology, an epithet applied to the day inserted in a leap-year. The intercalary day was assigned to February because it was the shortest month. It was inserted by the ancient Romans between the 24th and 25th, a place it still retains in the ecclesiastical calendar; but in the civil, a day is added at the end of the month [See CALENDAR and BISSEXTILE.]

INTERCOLUMNIA'TION (*intercolumnium*: *Lat.*), in Architecture, the space between two columns, which is always to be proportioned to the height and diameter of the columns.

INTERCOS'TAL (*inter*, between; and *costa*, a rib: *Lat.*), in Anatomy, an appellation given to such muscles, nerves, arteries, and veins, as lie between the ribs.

IN'TERDICT (*interdictio*, a prohibiting: *Lat.*), an ecclesiastical censure, by which the church of Rome forbids the performance of divine service in a kingdom, province, town, &c. In the middle ages, it was a very formidable matter; it caused all spiritual services to cease in the kingdom against which it was issued: the churches were shut up, no sacraments except baptism were administered, corpses were buried without funeral rites, and all the functions of a church which was then believed to be the only medium of salvation ceased. In 998, Gregory V. compelled king Robert of France to dissolve his marriage with his cousin Bertha, by an interdict. England was laid under an interdict by Innocent III. in the reign of John. The last time it was tried as an instrument of intimidation was in 1809, when a powerless interdict was issued against Napoleon by Pius VII.

IN'TEREST (*intérêt*: *Fr.*), the sum of money paid or allowed, according to a fixed rate, for the loan or use of some other sum. The sum lent is called the *principal*; the sum agreed on as interest is called the *rate per cent.* Interest is distinguished into *simple* and *compound*. Simple interest is that which is paid on the sum originally lent. Compound interest is that which is paid not only upon the principal but upon arrears of unpaid interest. When interest at five per cent. is thus added to principal the accumulations equal the original sum in about fourteen years.——INTEREST, in Arithmetic, a rule by which the interest on money is computed.

INTERFE'RENCE (*inter*, between; and *fero*, I bring: *Lat.*), in Optics, certain phenomena which result from the action of rays of light upon each other. If two minute pencils of light, radiating from two different luminous points, fall on a piece of paper, &c., at the same spot, equally distant from the luminous points, a greater intensity of light is produced than by either pencil singly; also, if the length of one of the rays exceeds that of the other by some certain difference, or by some multiple of that difference, the intensity of the light thrown on the paper is similarly augmented. But if one ray is longer than the other, only to the amount of half that difference, or some multiple of the half, the two pencils will destroy each other, and a black spot or fringe will be produced. The *difference* of length required by the different coloured rays is different. This mutual action of the rays, increasing each other in one case, and destroying each other in the other, is termed interference. It is analogous to what occurs when two organ-pipes are sounded together, according as they are quite or not quite in unison; if they are quite in unison, each will increase the sound of the other; if not quite in unison, intervals of silence will be produced, instead of a continuous sound. If light is merely the *vibration* of an ethereal medium, the effects produced with the two rays of light can be explained in the same way as that with the two sounds; that is, the waves of light, like those of sound, when they correspond, augment each other, but, when they come in contact in opposite phases, neutralize each other. The ease with which the undulatory theory explains interference, and the difficulty of explaining it by the theory of emission, are considered a very strong argument in favour of the truth of the former.

INTERJEC'TION (*interjectio*, literally a throwing between; *Lat.*), in Grammar, an indeclinable part of speech, serving to express some passion or emotion of the mind; as, '*Alas!* my fondest hopes are now for ever fled.'

INTERLOC'UTORY OR'DER or DECREE' (*interlocutio*, a speaking between. *Lat.*), in Law, an order that does not decide the cause, but only some matter incident to it, which may happen in an intermediate stage.

IN'TERLUDE (*interludo*, I play between: *Lat.*), in the Drama, a light entertainment exhibited on the stage between the principal performance and the afterpiece. At present, the term *interlude* is applied principally to comic operas, written for two or three persons. In ancient tragedy, the chorus sang the interludes between the acts.

INTERLU'NIUM (*Lat.*), in Astronomy, the time in which the moon does not perceptibly change.

INTERMIT'TENT FE'VERS (*intermitto*, I leave off for a time: *Lat.*), such fevers as subside and soon return. These fevers are distinguished into various classes, according to the interval of time between the attacks; as *tertian* fever, *quartan* fever, &c.

INTERMODIL'LION (*inter*, between: *Lat.*; and *modillion*), in Architecture, the space between two modillions, which should be equal throughout the entablature.

IN'TERNODE (*inter*, between; and *nodus*, a knot: *Lat.*), in Botany, the space intervening on a branch between the leaves; or that contained between any two knots or joints of the stalk of a plant.

INTEROS'SEOUS MUS'CLES (*inter*, between; and *ossa*, the bones: *Lat.*), in Anatomy, small muscles between the metacarpal bones of the hand, invented for moving the fingers; and between the metatarsal bones of the foot, for moving the toes.

INTERPLEADER. In Law, a bill of interpleader in equity is filed by one from whom the same article or sum is claimed by two parties, with a view to ascertain the person to whom it ought to be delivered or paid. In common law courts, relief can be given against adverse claims made on sheriffs, &c., having no interest in the matter, by a judge's order, calling on a third party to maintain or relinquish his claims.

INTERPOLA'TION (*interpolatio: Lat.*), in Mathematics, that branch of analysis which treats of the methods by which, when a series of quantities succeeding each other, and formed all according to some determinate law, are given, others subjected to the same law may be interposed between them. ——In Philological criticism, the insertion of spurious passages in the writings of some ancient author.

INTERREG'NUM (*Lat.*), the time during which a throne is vacant, in elective kingdoms; for in such as are hereditary, like that of England, there is no such thing as an *interregnum*.

INTERROGA'TION (*interrogatio*, a questioning: *Lat.*), in Grammar, the character (?) denoting a question; as, 'Do you love me?' ——INTERROGATION, in Rhetoric, a figure containing a proposition in the form of a question.

INTERROG'ATORY (*interrogatorius*: *Lat.*), in Law, a question in writing, demanded of a witness in a cause, who is to answer it under the solemnity of an oath.

INTERSEC'TION (*intersectio: Lat.*), in Mathematics, the cutting of one line or plane by another; thus we say, that the mutual intersection of two planes is a right line.

INTERSTEL'LAR (*inter*, between; and *stella*, a star: *Lat.*), in Astronomy, between the stars; also, what is situated beyond the solar system.

IN'TERVAL (*intervallum*, literally the space between two palisades: *Lat.*), in Music, the difference between the number of vibrations produced by one sonorous body of a certain magnitude and texture, and the number of those produced by another of a different magnitude and texture, in the same time. The ancients divided the *intervals* into simple or uncomposite, which they called *diastems*; and composite, which they called *systems*. Modern musicians consider the *semitone* as a simple interval, and call only those composite which consist of two or more semitones.

INTES'TACY (*intestatus*, a person that has made no will: *Lat.*), in Law, the condition of one who dies without leaving a will. Freehold lands and tenements, in which he has an estate of inheritance, descend to his heir; copyhold lands, to the heir by the custom of the manor; chattels must be distributed, subject to debts, by the party who takes out letters of administration. [See ADMINISTRATION, LETTERS OF.]

INTESTINA'LIA (*intestina*, an intestine: *Lat.*), *intestinal worms*. [See ENTOZOA.]

INTES'TINES (same *deriv.*), the convoluted membranous and muscular tube, reaching from the stomach to the anus. They consist of the large and small intestines; the former including the *cæcum*, *colon*, and *rectum*; the latter, the *duodenum*, the *jejunum*, and the *ileum*. They are attached to the body by the mesentery. The inner surface of the small intestines is covered with villi, hair-like bodies formed of folds of the mucous membrane. The structure of the intestinal canal is very different in different animals.

INTONA'TION (*in*; and *tonus*, a tone: *Lat.*), in music, the act of sounding with the voice the notes of the scale, in succession, or at any intervals. To do this successfully, a good ear is almost indispensable; and the key, or, as it has been sometimes called, the *tone*, in which the piece is written, must be carefully observed.

INTRA'DOS, the interior and lower line or curve of an arch, the exterior being termed the *extrados*.

INTRAN'SITIVE (*intransitivus: Lat.*), in Grammar, an epithet for a verb which expresses actions that do not *pass over* to an object; as, I *go*, I *come*, I *sleep*, &c.

IN TRAN'SITU (*Lat.*), during the passage from one place to another.

INTRENCH'MENT, in Fortification, any temporary work that shelters a post against the attacks of an enemy.

INTRU'SION (*intrudo*, I thrust in: *Lat.*), in Law, a species of injury to freehold property, which occurs when a stranger intrudes between the death of a tenant for life or years, and the entry of the heir of a remainderman, or reversioner, expectant on the estate for life or years, who had died previous to the decease of such tenant.

INTUI'TION (*intueor*, I contemplate: *Lat.*), in Philosophy, knowledge obtained without the instrumentality of reason; the instantaneous act of the mind, in perceiving the agreement or disagreement of two ideas.

INTUSSUSCEP'TION (*intus*, within; and *susceptio*, a receiving: *Lat.*), in Anatomy, the falling of one part of an intestine into another; or the passing of one part within another, causing a duplicature of the intestine.

IN'ULIN, in Chemistry, a white and pulverulent starch-like substance, extracted from the root of the *Inula Stellenium*, or elecampane. In its chemical properties, it seems intermediate between gum and starch.

INUNDA'TION (*inundatio: Lat.*), in Agriculture, the overflowing of land from natural causes, and without the intervention of art. It is termed *irrigation* when it is the result of design and skill.

IN VAC'UO (*Lat.*), in empty space, or in space devoid of air.

INVA'LID (*invalidus*, weak: *Lat.*), a person who is maimed, wounded, or otherwise disabled. In military and naval affairs, a soldier or sailor wounded or disabled in war, and unfit for service.

INVEN'TION (*inventio*, from *invenio* I find: *Lat.*), in the Fine Arts, the production and selection of such objects as are proper to enter into the composition of a work of art.——In Poetry, it is applied to whatever the poet adds to the history of the subject. ——In Rhetoric, the finding and selecting of arguments and means of illustration.

INVER'SE PROPOR'TION (*inversus*, inverted: *Lat.*), in Arithmetic, a rule in which it depends on the question whether the first or the second term in the statement shall be the greater. When the quantity required must be larger than the given quantity of the same kind, the second term must be the greater, and *vice versâ*. This rule is used when the effect or result of any operation is *less* in proportion as the cause is *greater*, or is *greater* in proportion as the cause is *less*.

INVER'SE RA'TIO (same *deriv.*), the ratio of the reciprocals, or the ratio inverted. Thus, ⅕ : ⅙, or 6 : 5, is the inverse of the ratio 5 : 6.

INVER'SION (*inversio: Lat.*), in Arithmetic, &c., the changing antecedents into consequents in the terms of a proportion, and the contrary.——In Grammar, a change of the natural order of words.——In Music, the change of place between two notes of an interval.——In Rhetoric and Philology, the transposition of words out of their natural order. Thus, '*Mulierem fortem quis inveniet?*' for '*Quis inveniet mulierem fortem?*' There were much greater facilities for transposition in the ancient than in the modern languages, on account of the different cases, &c., being indicated by their terminations.

INVER'TEBRATES (*in*, not; and *vertebratus*, furnished with a backbone: *Lat.*), animals without vertebrae, or an internal bony skeleton; such as worms and shellfish.

INVES'TITURE (*Fr.*), in Feudal Law, the open delivery of seisin or possession. There was anciently a great variety of ceremonies used at investitures. Originally they were made by a certain form of words; afterwards, by such things as had the greatest resemblance to what was to be transferred: thus, where lands were intended to pass, a turf, &c., was delivered by the grantor to the grantee.

INVOCA'TION (*invocatio*, from *invoco*, I call upon: *Lat.*), in Poetry, an address at the beginning of a poem, in which the poet calls for the assistance of some divinity, particularly of his muse, or the deity of poetry. In the course of an epic poem several invocations may occur, particularly when anything extraordinary is to be related; but the first invocation is always the most considerable.

IN'VOICE (*in;* and *voie*, the road: *Fr.*), in Commerce, a written account of the particulars of merchandize shipped, or sent to a purchaser, factor, &c., with the value or prices and charges annexed.

INVOLU'CRUM (a covering: *Lat.*), in Botany, the name of the leaves or scales surrounding the heads of composite flowers; also the whorl of bracts at the base of the entire umbel in umbelliferous plants. This is called the general involucre; whilst that at the base of the smaller umbels is called the partial involucre or involucel. In *ferns*, the superincumbent cuticle covering the *sori*, or small heaps of reproductive granules, found growing on their fronds. In the *Equisetaceæ*, the cases of the reproductive organs.

IN'VOLUTE (*involutus*, folded in: *Lat.*), in the higher Geometry, a curve supposed to be described by the extremity of a string, unwinding itself from the arc of another curve, about which it has been lapped.

INVOLU'TION (*involutio*, a wrapping up: *Lat.*), in Arithmetic and Algebra, the raising any quantity to a given power, by multiplying it into itself the required number of times: thus, the cube or third power of 4 is obtained by multiplying 4, the root, into itself twice; as $4 \times 4 \times 4 = 64$. The index, or exponent of the power, in this case 3, tells the number of factors, each of which is equal to the quantity to be involved; and the number of multiplications to be performed is always one less than the exponent. [See INDEX.]

I'ODINE (*iödēs*, violet-coloured: *Gr.*), in Chemistry, a substance of a dark colour and a metallic lustre; when dry it fuses at 227°, and boils and evaporates at 345°, producing purple fumes, whence its name; if heated with water, it distils over at a temperature below 212°. It is a supporter of combustion; phosphorus placed in it will take fire spontaneously. It is an irritant poison, has an acrid taste, and an odour somewhat like that of chlorine: in small doses it has been found useful in certain forms of glandular disease. It is dissolved by 7000 times its weight of water, the solution being brown; it dissolves easily in alcohol and ether. Starch will detect iodine in water containing only the 400,000th part of its weight of that substance, on account of the blue tinge produced by the iodide of starch which it forms; but the liquid must be cold, as this blue substance gives a colourless solution with hot water. Its compounds are termed *iodides*. It is used chiefly in medicine and photography, and, in this country, is generally obtained from kelp.

ION'IC OR'DER, the third of the five orders of architecture; being a kind of mean between the massive and the graceful. The first idea of this order was given by the people of Ionia. Its distinguishing feature is the *volute* of its capital. In the Grecian Ionic, there are two front and two rear volutes, connected by baluster-like forms on the flanks. In the Roman Ionic, there are on each column four diagonal volutes, and an abacus with curved sides; so that it presents the same appearance from whatever side it is viewed. The Greek volute continues the fillet of the spiral along the face of the abacus; in the Roman its origin is behind the ovolo. The height of the column is about nine diameters; and the base varies in different examples. The shaft is cut with 24 flutes. In Grecian specimens, the entablature is very simple; in modern, it is sometimes greatly enriched; and the frieze is often *cushioned*—that is, presents a convex instead of a plane surface in front.

ION'IC PHILOS'OPHERS, a sect founded by Thales, a native of Miletus in Ionia, which occasioned his followers to assume the appellation of *Ionic*. Thales was succeeded by Anaximenes, his disciple; also by Diogenes of Apollonia, and Heraclitus of Ephesus. Thales considered water, and Anaximenes air, as the original material out of which all things had sprung, and into which they would ultimately be resolved. Their successors improved these doctrines, by considering any material element as a mere symbol, calculated to present more vividly to the imagination the energy of some one principle which is the ground of all vital appearances: hence they are not to be considered as *materialists*. They admitted but *one* world, which they regarded as the work of God, and animated by him as its soul. They maintained that the universe was governed by destiny; by which they meant the immutable laws of Providence. They asserted matter to be changeable, but denied that it was divisible to infinity. They believed the existence of *spirits* or *demons*, as intelligent and immortal substances. The soul, according to their doctrine, existed after it left the body; and they attributed to inanimate things a kind of torpid soul.

IPECACUAN'HA, the root of the *Cephaelis Ipecacuanha*, a small composite plant found in damp Brazilian forests. It was introduced into Europe in the 17th century, when it was much esteemed for the cure of dysenteries. Its taste is bitter and acrid; it is one of the safest and mildest emetics with which we are acquainted, and is administered as a powder, as a tincture, or infused in wine.

IRID'IUM (*iris*, the rainbow: *Gr.*), a metal discovered in 1803, which received its name from its soluble compounds presenting all the colours of the rainbow. Iridium occurs only in the ore of platinum; it is the most refractory of all the metals, is brittle, and has a white colour. No acid will attack it, but it oxidises when ignited to redness in the air. Its equivalent is 99.

I'RIS (same *deriv.*), in Anatomy, a variegated circle which surrounds the pupil of the eye. It is formed by the choroid membrane, which becomes detached from the sclerotic coat when it reaches the edge of the cornea, and forms a curtain behind it. By the dilation or contraction of the iris more or less light is admitted through the opening in front called the pupil.—In Astronomy, one of the newly discovered planets, of the group between Mars and Jupiter. Its period is about 1342 days.—In Botany, a genus of bulbous rooted plants with handsome flowers: nat. order *Iridaceæ*.

I'RON (*iren: Sax.*), a metal known from a very remote antiquity. It is of a peculiar grey colour, and very bright when polished; it is not very malleable, but is extremely ductile and tenacious. At a red heat, it is soft and pliable. Its specific gravity is 7·7; it requires the highest temperature of a wind furnace to melt it. It is attracted by the magnet. It has been found *native*, that is, in the metallic state, only in bodies of meteoric origin. Its ores are very abundant as oxides, carbonates, &c.; and in combination with earthy matters, as *clay iron stone* in the coal districts; more or less of it is found also in almost all soils; and it causes a red colour in many. It combines with carbon so as to form *steel*, and in still greater quantity so as to form *cast iron*. At a high temperature, it burns slowly in the air; but in pure oxygen, with great brilliancy and the abundant emission of sparks. The acids act energetically on iron. It readily combines with sulphur when heated. It rusts in a moist atmosphere, particularly when carbonic acid is present in abundance, oxide of iron, or carbonate, being formed. In the great ironworks, the ore, broken into small pieces, and mixed with lime or some other substance to promote its fusion, is thrown into the furnace; and baskets of charcoal or coke, in due proportion, are thrown in along with it. A part of the bottom of the furnace is filled with fuel only. This being kindled, the blast of a great bellows, or of a blowing machine, is directed on it, and soon raises the whole to a most intense heat; this melts the ore immediately above it, and the reduced metal drops down through the fuel and collects at the bottom. The rest sinks down to fill up the void left by the consumed fuel; and this, being in its turn exposed to the blast, is also reduced. More ore and fuel are supplied above, and the operation goes on till the melted metal at the bottom, increasing in quantity, rises almost to the aperture which admits the current of air; it is then let out by piercing a hole in the side of the furnace, and, being conducted to moulds, forms what are called *pigs* of cast iron. The substitution of pit-coal in 1619 for wood, in the smelting of iron, which became general in 1740, gave an extraordinary impetus to the working of this important metal. In 1740, the amount of iron produced in England and Wales was only 17,000 tons; in 1850, it was 2,000,000 tons. But, on account of the sulphur and other impurities contained in mineral coal, the metal produced with it is not so fine, nor does it answer for some purposes so well, as that obtained with wood. The use of a *hot blast* instead of cold air in blowing, the superior efficiency of which was discovered in 1827, was the greatest improvement ever effected by simple means in any manufacture. Pig iron contains from 2 to 5 per cent. of its weight of carbon. Wrought or malleable iron is nearly pure iron. It may be made either by direct reduction of the ore, or by removing the carbon and impurities from cast iron. In the latter case the principle of the processes adopted is to bring the melted iron into contact with air sufficient to oxidate the carbon and silicon. The usual plan is to stir the melted iron whilst in the furnace with a rake, and this is called *puddling*. According to Mr. Bessemer's plan, jets of air are forced through the melted iron by a blowing machine. In either case the iron on being removed from the furnace is hammered and then passed between rollers, with the view of inducing the fibrous structure which imparts strength and toughness to it. Malleable iron is distinguished from cast iron not only by having a fibrous in place of a granular or crystalline structure, but by its capability of being *welded*—that is, two pieces raised to a white heat may be pressed or hammered into such firm union that they form one piece. Great Britain is the largest iron producing country in the world, her annual production of cast iron being nearly four millions of tons.

IRON-FLINT, in Mineralogy, a sub-species of quartz, with a fracture more or less conchoidal, shining and nearly vitreous. It occurs in six-sided prisms, in small grains, and also in masses. Its varieties are red, yellow, and greenish.

IRON PYRI'TES (*purites*, from *pur*, fire: *Gr*.), *yellow sulphuret of iron*, an abundant ore of iron, containing one atom of iron, and four of oxygen; it is used chiefly for the production of sulphate of iron, or *green vitriol*, and recently for obtaining sulphur. Sulphurets of the metals were termed *pyrites*, because the yellow sulphuret of iron, to which in strictness the name should be confined, strikes fire with steel.

I'RONY (*eirōneia*, from *eirōn*, a dissembler: *Gr*.), in Rhetoric, was understood by the ancients, at first, to mean the representation of things or qualities as less than they really are; afterwards, and among the moderns, it designated the use of expressions contrary to the thoughts of the speaker. In the ordinary sense, irony means the bestowing of praise where evidently none is deserved.

IRRADIA'TION (*irradio*, I illuminate: *Lat*.), in Physics and Astronomy, the apparent enlargement of an object strongly illuminated. This is due to the impression produced by light on the retina being extended to a small distance round the focus of the rays concentrated by the crystalline lens. Irradiation causes a star to appear not a point, but a disc; and makes the bright part of the moon seem of greater diameter than the dark portion, at her first quarter.

IRRITABIL'ITY (*irritabilitas*: *Lat*.), in Physiology, a property possessed by most of the living tissues, in consequence of which motion is produced under the action of certain stimuli.

ISA'IAH, or THE PROPHECY OF ISAIAH, a canonical book of the Old Testament. Isaiah is the first of the four great prophets, the other three being Jeremiah, Ezekiel, and Daniel.

ISCHIAD'IC (*ischiadikos*, from *ischion*, the hip-joint: *Gr*.), in Medicine, an epithet for that rheumatic affection of the hip called *sciatica*.

IS'CHIUM (*ischion*, the hip-joint: *Gr*.) in Anatomy, one of the bones of the fœtal pelvis, and part of the *os innominatum* of the adult. [See INNOMINATUM OS.]

ISCHNOPHO'NIA (*ischnophōnia*: from *ischnos*, slender; and *phōnē*, a voice: *Gr*.), in Medicine, a shrillness of the voice; but more frequently an impediment or hesitation of speech.

IS'ERINE (because from *Iser*, in Bohemia), *titaniate of iron*; a mineral of an iron-black colour, and of a splendid metallic lustre, occurring in small obtuse angular grains.

I'SIAC MYS'TERIES. The worship of Isis [See OSIRIS] was transplanted from Egypt to Italy, but the rites became so licentious that they were forbidden, and Tiberius ordered the images of the goddess to be cast into the Tiber. They were however revived, and fell under the lash of Juvenal.

I'SINGLASS (*hausen-blasse*, sturgeon's bladder: *Ger*.), in Commerce, a substance, consisting of gelatine, and obtained chiefly from the sounds or air bladders of sturgeons. The sounds of fresh-water fish are to be preferred for the purpose, because these are the most transparent, flexible, and delicate; but those of the cod and ling are used by the fishermen of Newfoundland and Iceland. The coarser sorts of isinglass are made of the intestines of the fish. Good isinglass should be perfectly free from taste and smell, and quite soluble in boiling water. Isinglass boiled in milk forms a nutritious jelly, which, when flavoured, is *blanc-manger*. It is also used for fining fermented liquors, and various other purposes.

IS'LAMISM, the practical as well as the doctrinal tenets of the Mohammedan religion, embracing the whole of their civil and religious polity.

ISOCH'RONAL, or ISOCH'RONOUS, (*isochronos*: from *isos*, equal; and *chronos*, time: *Gr*.), performed in equal times. An epithet applied to the vibrations of a pendulum.

ISOLA'TION (*isola*, an island: *Ital*.), the same as *insulation*, which see.

ISOMER'IC BODIES (*isos*, equal; and *meros*, a part: *Gr*.), in Chemistry, are compounds which consist of the same elements in the same proportions, but have different properties—probably from the different way in which they are combined or grouped. Cyanic, cyanuric and fulminic acids are examples; all these being compounds of carbon, nitrogen, and oxygen in the same proportions.

ISOMET'RICAL PER'SPECTIVE (*isos*, equal; *metron*, measure: *Gr*.). There is a useful method of drawing objects whereby three sides of a parallelopiped are shown, and every part of the drawing is on the same scale, there being no diminution of distant parts as in ordinary perspective drawings. Such drawings are said to be in isometrical perspective.

ISOMOR'PHISM (*isos*, equal; and *morphē*, a form: *Gr*.). Substances which resemble each other in their crystalline forms, but differ in their elements, are *isomorphous*. Phosphate and biphosphate of soda are isomorphous with arseniate and binarseniate of soda.

ISOPERIMET'RICAL FIG'URES (*isoperimetros*, of equal circumference: *Gr*.), such as have equal perimeters or circumferences.

ISOS'CELES (*isoskeles*: from *isos*, equal; and *skelos*, a leg: *Gr*.), in Geometry, a term applied to a triangle having two equal sides.

ISOTHER'MAL (*isos*, equal; and *thermē*, heat: *Gr*.), having an equal temperature. *Isothermal lines* are those drawn on a map through places having the same annual mean temperature. Geographers, to avoid confusion, group the lines into zones or bands, which are called *isothermal zones*.

ISOTON'IC (*isotonos*, equally stretched: *Gr.*), in Music, the scale of equal temperament, in which the octave is divided into twelve equal parts or mean semitones.

IS'SUANT (issuing: *Fr.*), in Heraldry, an epithet for a lion or other beast coming out of the bottom line of any chief or fess.

IS'SUE (*Fr.*), in Law, the legitimate offspring of parents.——The point or matter *at issue* between contending parties in a suit is some fact affirmed on the one side and denied on the other.——Issue, in Medicine, an artificial vent for noxious humours in the body.

ISTH'MIAN GAMES, so called because they were celebrated in the Isthmus of Corinth, which joins the Peloponnesus to the continent. They were held at the temple of Isthmian Neptune, which was surrounded with a thick forest of pine; and the contests were of the same kind as at the Olympic games.

ISTH'MUS (*isthmos: Gr.*), in Geography, a neck or narrow strip of land which joins a peninsula to a continent, as the isthmus of Corinth; or which unites two continents, as the isthmus of Darien, that connects North and South America.

ITAL'IAN LAN'GUAGE. This beautiful and harmonious language is derived from the classical Latin, corrupted by many local dialects. The Italian differs from Latin very much as the modern differs from ancient Greek. [See Greek Language.] For a long period Italy has lost the high place she once possessed in literature; but Dante (1265—1321), Petrarch (1304—1374), Boccaccio (1313—1375), Ariosto (1474—1533), and Torquato Tasso (1544—1595) have written works which will make her language to be studied when it has ceased to be a living tongue. And amongst *dii minores* there were Pulci, Boiardo, Bernardo Tasso, Guarini Metastasio, Goldoni, and Alfieri. These were poets; but there are many celebrated names in other departments: for example, Machiavelli, Guicciardini, Benvenuto, Cellini, and Vasari, as writers of prose. Galileo was a leading pioneer in science. In painting and sculpture, it is universally admitted that the Italians have excelled all the other moderns.

ITAL'IC SCHOOL OF PHILOS'OPHY, the Pythagorean and Eleatic systems taken together. The term is, however, sometimes used to express that founded by Pythagoras; which was so called, because he taught in Italy, spreading his doctrines among the people of Tarentum, Metapontus, Heraclea, &c.

ITAL'ICS, in Printing, characters or letters (first used in Italy) which stand inclining; thus—*Italic.* They are often used by way of distinction from Roman letters, for emphasis or antithesis, or on account of some peculiar importance attached to the words in which they are employed.

I'VORY (*ivoire: Fr.*; *ebur: Lat.*), the tusk of the male elephant, a hard solid substance, of a white creamy colour, and greatly esteemed for the fineness of its grain, and the high polish it is capable of receiving. That of India becomes yellow; but that of Achem and Ceylon is free from this imperfection. Ivory is extensively used by cutlers in the manufacture of handles for knives and forks; by miniature painters for their tablets; by turners, in making numberless useful and ornamental objects, as well as for chessmen, billiard-balls, toys, &c.; also by musical and philosophical instrument-makers; by comb-makers; and by dentists for making artificial teeth, for which, however, the ivory of the walrus is preferred. Each tusk weighs, on an average, about 60 lbs.; and about 2,000 cwt. are imported each year. The western and eastern coasts of Africa, the Cape of Good Hope, Ceylon, India, and the countries to the eastward of the straits of Malacca, are the great sources whence supplies of ivory are derived. The structure of ivory is the same as that of the dentine of the human tooth. [See Dentine.]

I'VORY BLACK, the mixture of charcoal and phosphate of lime obtained by burning bone; it is very effective in depriving certain substances of their colour.

I'VY (*ifig: Sax.*), *Hedera helix*: nat. order, *Araliaceæ*, an evergreen climbing shrub, which attaches itself to other objects by aerial roots. In classical mythology this plant was sacred to Bacchus, whose head was represented as surrounded by a wreath of it.——*Ground Ivy* is a trailing perennial plant, with a blue flower, which is wild in Britain. It is the *Glechoma hederacea* of botanists: nat. order, *Labiatæ*.

J

J, when reckoned a distinct letter, as it now always is, instead of being mixed up with *i*, as formerly, in dictionaries, &c., is the tenth in the alphabet; and has a soft sound in English, like that of the *g* in *genius*: thus, *jet*. It is only within the last century that any distinction has been made between *i* and *j*. In the Spanish language, *j* represents a guttural; and is often substituted for *x*, which has the same sound.

JAC'AMAR, in Ornithology, a genus of scansorial birds, closely allied to the kingfishers, but differing from them in their feet, and in inhabiting moist places; also, their plumage is not so smooth, and always exhibits a metallic lustre. They are solitary birds, feed on insects, and build in low bushes. They were arranged by Linnæus under the genus *Alcedo*, but were placed by Cuvier in a separate genus, *Galbula*. There are several species, some of which are natives of India, but the most beautiful are met with in South America.

JA'CINTH (*jacinthe: Fr.*), the *Hyacinth*, which see.

JACK, in Mechanics, a well-known contrivance for raising weights. The ordinary *kitchen-jack* is a compound machine, in which the weight with which the spit is charged is the power applied to overcome the friction of the parts, and in which a steady and uniform motion is obtained by means of the fly.——The *smoke-jack* is moved by a fan placed horizontally in the chimney; and, being made to revolve perpetually by the draught of the fire, it requires no winding up.——JACK, in Ichthyology, a name given to a young pike.——JACK, the horse or wooden frame upon which timber is sawn; a coat of mail, and likewise the garment worn over it; the small bowl which serves as a mark at the exercise of bowling, &c.——JACK, in a ship, an ensign or flag hoisted up at the spritsail-topmast head.

JACK, or JACA TREE, the common name of an East Indian tree, the *Artocarpus integrifolia* of botanists, allied to the mulberry-tree. It produces a fruit somewhat resembling but inferior to the bread fruit, the produce of another species of *Artocarpus*.

JACK'AL (*tschakkal: Ar.*), the *Canis aureus* of zoologists, a beast of prey, resembling the fox in appearance, but the wolf in its habits. It rouses other beasts by its cry, so that they are easily taken by the lion, whence it is called the *lion's provider*. Like the vulture and hyæna, the jackal feeds upon putrefying animal substances, which it scents at a great distance, and thus it soon frees the air from the effluvium. It is a native of Asia and Africa; it breeds with the dog, and their offspring are very prolific. It is abundant in the warmer parts of India and Africa, but is not found in the New World.

JACK'DAW, the *Corvus Monedula* of ornithologists, a black bird of the crow family, well known for its mischievous habits and garrulity.

JAC'OBIN, a name given, during the revolution in France, to the more violent advocates for republican government. The appellation originated in the circumstance that the secret meetings of the party were held in a building anciently belonging to the Jacobin monks (an order of Dominicans), where they concerted measures for influencing the proceedings of the National Assembly. Hence the word *Jacobin* has been applied to any turbulent demagogue who opposes government, in a secret and unlawful manner. The *Jacobin Club* had the following origin:—Some short time after the American revolution, political societies were formed in Paris (where *bureaux d'esprit*, or associations for the discussion of literary subjects, had previously been common), in which political subjects were debated, and the members of which were almost universally inclined to republicanism. At first their true object was studiously concealed; but, gathering strength, they displayed their real intentions. Their external symbol was a red cap; but afterwards a dirty dress was the token of their *sansculottism*. The revolution proceeding rapidly, similar societies were formed in nearly all the towns of France; and thus they became enabled to direct the public opinion. In 1792, the leading club, in which sometimes more than 2,500 members convened, kept up a correspondence with more than 400 affiliated societies; and the number of Jacobins in all France was estimated at about 400,000.

JAC'OBITES (*Jacobus*, James: *Lat.*), in English History, that party which, after the revolution of 1688, adhered to James II. and his descendants. Subsequently to the death of James, they languished for a while, but then revived; and towards the close of the reign of Anne, Bolingbroke and others of her ministers were in treaty with his son regarding his return. The first Scotch rebellion broke out in 1715, after the accession of George I., but failed; the failure of the second rebellion, also, in 1745, put an end to the political existence of the party, even in Scotland; though a correspondence is said to have been kept up with Charles Edward until his death in 1787. His brother, the cardinal of York, died in 1807. According to the strict rules of hereditary descent, the house of Sardinia and some other families intervene between the House of Brunswick and the crown of England.——JACOBITES, in Church History, the name of two sects of Christians in Syria and the adjacent countries. They hold that Jesus Christ had but one nature, and they practice circumcision before baptism. Many vain attempts have been made to unite them with the Church of Rome.

JA'COB'S STAFF, the same as *cross staff*, a mathematical instrument, for taking heights and distances where much accuracy is not required.

JACO'BUS (James: *Lat.*), a gold coin belonging to the reign of James I., of the value of 25*s.*

JADE, in Mineralogy, *nephrite*, a stone remarkable for its hardness and tenacity. It consists, essentially, of silica, alumina, and magnesia. The Chinese manufacture it into various articles.

JA'GUAR, the *Leopardus onça* of zoologists, one of the Felidæ which has a body four or five feet long, with fur coloured brownish yellow, with black spots. It haunts the wooded banks of great rivers in South America. It is a voracious animal, attacking oxen, horses, and any smaller animals that come in its way, but seldom man. It roars much by night. It is usually killed by being driven by dogs up a tree, where it is despatched by bullets.

JAL'AP (from *Xalapa*, in Mexico, whence it originally came), a resin extracted from the roots of various plants belonging to the genus *Ipomœa* and other genera: nat. order, *Convolvulaceæ*. It is obtained in globular pieces of a dense and resinous texture; in powder it has a nauseous odour and taste. It is a drastic purge, but is liable to gripe and nauseate.

JAMB (*jambe*, a leg: *Fr.*), in Architecture, the side-piece or post of a door; or the side-piece of a fireplace.

JAN'IZARIES, or JAN'ISSARIES (a corruption of *yeni tscheri*, new troops: *Turk.*), the appellation given to the grand seignior's guard, or the soldiers of the Turkish infantry. The janizaries becoming turbulent, and rising in arms against the sultan in May 1826, they were attacked, defeated, and subsequently abolished; and their place was supplied by troops trained after the European manner.

JAN'SENISTS, a set of Roman Catholics in France, who followed the opinions of Jansen, bishop of Ypres, and constituted a formidable party in the latter half of the 17th century. They were Calvinists in some respects; in others they approached to the reformed opinions; but they never separated from the Romish Church. Certain doctrines extracted from their writings were condemned by the bulls of two popes. They maintained a severe contest with the Jesuits, by whom they were at last crushed. Arnauld, of the monastery of Port Royal, was one of the most eminent of the Jansenists. That monastery was suppressed by Louis XIV. in 1709.

JAN'UARY (*Januarius*, literally pertaining to Janus: *Lat.*), the first month of the year. According to some, its name was given by the Romans in honour of *Janus*, the divinity who presided over the new year and all new undertakings; but, according to others, it is derived from *janua*, a gate.

JAPAN VARNISH is the produce of a tree belonging to the genus *Rhus*: nat. ord. *Anacardiaceæ*. It seldom exceeds the height of 20 feet. From the seed, oil and wax are pressed, whilst the sap, taken from the tree in spring, yields the well known lacquer. When it first exudes on cutting the trunk, it is white and of the consistence of cream, but it soon turns black. But the common Japan varnish of Europe is composed of seedlac, resin, and spirit of wine. To this is added the colour required. After every coat, the article must be subjected to as high a temperature as may be applied without injuring it or the varnish. Figures or flowers, upon the japan, should be executed with coloured varnish; but oil, which cannot be lasting, is frequently substituted. All bodies, the substance of which is firm, may be japanned. Paper is too flexible, unless under the form of 'papier mâché.' The manufacture of japanned goods, as tea-trays, candlesticks, snuff boxes, &c., is carried on very extensively at Birmingham.

JAP'ANESE CE'DAR, The, is an evergreen coniferous tree, which reaches the height of from 80 to 100 feet in its native land. It is the *Cryptomeria japonica* of botanists: nat. ord. *Coniferæ*. It is being introduced into English shrubberies.

JAP'ANESE ME'DLAR, The, is the edible fruit of an evergreen tree called *Eriobotrya japonica* by botanists: nat. ord. *Rosaceæ*. The flower is white, the ripe fruit yellow, and somewhat resembling a plum in shape.

JARGOO'N, in Mineralogy, one of the varieties of *zircon*, found in Ceylon.

JAS'MINE (*jasmin*: *Fr.*, from *iasmê*, a fragrant perfume: *Gr.*), the name of plants belonging to the genus *Jasminum*. One species with white flowers, the *J. officinale*, thrives in this country without shelter; its flowers are highly fragrant, and afford, by distillation, an essential oil.

JAS'PER (*jaspe*: *Fr.*), in Mineralogy, a genus of stones, of the siliceous class, being a sub-species of rhomboidal quartz. It is of a complex irregular structure, of a great variety of colours, and emulates the appearance of the finer marbles or semi pellucid gems. They all readily strike fire with steel.

JAS'PI CA'MEA (*jasper*, and *cameo*), the dull, broad-zoned, green and white cameo; a very elegant species, much resembling the common cameo in all things but colour.

JAS'PONYX (*jasper*, and *onyx*), in Mineralogy, the purest horn-coloured onyx, with beautiful green zones, composed of the materials of the finest jaspers.

JAT'ROPHA, in Botany, a genus of plants: nat. ord. *Euphorbiaceæ*. [See CASSADA.]

JAUN'DICE (*jaunice*, from *jaune*, yellow: *Fr.*), a disease of which the distinguishing peculiarity is, that the skin becomes yellow. It proceeds from some affection of the liver and gall-bladder; and is often superinduced by a long continuance of melancholy and painful emotions.

JAY (*geai*: *Fr.*), the *Garrulus glandarius* of ornithologists, a handsome British bird of the crow family. Its upper wing-feathers are blue, variegated with black and white. Jays are lively, petulant, and rapid in their movements, as well as exceedingly noisy, and, like their kindred the magpie and jackdaw, they can be taught a variety of words and harsh grating sounds.

JEHO'VAH ('I am:' *Heb.*), one of the Scripture names of God, signifying the Being who is self-existent and gives existence to others. It was so venerated by the Jews that they never pronounced it, nor even fully wrote it. When reading the Scriptures, they used the word *Adonai* (Lord) wherever it occurred. [See ELOHIM.]

JEL'LY (*gelée*: *Fr.*). [See GELATINE.]

JERKED BEEF, or CHARQUE, an article of large consumption in Brazil, Cuba, and other places. Its preparation is chiefly carried on in Chili and Buenos Ayres during the dry summer months. The meat is cut up in thin slices without bones or fat, and thoroughly dried on hurdles in the sun. The slices are then made up into bundles, and sewed up in hides.

JERU'SALEM A'RTICHOKE. [See ARTICHOKE.]

JESS'ED, in Heraldry, an epithet for a hawk or falcon having the jesses or straps of leather, which were used for tying the bells on its legs, and which are generally of a different tincture.

JES'UITS, or the SOCIETY OF JESUS, a

political and religious order in the Roman Catholic church, corresponding with a chief at Rome, was instituted by Ignatius Loyola, A.D. 1540. It is a religious body, with a military constitution. Its superior is called its general, and his government is despotic. Unlike other communities of monks, the duties of this are to be performed in active life. Its ostensible aim is to rectify every disorder in society; and the means by which this is to be effected is the possession of unlimited power. No other religious order affords a parallel to this; for, while those who give themselves only to devotion and religious contemplation present few distinguishing traits, the Society of Jesus early raised itself to a degree of historical importance unparalleled in its kind. Their privileges and immunities were almost unbounded; and they were exempt from all episcopal and civil jurisdiction and taxes, so that they acknowledged no authority but that of the pope and the superiors of their order. It was expelled from England in 1604; from Venice in 1606; Portugal in 1759; France in 1764; Spain and Italy in 1767, and was suppressed by Clement XIV. in 1773 The order has, however, since been restored.

JET, a solid, opaque, inflammable substance, found in large detached masses, of a fine and regular structure, having a grain like that of wood, splitting more easily in one direction than in any other, and taking a good polish It is very light, moderately hard, and not fusible; but it is readily inflammable, and burns a long time with a fine greenish flame It attracts light substances when rubbed, becoming electric, like amber; hence it has been called *black amber*. It is frequently used for ornamental purposes, buttons, bracelets, snuff boxes, &c. Mineralogists consider jet to be a variety of lignite, and, therefore, to be of vegetable origin.

JET D'EAU (*Fr.*), a fountain which throws water up into the air. When the jet is slightly inclined it throws the water to a greater height than when it is perpendicular, but the effect which it produces is not nearly so pleasing.

JEU D'ESPRIT (*Fr.*), a witty saying.

JEWS, the descendants of Abraham, once an independent tribe in Palestine, but dispersed by the Romans. They are still distinguished by their religion, peculiar pursuits, and primitive customs; but have lost the distinction of twelve tribes, though perhaps more numerous than at any period. [See JUDAISM.] They are the negotiators of money between all nations, and are everywhere remarkable for their successful enterprise and accumulation of wealth.

JEW'S'-HARP (*jaw's harp*, from the place where it is played), an instrument of music, of a very imperfect character. It is placed between the teeth, and, by means of a spring struck by the finger, gives a sound that is modulated by the breath.

JEW'S'-STONE, the fossil spine of a very large egg-shaped sea-urchin. Its colour is a pale dusky grey, with a tinge of red.

JIB, the foremost sail of a ship, extended from the outer end of the *jib-boom* towards the foretopmast-head. In sloops, it is on the bowsprit, and extends towards the lower mast-head. Beyond the jib-boom is sometimes extended the *flying jib-boom*.

JIG'GER, in a ship, a rope about five feet long, with a block at one end and a sheave at the other, it is used to hold on the cable when it is heaved into the ship by the windlass.

JOB, or THE BOOK OF JOB, a canonical book of the Old Testament, containing the narrative of a series of calamities which happened to a man named Job, as a trial of his patience and fortitude; together with conferences which he held with his several friends on the subject of his misfortunes; and the manner in which he was restored to happiness. Many of the Jewish Rabbins hold that this relation is purely a fiction; others think it a simple narrative of a matter of fact; while a third class of critics acknowledge that the groundwork of the story is true, but that it is written in a poetical style, and decorated with peculiar circumstances, to render the narration more profitable and interesting.

JOIN'ER (*joindre*, to join: *Fr.*), a mechanic who fits together the several pieces of wood which have been prepared for each other. He differs from the carpenter, inasmuch as he does the finer work, that requires more skill.

JOINT (*Fr.*), in Anatomy, the place where any bone is articulated or joined with another.——JOINT, in Botany, the knot in the stalk of a plant.——JOINT, in Joinery, the parts where two pieces of wood are united. ——JOINT, in Masonry, the separation between the stones, which is filled with mortar.

JOINT-STOCK COM'PANIES, commercial associations, having a stock or fund formed by the union of contributions from different persons. [See COMPANY.]

JOINT TEN'ANCY (*joint-tenancier*, a joined-tenant: *Fr.*), in Law, an estate vested in two or more persons created at the same time, each having the same interest and title. It is subject to the right of survivorship; and may be severed by partition, or by the alienation of any party. Personal chattels may be the subject of joint tenancy.

JOIN'TURE (*Fr.*), in Law, the annuity payable to a widow out of her husband's estate, either under his will or by virtue of her marriage settlement

JO'NAH, PROPHECY OF, a canonical book of the Old Testament, in which it is related that Jonah was commanded by God to go and prophesy the destruction of the Ninevites, on account of their wickedness. Instead of obeying the divine command, he embarked for Tarshish; but a tempest arising, the mariners drew lots to determine who was the cause of it; and the lot falling on him, he was thrown into the sea. Being swallowed by a great fish, he was, after three days, cast on the shore; and boldly preaching to the people of Nineveh, he predicted their destruction, which, however, on account of their repentance, was averted. Jonah, dreading the suspicion which might attach to him as a false prophet, retired to a mountain at a distance from the city, where he learnt the folly and unreasonableness of his own discontent. It may be observed that some critics consider this book as a number of traditions, collected after the destruction of Nineveh; while others treat it as a mere allegorical poem.

JON'GLEURS, an old French word derived from the Latin *Joculatores*, the name given to the buffoons of the time of the Troubadours. They stationed themselves at cross roads, in grotesque dresses, and drew a crowd around them by the exhibition of dancing monkeys and the performance of legerdemain feats, accompanied by ridiculous antics and grimaces. They thus prepared the bystanders for the verses they recited. Troubadours were frequently introduced at a princely court, under the name of Jongleurs In this word we see the origin of our Jugglers.

JON'QUIL (*jonquille* · *Fr.*), a plant of the genus *Narcissus*, the flowers of which are either single or double, and are much esteemed for their sweet scent.

JOSH'UA, a canonical book of the Old Testament, containing a history of the wars and transactions of the person whose name it bears. It is divisible into three parts, the first of which is a history of the conquest of Canaan; the second, which begins with the 12th chapter, is a description of that country, and the division of it among the tribes; and the third, comprised in the last two chapters, contains the renewal of the covenant which he caused the Israelites to make, and the death of their victorious leader.

JOUR'NAL (*giornale*: *Ital.*; from *diurnale*, belonging to a day: *Lat*), any book in which is kept an account of what passes from day to day. It is often applied to a periodical publication.——In Navigation, a book in which is kept an account of the ship's course, winds, weather, &c.

JU'BILEE (*jubilo*, I shout: *Lat.*), a grand festival celebrated every forty-ninth or fiftieth year—it is not certain which—by the Jews, in commemoration of their deliverance out of Egypt. At this festival, which was a season of joy, all debts were to be cancelled; all bond-servants were set free; all slaves or captives were released; and all estates which had been sold reverted to the original proprietors or their descendants.——In imitation of the Jewish jubilee, the Roman Catholic church instituted a year of jubilee, during which the popes grant plenary indulgences, &c. It was first established by Boniface VIII., who proclaimed a general indulgence to all Christians who should visit the tombs of the apostles, at Rome, in the year 1300; and was intended to be celebrated only every hundredth year; but it was found so gainful, that Clement VI. reduced the interval to fifty years; on which occasion it received the name of jubilee, as it thus acquired some resemblance to the Jewish festival of that name. In 1389, Urban V. reduced the term to thirty-three years; but it was raised again, by Nicholas V., to fifty; and finally, in 1470, was settled at twenty-five, by Paul II. It begins on Christmas-day, by the pope opening with great solemnity a door in the church of St. Peter's, which is walled up at every other time.

JU'DAISM, the religious doctrines and rites of the Jews, a people of Judah, or Judea. These doctrines and rites are detailed in the five books of Moses, hence called *the Law*. The *Caraites* acknowledge no other code; but the *Rabbinists*, one of the two sects into which the Jews are divided, add those precepts inculcated by the *Talmud*. The following is a summary of the religious creed of the Jews:—1, that God is a creator and active supporter of all things; 2, that God is ONE, and eternally unchangeable; 3, that God is incorporeal, and cannot have any material properties; 4, that God shall eternally subsist; 5, that God is alone to be worshipped; 6, that whatever has been taught by the prophets is true; 7, that Moses is the head and father of all contemporary doctors, and of all those who lived before and shall live after him; 8, that the law was given by Moses; 9, that the law shall always exist, and never be altered; 10, that God knows all the thoughts and actions of man; 11, that God will reward the observance and punish the breach of his law; 12, that the Messiah is to come, though he tarry a long time; and 13, that there shall be a resurrection of the dead when God shall think fit. These doctrines, commonly received by the Jews to this day, were drawn up about the end of the 11th century by the famous Jewish rabbi Maimonides.

JUDGE (*judex*: *Lat.*). In the superior courts of common law in England there are fifteen judges, viz.:– the Lord Chief Justice of the King's (or Queen's) Bench; the Lord Chief Justice of the Common Pleas; the Lord Chief Baron of the Exchequer; the four Puisne or inferior Judges of the two first courts; and the four Puisne Barons of the latter court. The salary of the Chief Justice of the King's (or Queen's) Bench is 8,000*l.*; that of the other Chief Justices 7,000*l*; and that of the Puisne Judges, 5,000*l.* The Chief Justices are installed or placed on the bench by the Lord Chancellor, and the Puisne Judges by the Lord Chancellor and the Chief Justices. The Judges of the Court of Chancery consist of the Lord Chancellor, the Master of the Rolls, the two Lords Justices, and three Vice-Chancellors.

JUDG'ES, THE BOOK OF, a canonical book of the Old Testament, so called from its relating the state of the Israelites under the administration of many illustrious persons who were called judges, from the circumstance of their being both the civil and military governors of the people. The power of the judges extended to affairs of peace and war. They were protectors of the laws, defenders of religion, and avengers of all crimes; but they could make no laws, and impose no new burdens upon the people. They lived without pomp or retinue, unless their own fortunes enabled them to do it; for the revenues of their office consisted in voluntary presents from the people. Their administration continued from the death of Joshua till the beginning of the reign of Saul.

JUDG'MENT (*jugement: Fr.*), in Law, the sentence or doom pronounced in any cause, civil or criminal, by the judge or court by which it is tried. Judgments are either *interlocutory*, that is, given in the middle of a cause on some intermediate point, or *final*, so as to put an end to the action.——In Metaphysics, a faculty of the soul, by which it compares ideas, and perceives their agreement or disagreement.

JUDI'CIUM DE'I (the judgment of God: *Lat.*), a term formerly used to express all extraordinary trials regarding accusations which were incapable of proof or disproof by ordinary means: such as those of arms, ordeals, &c. It was supposed that God would, in such cases, specially interfere to clear the innocent and confound the guilty.

JU'GULAR FINS (*jugulum*, the throat, *Lat.*), in Ichthyology, when the ventral fins are placed on the throat before the pectoral fins they are called jugular, as in the cod and whiting.

JU'GULAR VEINS (same *deriv.*), in Anatomy, veins which run from the head down the sides of the neck, and are divided, from their situation, into *external* or superficial, and *internal* or deep-seated. By their union with the *subclavian* vein, they form the superior *vena cava*, which ends in the superior portion of the right auricle of the heart.

JU'JUBE (*Fr.*), a half-dried fruit of the plum kind, about the size and shape of an olive, the produce of the *Rhamnus Zizyphus* of Linnæus. Jujubes, when in perfection, have an agreeable sweet taste; in the southern parts of Europe, where they are common, they constitute an article of food in their fresh state; but they are medicinal when half dried.

JU'LIAN PE'RIOD, in Chronology, a revolution of 7980 years; which arises from multiplying 28, 19, and 15—that is, the solar cycle, the lunar cycle, and the cycle of indiction—into one another. This period is of great use, as the standard and general receptacle of all other epochas, periods, and cycles; and had historians remarked the number of each cycle corresponding to each year, there could have been no dispute about the time of any action or event in past ages.—When the Christian era commenced, 4,713 years of the Julian period were elapsed; 4,713, therefore, being added to the year of our Lord, will give the year of the Julian period. When the corresponding year of the Julian period is required for any year before Christ, subtract the year before Christ from 4,714, and the remainder is the required number.

JULY', the seventh month of the year. It was the fifth month of the old Roman year, and was known at first by the name of *Quintilis*. It received the name of July in compliment to Julius Cæsar, who reformed the calendar, placing this month, as it is at present, the seventh in order.

JUNCA'CEÆ (*juncus*, a rush, *Lat.*), a nat. order of herbs, including the common rushes.

JUNE, the sixth month of the year, and that in which is the summer solstice. It was the fourth month of the old Roman year, but the sixth of the year as reformed by Julius Cæsar. Some suppose it received its name in honour of Junius Brutus.

JU'NIPER-TREE (*juniperus: Lat.*), the *Juniperus communis*, the berries of which are considered as stomachic, carminative, and diuretic. The oil obtained from them is employed to flavour Hollands gin.——*Juniperus Sabina*, or savin, is a powerful and active medicine; but its heating qualities render it hurtful, unless used with the greatest caution.——*Juniperus Bermudiana* is the pencil cedar, a tree growing at the Bermudas.——*Juniperus Virginiana*, the red cedar of North America, yields a rubefacient oil. The Junipers belong to the order of *Coniferæ*.

JU'PITER, in Astronomy, the largest of the planets, and the most brilliant, excepting Venus. Jupiter revolves about the sun at the distance of 490 millions of miles from that body, and his periodical revolution is estimated at 4,332 days 14 hours 2 min. 8½ secs., or about twelve of our years. His mean diameter is 87,000 miles, his bulk 1,300 times greater than that of our globe, and the length of his day and night is equal to somewhat less than ten of our hours. It has therefore been calculated that this planet moves in its orbit at the rate of 26,000 miles in an hour; its equatorial parts, therefore, are carried round 26 times faster than the similar parts of our earth. Jupiter is surrounded with what are called by us his zones or belts, but which have been supposed to be clouds. His axis is so nearly perpendicular to the plane of his orbit that he has little change of seasons, the obliquity being only 1° 18′ 5″ at the beginning of the present century, and it undergoes a diminution of about the fourth of a second in a year. The difference in the length of his polar and equatorial diameters is equal to about 6,000 miles, the former being to the latter as 14 to 15. This is evidently occasioned by the quick motion round his axis. His density is very nearly the same as that of the sun, or about one-fourth of the mean density of the earth. Four satellites revolve about Jupiter; they are frequently eclipsed in the shadow of their primary, or hidden behind his body; and the great use made of these eclipses by geographers and navigators has occasioned them to be very carefully observed.

JURISCONSUL'T (*juris consultus*, skilled in the law: *Lat.*), a class of Roman lawyers, denoted by the abbreviation *ictus*; they very probably confined themselves to the giving of opinions.

JURISDIC'TION (*jurisdictio: Lat.*), in its most general sense, the power to make, declare, or apply the law; when confined to judiciary department, it is what we denominate the *judicial power*, the right of administering justice through the laws.

JURISPRU'DENCE (*juris-prudentia: Lat.*), the science concerned with the exposition of the principles of laws, excluding from this term the laws of God, the rules of morality, and those general expressions of fact which are only laws in a metaphorical or figurative sense. A law properly so called is a command given by political superiors to political inferiors, obliging the latter to pursue a certain course of conduct. General or comparative jurisprudence, the philosophy of positive law, is to be distinguished on the one hand from national or particular jurisprudence, and on the other from the science of legislation, being concerned with the principles on which the systems of law in civilized communities are built, and with the notions and distinctions common to such systems.

JU'RY (*juré*, sworn: *Fr.*), in Law, a certain number of persons sworn to decide justly on the matter before them. The origin of the trial by jury has been traced back to a very early period in British history, and seems, indeed, in some form, to have been used from the earliest times. The constitution of England, in committing the administration of justice to the hands of juries, has subjected them to no restraint that can prevent the free discharge of their duty. All questions of fact are submitted to the jury, questions of law being reserved for the decision of the court. A juror, in giving his verdict, is to be governed by nothing but his own opinion. The jury may find, under certain circumstances, a *special* verdict—that is, one in which the facts of the case are specially stated, and which leaves it to the court to apply the law; or they may find a *general* verdict, subject to a special case, as to a point of law. Juries are of several kinds; among these, there are, in the polity of Britain, *grand* and *petty* juries in criminal cases, and *common* and *special* juries in civil.——The *Grand Jury* consists of a body of men of some consideration in their county: they are summoned by the sheriff for every session of the peace, every commission of oyer and terminer, and of general gaol delivery; and to them all indictments are preferred. The grand jury must consist of twelve persons at least, and not more than twenty-three; that twelve may be a majority. The members are instructed in the articles of their enquiry, by the judge or justice who presides on the bench. They then withdraw, to sit and receive indictments; and they are only to hear evidence on the part of the prosecution: for the finding an indictment is merely in the nature of an enquiry or accusation, which is afterwards to be tried and determined; and the grand jury are only to ascertain whether or not there be sufficient cause to call upon the party to answer it. Formerly, the grand jury used to endorse their decision upon the indictment, in Latin; but now, they write upon an indictment which they reject, either the words 'Not a true bill,' or 'Not found,' and upon one of the truth of which they are satisfied, 'A true bill.'——The *Petit* or *Petty Jury* consists of twelve persons, and no more: it is for the trial of all criminal offences, and of all issues of fact in civil cases of the common law. The qualifications of petty jurors do not differ, generally, from those necessary for grand jurors: their duties being equally important, and demanding equal intelligence.——*A Special Jury* is composed of persons of a higher rank, such as merchants, bankers, and landowners. They are summoned only at the instance of one of the parties. When the cause is called for trial, if all the jurors do not appear, or if any of them are justly objected to and set aside, either party may pray a *tales*. That is, the deficiency may be supplied from among the bystanders, having suitable qualifications: which is called taking jurors *de talibus circumstantibus* (from similar men among the bystanders): from which circumstance, the persons thus selected are called *talesmen*. Formerly, questions of fact could not be decided in the Court of Chancery through the instrumentality of a jury, but by recent Acts of Parliament juries may now be summoned and questions of fact tried by a judge of that court in the same way as in a court of common law.

JU'RY-MAST, a temporary or occasional mast, used in the place of the foremast or mainmast, which has been destroyed by a storm.

JUS DIVI'NUM (divine law), that law which is made known by a revelation.——JUS GENTIUM, the law of nations, or the laws established between different kingdoms and states, in relation to each other.——JUS HÆREDITATIS, the right or law of inheritance.——JUS PATRONATŪS, in the canon law, the right of presenting to a benefice; or a kind of commission granted by the bishop to enquire who is the rightful patron of a church.——JUS POSSESSIONIS, the right of seisin or possession, as *jus proprietatis* is the right of ownership of lands, &c.——JUS IMAGINUM, in Antiquity, the right of using pictures and statues, similar to the modern right of bearing coats of arms: it was allowed to none but those whose ancestors or themselves had borne some curule office.——JUS QUIRITIUM, the fullest enjoyment of Roman citizenship. This was also called *jus civile* and *jus urbanum*.

JUS'TICE (*justitia*: *Lat.*) is either distributive or commutative. *Distributive* justice belongs to magistrates or rulers; and consists in dispensing to every man that which the laws and the principles of equity require. *Commutative* justice consists in fair dealing in trade, and other mutual intercourse between man and man.

JUS'TICE OF THE PEACE, a magistrate, appointed by royal commission to keep the peace of the county or borough in which he resides. On the commission of grave offences the preliminary enquiry is usually made before a justice; who may either dismiss the person charged or commit him for trial. Many statutes have empowered justices to act judicially in numerous minor matters. The court of quarter sessions in counties and boroughs is composed of the justices in the commission of the peace.

JUSTI'CIARY, or COURT OF JUSTICIARY, in Scotland, a court of supreme jurisdiction in all criminal cases. No appeal is competent to the House of Lords from this court.

JUSTIFICA'TION (*justus*, just; and *facio*, I make: *Lat.*), in Law, the showing good reason, in a court, why one has done that for which he is called to answer. *Pleas in justification* must set forth some special matter: thus, on being sued for a trespass, a person may justify it by proving that the land is his own freehold; that he entered a house in order to apprehend a felon, or, by virtue of a warrant, to levy a forfeiture, or in order to take a distress.

JUTE, a fibre largely imported into this country for the purpose of manufacture, is obtained from the inner bark of an East Indian tree, the *Corchorus capsularis*, which belongs, like our lime tree, to the nat. order *Tiliaceæ*.

JUTES, the people of Jutland, some of whom, it is traditionally said, formed colonies in Kent and the Isle of Wight under Hengist and Horsa, who landed in the Isle of Thanet in A.D. 449.

K

K, the eleventh letter of the alphabet, is usually denominated a guttural, but it is more properly a *palatal*, being formed by pressing the root of the tongue against the upper part of the mouth, with a depression of the lower jaw and opening of the teeth. It has the hard sound of *c* before *e* and *i*, where, according to the English analogy, *c* would be soft, as in the words *kept* and *king*; it is seldom found at the end of words except in monosyllables, as *clock*, *back*, *&c.*; being generally omitted where it was formerly used, as in *music*, *public*, &c. It is introduced between a vowel and the silent *e* final, as *choke*, *broke*, *&c.* Before *n* the *k* is silent, as in *knife*, *knee*. It is borrowed from the Greek *kappa*, and was very little used among the Latins, perhaps never but in words borrowed from the Greek language. It was often employed by the Romans, instead of *c*, as an abbreviation: thus K. T. for *capite tonsus*. We use it as an abbreviation for Knight; as K C B *Knight Commander of the Bath*. As a numeral the Romans used it for 250, and, with a stroke over it, for 250,000.

KAABA, the name given by Mahommedans to the holy house at Mecca, which is thought to have been originally built by angels in Paradise. In its wall is a black stone, probably of meteoric origin, which is said to have been brought by the angel Gabriel from Paradise, and to this great respect is paid.

KALEI'DOSCOPE (*kalos*, beautiful; *eidos*, form; and *skopeo*, I examine: *Gr.*), an optical instrument for presenting to the eye an ever-varying succession of splendid tints and symmetrical forms. It was invented by Sir D. Brewster; and is chiefly used by calico-printers, potters, and carpet-manufacturers, who are thus supplied with an endless variety of patterns. It is now sold as a common toy. It consists of a tube, containing two reflecting surfaces inclined to each other at any angle which is an aliquot part of 360°. The eye-glass placed immediately against one end of the mirrors, as well as another glass similarly situated at their other end, are of common transparent glass; the tube is continued a little beyond this second glass, and, at its termination is closed by a ground glass, which can be put on and off. In the vacant space thus formed are placed beads, pieces of coloured glass, and other small bright objects; and the changes produced in their positions by turning the tube give rise to the different figures.

KA'LI (the ashes of vegetable substances: *Arab.*), the *Salsola Kali*, or glasswort, a shore plant, from which the *alkali* of commerce was formerly procured by burning.

KAL'MIA, in Botany, a beautiful North American genus of shrubs, called laurel, ivy-bush, calico-bush, &c., having cup-shaped flowers, of a fine rose or purple colour, disposed in large corymbs. It is naturally allied to *Rhododendron*. The wood is very hard, susceptible of a fine polish, and resembles box.

KAMPTU'LICON, a compound of gutta-percha, caoutchouc, and ground cork, intimately mixed and subjected to great pressure. It is chiefly used for covering floors, for which purpose it possesses the advantages of being unaffected by damp, being a non-conductor of heat, and a deadener of sound.

KAM'SIN, the name given to a hot and dry southerly wind, common in Egypt and the deserts of Africa, which prevails more or less for fifty days. On the approach of this wind the sky becomes dark and heavy, the air grey and thick, and filled with a dust so subtle that it penetrates everywhere. It is not remarkably hot at first, but its temperature increases the longer it continues, and while it lasts causes a difficulty of breathing, which, when at its highest pitch, sometimes ends in suffocation.

KANGAROO', the name of some Australian animals belonging to the genus *Macropus*. The limbs are strangely disproportioned, the fore legs being small and short, whilst the hinder are long and powerful. The largest species, *M. Major*, is four or five feet in length, with a tail three feet; its usual position is standing on its hind feet, its fore feet being employed like a pair of hands. It lives on vegetables, and, instead of walking, takes leaps of about fifteen feet. It is furnished, like the opossum, with a pouch in the abdomen, which is a receptacle for its young, and is resorted to after they become strong for the sake of warmth and protection. They use their tails and hinder feet as weapons of defence. When they are pursued and overtaken by dogs they turn, and, seizing them with their fore feet, strike them violently with their hinder limbs, thereby often destroying them. The flesh of these animals is said to be nutritious and savoury, somewhat resembling mutton.

KAN'TIAN PHILOS'OPHY, called also *Critical Philosophy*, a system invented by Kant, professor of philosophy in the university of Königsberg, during the latter half of the last century. He divides the speculative portion of our nature into three provinces, *sense, understanding*, and *reason.* Our senses tell us only what things appear to be, not what they are or are not. Experience requires time and space. The truth of the fundamental axioms of geometry rests on our intuitions of space, in its three dimensions—intuitions not derived from sense, but the ground of all our experience. The understanding combines and classifies the materials yielded by sense; and its operations are generalized into four categories: *quantity*, including unity, multeity, and totality; *quality*, divided into reality, negation, and limitation; *relation*, that is, substance and accident, cause and effect, action and reaction; and *modality*, subdivided into possibility, existence, and necessity. These are the moulds in which the rude material is shaped into conception, and becomes knowledge. The categories are the subject-matter of logic. Reason consists in the power of forming ideas, which regulate, but can never constitute, science. The reason strives perpetually after the existence of God, immortality, &c., but it can decide nothing about them. The *moral faculty*, or practical reason, supplies the deficiencies of speculative reason; but it determines not what is, but what ought to be: the speculative reason gives the *form* of our *knowledge*, the practical prescribes the *form* of our *action.* Obligation is not merely a feeling: it is a pure form, under which the reason is obliged to regard human conduct. The personality of man, which lies at the ground of speculative knowledge, becomes, in relation to action, freedom of the will. The only valid foundations of belief in God, the immortality of the soul, and a future state, in which the demands of the practical reason shall be realized, are to be sought for in our moral nature.

KA'OLIN, the Chinese name for porcelain clay, which consists essentially of silica and a smaller quantity of alumina, and is derived from the decomposition of the felspar of granitic rocks. It is found in vast quantities in Cornwall.

KAR'PHOLITE (*karphos*, any small dry body—a fruit; and *lithos*, a stone: *Gr.*), a mineral, of a fibrous structure and a yellow colour. It is a hydrated silicate of alumina and manganese.

KARROO, the name given at the Cape of Good Hope to large tracts of ground composed of sand mixed with clay containing particles of iron, which give it a yellow colour. The Great Karroo, in the middle of the colony, is a tract nearly 300 miles long by from 80 to 100 miles broad, and having an elevation of 3,000 feet.

KAVAGS, an armed Turkish constable.

KAWA or AVA, the native name of a plant (*Macropiper methysticum*), nat. ord. *Piperaceæ*, grown in Polynesia for the sake of its juice, from which is prepared an intoxicating beverage, having peculiar effects. 'The taste is sweet and agreeable, producing a glow in the stomach. It induces a sort of intoxication widely different from the form that alcoholic inebriation assumes. Men under the influence of Kawa neither stagger about, nor speak thick and loud A sort of shiver affects the whole frame, the gait becomes listless and slow, but they never lose consciousness. At last great weakness is felt in all the joints; headache and an irresistible inclination to sleep intervene, and a state of complete repose becomes an absolute necessity. Inveterate drinkers are haggard and melancholy, their eyes are sunken, their teeth of a bright yellow colour, the skin dry and chopped, and the body covered with boils.'—*Voyage of the Novara.* In preparing the beverage the root is chewed in the mouth, and when changed into little cones held together by saliva they are mingled with water in a wooden vessel and gently squeezed by the hand. It is drunk out of the half of a cocoa-nut shell. Chemists have discovered a peculiar alkaloid in the root, which has been named Kawaine.

KECK'LING, among seamen, winding or twining small ropes about a cable or bolt-rope, to save them from galling.

KEDGE or KEDG'ER (*kaghe*, a small vessel: *Dut.*), a small anchor used to keep a ship steady when riding in a harbour or river.——KEDGING, furling the sails, and letting a ship drift with the tide, when the wind is contrary to it.

KEEL (*koilos*, hollow, a term specially applied to ships: *Gr.*), the lowest piece of timber in a ship, running her whole length from the lower part of her stem to the lower part of her stern-post, and supporting the whole frame. Sometimes a second keel, or *false keel*, as it is called, is put under the first.——KEEL or *Carina*, in Botany, the lower part of a papilionaceous corolla, enclosing the stamens and pistil. It consists of two petals more or less united into a form which has suggested its name.——A leaf is said to be *keeled* when it has a longitudinal prominence on the back.

KEEL'-HAULING, among seamen, a punishment formerly inflicted on offenders at sea, by letting them down from the yard-arm with ropes, and drawing them under the keel from one side to the other.

KEEL'AGE, the duty paid by a ship on coming into port.

KEEL'SON or KEL'SON, in Naval Architecture, the inside keel; a principal timber in a ship, laid withinside across all the timbers over the keel, and fastened with long bolts, so as to form the interior or counterpart of the keel.

KEEP (*kepan*, to keep: *Ang. Sax.*), a strong tower in old castles, into which the besieged retreated in cases of extremity It is also called the *donjon* or *dungeon.*

KEEP'ER (same *deriv.*), a title given to various official persons, as, the *keeper of the great seal*, a lord by his office, and one of the privy council, through whose hands pass all charters, commissions, and grants of the sovereign under the great seal; the *keeper of the privy seal*, through whose hands pass all charters, &c., before they come to the great seal. There are also other official persons bearing the title of *keeper*.

KEEP'ING (same *deriv.*), a term used in various branches of the *fine arts*, to denote the just proportion and relation of the various parts.——In Painting, it signifies the peculiar management of colouring and *chiaro oscuro*, so as to produce a proper degree of *rilievo* in different objects, according to their relative position and importance. If the lights, shadows, and half-tints be not in proper *keeping*, that is, in their exact relative proportion of depths, no rotundity can be effected; and without due opposition of light, shade, and colours, no apparent separation of objects can take place.

KELP, the calcined ashes of marine plants from which soda was formerly obtained. Since the alkali required for manufacturing purposes can now be obtained more cheaply from common salt, sea-weed is consumed as manure, except what is required for the obtaining of iodine.

KEP'LER'S LAWS, in Astronomy, those laws which govern the planetary motions. They were first discovered and demonstrated by Kepler, and are three in number:—1. The planets describe ellipses, each of which has one of its foci in the sun. 2. Every planet moves, so that the line drawn from it to the sun describes about the sun areas proportional to the times. 3. The squares of the times of the revolutions of the planets are as the cubes of their mean distances from the sun.

KER'MES (a little worm: *Arab.*), species of the genus *Coccus* of entomologists, found in the excrescences of oak-trees, growing in the south of Europe. It is an article extensively used in dyeing, and is inferior to nothing but cochineal as a means of producing scarlet. *Kermes-grains*, as they are called, are the dried bodies of the female insects of the species *Coccus Ilicis*, which lives upon the leaves of the *Quercus Ilex*, or prickly oak. It was formerly called *Vermiculus*, whence the French *vermillion*. Kermes has been employed from time immemorial in India to dye silk; and was also used by the ancient Greeks and Romans for the same purpose; but since the introduction of cochineal, it has become an object of comparatively trifling importance. ——KERMES MINERAL, a name given, on account of its red colour, to the sulphuret of antimony.

KES'TREL, the *Falco Tinnunculus*, a British bird with yellow legs, a brown back, a spotted breast, and a rounded tail, broad towards the end. It is about the size of a pigeon, and very bold. It builds in hollow oaks, and feeds on quails and other small birds.

KETCH (*caicchio*: *Ital.*), a vessel with a main and mizen mast, usually from 100 to 250 tons burden. Ketches are generally used as yachts, or as bomb-vessels; the latter, which are built remarkably strong, are furnished with all the apparatus necessary for carrying on a vigorous bombardment.

KETCH'UP or **CATS'UP**, a sauce prepared from mushrooms.

KEY (*cæge*: *Sax.*), in Architecture, a piece of wood let into the back of another in a direction contrary to the grain, to prevent warping.——In Music, the fundamental note or tone, to which the whole piece is accommodated, and in which it usually begins and always ends. There are but two species of keys: one of the major and one of the minor mode, all the keys in which we employ sharps or flats being deduced from the natural keys of C major and A minor, of which they are mere transpositions.——The *keys* of an organ or pianoforte are moveable projecting levers, made of ivory or wood, so placed as conveniently to receive the fingers of the performer, by which the mechanism is set in motion, and the sounds produced. The whole together form the *keyboard* or *clavier*.

KEY'-STONE, in Architecture, the last or middle stone placed on the top of the arch or vault.

KHA'LIF. [See CALIPH.]

KHAN, an Asiatic governor. In the north of Asia, this title expresses the full regal dignity; but there are also *khans* of provinces, cities, &c.——KHAN, a word used by us to signify an eastern *caravansera*, in which travellers receive a gratuitous lodging for one night.

KID'NAPPING (*kind*, a child: *Dut.*; and *nap* or *nab*), the forcible seizing and taking away a man, woman, or child, in order to carry them abroad. The offence is felony. Masters of vessels leaving any of their men in other countries against their will are punishable. The taking away or detaining any child under ten years of age, with intent to deprive the parents or guardians of the possession of such child, or with intent to steal any article on its person, is punishable with penal servitude of not more than seven nor less than three years, or imprisonment, with or without hard labour, for not more than two years; and also, if a male, with a whipping, if the court think fit.

KID'NEY-BEAN, a garden pulse, so named from its resembling a kidney in shape; it has a papilionaceous flower, the pistil of which becomes a long pod, that is eaten before the seeds are fully formed. There are several species belonging to the leguminous genus *Phaseolus*.

KID'NEYS, in Anatomy, two oblong flattened glands, the office of which is to separate the urine from the blood. One of them lies on the right, and the other on the left, of the back-bone. At the middle of each kidney, where the blood-vessels enter, is a large membranous bag, which diminishes like a funnel, and forms a long canal (the ureter), that conveys the urine from the kidney to the bladder.

KIL'LAS, a provincial name for the clay-slate rocks of Cornwall.

KILN (*cyln: Sax.*), a large furnace or stove, used for heating, drying, or burning: thus, a *malt-kiln, brick-kiln*, &c.

KIL'OGRAMME or KIL'OGRAM (*chilias*, a thousand: *Gr.*; and *gramme*), one thousand French grammes, or 15,434 grains troy.

KIL'OLITRE (*chilias*, a thousand: *Gr.*; and *litre*), one thousand French litres, or 61,028 cubic inches.

KIL'OMETRE (*chilias*, a thousand: *Gr.*; and *mètre*), one thousand French mètres, or 39,370·091 inches=3280·9 feet.

KINCOB, Indian brocade.

KING (*cyning: Sax.*), in Ancient and Modern History, the name given to an officer who exercises the supreme functions of political government. Kings are *absolute* monarchs, when they possess the powers of government without control, or the entire sovereignty over a nation; and *limited* monarchs, when their power is restrained by fixed laws; *hereditary*, when they hold the powers of government by right of birth or inheritance; and *elective*, when raised to the throne by election.——The English monarch's power is limited. He has the prerogative of commanding armies and equipping fleets; but without the concurrence of his parliament he cannot maintain them. He can bestow places and employments; but without his parliament he cannot pay the salaries attached to them. He can declare war; but without his parliament it is impossible for him to carry it on. 'He can do no wrong;' since his ministers are accountable for the acts they advise. The law ascribes to a king of England, in his *political* capacity, immortality, for 'the king never dies;' and on his decease, which is called his demise, his regal dignity is vested, without any interregnum or interval, at once in his heir.

KING-AT-ARMS, in Heraldry, an officer of great antiquity, whose business is to direct the heralds, preside at their chapters, and have the jurisdiction of armoury. In England there are three kings-at-arms, *Garter*, *Clarencieux*, and *Norroy*: the first is called *principal king-at-arms*, the other two *provincial kings*. Norroy officiates north of the Trent. There are also *Lion* king-at-arms for Scotland, and *Ulster* king-at-arms for Ireland.

KING'DOM, in Natural History, a general division of natural objects, as the *animal*, the *mineral*, and the *vegetable kingdoms*.

KING'FISHER. [See HALCYON.]

KINGS, BOOKS OF, two canonical books of the Old Testament, so called because they contain the history of the kings of Israel and Judah, from the beginning of the reign of Solomon down to the Babylonish captivity, for the space of nearly six hundred years.

KING'S BENCH (*Bancus Regius*), so called because the king used formerly to sit there in person. It may follow the person of the sovereign to any part of the kingdom, but for centuries has been held at the ancient royal palace of Westminster. It is the supreme court of common law in this kingdom, consisting of the Lord Chief Justice, and four puisne or inferior judges, who hear and determine, for the most part, all pleas which concern the crown. The jurisdiction of this court is very extensive. Its justices are sovereign justices of oyer and terminer, of gaol delivery, and of eyre; supreme conservators of the peace; and coroners throughout England, some provincial jurisdictions excepted. They have cognizance of all matters of a criminal and public nature, judicially brought before them, to give remedy either by the common law or by statute; and their power is original and ordinary: that is, after the king has appointed them, they do not derive their jurisdiction from him, but from the law. They can take any cause out of an inferior court, by a writ of *certiorari*, and, by means of a *prohibition*, can restrain all other courts from proceeding, where they exceed or misuse their powers. Whatever crime is against the public good, though it does not injure any particular person, comes within the scope of the jurisdiction of this court; and no subject can suffer any kind of unlawful violence or injury to his person, liberty, or possessions, but he may here have a proper remedy, not only by way of satisfaction in damages, but by the exemplary punishment of the offender: for this court is considered as the guardian of the morals of all the subjects of the realm. It is in the discretion of this court to inflict fine and imprisonment, or punishment more severe, on offenders. It may commit to any prison it shall think proper, and the law allows no other court to remove or bail persons it imprisons; but this court may grant a *habeas-corpus* to relieve persons imprisoned by any other authority or means. This court can try all causes capable of coming before a jury, in many of which the sovereign is plaintiff. There is a *crown side*, or *crown office*, which takes cognizance of all criminal causes, from treason down to the most trivial breach of the peace; and a *plea* side, which takes cognizance of civil causes.

KING'S E'VIL, in Medicine, a scrofulous disease usually attended with suppurating tumours. The gift of curing this disease was formerly attributed to the kings and queens of England, and had its origin in the time of Edward the Confessor; but the practice of *touching for the evil* (as it was termed) has been discontinued since Queen Anne's time.

KIN'IC ACID, sometimes called *cinchonic acid*, is obtained from the cinchona bark. It forms salts called *kinates*.

KI'NO (*Ind.*), an extract obtained from some species of *Pterocarpus*, leguminous trees growing in Africa and the East Indies. The best kind is in the form of brilliant fragments of a deep brownish-red colour. It contains tannin, gum, and extractive matter, and is highly astringent.

KI'OSK (*Turk.*), a kind of summer-house, or open pavilion, with a tent-shaped roof, and supported by pillars. *Kiosks* have been introduced from Turkey and Persia into European gardens, which they greatly embellish

KIP'PER, a term applied to a salmon when unfit to be taken, and to the time when they are so considered. *Kippered* salmon means salmon split open, salted and dried or smoked.

KIRK (*kirche: Ger.*), the name given in Scotland to the church, as a building, and also to the form of religion established in that country.——KIRK-SESSIONS, an inferior ecclesiastical court in Scotland, consisting of the ministers, elders, and deacons of a parish.

KIRSCH'WASSER (cherry-water: *Germ.*), a spirituous liquor obtained by fermenting and distilling bruised cherries, called *kirschen* in German. It often contains a considerable amount of prussic acid, derived from the bruised kernels of the fruit.

KIT'-CAT, a term applied to a portrait three-fourths of the length of the body. The word originated with a club in London, to which Addison and Steele belonged, and which was so called from a pastrycook named Christopher (Kit) Cat, who served it with mutton-pies! It was necessary that the pictures which decorated the room in which the club met should be of this size, on account of its height. Among these were the portraits of the members, painted by Sir Godfrey Kneller.

KITE (*cyte: Sax.*), a bird of prey, the *Falco Milvus*, remarkable for gliding through the air without often moving its wings. The tail is forked, which distinguishes it from all other British birds of prey.——KITE, a plaything for boys, consisting of a slight wooden frame covered with paper, and constructed so as to rise in the air, where, by the aid of a long string, it may be allowed to fly at the pleasure of the person who holds it. Romas in France, and Dr. Franklin in America, first used a kite for the purpose of raising an electrical conductor into the air, and bringing down atmospheric electricity—a very dangerous experiment, particularly in a thunderstorm, and fatal to one experimentalist.

KIWI-KIWI, the New Zealander's name for some species of rare birds allied to the ostriches and belonging to the genus *Apteryx* of naturalists. They have long bills, hair-like plumage, and wings so small that they appear to have none until closely examined. The plumage is prized as an ornament by the Maori chiefs.

KNEE'-PAN, in Anatomy, the *patella*, a little round bone placed in the fore-part of the knee. It is attached by a ligament to the upper surface of the tibia. It protects the joint in front and changes the direction of the tendons which descend from the thigh to be inserted in the tibia.

KNEES (*cneo*, the knee: *Sax.*), in Naval Architecture, pieces of timber bowed like a knee, which bind the beams and side timbers together.——KNEES, in Russia, nobles of the first class, descended from the former ruling families of particular provinces in the Russian empire.

KNIGHT (*knecht*, an attendant: *Ger.*), a title of honour, originally bestowed on every young man of rank after he was admitted to the privilege of bearing arms. It is now an order of gentlemen next to baronets, or a mere honorary distinction. A knight is at present made by the sovereign touching him with a sword as he kneels, and saying, 'Rise up, Sir Thomas Phillips,' or whatever may be the name of him who receives the honour of knighthood [See CHIVALRY.]

KNIGHT-ER'RANT, in the language of Chivalry, a knight wandering in search of adventures, sometimes under vows for a certain period; he was not altogether a fiction of romance.

KNIGHT-MAR'SHAL, an officer in the royal household of Great Britain and Ireland, who formerly had jurisdiction and cognizance of offences committed within the household and verge, and of all contracts to which members of the household were parties.

KNIGHT OF THE SHIRE, a member of parliament representing a *shire*, in contradistinction from a burgess, who represents a *borough*. A knight of the shire is so called, because, as the *terms* of the writ for election still require, it was formerly necessary that he should be a knight. This restriction was coeval with the tenure of knight-service, when every man who received a knight's fee immediately of the crown was constrained to be a knight; but at present any person may be chosen to fill this office, and he does not now require a money qualification.

KNIGHT'-SERVICE, a tenure of lands, instituted on the decline of the feudal spirit, with the view of reviving political vigour. It originally consisted in investiture of lands, upon express condition that the person so invested should serve in the wars of his lord.

KNIGHT'HOOD, ORDERS OF. These were of two kinds: associations or fraternities of a religious character, such as those of the Templars, Hospitallers, and Teutonic knights; or mere honorary bodies, established by sovereigns, such as the order of the Garter.

KNOT (*knoten: Germ.*), in Seamen's language, one of the divisions of the log-line, which, to avoid the necessity of calculation, are at such intervals that the number of knots unwound while the glass runs down shows the number of miles sailed per hour. Thus, let it be a half-minute glass, it will run down 120 times in an hour; if, therefore, the knots, which are pieces of coloured cloth, are fastened at distances each equal to the 120th part of a mile, the number of knots run out will be the number of miles per hour. A *nautical* mile is the sixtieth of a degree, or about 6,100 feet; the one-hundred-and-twentieth of this is 51 feet; hence, with a half-minute glass, the knots must be 51 feet apart, and at a proportional distance with any other glass. The first knot is placed about five fathoms from the log, to allow the latter to get clear of the ship, and that space is called the *stray* line. [See LOG.]——KNOT, a fen bird allied to the snipes, the *Tringa canutus* of ornithologists, the flesh of which is very delicious.

KNOUT, an instrument of punishment in Russia. It consists of a handle two feet long, having a flat leathern thong about four feet long attached to it. At the end of the thong is a ring of brass, to which is fastened a strip of hide which has been soaked in milk and dried in the sun to make it hard, and is about two inches wide at first, but terminates in a point. A practised hand will deeply indent a deal board with this cruel instrument. If it happen to strike the culprit with its edge it cuts like a knife.

KOL'LYRITE, in Mineralogy, hydrous silicate of alumina, a variety of clay, the colour of which is either pure white or slightly shaded with grey or yellow.

KO'RAN. [See ALCORAN.]

KOU'MISS or KU'MISS, an intoxicating liquor made by the Calmuck Tartars, by fermenting and distilling mare's milk.

KOUPH'OLITE (*kouphos*, light; and *lithos*, a stone: *Gr.*), in Mineralogy, a variety of *phrenite*, of a greenish-white colour, translucent, glistening, and pearly. It is found in the Pyrenees.

KRA'KEN (*Germ.*), a name formerly applied to a fabulous marine monster of great size.

KRE'OSOTE. [See CREOSOTE.]

KU'FIC, a term applied to the ancient Arabic letters, &c., so called from Kufa or the Euphrates.

KY'ANITE. [See CYANITE.]

L

L, the twelfth letter of the English alphabet. It is the first mute, or semi-vowel, and is formed in the voice by intercepting the breath between the tip of the tongue and the fore-part of the palate, with the mouth open. There is something of aspiration in its sound, and therefore our British ancestors usually doubled it, or added an *h* to it; as in *llan*, or *lhan*, a temple. In English words of one syllable, it is doubled at the end, as in *all*, *wall*, *mill*, *well*, &c., but not after diphthongs and digraphs, as *foul*, *fool*, *prowl*, *growl*, *foal*, &c; some words of more syllables than one, as *foretel*, &c., are now written with a double *l*. In some words, *l* is silent, as in *half*, *calf*, *talk*, *chalk*. In combination, it may be placed after most of the consonants, as in *blue*, *clear*, *flame*, &c., but before none of them. In some ancient languages, it is represented by two lines forming an angle. In the Greek, the vertex of the angle is at the top; in the Etruscan, at the right-hand side; in the Celtic, at the left, or below, &c. The Romans used it as an abbreviation for *Lucius*; for *Sestertium*, the equivalent to a thousand sesterces, as LLS. [see H.] We use it for *Law*, as B C L. *Bachelor of Civil Law*; and doubled for *Laws*, as LL.D. *Doctor of Laws*; for *loco*, as L.S. *Loco Sigilli* (the place of the seal); also, with figures, for the sign of the pound sterling (abbrev. of *libra*, a pound: *Lat.*) As a numeral, L denoted, with the Romans, 50; and, with a dash over it, 50,000.

LA, in Music, the syllable by which Guido indicated the sixth note in the scale. [See GAMUT.]

LAB'ADISTS, a sect who lived in the 17th century, the followers of Jean de Labadie. They endeavoured to introduce the doctrines of the Quietists among Protestants [see QUIETISM]; and, like the Quietists, were in some instances guilty of immorality.

LA'BARUM (*Lat.*), in Roman Antiquity, the standard borne before the emperors; being a rich purple streamer, supported by a spear. It was introduced by Constantine after his conversion, and contained a figure of the cross and the Greek words '*en touto nika*,' conquer in this

LAB'DANUM or LAD'ANUM, the resin of the *Cystus Creticus*, a shrub which grows in Arabia, Candia, and other parts of the Greek Archipelago. It is used in medicine, chiefly in external applications.

LA'BEL (*labellum*, a small slip of writing: *Lat.*), in Heraldry, a figure, chiefly used as a distinction or difference in the coat armour of an eldest son, in which case it has three points. If borne by the heir presumptive to a grandfather living, it has five points; and so on.

LA'BELLUM (dim of *labium*, a lip: *Lat.*), in Botany, the middle division of the corolla in orchids. It is usually larger than the other divisions, and unlike them in form. It is not unfrequently spurred or furnished with appendages.

LA'BIA (*Lat.*), in Anatomy, the lips, the red part of which is called *Prolabium*, and the angles their commissures.

LA'BIALS (*labium*, a lip: *Lat.*), in Grammar, an epithet for those letters which are pronounced chiefly by means of the lips, viz *b*, *f*, *m*, *p*, *v*.

LABIA'TÆ, a natural order of plants consisting of herbs and undershrubs natives for the most part of temperate regions. The corolla is more or less bi-labiate, whence the name of the order. The plants abound with volatile oils, which are largely employed in the manufacture of perfumery. Many kitchen herbs belong to this order, such as mint, thyme, sage, marjoram, and savory. The well-known lavender, hyssop, rosemary, and salvia, as well as the fragrant patchouli, are placed here.

LA'BIATE (same *deriv.*), lipped; a term applied by botanists to a monopetalous corolla with two lip-like divisions of the limb, such as is seen in the order *Labiatæ*.

LAB'ORATORY (*laboro*, I work out: *Lat.*), a workshop or building, properly fitted up with apparatus necessary for the various operations, processes, and experiments, that may be required by the practical chemist.——In military affairs, a place where all sorts of fireworks are prepared, both for actual service and for experiments.

LA'BOUR (*labor: Lat.*) It is interesting to mark the progressive advance in the price of labour during the last 500 years, compared with the prices of provisions; and satisfactory at the same time to know that the wages of the labourer and artisan of every description have risen in a much greater proportion than wheat, by the price of which their wages were originally regulated. In the year 1352, 25 Edw. III, wheat was 1*s.* 10*d.* per bushel. The following are the rates of wages *per day* at that time, as established by law:—Haymakers, 1*d.* A mower of meadows, 5*d* ; or 6*d.* an acre Reapers of corn, in the first week of August, 2*d.*, in the second, 3*d.*, and so till the end of August, without meat, drink, or other allowance, finding their own tools. For threshing a quarter of wheat or rye, 2½*d.* ; a quarter of barley, beans, peas, and oats, 1½*d.* A master carpenter received 3*d.* per day; other carpenters, 2*d.* A master mason, 4*d* ; other masons, 3*d.* ; and their servants, 1½*d.* Nearly a century after, *i. e.* in the year 1455, 23 Henry VI, the wages were:—For a bailiff of husbandry, 23*s* 4*d.* per annum, and clothing of the value of 5*s*, with meat and drink ; chief hind, carter, or shepherd, 20*s.*, clothing 4*s.*; boy under 14 years, 6*s.*, clothing 3*s.* Free mason, or master carpenter, 4*d* per day, and, without meat or drink, 5½*d.* Master tiler or slater, mason, or ordinary carpenter, and other artificers concerned in building, 3*d.* per day, and, without meat and drink, 4½*d.*; every other labourer 2*d.*, and, without meat and drink, 3½*d.* ; after Michaelmas there was a proportional abatement. In time of harvest, a mower 4*d* a day, and, without meat and drink, 6*d.* ; a reaper or carter, 3*d.*, and, without meat and drink, 5*d.*; a woman labourer, and other labourers, 2*d.* per day, and, without meat and drink, 4½*d.*——It has been found that the factory operative in England works 69 hours per week, for which, on an average, he has 11*s* wages; in France, he works from 72 to 84 hours, and has 5*s* 8*d.*; in Switzerland, he works from 78 to 84 hours, and has 4*s.* 5*d* ; in the Tyrol, he works from 72 to 80 hours, and has 4*s.*; in Saxony, he works 72 hours, and has 3*s.* 6*d.* ; at Bonn, in Prussia, he works 94 hours, and has 2*s.* 6*d.*

LAB'RADORITE or LAB'RADOR SPAR, a mineral found on the coast of Labrador, and also in some parts of Europe. It is a variety of opaline felspar, and reflects beautiful colours, according to the direction in which the light falls on it.

LAB'YRINTH (*laburinthos: Gr.*), a *maze* or place full of intricate windings, which render it difficult to find the way from the interior to the entrance. The labyrinth of Egypt, built by Psammetichus, on the banks of the Nile, consisted of twelve contiguous palaces, containing 3000 chambers, 1500 of which were underground. Pliny says it existed in his time, and was then 3600 years old. There were also other celebrated labyrinths in antiquity, such as those of Crete, Cusium, &c.——LABYRINTH, in Anatomy, that part of the internal ear which is behind the cavity of the tympanum.

LABYRIN'THODON (*laburinthos*, a labyrinth ; *odous*, a tooth : *Gr.*), a genus of fossil batrachians, of which a few bones and some foot-marks have been found in the triassic strata of Europe. The animals appear to have been gigantic frogs. The structure of the teeth is very curious, exhibiting a radiating series of folds which resemble the windings on the surface of the brain.

LAC. [See GUM-LAC.]

LAC'CIC A'CID, an acid obtained from stick-lac. It is yellow, crystallizable, and forms salts termed *laccates*.

LACE, a delicate kind of network, used as an ornament of dress, formed of silk, cotton, or flax, &c. The most celebrated and costly is made at Brussels. Buckinghamshire formerly manufactured large quantities of what was called pillow or bobbin lace, from being woven upon a pillow or cushion by means of bobbins; but the machine lace of England is now equal to any wrought by hand, and is much cheaper. In speaking of the modern machine-made bobbin-net lace, Dr. Ure says, 'This elegant texture possesses all the strength and regularity of the old Buckingham lace, and is far superior in these respects to the point net and warp lace, which had preceded, and, in some measure, paved the way for it. Bobbin-net may be said to surpass every other branch of human industry in the complex ingenuity of its machinery; one of Fisher's spotting frames being as much beyond the most curious chronometer in multiplicity of mechanical device as that is beyond a common roasting-jack.' A *rack* of lace is a certain length of work, which, counted perpendicularly, contains 240 meshes or holes ; and such has been the progress of improvement and economy in this manufacture, that the cost of labour in making a *rack*, which was, twenty years ago, 3*s* 6*d.*, is now not more than one penny!——*Lace made by caterpillars.* These animals have been very ingeniously used as a means of producing an exceedingly fine kind of lace, possessed of considerable durability. A stone slab or other flat body having been covered with a paste, made of the leaves of the plant on which the caterpillar feeds, the pattern intended to be left open is drawn upon it with olive-oil, and, having been placed in a sloping position, caterpillars remarkable for producing a strong web are put at its lower side. They eat and spin their way to the top, carefully avoiding every place that has been touched with the oil. A veil made in this way, 26½ inches by 17 inches weighed only 1·51 gr. One of the same size, made of the finest patent net, would weigh about sixty times as much.

LACE BARK, the inner bark of an evergreen shrub, a native of Jamaica, the *Lagetta linteana*, nat. order *Thymelaceæ*. When macerated and stretched it has the appearance of coarse lace or net.

LACER'TA (a lizard : *Lat.*), in Zoology, the *Lizard*. The gradual discovery of many new forms has caused naturalists to form several genera in place of the Linnæan genus Lacerta. These constitute the family, *Lacertinidæ*. The species are all scaly four-legged reptiles furnished with long tails. They are harmless, timid, and nimble in their motions, feeding on insects and fruit, and loving warmth.

LACH'RYMAL (*lachryma*, a tear: *Lat.*), an appellation given to several parts of the eye from their serving to secrete or convey away the tears: as the *lachrymal ducts*, the *lachrymal glands*.

LACHRYM'ATORY (same *deriv.*), in Antiquity, a small glass bottle or phial in which were collected the tears of a deceased person's friends, and preserved along with the ashes and urn. Many of them have been found in the tombs and sepulchres of the ancients.

LA'CING (*lacer*, to lace: *Fr.*), among mariners, the rope or line used to confine the heads of sails to their yards.

LACIN'IATED (*lacinia*, a lappet: *Lat.*), in Botany, an epithet denoting a leaf which has several sinuses down to the middle, and the lobes which separate these indented or jagged.

LACK (*lakh*, an East Indian word), in Commerce, the number of 100,000 rupees, equal to about 10,000*l.* sterling.

LAC'QUER or LACK'ER (*lac*, a gum used in the varnish), a sort of varnish applied to tin, brass, or other metals. The basis of lacquer is a solution of shellac in alcohol, coloured with gamboge, saffron, &c. It is used to give a golden colour to brass and other metals, and to preserve their lustre.

LAC'TEALS or LAC'TEAL VES'SELS (*lac*, milk: *Lat.*), in Anatomy, the absorbents of the mesentery, which convey the milklike fluid, termed *chyle*, from the small intestines to the thoracic duct.

LAC'TIC A'CID (same *deriv.*), in Chemistry, the acid of sour milk, and the constant product of the fermentation of sugar, starch, and bodies of that class. It may be obtained from beet-root; and the acidity of sauerkraut is due to its presence. The juice of flesh contains it. Its salts are termed lactates.

LACTIF'EROUS (*lac*, milk: and *fero*, I bear: *Lat.*) or LACTESCENT, in Botany, an appellation given to plants abounding with a milky juice, as the sow-thistle and euphorbia.

LACTOM'ETER (*gala*, milk; and *metron*, a measure: *Gr.*; or *lac*, milk: *Lat.*; and *metron*, a measure: *Gr.*), an instrument for ascertaining the quantity of cream in milk.

LACTU'CA (a lettuce; from *lac*, milk: *Lat.*, on account of the appearance of its juice), in Botany, the name of a genus of plants: nat. ord. *Compositæ*. The *Lactuca sativa*, or common lettuce, is a well-known salad herb. The *Lactuca virosa*, or strong-scented lettuce, a common plant in our hedges and ditches, has an opiate juice.

LACU'NAR (*Lat.*), in Architecture, the ceiling or under surface of the member of an order; the under side of the corona of a cornice; the under side of the architrave, between the columns. Any ceiling or under surface, consisting of compartments sunk, but without spaces or bands between the panels, is a *lacunar*: if there are bands, it is a *laquear*.

LACUS'TRINE (*lacus*, a lake: *Lat.*), appertaining to a lake. *Lacustrine Dwellings* are the dwellings of ancient peoples, carried on piles over a lake. The piles on which such dwellings stood, and the remains of pottery and implements in stone, bone, and metal, have been recently discovered in several lakes in Switzerland, Savoy, and Scotland.——*Lacustrine deposits*, in Geology, are the deposits at the bottom of lakes.

LA'DY-BIRD or LA'DY-COW, in Entomology, small beetles with red or yellow wing-cases marked with black spots, belonging to the genus *Coccinella*. They, as well as their larvæ, feed on aphides or plant lice.

LA'DY-DAY, the 25th of March, so called because it is the day of the Annunciation of the Virgin Mary.

LADY'S-SLIPPER, a rare English orchid, the *Cypripedium calceolus* of botanists; the labellum or middle petal is inflated and bears some remote resemblance to a slipper.

LAGOON' (*lagone*, a pool: *Ital.*), a name given to those creeks, or shallow lakes, which extend along the shore of the Adriatic, and which contain numerous small islands: Venice, for instance, is built on sixty of them. Towards the sea the islets are secured by dams, natural or artificial.

LAGOON ISLAND. [See ATOLL.]

LAGOPHTHAL'MIA (*lagōs*, a hare; and *ophthalmos*, an eye: *Gr.*), in Medicine, a disease in which the eye cannot be shut. It may arise from various causes, but the most frequent is a cicatrix, after a wound, ulcer, or burn.

LAG'OPUS (*lagōs*, a hare; *pous*, foot: *Gr.*), a genus of gallinaceous birds, belonging to the family of *Tetraonidæ*, and including the PTARMIGAN and RED GROUSE.

LAIR (*lager: Ger.*), among sportsmen, the place where the deer harbour by day. This term is also used to signify a place where cattle usually rest under shelter; also the bed or couch of a wild beast.

LAIRD, a title of honour in the Highlands, formerly equivalent to *Lord*, but now applied to a landed proprietor under the degree of knight.

LAKE (*lacus: Lat.*), a large collection of inland water, having no direct communication with the ocean. The largest lake on the old continent is the Caspian Sea, 700 miles long, and 200 broad. In North America, a series of magnificent lakes run into each other, the largest of which, Lake Superior, is 540 miles long, and 150 broad. All the great American lakes are of fresh water.——LAKE, in Painting, a fine red colour, between carmine and vermillion. It is formed by precipitating the colouring matter from vegetable solutions, or cochineal, by means of alum or oxide of tin. There are *cochineal* and *lac* lakes, *madder* lake, &c.

LAMAISM, the form of BUDDHISM (which see) prevalent in Tibet. The Grand (Dalai) Lama, the successor of Sakya-sinha, or Buddha the founder of Buddhism, and who is believed to be animated by the perfectly virtuous soul of that holy man, resides at Teshu Lumbo, in the north of Tibet, and is undoubtedly one of the most honoured beings living in the world. He is worshipped as a supernatural being by his subjects, and is never to be seen but in the secret recesses of his palace, where he sits cross-legged on a cushion. The people believe that the supreme divinity lies in him, that he knows and sees everything in the deepest recesses of the heart, and that he never dies, but that, on the dissolution of his mortal frame, his soul enters into another body, in which he is born again, and in which he can be discovered only by some among a favoured class of priests. The worship paid to him by his followers consists in clamorous songs and prayers, in splendid processions, in the solemnisation of certain festivals, and in austerities practised by them. The inferior priests are also called Lamas, and their residences Lamaseries; on all their temples and sacred articles are inscribed the words 'Om Mani Padari om,' an invocation to Sakya, and supposed to signify 'Hail to him of the Lotus and Jewel.' Sakya is usually represented as holding a lotus flower with a jewel in it. These words are continually in the mouths of the devotees, and are placed upon the cylinders, which are so mounted that they can be made to revolve by means of a piece of string. Inside are placed written prayers, which are supposed to be repeated every time the cylinder makes a revolution. There are also praying machines turned by a stream of water. These consist likewise of revolving cylinders containing prayers, and their rotation is believed to redound to the benefit of the faithful. There are two principal sects of Lamas, those who wear red mitres and those who wear yellow. The yellow-mitred Lamas have, however, driven the red mitres out of Tibet, and the latter are now only to be found in Sikkim and Bhotan, amongst the Himalayas.

LAM'BDACISM (*lambdakismos*, from *lambda*, the Greek *l*), a fault in speaking, which consists in too much stress being laid on the pronunciation of the letter *l*.

LAMBDOI'DAL (*lambdoeidēs*, from *lambda*, the Greek *l*; and *eidos*, form: *Gr.*), in Anatomy, an epithet for a suture of the occiput.

LAMEL'LÆ (*Lat.*), in Natural History, thin plates.

LAMENTA'TIONS (*lamentatio: Lat.*), a canonical book of the Old Testament, written by the prophet Jeremiah. The first four chapters of the Lamentations are an *abecedary*, every verse or couplet beginning with one of the letters of the Hebrew alphabet, in the alphabetical order.

LA'MIÆ (*Lat.*), the name given by the Romans to evil spirits, who, they supposed, assumed the shape of handsome women, but changed themselves into ugly shapes whenever they chose. They could take out and replace their eyes, and amongst other evil deeds they devoured children.

LAM'INA (a thin plate: *Lat.*), a layer coat or thin plate; applied to the plates of minerals, bones, &c.——In Botany, the broad or spreading part of a petal as distinguished from the tube or claw. Also the broad part of a leaf as distinguished from the stalk.——In Mineralogy, a plate or thin piece of metal.——**LAMINÆ**, in Anatomy, the two plates or tables of the skull.

LAM'INABLE (same *deriv.*), an epithet for a metal which may be extended by passing it between steel or hardened cast-iron rollers.

LAM'MAS-DAY, a festival celebrated on the first of August by the Roman Catholic church, in memory of St. Peter's imprisonment. This word has been derived from *Lamb-mass*, on account of the custom, observed in some places, of bringing a lamb alive into the church on this day during mass; also from *Loaf-mass*, considering it a thanksgiving day for the first fruits of the corn, &c.

LAM'PAS or **LAM'PERS** (*lampas*, a torch: *Gr.*), a swelling in the palate of a horse's mouth. It is so called, because cured by burning with a lamp or hot iron.

LAMP'BLACK, a colour procured from the soot of a lamp; or rather, a fine soot formed by the condensation of the smoke of burning pitch, or some resinous substance in a chimney terminating in a cone of cloth.

LAM'PREY, a genus of eel-like fishes, which adhere firmly to rocks and other bodies by the suctorial mouth. They form the genus *Petromyzon* of ichthyologists. Their bones are cartilaginous, and they are destitute of fins at the fore part of the body. They are considered a delicacy, and are in season in the months of March, April, and May. Three species have been taken in British rivers. [See PETROMYZON.]

LAMPY'RIDÆ (*lampuris*, a glow-worm: *Gr.*), a family of soft-skinned serricorn beetles, in one division of which the female is luminous. [See GLOW-WORM.]

LA'NATE (*lanatus*, furnished with wool: *Lat.*), in Botany, covered with a substance like curled hairs; as a *lanate* leaf or stem.

LAN'CASTER, CHANCELLOR OF THE DUCHY OF, the officer before whom, or his deputy, the court of the duchy of Lancaster is held. The office has long been a sinecure; its salary is 4000*l.* per annum. Its holder has a seat in the cabinet.

LAN'CEOLATE (*lanceolatus*, from *lancea*, a lance: *Lat.*), in Botany, oblong and gradually tapering towards each extremity; as, a *lanceolate* leaf.

LA'NCERS (same *deriv.*), a body of men armed with long lances, and mounted on swift horses. They were first employed in Poland, but are now common in other countries. In the British army there are five regiments of lancers.

LA'NCET (*lancette: Fr.*), a two-edged surgical instrument, used in bleeding, opening tumours, &c.

LAND (*Ger.*), in Geography, the solid matter which constitutes the fixed part of the surface of the globe, as distinguished from water.——**LAND**, in seamen's language, makes part of several compound terms: thus, *to make the land* is to discover land from sea, as the ship approaches it. *Land-locked* is when land lies all round the ship so that no visible point is open to the sea: if at anchor in such a place, she is said to ride land-locked, and is considered safe from wind and tide. A *land-mark* is any mountain, rock, steeple, tree, &c., that may serve to make the land known at sea, and thus direct ships passing by how to steer, so as to avoid rocks, shoals, whirlpools, &c The *land is shut in*, when another point of land hinders the sight of that from which the ship came. The ship lies *land to*, when she is so far from shore that it can only be just discerned. *Land-turn* is a wind that in almost all hot countries blows, at certain times, from the shore in the night. *To set the land* is to see by the compass how it bears from the ship. A *land-breeze* is a current of air which, in many parts within the tropics, particularly in the West Indies, regularly sets from the land towards the sea during the night, and this even on opposite points of the coast. The land radiates heat much more rapidly than the sea, and consequently the air upon it becomes colder and more dense than that over the sea. It, therefore, presses upon and takes the place of the latter which ascends. This process will take place as long as the radiation goes on. By day the reverse process takes place by reason of the greater heating of the air over the land.

LANDAU', a coach which separates at the top, so as to form an open carriage. It derives its name from the place in Germany where it was originally made.

LAND'GRAVE (*landgraf*, land-count: *Ger.*), a title assumed by some German counts, in the 12th century, to distinguish them from the counts under their jurisdiction.

LAND'ING (*landung*: *Ger*), in Architecture, the first part of a floor at the head of a flight of stairs.

LAND'SLIP, the sliding down of a considerable tract of land from a more elevated place, on account of an earthquake, of being undermined by water, &c.

LAND'WAITER, an officer of the Custom-house, whose duty it is, upon landing any merchandise, to examine and take an account of the various articles.

LAND'WEHR (land guard: *Ger.*), the militia of Prussia and Austria.

LAN'GREL SHOT or LAN'GRAGE, a particular kind of shot used at sea for disabling the sails and rigging of an enemy's ship. It consists of two bars of iron, which are joined in the middle by a chain or shackle, that it may be the more easily put into the gun, and half a ball of iron at each end: it does great execution among the enemy's rigging.

LAN'GUAGE (*langage*: *Fr.*), the faculty of articulate speech is one of the marks by which man is distinguished from the brutes. As to the origin of speech several theories have been proposed, but that seems the most probable which assumes it to be the result of a mental instinct, from being given to it by the intellect. The study of languages, comparing one with another so as to ascertain the principles common to all, and the principles distinctive of each class or family, has been pursued on a rational system only of late years, and though something has been done in regard to tracing the growth and relationship of tongues, much remains to be effected before the study can take its place amongst other sciences. After investigating the grammars of the best known tongues it has been proposed to divide them into three families, viz.: the Aryan, Semitic, and Turanian, each containing various languages, dead and living. The Aryan family embraces the Sanscrit, Celtic, Italic, Hellenic, Teutonic, and other languages. The Semitic division comprehends the Arabic Hebrew and Syriac with their cognate tongues. To the northern division of the Turanian family belong the Mongolian, Turkish, Finnish, and other languages, whilst in the southern division of that family are placed the Malayan and many little known eastern tongues.

LAN'GUED (*langue*, the tongue: *Fr.*), in Heraldry, an epithet for the tongue of an animal, represented of a different tincture from the body.

LANGUEN'TE (*Ital.*), a musical term, signifying that the passage is to be performed softly or languishingly.

LAN'IARD, a short piece of rope or line, fastened to several portions of a ship's rigging, &c., and serving to secure them in their places; but more especially those used to extend the shrouds and stays of the masts.

LANIG'EROUS (*laniger*, fleece-bearing: *Lat.*) or LANUGINOUS, an epithet applied to such trees as bear a woolly or downy substance, such as the catkins of willows, &c.

LA'NIUS (a butcher; from *lanio*, I tear to pieces: *Lat.*), in Ornithology, a genus of passerine birds, known as *Shrikes* or *Butcher-birds*, so called from the savage manner in which they rend their prey, which consists of small birds. They have straight bills with a tooth on each mandible at the extremity, like other *dentirostres*, and a tongue jagged at each end. The species best known in England are the Great Shrike (*Lanius Excubitor*) and the Red-backed Shrike (*Lanius Collurio*). The shrikes imitate part of the songs of other birds near them. They have acquired one of these common names from the habit they have of hanging up their prey (mice, frogs, small birds, &c.) upon a thorn, or wedged in a forked branch, as a butcher hangs up his meat. This is for the convenience of tearing the food in pieces.

LANNER, the *Falco lanarius* of ornithologists, a bird of prey which inhabits the south of Europe. In size it is between the Peregrine and the Gyr-falcon. The male, which is smaller, is called the Lanneret.

LANS'QUENETS (*landes knecht*, a country lad: *Ger.*), German infantry, raised by the emperor Maximilian, to oppose that of the Swiss, in the fifteenth century.

LAN'TERN (*lanterne*: *Fr.*), in Architecture, an erection, either square, circular, elliptical, or polygonal, on the plan; placed on the top of a dome, or over an apartment, to give light.

LAN'TERN-FLY, a homopterous insect of South America, of the genus *Fulgora*, said to emit a strong phosphoric light from some part of its head; but the existence of this property has been denied.

LAOC'OON, a celebrated relic of Greek sculpture, executed in marble by Agesander and his two sons, Polydorus and Athenodorus, the three most celebrated artists at Rhodes. This fine production of antiquity was found at Rome in the palace of Titus, in the beginning of the 16th century, and is now in the Vatican Museum at Rome. Laocoon, a priest of Neptune, is represented, with his two sons, enveloped in the folds of two monstrous serpents; and the whole displays the most thorough knowledge of anatomy, of character, and of ideal perfection. The story of the serpents issuing from the sea, and strangling the priest whilst sacrificing a bullock, and twining round the sons, is told by Virgil in the second book of the Æneid.

LAP'IDARY (*lapidarius*, relating to stones: *Lat.*), one who polishes and engraves stones. This is effected by means of friction produced by wheels of various materials, according to the nature of the stone to be worked. Thus diamonds require wheels of soft steel; rubies, sapphires, and topazes, copper wheels; emeralds, amethysts, &c., leaden wheels—worked with oil and various powders.——The term is also applied to a virtuoso skilled in the nature, kinds, &c., of precious stones, or a merchant who deals in them.——LAPIDARY STYLE, that which is proper for monumental or other inscriptions, requiring terseness, compactness, and elegance.

LA'PIS (*Lat.*), in Roman Antiquity, a mile; because, at every mile, a stone (*lapis*) was erected, with the distance from Rome marked upon it. Thus *centesimus lapis*, or *centesimum* (*ad centesimum lapidem*, if written in full), meant one hundred miles from that city. The use of milestones has been adopted by all the nations of modern Europe.

LA'PIS LA'ZULI, a blue mineral, consisting chiefly of silica and alumina, with a little soda, and some peculiar combination of sulphur, to which its colour is considered due. It is often sprinkled with yellow pyrites, and is found in masses or nodules. It was formerly much used in inlaid work, and furnished the pigment called ULTRAMARINE (which see), until a new method of preparing this was discovered.

LA'PIS MARMO'REUS (marble stone: *Lat.*), in Archæology, a marble stone in Westminster Hall, in the midst of which stood a chair in which our kings anciently sat at their coronation. The courts of Chancery and King's Bench were erected over this stone.

LAPSE (*lapsus*, a slipping: *Lat.*), in Ecclesiastical Law, an omission on the part of the patron to present to a benefice within six months after it is vacant, upon which default the ordinary has a right to collate to it. If the ordinary neglect to present for six months, the right of presentation passes to the metropolitan; and if the metropolitan neglect for six months, to the crown.——LAPSED LEGACY, one which falls or is lost by a lapse; as where the legatee dies before the testator, or where a legacy is given upon a future contingency, and the legatee dies before the contingency happens. If the legatee who dies before the testator be a child of the latter, and leave issue, the legacy does not lapse, but goes to the issue—unless this is prevented by a clause in the will.

LAP'WING, or PEE-WIT, the *Vanellus cristatus* of ornithologists, a British bird allied to the plovers. The young ones are covered with a thick down when they are hatched; and at the approach of danger they squat down, while the mother tries to draw off the attention of the intruders, by fluttering about with cries of pain, and even running along the ground as if lame.

LAR'BOARD, a term for the left-hand side of a ship, when looking towards the stem or head; opposed to *starboard*. As serious mistakes are likely from the resemblance in sound between the words larboard and starboard, *port* is now generally used instead of the former.

LAR'CENY (*latrocinium*, highway robbery: *Lat.*), in Law, the felonious and fraudulent taking away the goods or property of another without his consent. Larceny was formerly divided into *grand* and *petty*: the former being the stealing of an article over the value of one shilling, and the latter not over that sum; but this, with other distinctions, has been abolished. In certain cases, however, in which without great rigour it would be difficult to preserve property, the punishment of larceny has been made very severe.

LARCH (*larix*: *Lat.*), a well-known deciduous-leafed coniferous tree, the *Larix Europæa* of botanists. It abounds with resin from which turpentine is obtained. Its timber is very strong and remarkably durable when exposed to the weather. Similar timber is yielded by two North American species, the black larch and red larch.

LA'RES (*Lat.*), in Antiquity, the domestic or household gods among the Romans, which the family honoured as their protectors. They were images of wood, stone, or metal, and generally stood upon the hearth in a kind of shrine. There were also Lares of the city, country, &c.

LAR'GO and **LARGHET'TO** (*Ital.*), musical terms directing a slow movement. *Largo* is one degree quicker than *grave*, and two degrees quicker than *adagio*. *Larghetto* is one degree quicker than *largo*.

LARK (*lerche*: *Ger.*), birds of the genus *Alauda*. The *sky-lark*, or *lavrock* (*Alauda arvensis*), which is the most harmonious of this musical family, commences its song early in the spring, continues it during the whole summer, and is one of those few birds that chant whilst on the wing. When it first rises from the earth, its notes are feeble and interrupted; as it ascends, however, they gradually swell to their full tone, and long after it is lost to the sight it still continues to charm the ear with its melody. It mounts almost perpendicularly, but descends in an oblique direction, unless threatened with danger, when it drops like a stone. The *wood-lark*, *Alauda arborea*, is distinguished by its smaller size and less distinct colours. It is generally found near the borders of woods, perches on trees, and sings during the night, so as to be sometimes mistaken for the nightingale. There are two or three other species, but they are very inferior as songsters to the before-mentioned.

LARK'SPUR, the name of plants belonging to the genus *Delphinium* (allied to the ranunculus and columbine) of which there are numerous species. Many of these are common in our gardens, where they are cultivated for the beauty and brilliant colours of their flowers.

LA'RUS (*Lat.;* from *laros: Gr.*), in Ornithology, a genus of seabirds with long wings and webbed feet, well-known as Gulls. Many species frequent our coasts, and of these the *Larus canus* is the commonest. It feeds on fish and carrion, is very voracious, and when frightened discharges the contents of the maw.

LAR'VA (a mask: *Lat.*), in Entomology, the grub or caterpillar state of an insect; the stage in the metamorphosis of an insect which it assumes on issuing from the egg, and before it becomes a pupa. The term is also applied to the early stage of lower animals.——LARVA, among the ancient Romans, a spectre, often represented under the form of a skeleton; or an old man, with shorn locks and a long beard, and carrying an owl on his hand.

LARYNGO'SCOPE (*larugx*, the throat; and *scopeo*, I see, *Gr.*), an instrument for examining visually the parts within the larynx. It consists of a concave reflecting mirror, its centre perforated with an aperture through which the surgeon looks. This is held before his eye, by means of a handle which is grasped by the teeth. A column of light from a lamp placed in a suitable position is reflected from the mirror, and thrown into the patient's open mouth, whilst a metal speculum is introduced therein, and held above the larynx. Any image thrown upon the metal speculum is clearly seen by the surgeon looking through the perforation in the mirror before his eye.

LARYNGOT'OMY (*larunx*, and *temno*, I cut: *Gr.*), in Surgery, the operation of cutting the larynx or windpipe, for assisting obstructed respiration, or removing foreign bodies.

LA'RYNX (*larugx: Gr.*), an organ of the voice, being a cartilaginous cavity which is connected with the windpipe, and on the size and flexibility of which depend the powers and tones of the human voice. The superior opening of the larynx is called the *glottis*.

LASCAR', in the East Indies, a native seaman.

LAS'SITUDE (*lassitudo*, weariness: *Lat.*), among Physicians, a morbid sensation of languor which often precedes disease.

LAST (*hlæstan*, to load: *Sax.*), a measure or weight of different amount in different places, and with regard to different articles. It is, however, generally estimated at 4000 lbs.

LATEEN' SAILS, triangular sails with very long yards, much inclined to the horizon. They are frequently used by xebecs, polacres, settees and other vessels navigated in the Mediterranean.

LA'TENT HEAT (*latens*, lying hid: *Lat.*), an expression formerly employed under an erroneous theory to signify heat in combination, in distinction from *sensible* heat; the portion of heat which seems to disappear when a body changes its form from the solid to the fluid, or from the fluid to the aeriform state, &c. [See HEAT.]

LAT'ERAN COUN'CILS, councils held in the basilica of the church of St. John Lateran, at Rome. Eleven have been held in this basilica, four of which are considered by the Roman Catholics as general. This church derives its name from the Roman family of the *Laterani*, who had on its site a palace which was seized by Nero, and made an imperial residence.

LAT'ERITE (*later*, a brick: *Lat.*), a red brick-like rock, composed of alumina and oxide of iron. It occurs between layers of basalt in volcanic countries.

LATERI'TIOUS (same *deriv.*), of a brick-red colour.

LATEX (juice: *Lat.*), in Botany, the elaborated or descending sap, a granular fluid which flows along tubes called *laticiferous* vessels.

LATH (*lætta: Sax.*), in Carpentry, a long thin piece of wood, nailed to the rafters of a wall or roof to receive the plaster or covering.

LATHE, an engine used in turning wood, ivory, and other materials.——A term applied in Kent to part of a county, containing three or four hundreds.

LATICLA'VE (*latus clavus: Lat.*), the broad purple stripe which the Roman senators and patricians were allowed to wear on the toga.

LAT'IN, the language spoken by the ancient Romans, or the inhabitants of Latium, from which it derives its name.

LAT'ITAT (he lurks: *Lat.*), in Law, a writ formerly used in personal actions where the party had to be arrested in any other county than Middlesex. It derived its name from a supposition or fiction that the person concealed himself, and could not be found in Middlesex, the county where the court sat.

LAT'ITUDE (*latitudo*, breadth: *Lat.*), in Geography, the distance of any place from the equator, measured in degrees, minutes, and seconds, upon the meridian of that place. It is either north or south, according as the place is situated on the north or south side of the equator.——In Astronomy, the distance of a star north or south of the ecliptic.

LATITUDINA'RIAN (same *deriv.*), one who admits a latitude in belief and in the interpretation of the Scriptures.——In a general sense a latitudinarian is one who is not restrained by precise settled limits in opinion.

LATRI'A (*latreia*, divine worship: *Gr.*), the highest kind of worship, or that paid to God: distinguished by the Roman Catholics from *dulia*, or the inferior worship paid to saints.

LATRO'BITE, a mineral of a pale red colour, massive or crystallized: found in an island near the Labrador coast. It is a silicate of alumina, with lime, potash, and oxide of manganese.

LAT'TEN (*laiton: Fr.*), plates of brass or bronze, reduced to different thicknesses, according to the uses for which they are intended. Tinned iron is sometimes called *latten*.

LAUD'ANUM (*laudo*, I praise: *Lat.*, from its excellent qualities), in Medicine, a liquid preparation of opium.

LAUDS (*laudo*, I praise: *Lat.*), in the Roman Catholic church, prayers formerly said at daybreak, but now joined to *matins*.

LAUNCE-FISH, or **SAND LAUNCE**, the name given to two species of fish belonging to the genus *Ammodytes*, which are taken upon the British coasts. They bury themselves in the sand when the tide retires, and are dug out by the fishermen for bait.

LAUNCH, a particular kind of flat boat, used in underrunning the cables of ships. It is the largest of a man-of-war's boats.

LAURA'CEÆ, a natural order of exogenous trees, having flowers without petals and anthers which open by recurved valves to set the pollen free. Most of the species are aromatic and fragrant. To this order belong the CINNAMON, CAMPHOR, and SASSAFRAS trees, as well as the Laurels. [See LAURUS.]

LAU'REATE (*laureatus*, crowned with laurel: *Lat.*). In England the *poet laureate* was formerly an officer of the royal household, whose business was to compose a birth-day ode for the monarch, and another for the new year. These obligations have been dispensed with: and the honour of the laureateship, with the salary, is now given as the reward of high poetic genius.

LAUREA'TION (same *deriv.*), in the Scotch universities, the act of taking the degree of master of arts, which the students are permitted to do after four years' study

LAURENTIAN SYSTEM, in Geology, a series of palæozoic strata of considerable thickness, forming the oldest known strata of our globe. They have been found in Scotland, the United States, and Canada, in which colony they occupy an area of 200,000 square miles. They consist chiefly of metamorphic rocks (gneiss, quartzites, and schists), and are traversed by numerous dykes of granite, syenite and greenstone. It was supposed that they were destitute of organic remains, but a few invertebrate fossils (a coralline and some rhizopodous shells) have been recently discovered in their limestones. This system, which derives its name from the river St. Lawrence, lies under two other formations of similar character (the Labrador and Huronian series) both older than the Silurian.

LAU'RUS (*Lat.*), in Botany, a genus of plants belonging to the nat. ord. *Lauraceæ*. ——*Laurus nobilis*, the sweet bay tree, a native of Italy, but cultivated in our gardens and shrubberies as a handsome evergreen. It is the laurel which was sacred to Apollo, and was used for garlands.

LA'VA, the melted matter that flows from volcanoes, and solidifies to stone. Basalt is ancient lava.

LAVAN'DULA (from *lavo*, I wash: *Lat.*, from its being anciently used in baths and fomentations), in Botany, a genus of plants, nat. ord. *Labiatæ*, containing the *Lavandula Spica*, or common lavender, a plant cultivated in our gardens on account of the fragrance of its flowers. The essential oil, obtained from it by distillation, is of a bright yellow colour, of a very pungent taste, and possesses, if carefully distilled, the fragrance of the lavender in perfection.

LAW (*loi: Fr.*), a body of rules applicable to a given subject; also, a single one of those rules. The term has, therefore, a *collective* and a *particular* meaning. Whenever certain events invariably follow certain antecedents, we use the word *law* metaphorically, to express this invariable sequence. Thus we say the *law of gravitation*, the *laws of motion*, &c. In its strict sense, law is 'a command issued by a superior, imposing an obligation on an inferior.' *Human law* is comprehended under several heads:—The *law of nations* comprises the rules respected by the mutual consent of Christian nations, but seldom voluntarily infringed, and when infringed, considered to require reparation. They relate to the intercourse of nations in peace, the grounds of just war, the limits of lawful hostility, the rights of conquest, the privileges of ambassadors, &c. *Positive* or *municipal law* is a rule of civil conduct, prescribed by the supreme power in the state, commanding what is right, and prohibiting what is wrong; it comprehends the duties of individuals towards the community, and towards each other. Sometimes laws are enacted to explain other laws, sometimes to suit particular emergencies. Municipal law is in some cases supposed to have the immediate sanction of heaven. Thus, in Mohammedan governments, the code of law is found altogether, or principally, in the Koran. The Hindoos also, and some other nations, pretend to a religious sanction for their laws. *Roman law*, as collected and digested in the *pandects*, *code*, and *institutes* of the emperor Justinian, is the great foundation of most of the laws used in the states of modern Europe, and constitutes the *civil law*, which in England is chiefly confined to ecclesiastical matters. *Canon law* consists of the rules framed by the Christian church for its own spiritual guidance. In Roman Catholic times, it consisted of edicts of popes, decrees of councils, and authoritative declarations of fathers and doctors of the church. The canons of the Protestant church were enacted in 1603. The *common law of England* (in contradistinction from civil law, and from equity) consists in a certain portion of our laws, relating to a definite subject-matter, and administered in courts which follow certain rules of evidence and modes of procedure. But, used in contradistinction from *statute law*, which is of positive enactment, it means the ancient customary law, as set forth in the writings of the early jurists and in the reported judgments of the bench. Since, in its popular sense, com mon law is opposed to equity and ecclesiastical law, it comprises the whole of both *civil* and *criminal* law, as administered by courts having trial by jury, with all subjects which come under the jurisdiction of the common law courts of Westminster Hall, and the various jurisdictions, not exercising equitable authority, throughout the country. *Equity* was no doubt originally a jurisdiction of a remedial character to moderate the rigour of legal judgments, according to the conscientious opinion of the judge; but, at present, its rules are as accurately laid down by precedents as those of common law. *Maritime law* is that which relates to harbours, ships, and sailors. *Martial law* is that proclaimed by authority of parliament, on an emergency of rebellion, invasion, or insurrection; it puts under the cognizance of *courts-martial* a variety of matters not ordinarily appertaining to them, that they may be tried in a summary way; and is generally accompanied by the power of arresting, detaining, and summarily trying suspected persons. *Military law* is that administered by courts-martial under the authority of parliament, the mutiny act, &c.

LAWN (*linon: Fr.*), a superior kind of linen cloth. It was formerly made only in France and Flanders; but at present the lawn manufacture is brought to great perfection in Scotland and Ireland, where it bids fair to rival our foreign competitors.

LAY (*laikos*, from *laos*, the people: *Gr.*), an epithet in ecclesiastical law for what belongs to the people, in contradistinction from that which belongs to persons in orders. The term is used also by clergymen and lawyers, to indicate persons not belonging to their respective professions.——LAY BROTHERS and LAY SISTERS, in the Roman Catholic church, are such as perform the secular and servile offices in a monastery or convent.——LAY CORPORATION, any corporation or body which consists of laymen, created for some temporal purpose: such as charitable corporations, which are constituted for the perpetual distribution of the free alms of the founder.——LAY FEE, lands held in fee of a lay lord, as distinguished from those lands which belong to the church.——LAY IMPROPRIATION, the impropriating or applying the revenues of the church to the use of a layman.

LAY'ER (*Lager*, pressed down: *Ger.*), in Horticulture, a young shoot or twig bent down and covered with mould, for growth or propagation. This operation is performed by slitting or notching the branches, or by twisting them, and then laying them under the mould, the ground being first made very light. After being laid, they are watered. The slitting or notching obstructs the return of the sap from the leaves, and causes its accumulation at the wounded part, when roots are produced in consequence of the efforts of nature to perpetuate life.

LAY FIG'URE, among Painters, a structure usually of wood made to imitate rudely the human form. It is provided with joints so that it may be put into any attitude or posture. Its principal use is for adjusting drapery.

LAZARET'TO (*Ital.*), an hospital for the reception of those afflicted with contagious diseases. In some places, lazarettos are set apart for the observance of quarantine.

LAZO or LASSO (*Span.*), an implement employed by the Spaniards of South America for catching wild animals. It consists of a long and very strong rope made of raw hide, one end of which is attached to the saddle (for it is used when the man is on horseback) and the other carries a small metal ring by which a noose can be formed. When it is about to be used the noose, with a diameter of about eight feet, is whirled round the head, and dexterously kept open. The hunter gallops after his prey, and at the proper moment flings the noose so that it will unerringly catch a bull by the horns, and with the aid of his well-broken horse stop it in full career.

LAZ'ULITE, a mineral of a slight indigo-blue colour, generally granular or occurring in small pieces not exceeding the size of a hazel-nut. It is found in narrow veins, traversing clay-slate, with quartz, in Salzburg; and consists of alumina, silex, magnesia, lime, and oxide of iron.

LEAD (*læd: Sax.*), in Mineralogy, a metal found in considerable quantity and widely distributed, but seldom, if at all, in the pure metallic state. It is of a bluish-grey colour, and very brilliant when fresh cut, but soon tarnishes from exposure to the air. It is the softest and least elastic of all the metals; is easily flattened under the hammer; and is ductile in a very great degree, though much less so than gold. It may easily be cut with a knife, and stains the fingers bluish-grey when rubbed. Its specific gravity is 11·45. Lead fuses at about 600° Fahr., and renders other more refractory metals fusible. It becomes fluid long before it is red-hot, which is the case with no other metal, except tin; after melting, it very readily changes to an oxide of a grey colour, which, if the fire is increased and the mass is often stirred, assumes a yellow, and afterwards a fine florid red colour: this is the *minium* or common *red lead* of the shops. If the heat is rendered yet more intense, it runs into an oleaginous mass, which, as it cools, becomes of a yellowish or reddish colour, and is composed of a number of thin laminæ: this is *litharge*. These several substances have nothing of the appearance of the metal from which they are produced; yet, if a little iron-filings be added to them over the fire, or some pieces of charcoal or any other inflammable matter be thrown into them while they are hot, they become lead again, their oxygen being removed by the combustible substance. *Massicot*, the yellow oxide of lead, is soluble in many acids, and forms salts, of which the acetate and carbonate are the most important, the latter being, under the name of *white lead*, the basis of white oil-paint. The sulphuret is the most common ore of lead, and is the *galena* of mineralogists. It is roasted to expel the sulphur, which is driven off in the shape of sulphurous acid. Perfectly pure water soon corrodes lead, the oxygen it contains in solution forming an oxide, and its carbonic acid a carbonate. But river, and other waters holding sulphates, and carbonates in solution, have no such effect; they cover its surface with a thin coating, which entirely protects it. As a portion of this coating is carbonate of lead, iron or zinc pipes, in connection with it, may be a source of danger: the galvanic action causes alkaline matter to be evolved on the lead, which renders the oxide and carbonate soluble, and therefore in a state to be injurious Persons, like painters, whose trades require them to come very much in contact with preparations of this metal, sometimes suffer very severely from the effects of slow poisoning by it. The *painter's colic* is a very common and a very dreadful disease. Also, the acidity of sour wines, &c., is often most nefariously corrected with sugar of lead, a highly poisonous substance. Sulphuretted hydrogen affords a most delicate test for lead, since it will blacken, or at least darken, any fluid containing even a minute quantity of a salt of lead in solution In 1861 there were 390 lead mines worked in the United Kingdom, and the quantity of lead obtained from the ore raised during the year amounted to 65,634 tons of the value of 1,445,255*l.* ——LEAD FOR SOUNDING. The common hand lead weighs 11 lbs, and has about 20 fathoms of line: the deep sea lead weighs 28 lbs. The line is marked specially at 5, 7, 10, 13, 17, and 20, and the numbers between these are called *deeps*· hence they say, 'By the *mark* 7,' meaning 7 fathoms, and 'By the *deep* 9,' meaning 9 fathoms The *common lead* is heaved from the side, the *deep-sea lead*, from the fore-part of the vessel, and generally when the ship is heaved to

LEAF (*Sax*), an expansion of the bark of a plant It consists of cellular tissue or parenchyma through which vascular tissue in the form of veins, ribs, and nerves, ramify, the whole being covered with epidermis through which in most cases pass minute orifices, called *stomata*. Leaves are either sessile, that is, directly seated on the branch, or petiolate, that is, furnished with footstalks or petioles. The angle formed by the leaf and the branch is called the axil, and here it is that new leaf-buds usually appear. The young leaf is generally protected by some sort of sheath called a *stipule*, which drops off when the leaf has expanded. When leaves fall annually, they are styled deciduous, otherwise they are evergreen. The functions of leaves seem to be to expose the sap to the air and light, whereby it becomes elaborated and fitted for the formation of wood, new leaves, &c.

LEAF'-BUD, the rudiment of young branches, made up of scales surrounding a minute axis, which directly communicates with the cellular tissue of the stem. Stimulated by light and heat, they form branches or, if artificially removed from the plant, they serve to multiply the individual from which they have been taken.

LEAGUE (*lieue: Fr.*), a measure of length. The *sea league* is three nautical or geographical miles, or the twentieth of a degree: that is, about 3·45 English statute miles.——LEAGUE (*ligue: Fr.; from ligo*, I bind: *Lat.*), in Politics, a treaty of alliance between different states or parties, entered into for the execution of some common enterprise. It may be *offensive* or *defensive*, or both. It is *offensive* when the contracting parties agree to unite in attacking a common enemy; *defensive*, when the parties agree to act in concert in defending each other against an enemy.

LEAK'AGE (*Leck*, a leak: *Ger.*), in Commerce, an allowance, intended to compensate for the leaking of casks, or the waste of liquors by leaking

LEAP YEAR (*hleapan*, to jump: *Sax.*). [See BISSEXTILE]

LEASE (*laisser*, to allow: *Fr.*), in Law, a demise of lands or tenements, generally in consideration of rent or other annual recompense, for a term of years, for life, or at will. The party letting the lands, &c., is called the *lessor*, and the party to whom they are let, the *lessee* The lease must be for a shorter term than that during which what is leased belongs to the lessor, since, if it be for his whole term, it is not a lease, but an *assignment*.——LEASE AND RELEASE, in our law, two deeds by which in conjunction a freehold estate in lands and tenements could be conveyed. This form of conveyance was originally devised by lawyers as a means of *secret conveyance*. Land was made over to the purchaser by bargain and sale for a year: this did not require registration. Then the purchaser received a release of all the vendor's remaining interest The necessity for executing the lease for a year has been abolished by act of parliament.

LEASH (*lasse*, a string: *Fr*), in Sporting, the number three; as a *leash* of birds, a *leash* of greyhounds, &c. Also, a leather thong, by which a falconer held his hawk.

LEATH'ER (*Leder; Ger*), the prepared skins of animals. Tanning renders skin strong, tough, durable, and often waterproof, and prevents its putrefaction. In tanning, the skins are first cleaned of hair and cuticle: they are then impregnated either with vegetable tan and extract, if *tanned* leather is to be produced, or with alum and other salts if *tawed* leather; and sometimes the two processes of tanning and tawing are both employed. Lastly, they are treated with oil, which is termed *currying*. Thick sole leather is tanned; white kid, for gloves, is tawed, upper leather, for boots and shoes, is tanned and curried; fine Turkey leather is tawed, and afterwards slightly tanned. [See TANNING.]

LEAV'EN (*levo*, I make light: *Lat.*), a piece of sour dough, used to ferment, and render light a much larger quantity of dough or paste. During the seven days of the passover, no leaven was permitted to be in the houses of the Jews.

LECTISTER'NIUM (*Lat*: from *lectus*, a couch; and *sterno*, I prepare), a religious ceremony, used by the ancient Romans in times of great public calamity. It consisted in inviting the gods to an entertainment, their statues being taken down from

the pedestals, laid on couches and placed at table, while the attendants gravely put the viands to their lips,

LED'GER, the principal book used by merchants, in which every customer's particular account is kept: that into which a summary of the journal is carried.——LEDGER-LINES, in Music, those lines added to the usual stave of five lines, when more are wanted for notes ascending or descending.

LEE (*lee: Ger.*), a sea term for the quarter opposite to that from which the wind comes.——*Lee-board*, a small platform of planks, which, being let down into the water on the lee-side of flat-bottomed boats, opposes the tendency of the wind to drive them to leeward.——*Lee-lurch*, a sudden and violent roll of the ship to leeward in a high sea.——The *lee side* of a ship is the opposite of that on which the wind blows when it crosses her course, and which is called the *weather side*.——*Lee-shore*, a shore on the lee side of a ship.——*Lee-tide*, a tide running in the same direction as that in which the wind blows.——*Lee way*, the deviation of the course actually run by the ship from the course steered upon; the ship being generally impelled sideways as well as forwards by the action of the wind or currents.——*Leeward*, pertaining to the quarter towards which the wind blows. The terms *leeward* and *windward* were given to the West Indian islands, with reference to their situation in a voyage from the ports of Spain to Carthagena or Portobello.——*Under the lee of a ship*, on the side of it opposite to that on which the wind blows.——*Under the lee of the land*, near the shore which breaks the force of the wind.

LEECH (*læc: Sax.*). [See HIRUDO.]

LEG'ACY (*lego*, I bequeath: *Lat.*), in Law, a bequest or gift by will of any personal effects; a testamentary gift of real property being a *devise*. The person bequeathing is called the *testator*, and he to whom it is bequeathed the *legatee*. There is also a *residuary legatee*, or one to whom, after the several devises or bequests made by will, the residue of the testator's estate and effects are given. A *general* legacy is one not referring to any particular thing of the kind, as where a diamond ring, but not a particular ring, is bequeathed. A *specific* legacy is a bequest of a particular thing, as distinguished from all others of the same kind, as a bequest of 'the diamond ring which was given me by A.' A legacy is *demonstrative* when it is in its nature a general legacy; but there is a particular fund pointed out to satisfy it. *General* legacies are subject to a rateable abatement if the estate will not pay all in full. But a *specific* legacy is subject to no abatement, except that which may be required by payment of debts. A specific legacy may, however, be *adeemed*, that is, taken away: thus, if a particular horse is left to any one, but is sold by the testator before his death, that legacy is adeemed; if 100*l.* in consols is bequeathed, but it is afterwards transferred by the testator to another stock, that legacy also is adeemed. A *demonstrative* legacy does not abate with the general legacies, and is not liable to ademption by the non-existence or alienation of the fund pointed out for satisfying it. If a general legacy is bequeathed, no certain time of payment being mentioned, the legatee will be entitled to interest on his legacy from the expiration of a year after the death of the testator. That time is allowed an executor to ascertain if there be any debts; and if a legacy has been paid, the legatee must refund, should it be necessary for the payment of a debt, even though the year have expired. When the legatee is an infant child of the testator, he will be allowed interest for maintenance from the time of the death of the testator. If the legacy given is payable at a certain day, it must be paid along with interest from that day; but the executor is not bound to pay it before the year is expired, though the day mentioned is earlier than that time. If the legatee dies before the testator, his legacy lapses, unless he was a child of the testator and has left issue.

LEG'ATE (*legatus: Lat.*), the pope's ambassador to foreign countries: usually either a cardinal or a bishop. The power of a legate is sometimes given without the title. It was one of the ecclesiastical privileges of England from the Norman conquest that no foreign legate should be sent here, unless the king desired it upon some extraordinary emergency, as when a case was too difficult for the English prelates.

LEGA'TION (*legatio*, an embassy: *Lat.*), a term denoting the body of official persons attached to an embassy. Hence *secretary of legation*.

LEGA'TO (tied: *Ital.*), in Music, a word used in an opposite sense to *staccato*, and implying that the notes of a movement or passage are to be performed in a smooth and gliding manner.

LE'GEND (*legendum*, to be read: *Lat.*), a book used in the ancient Roman Catholic churches, and containing the lessons which were to be read. The word was afterwards employed to denote a chronicle or register of the lives of saints; and as these histories were filled with ridiculous stories, the offspring either of credulity or fraud, the name *legend* was given to improbable or incredible fables that make pretensions to truth.——LEGEND, the motto engraved upon medals, which differs from the *inscription* properly so called. The latter signifies words placed on the reverse of a medal in lieu of figures; but the former, those round the head or other figure.

LE'GERDEMAIN (light of hand: *Fr.*), tricks which, from the dexterity of the performer, are made to deceive the observer, and are called *sleight of hand*.

LE'GION (*legio: Lat.*), in Roman Antiquity, a body of soldiers in the Roman army, consisting of different numbers at different periods. In the war with Hannibal it was 5000; after this it was increased to, in some cases, 6000 or 6200; but the cavalry always remained the same. The number of legions kept in pay together also differed according to times and occasions. Each legion was divided into ten cohorts, thirty maniples, or sixty centuries;

hence, if the century always consisted of 100 men, the legion would contain 6000. The 300 cavalry attached to a legion were divided into ten *turmæ* or troops, and each troop into three *decuriæ*, or bodies of ten men each. Originally the legion was drawn up in three lines: the *hastati*, or first line, were young men in the flower of life, and were at first armed with spears (*hastæ*), whence the name; the *principes*, or second line, were men in the prime of life; and the *triarii*, or third line, were veteran soldiers. To these were afterwards added the *velites*, or skirmishers. Each legion was, as it were, a separate army, having its cavalry and light infantry, with the various warlike engines then in use; and this arrangement had so many advantages that it was revived by the elder Napoleon, who even made his legion to consist of the same number as the Roman. His had the advantage of artillery. The 24 *tribuni militum* were the chief officers of the legion, and its principal standard was a silver or bronze eagle. The legions were named according to the order in which they were raised, from their commanders (as the *Claudian legion*), or from the place where they were stationed, &c. Under Augustus there were 25 legions; under Alexander Severus, 32.

LE'GION OF HON'OUR, an order instituted by Napoleon, while consul (May 19, 1802), for military and civil merit. It consisted of different grades, as grand crosses, crosses, commanders, officers, and legionaries; all of whom received pensions with this mark of distinction. After the restoration of Louis XVIII., the order underwent some modifications, and the number of its members was diminished.

LE'GISLATURE (*legis*, of a law; and *latia*, a proposing: *Lat.*), that body in a state which is empowered to make laws. [See CONSTITUTION, COMMONS, PARLIAMENT, &c.]

LEGIT'IMACY (*legitimus*, lawful: *Lat.*), in Politics, in its strict sense, means the accordance of an action or an institution with the municipal law of the land. In the language of modern politics, the term has been used with reference to the old hereditary dynasties, and in contradistinction from those founded by recent wars and revolutions. But it is now very generally held that municipal law, or peaceable possession, affords the only right to a throne; and that all governments become legitimate as soon as they are thoroughly established.

LEGU'ME (*legumen*: *Lat.*), in Botany, a one-celled, one or many-seeded, two-valved superior fruit, dehiscing by a suture along its face and its back, and bearing its seeds on the ventral suture only. The fruit of the pea and bean is a legume. It is sometimes indehiscent, as in the *Cassia Fistula*; but the line of dehiscence in such species is indicated by the presence of sutures. In many genera it passes into a *drupe*.

LEM'MA (*lemma*, from *lambano*, I take *Gr.*), in Mathematics, a preliminary proposition which serves to prepare the way for the demonstration of some other.

LEM'MING (*Leming*: *Ger.*), the *Myodes Norvegicus* of Zoologists, a rodent animal allied to the rat, very abundant in the north of Europe, and on the shores of the Arctic ocean. It is as large as a rat, and is covered with a black and yellow fur. Lemmings occasionally migrate in such vast bodies as to devastate the country through which they pass. In these emigrations they move in a straight line, regarding neither rivers, mountains, nor any other obstacle.

LEM'ON (*limon*: *Fr.*), the fruit of a spiny tree, the *Citrus Limonum* of Botanists, a member of the orange order. It was originally brought from the tropical parts of Asia, but now grown in the south of Europe and other warm climates.——The preparation called *salt of lemons*, &c., used to remove ink-stains from linen, is binoxalate of potash. Its effect is produced by the oxalic acid dissolving with facility the oxide of iron in the ink, on the combination of which with the tannin and gallic acid the colour depends; while, at the same time, it can be used without any risk of injury to the cloth, on which it has no effect.

LE'MUR (a ghost: *Lat.*), a genus of quadrumanous animals. Each of their four extremities is provided with an opposable thumb; but the index digit of the hinder hand has its nail developed into a long, curved, sharp-pointed claw. The lemurs differ from the typical quadrumana, and approximate to the ordinary quadruped, in their elongated pointed head and sharp projecting muzzle. They are all natives of Madagascar and the neighbouring islands. Though they belong to a hot climate, they are covered with fur; but this is necessary, since they move about in the night season, when, even in tropical climates, it is often very cold. They feed on fruits, insects, and small birds.

LEM'URES (*Lat.*), among the ancient Romans, spectres or ghosts, believed to be the souls of the dead, which tormented men in the night. In order to propitiate them, a festival named *Lemuria* was observed. The legend is that it was instituted by Romulus for his brother Remus, and was named by him, on that account, *Remuria*, which became corrupted into *Lemuria*.

LENS (a lentil: *Lat.*), in Optics, a thin piece of glass or other transparent medium, bounded on both sides by polished spherical surfaces, or on one side by a spherical, and on the other by a plane surface. These spherical surfaces may be either convex or concave; and, by combination, give rise to the following:—A *spherical lens*, or sphere; a *double convex lens*, or one having two convex surfaces, which causes rays of light to converge; a *plano-convex lens*, having one plane and one convex spherical surface, which also causes the rays of light to converge; a *double concave lens*, having two concave surfaces, which causes the rays of light to diverge; a *plano-concave lens*, having one plane and one concave spherical surface, which also causes the rays of light to diverge; a *meniscus*, having one convex and one concave surface, the radius of the concave being the larger—it causes the rays of light to converge; a *concavo-convex lens*, having also one convex and one concave surface, but the radius of the concave being the smaller—it causes the rays to diverge. The effect of a meniscus is the same as that of a convex lens of the same focal distance; and that of a concavo-convex lens, the same as that of a concave lens of the same focal distance. The focus of a concave lens is *imaginary*. The focus of a lens may be very conveniently found in practice, by ascertaining at what distance from it the sun's rays are concentrated to the smallest point. [See OPTICS, CONCAVE, &c.]

LENTIC'ULAR SCAL'PEL (*lenticulaire*: *Fr.*), a surgical instrument employed for removing the jagged particles of bone from the edge of the perforation made in the cranium with a trephine.

LENTI'GO (a freckle: *Lat.*), in Medicine, a freckly eruption on the skin.

LEN'TIL (*lens*: *Lat.*), the *Ervum* lens of Botanists, a leguminous herb. The seeds, which are contained in a pod, are round, flat, and rather convex in the middle. It is cultivated for its seeds, which afford a nutritious food, and also as fodder for cattle.

LEN'ZINITE, a hydrated silicate of alumina, found at Erfield in Prussia: it is white, translucent, and falls into small hard grains when put into water.

LE'O (a lion: *Lat.*), in Astronomy, one of the twelve signs of the zodiac, the fifth in order.

LE'ONINE VERSE, a kind of Latin verse, consisting of hexameters and pentameters, of which the final and middle syllables rhyme. According to some, it derived its name from one of the popes, Leo; according to others, from Leoninus, a monk of the 12th century. The following, which is the Latin paraphrase of a well-known doggrel verse, has been given as an example:—

'Dæmon languebat; monachus tunc esse volebat:
Ast ubi convaluit, mansit ut antè fuit.'

LEOP'ARD (*leo*, a lion; and *pardus*, a panther: *Lat.*), the *Leopardus varius* of Zoologists. The panther is now considered to belong to the same species, the only difference being that the leopard has small spots thickly set, whilst the panther's spots are large and open. But it has been found that there is so much variation in these respects that the distinction cannot be relied on. The species is a native both of Africa and Asia. The body of this fierce and rapacious animal is about four feet long. From the great flexibility of the limbs and spine, it can take surprising leaps, swim, crawl, and ascend trees. The hunting leopard of India is the CHEETAH.

LEPID'OLITE (*lepis*, a scale; and *lithos*, a stone: *Gr.*), a mineral of a granular and foliated texture, moderately hard, and of a pinkish colour. It contains *lithia*.

LEPIDOP'TERA (*lepis*, a thin flake; and *pteron*, a wing: *Gr.*), in Entomology, an order of insects comprehending the butterflies and moths. The maxillæ are modified into a spiral suctorial apparatus (hence they form a section of the transtelliate insects); they possess for the most part four large membranous wings, more or less covered with delicate scales; and their metamorphosis is complete. The abdomen of lepidopterous insects consists of six or seven annuli, and is attached to the thorax by a very small portion of its diameter. The females usually deposit their ova, often very numerous, on the vegetables that are to nourish the larvæ—which are well known as *caterpillars*—and perish soon after. Some species of larvæ attack woollen cloths, furs, leather, bacon, wax, &c. Some of them form societies, and live under a silken tent, which they spin in common. Caterpillars usually change their skin four times, before passing into the state of nymph or chrysalis: most of them spin a cocoon, in which they enclose themselves. The lepidoptera issue from their nymphal envelope through a slit which is effected in the back of the thorax.

LEP'ROSY (*lepra*, from *lepros*, rough: *Gr.*), a cutaneous disease, appearing in dry, white, thin, scurfy scales, either on the whole body or some part of it. The leprosy is of various kinds: that to which the Jews were particularly subject is supposed to have been elephantiasis, or black leprosy. The Jewish law, without excepting even kings, excluded lepers from communion with mankind, banishing them into the country or uninhabited places.

LE'PUS (a hare: *Lat.*). [See HARE.]

LE'ROI LE VEUT (the king wills it: *Fr.*). [See ASSENT.]

LETH'ARGY (*lēthargia*, from *lēthē*, forgetfulness: *Gr.*), a heavy unnatural slumber, sometimes bordering on apoplexy, from which it is difficult to rouse the patient. Sometimes it arises from a plethoric state, or from over-fatigue of mind.

LE'THE, in the ancient Mythology, one of the rivers of hell, signifying *oblivion* or forgetfulness; its waters having, according to poetical fiction, the peculiar quality of making those who drank of them entirely forget everything.

LETTER (*littera*. *Lat.*), a mark or character, written, printed, or engraved; used as the representative of a sound, or of an articulation of the human organs of speech. As sounds are audible, and communicate ideas by means of the ear, so letters are visible representatives of sounds, and communicate thoughts by means of the eye. It is not known by whom, or even by what nation, letters were invented. They are divided into *vowels* and *consonants*, and the latter into *mutes* and *liquids*. Diphthongs, also, are included in the classification.——LETTER OF ATTORNEY, called also *power of attorney*, in Law, a writing by which a person appoints another to do a lawful act in his stead, as to receive debts, &c.——LETTER OF CREDIT, among Merchants, a letter written by a merchant or banker to his correspondent abroad, requesting him to credit the bearer as far as a certain sum.——LETTER OF MARQUE, an extraordinary commission granted by the government to commanders of merchant-ships or others, in time of war, to make reprisals on the enemy. The ship so commissioned is also called a *letter of marque*. [See PRIVATEER.]——LETTERS-PATENT, writings to which is attached the great seal of England; so called because they are open. They authorize some act, grant some right, or confer some place or dignity. [See PATENT.]

LET'TISH, the language spoken in Courland and Livonia. With the Lithuanian, a language spoken in Eastern Prussia and the neighbouring part of Russia, it forms the Lettic division of the Indo-European or Aryan family.

LEU'CIN (*leukos*, white : *Gr.*), in Chemistry, a white pulverulent substance obtained from the fibres of beef, albumen, or casein, by boiling it in a strong solution of potash and neutralizing the liquid with sulphuric acid.

LEU'CITE (same *deriv*), a crystallized mineral, consisting of silica, alumina, and potash; of a grey or white colour, and generally opaque; somewhat like a *garnet* It occurs in *lava*, particularly that of Vesuvius: hence it has been termed *Vesuvian* or *volcanic garnet.*

LEUCOPHLEGMA'TIC (*leukophlegmatos :* from *leukos*, white ; and *phlegma*, phlegm : *Gr.*), in Medicine, an epithet for a dropsical habit, with a white bloated skin

LEUCO'THIOP (*leukos*, white ; and *Aithiops*, an Ethiopian : *Gr.*), an *albino*, or a white person of a black race

LEVANT' (*levante*, rising : *Ital*), a name under which are included Turkey, Syria, Asia Minor, Greece, Egypt, &c , washed by the Mediterranean and its contiguous waters The word is applied, in a general sense, to any country which is to the east of us.

LEVA'RI FA'CIAS (you will cause to be raised : *Lat*), in Law, a writ directed to the sheriff to levy a judgment debt upon the lands and goods of the party against whom it is issued ; and by virtue of which the sheriff may seize all his goods, and receive the rents and profits of his lands, till satisfaction be made. It is superseded, in practice, except in cases of outlawry, by a writ of *elegit*, which takes possession of the lands themselves.

LEVA'TORS (*levator*, a lifter : *Lat.*), in Anatomy, an appellation given to several muscles, whose office is to lift up the parts to which they are respectively attached.

LEV'EE (*lever*, to rise : *Fr* ,—because it was originally a visit paid to the sovereign, on his rising in the morning), a ceremonial visit to the sovereign, paid by the nobility, gentry, &c., to him. It is attended by gentlemen only, by which it is distinguished from what is termed a *drawing-room.* The Commander-in-chief of the Army and the Speaker of the House of Commons have also their levees.

LEV'EE-EN-MASSE (a universal rising : *Fr.*), a military expression for the patriotic rising of a whole people, including all those capable of bearing arms, who are not otherwise engaged in the regular service. It is the most formidable obstacle an enemy can encounter. In Germany it is called the *Landsturm*, in distinction from the *Landwehr*, or militia ; and in 1813 the governments of Northern Germany called it forth in every part of the country.

LEV'EL (*læfel* : *Sax.*), is an instrument for ascertaining when a line is at right angles to the direction of the gravitating force at any given place, and when consequently it lies in the plane of the horizon of that place. A *spirit level* is attached to the telescope of the *levelling instrument* by which engineers ascertain the difference of elevation between two points. Levelling may also be performed by the theodolite.——The art of *levelling* is particularly applied to the laying out grounds, regulating descents, draining morasses, conducting water, &c. ; and, in fortification, the reducing an uneven surface to that of a plane, so that the works may be of a corresponding height and figure.

LE'VER (*lever*, to raise : *Fr.*), in Mechanics, a rod moving about a centre or prop called a *fulcrum*, and having forces applied to two or more points in it. The lever is either *rectilinear*, as a balance-beam ; or *angular*, as a bell-crank. And its arms move in the *same plane*, as in the examples just mentioned ; or in *different planes*, as in the mechanism of organs, locomotives, &c. The lever also has *equal* arms, as in the common balance, where no mechanical advantage is gained ; or *unequal.* If unequal, the fulcrum is either *between* the extremities, or *at one* of them. When the fulcrum is between the extremities, whether equidistant from them or not, it is a lever of the *first order.* If the fulcrum is at one extremity, and the power at the other, it is a lever of the *second order.* If the fulcrum is at one extremity, and the weight or resistance at the other, it is a lever of the *third order.* Whatever the kind of lever, when there is equilibrium, the power is to the weight as the length of the arm on which the weight acts is to the length of the arm on which the power acts—provided the directions in which the power and weight act are perpendicular to the arms of the lever ; otherwise, the power is to the weight as the length of a perpendicular from the fulcrum to the direction in which the weight acts is to the length of a perpendicular from the fulcrum to the direction in which the power acts.

LEVIGA'TION (*levigatio*, a smoothing : *Lat.*), the mechanical operation or process of grinding the parts of bodies to a fine paste, by rubbing them with the flat face of a stone called a muller upon another stone called the table or slab, or by analogous means. If the result is stirred in water, powders of different degrees of fineness may be obtained by separating those which subside in successive intervals of time.

LE'VITES, a term applied in Scripture to such of the tribe of Levi as were employed in the lower offices and ministries of the temple. In this particular, they were distinguished from the priests, who, being descended from Aaron, were likewise of the tribe of Levi. The Levites bore some resemblance in the tabernacle and temple of the Jews to the deacons among Christians. They were employed in bringing wood, water, and other necessaries for the sacrifice, and they sang and played upon instruments in the temple. They also applied themselves to the study of the law, and were the ordinary judges of the country, though always subordinate to the priests. Their subsistence was derived from the tithes of corn, fruit, and cattle, throughout Israel; but the priests were entitled to a tenth of their tithes, by way of first-fruits to the Lord.

LEVIT'ICUS, a canonical book of the Old Testament, so called from its containing the laws and regulations relating to the priests, Levites, and sacrifices. These duties, rites, and ceremonies formed what is termed the *Levitical law*.

LEV'ITY (*levitas*: *Lat.*), in Physics, the privation or want of weight in a body, when compared with another that is heavier, in which sense it stands opposed to *gravity*.

LEXICOL'OGY (*lexis*, diction; and *logos*, a description: *Gr.*), that branch of literature which treats of the proper meaning and just application of words.

LEX'ICON (*Gr.*), a book containing an alphabetical arrangement of the words of a language, with an explanation of the meaning of each.

LEY, in Chemistry, the solution of a caustic alkali: in ordinary language, the impure alkaline solution obtained from ashes, and rendered caustic by lime.

LEY'DEN JAR (from the place where its principle was discovered), in electrical experiments, a glass jar having the outside and the inside coated to a certain height with tin-foil. The glass under the foil can then be charged with the opposite electricities, which may be preserved in the same state for any length of time. But if a piece of metal be made to connect the two coatings the two charges instantly unite with violence.

LEZE MAJ'ESTY (*crimen læsæ majestatis*: *Lat.*), in Jurisprudence, any offence against the sovereign power of the state. Among the Romans, it comprehended rebellion, usurpation of office, &c.

LHER'ZOLITE, in Mineralogy, a variety of pyroxene, of an emerald-green colour, brilliant when crystallized, and translucent.

LIA'NAS, or LIA'NES (*liar*, to tie: *Span.*), the name given in Spanish America to twining plants which spread from tree to tree and render a tropical forest impassable—the Cable plants of the English.

LI'AS, in Geology, a secondary formation lying between the oolite and the trias, consisting of beds of argillaceous limestone, marl, and clay, richly stored with fossils. The name is an English provincial one, but it has been generally adopted by geologists. In England the lias forms an almost continuous band from the sea at Lyme Regis, in Dorsetshire, to the coast of Yorkshire, being only interrupted by the Mendip Hills in the southern and by the marshland at the mouth of the Humber in the northern part of this long range. At Whitby the strata consist of shales enclosing jet and large fragments of bitumenised wood. The lime obtained from some of the lias beds has the valuable property of hardening under water. In France and Germany the lias is also well developed. As to fossils, ammonites and other mollusca abound; fish are plentiful, but the most remarkable feature is the number of gigantic reptiles that have been discovered in this formation. [See ICHTHYOSAURUS, PLESIOSAURUS, PTERODACTYLE.]

LIBA'TION (*libatio*, from *libo*, I pour out: *Lat.*), among the Greeks and Romans, was an essential part of solemn sacrifices. It was also performed alone, as a drink offering, by way of procuring the protection and favour of the gods in the ordinary affairs of life. At sacrifices, after the libation had been tasted by the priest and handed to the bystanders, it was poured upon the victim. At entertainments, a little wine was generally poured out of the cup, before the liquor began to circulate, to show their gratitude to the gods for the blessings they enjoyed. The libations to the dead were not performed till the ninth day after the burning or interment; and consisted of milk, wine, or blood, and generally concluded the funeral solemnities.

LI'BEL (*libellus*, a little book: *Lat.*), in Law, the publication of written or printed matter which tends to degrade a man in the opinion of his neighbours, or to make him hated or ridiculous. Both the author and the publisher of a libel are liable to an action. Any book, pamphlet, writing, or picture, containing such representations, although only communicated to a single person, is considered in law a publication; and libellers may be brought to punishment by a prosecution, or be compelled to make reparation by a civil action. The latter is grounded upon the injury which the libel is supposed to occasion to the individual; the public prosecution, upon its tendency to provoke a breach of the peace. A person who sends a libel privately to the person libelled is indictable (but not actionable), because this proceeding has a tendency to cause a breach of the peace. Formerly it was immaterial, with respect to an indictment for libel, whether the matter of it was true or false, since the provocation, and not the falsity, was to be punished *criminally*; but it was otherwise in an action for *damages*. At present, however, in pleading to an indictment, the defendant may, by way of defence, allege the truth of the matters charged, and may show that their publication is for the good of society. Special provisions have been made for the benefit of editors and proprietors of newspapers and other periodical publications. Unless the intent is shown to be malicious, it is no libel to print or reprint parliamentary papers, or extracts from them. The jury are now authorized to decide not only on the publication and meaning of the libel but also on its criminality, which was formerly left to the judge. Libel is a greater offence than *slander*. Any person who with a view to extort money or to procure an appointment publishes, or threatens to publish, a libel, or offers to prevent the publishing of one, is indictable. In all indictments or informations by a private prosecutor for a *defamatory libel*, if judgment is given for the defendant, he is entitled to costs from the prosecutor.——LIBEL, in the Ecclesiastical and Admiralty courts, the formal written statement of the complainant's ground of complaint against the defendant.

LIBEL'LULA, in Entomology, a genus of neuropterous insects including the various species of DRAGON-FLY, which see.

LI'BER (the inner bark: *Lat.*), in Botany, the inner lining of the bark of exogenous plants. It is a mixture of woody and cellular tissue, and seems to be formed annually at the same time as the concentric zones of wood. It conveys downwards the secretions elaborated in the bark and leaves; and it is the principal seat of the laticiferous vessels. The liber layer of the Lime and some other trees affords material for cordage and mats. [See LACE BARK.] It is their liber which renders the flax, hemp, mallow, and nettle tribes valuable for manufacturing purposes. Sacks are made in Western India from a tree called *Antiaris saccidora* by cutting a thick branch, letting it soak a while in water, and then beating it with clubs until the liber and bark separate from the wood. They are then pulled inside out, and the wood is sawn off near the lower end, where a piece is left to form the bottom of the sack.

LIB'ERAL ARTS (*liberalis*, belonging to freedom: *Lat.*), such as depend more on the exertion of the mind than on manual labour. The term was first applied to them to distinguish them from the *mechanic arts*, originally exercised chiefly by slaves.

LIBER'TUS (a freedman: *Lat.*), in Roman Antiquity, a person who from being a slave had obtained his freedom. According to Suetonius, the *liberti* were such as had been actually made free themselves; the *libertini* were the children of such persons; but *libertinus* seems rather to mean one belonging to the *class* of liberti.

LIB'ERTY (*libertas: Lat.*), in general denotes a state of freedom, as distinguished from *slavery*, the power of living as a man pleases, or without being controlled by another. It is of various kinds:—1. *Natural* liberty, a state of exemption from the control of others, and from positive laws and the institutions of social life. 2. *Civil* liberty, the security from the arbitrary will of others, which is afforded by the laws. 3. *Political* liberty, civil liberty in a more extensive sense; it properly designates the freedom of a nation or state from all unjust abridgment of its rights and independence by another nation. 4. *Religious* liberty, or *liberty of conscience*, the right of forming one's own opinion on religious subjects and of worshipping the Supreme Being according to the dictates of conscience, unfettered by external control.——LIBERTY OF THE PRESS, the free power of publishing what one pleases; subject, however, to punishment for what is mishievous to public morals, or injurious to individuals. 'Men,' says Lord Macaulay, 'are never so likely to settle a question rightly as when they discuss it freely. A government can interfere in discussion only by making it less free than it would otherwise be. Men are most likely to form just opinions when they have no other wish than to know the truth, and are exempt from all influence either of hope or fear. Government, as government, can bring nothing but the influence of hopes and fears to support its doctrines. It carries on controversy ot with reason but with bribes and threats. If it employs reasons, it does so not in virtue of any powers which belong to it as a government. Thus, instead of a contest between argument and argument, we have a contest between argument and force. Instead of a contest in which truth, from the natural constitution of the human mind, has a decided advantage over falsehood, we have a contest in which truth can be victorious only by accident.'

LI'BRA (the balance: *Lat.*), in Astronomy, a sign of the zodiac: so called because, when the sun enters it, the days and nights are equal.——LIBRA, in Roman Antiquity, a pound weight; also a coin equal in value to twenty denarii.

LI'BRARY (*librarium: Lat.*), a word used to denote either a collection of books or the apartment or edifice for holding them. The first public library of which we have any certain account in history was founded at Athens by Hipparchus, 526 B.C.; the second of any note, at Alexandria, by Ptolemy Philadelphus, 284. The latter was burnt by the Roman army, 47 B.C., 400,000 valuable books being destroyed in the conflagration. A second library, formed from the remains of the first at Alexandria, by Ptolemy's successors, and said to have consisted of 700,000 volumes, was totally destroyed by the Saracens, at the command of the caliph Omar, A.D. 642. How many treasures of ancient lore were thus irremediably lost must ever remain unknown: but it is more than probable, when we consider the labour of transcribing, that a very trifling portion of the literature of remote ages has been preserved to us. The most valuable libraries in Europe, at present existing, have been stated to contain printed books and manuscripts as follows:—The Royal Library, Paris, 824,000 vols. and 80,000 MSS. The Bodleian Library, Oxford, 420,000 vols. and 30,000 MSS. The Royal Central, Munich, 800,000 vols. and 24,000 MSS. The Vatican, Rome, 100,000 vols. and 40,000 MSS. University, Göttingen, 300,000 vols. and 5,000 MSS. British Museum, nearly 700,000 vols. and 32,000 MSS. Vienna, 453,000 vols. and 16,000 MSS. St. Petersburg, 505,000 vols. and 21,000 MSS. Naples, 300,000 vols. and 6,000 MSS. Dresden, 300,000 vols. and 3,700 MSS. Copenhagen, 557,000 vols. and 30,000 MSS. Berlin, 460,000 vols. and 5,000 MSS. These numbers can be given only as approximations, since the number of works in the various libraries is continually augmented, and in some of them with great rapidity; but they serve to convey an idea of the vastness of these collections, as well as their relative magnitudes.

LIBRA'TION (*libratio*, a weighing: *Lat.*), in Astronomy, an apparent irregularity of the moon's motion, which makes her seem to librate about her axis, sometimes from the east to the west, at others from the west to the east; so that the parts in the western limb or margin of the moon sometimes recede from the centre of the disk, and sometimes move towards it, by which means they become alternately visible and invisible to the inhabitants of the earth. It is of three kinds:—1. Libration in *longitude*, which is ocasioned by the rotary motion of the moon about her axis not being always precisely equal to the angular velocity in her orbit. 2. Libration in *latitude*, which is occasioned by the inclination of the moon's axis of rotation to the plane of her orbit: her axis retaining the same direction in space, the poles of rotation and parts adjacent to them become alternately visible as she moves in her orbit. 3. *Diurnal* libration, which is a consequence of the lunar parallax: the spectator at the earth's surface observes points on the moon's disk at her rising, which disappear as her elevation increases, while new ones on the opposite border come into view as she descends.

LICEN'TIATE (same *deriv.*), in Law, one who has full license to practise any art or faculty; generally, a physician who has a license to practise granted by the College of Physicians. Cambridge is the only English university which grants the degree of *licentiate*, and that only in medicine.

LICHENOG'RAPHY (*leichên*, a lichen; and *grapho*, I write: *Gr.*), the science which illustrates the natural history of *lichens*.

LICH'ENS (*Lat.*; from *leichên*: *Gr.*), in Botany, an order of cryptogamic plants found in all parts of the world. They grow on the ground, on rocks and stones, and on tree trunks. They are frequently mere crusts of various bright colours; but often they rise up, and form small branches. They draw their nourishment from the air, not from the substance to which they are attached. The reproductive matter is of two kinds:—1. Spores, which are usually immersed in discs or shields that burst through the outer layer. 2. Minute cells, that are thrown off from an inner layer. Lichens are abundant in the temperate and cold parts of the earth. Many of them are of no known use; but some, as the reindeer moss (*Cenomyce rangiferina*), the Iceland moss (*Cetraria Islandica*), and several species of *Gyrophora* (*Tripe de roche*), are capable of supporting animal life. Iceland moss, when deprived of its bitterness by boiling, is an excellent food for invalids. Some lichens are used as medicines; thus, the *Variolaria faginea*. But their principal importance is as dyes, many of them affording brilliant colours; thus, orchil, cudbear, perolle, &c. 'Lichens,' says Mr. H. Y. Hind, 'grow with exceeding slowness, but retain their general form and vitality for very many years. They are truly "time-stains." They survive the most intense cold and live during long summer droughts in tropical climates. From the polar zones to the equator, under all conditions of heat and cold, on the most unyielding and barren rocks, on the living and the dead, wherever there is light, lichens grow.'

LIC'TORS (*lictores*, from *ligo*, I bind: *Lat.*), in Roman Antiquity, officers or beadles who carried the fasces before the chief magistrates whenever they appeared in public. It was also a part of their duty to be the public executioners in beheading, scourging, &c. A dictator was attended by twenty-four lictors; a consul by twelve; the master of the horse, and prætor, by six; and each Vestal virgin had one.

LIEGE (*lige*: *Fr.*), a term used chiefly in combination: thus, *liege lord*, one that acknowledges no superior, the chief lord of the fee; *liege man*, who owes homage and allegiance to the liege lord. By the term *liege people* are meant the subjects of a monarch, because they owe him their allegiance.

LI'EN (a bond: *Fr.*), in Law, the right which one person, in certain cases, possesses of detaining property belonging to another, when placed in his possession, until some demand, which he has, is satisfied. Liens are of two kinds: *particular liens*, that is, where the person in possession of goods may detain them until a claim which accrues to him in respect of those identical goods is satisfied; and *general liens*, that is, where the person in possession may detain the goods, not only for his claim accruing in respect of them, but also for the general balance of his account with the owners. Some liens are created by express agreement, and some by usage.

LIEUTEN'ANT (*Fr.*, literally one who holds a place), an officer who supplies the place and discharges the office of a superior in his absence. Of these, some are civil, as lord-lieutenants of kingdoms, and lord-lieutenants of counties; and others are military, as lieutenant-generals, lieutenant-colonels, lieutenants of horse, foot, or of ships of war.——*Lord-lieutenant of Ireland*, the chief executive officer of the Irish government, representing, in some respects, the person of the sovereign. He corresponds with the secretary for the Home Department; but the management of Irish affairs in London is chiefly committed to his chief secretary. His salary is usually 20,000*l.* per annum. He has the power of bestowing certain offices under the government, of creating knights, and of pardoning all crimes except high treason. Before the union, he summoned and prorogued the Irish parliament; but no bill could be passed without the royal assent.——*Lord-lieutenants of counties*, officers who, upon any invasion or rebellion, have power to call out the militia, and to give commissions to colonels and other officers, to arm and form them into regiments, troops, and companies. Under the lord-lieutenants are *deputy-lieutenants*, who have similar powers; these are chosen by the lord-lieutenants out of the principal gentlemen of each county, and presented to the sovereign for approbation.——*Lieutenant-general*, an officer next in rank to the general.——*Lieutenant-colonel*, the officer between the colonel and the major.——*Lieutenant*, in the army, the officer next below a captain. In the navy, an officer who ranks with a captain in the army: there are *first* and *second* lieutenants, with different pay.

LIFE (*liflan*, to live: *Sax.*), in a general sense, that state of animals and plants, or of any organized beings, in which their natural functions and motions are performed; or in which the organs are capable of performing their functions. The life of an animal body may be spoken of in a chemical and a physiological sense. Life is antagonistic to ordinary chemical action: the moment death occurs, decomposition begins, though it may not be at once perceptible: the stomach, on which, during life, the gastric juice has no action, is sometimes perforated by it after death. The following are the results of careful investigation, regarding the duration of human life:—1. The proportion of births to the actual stationary population of any place, expresses, or is relative to, the average duration of life in that population. For example, suppose this proportion to be in the ratio of one to twenty-eight, the average life of the inhabitants of the place will be found to be twenty-eight years. 2. The female sex enjoys at every period of life, except at puberty, at which epoch the mortality is rather higher among young females, a greater longevity than the male sex. 3. Pregnancy and labour occasion, indeed, a considerable loss of life; but this loss disappears, or is merged, in the general mass. 4. The so-called climacteric periods of life do not seem to have any influence on the longevity of either sex. 5. The average duration of life, at the present time, is in Russia about twenty-one years; in Prussia, twenty-nine; in Switzerland, thirty-four; in France, thirty-six; and in England, thirty-eight years. 6. The average duration of life has, in recent times, increased very greatly in most cities of Europe, which arises from greater cleanliness and better ventilation. 7. In reference to the influence of professions or occupations in life, it seems that ecclesiastics are, on the whole, the longest, and medical men the shortest livers: military men are nearly between the two extremes; but yet, proportionally, they, more frequently than others, reach very advanced years. 8. The mortality is generally greater in manufacturing than in agricultural districts. 9. Marriage is decidedly favourable to longevity. 10. The mortality among the poor is always greater than among the wealthier classes. 11. The mortality in a population appears to be always proportionate to its fecundity: as the number of births increases, so does the number of deaths at the same time.

LI'FE-BOAT, a vessel so constructed as to be capable of putting to sea in the most stormy weather, and withstanding the fury of a tempest; by means of life-boats many lives are annually saved from wrecks and vessels in distress. They are generally built wide and shallow, with the head and stern alike, that they may be rowed in either direction. They are cased round on the inside of the upper part with cork, to render them buoyant, although filled with water, and loaded with as many persons as can be placed in them; the cork also tends to preserve equilibrium, or to restore it. It is painted white, to be conspicuous on emerging from a hollow sea.

LI'FE-BUOY, a buoy with a mast, to render it conspicuous. It is thrown into the sea when any one falls overboard; and has usually attached to it a composition, which is fired by the very act of disengaging it from its place, and which burns with a strong light.

LI'FE-ESTATES, in Law, freehold estates not of inheritance.

LI'FE-GUARDS, the body-guard of a sovereign prince. There are two regiments of English life-guards, each having 32 officers, 53 non-commissioned officers, and 851 privates.

LIFTS, the ropes which support the ends of yards or booms against the weight of the men upon them.

LIG'AMENT (*ligamentum*, from *ligo*, I bind: *Lat.*), in Anatomy, a strong elastic membrane, connecting the extremities of the movable bones. Boiled in water, membranes yield more or less gelatine, and leave some insoluble albumen. They are divided generally into *capsular* ligaments, which surround the joints like a bag, and *connecting* ligaments.

LIG'ATURE (*ligatura*, from same: *Lat.*), in Surgery, a cord, band, or string of various thickness, covered with white wax; it is used for the purpose of tying arteries, veins, or other parts.——In Music, a line connecting notes.

LIGHT, in Physics, that peculiar property of matter which affects the nerves of sight, and causes us to see.——A *ray of light* is an exceedingly small portion of light as it comes from a luminous body. A *beam of light* is a collection of parallel rays. A *medium* is a body which affords a passage for the rays of light. A *pencil of rays* is a mass of diverging or converging rays. *Converging* rays are those which tend to a common point; *diverging* rays, those which come from one point, and continually separate as they proceed. The rays of light are *parallel*, where the lines which they describe are so. The *radiant point* is the point from which diverging rays proceed. The *focus* is the point to which the converging rays are directed. Light passes off from a luminous body in all directions; and its intensity decreases as the square of the distance increases: thus, if one object is twice as far from a luminous body as another of the same size, it will receive only one-fourth as much light as the latter. The velocity with which light travels is enormous; it was estimated, on astronomical data, at 183,470 miles per second; but according to Léon Foucault's recent experiments with the 'turning mirror,' it is 185,170 English miles per second; and it requires little more than a quarter of an hour to pass through the diameter of the earth's orbit. When light encounters an obstacle, some of it is reflected, some absorbed, and, if the interposed body is not opaque, some of it is transmitted. During transmission it is modified, being in some cases, as with doubly refracting crystals, decomposed into two white rays, possessing different properties; and in others, as with glass prisms, decomposed into a number of *coloured* rays, accompanied by rays which are colourless, and in fact *invisible*, but which have marked chemical and calorific properties. Light, heat, and the chemical principle seem to be modifications of the same element; but there are circumstances in which they differ:—a thin plate of glass will intercept much of the heat, but none of the light, of an ordinary fire; the quantity, however, of heat intercepted diminishes as its intensity is increased, and the rays from a body that is white-hot pass through it with but little interruption. On the other hand, obsidian and black mica allow free passage to the heat, but intercept all the light. Pale yellow glass intercepts all the chemical, but transmits all the luminous rays. Blue glass intercepts most of the luminous, but none of the chemical rays. Solar light may be considered to consist of two rays of *different polarities;* of three kinds of rays having different properties, the *calorific*, the *chemical*, and the *luminous;* and the last of three different colours, the *blue*, the *yellow*, and the *red*, from which all others are formed: white being due to the presence, and black to the absence, of all the colours. Two theories have been proposed regarding the nature of light, each capable of explaining all its phenomena, with perhaps the exception of *interference* [which see]. The one called that of *emission*, adopted by Newton, supposed light to consist of exceedingly minute particles of a peculiar matter thrown out by a luminous body. It seems most in accordance with chemical science, many experiments in which appear to show that light is actually combined in some instances with elementary substances, and in others liberated from them. Thus, when carbon and oxygen are united so as to form carbonic acid, light is set free; but when carbonic acid is again decomposed by the vegetable, light is required, seemingly that it may enter into combination. The other theory, called the *undulatory*, adopted by most modern philosophers, supposes light to be the vibration of some ethereal medium which pervades all space, just as sound is the vibration of atmospheric air. Astronomy furnishes us with some reason for supposing the existence of such a medium; and it is certain that we cannot as yet satisfactorily explain the phenemenon of *interference*, except by the undulatory theory.——*Effects of light on vegetables*. The change of position in the leaves of plants, at different periods of the day, is entirely owing to the agency of light, and that plants which grow in windows in the inside of houses, are, as it were, solicitous to turn their leaves towards the light. The more fully plants are exposed to the light, the *more colour* they acquire. Sir Humphry Davy found, by experiment, that red rose-trees, carefully excluded from the light, produce roses almost white.

LI'GHTHOUSE, a tower or lofty building on the sea-coast, intended to direct seamen in navigating ships at night, by the exhibition of a light which is of some definite intensity and colour, and which sometimes revolves or disappears at certain fixed periods. Lighthouses were used in very ancient times; that which was constructed on the isle of Pharos, opposite to Alexandria, was so celebrated, that it has given its name to all similar erections. It is said to have been 500 feet high; to have been visible at a distance of 45 miles; and to have cost 800 talents, or about 16,000*l.* of our money. The old mode of lighting a beacon was to burn wood or coal in a grate on the top; down to 1807, candles were burned in the Eddystone lighthouse. But, whatever materials are used, much of the light must be lost, unless means are taken to give it a horizontal direction. This may be effected by either a catoptric or dioptric apparatus, that is, either by reflection or refraction. When the *catoptric system* is used, the flame of an argand burner is usually placed in the focus of a parabolic reflector; and, to produce a light of sufficient intensity, eight lamps and mirrors are generally united, in such a way that the lights are blended into one. When the light is to revolve, the lamps are attached to a frame, which is moved round with the proper velocity by clockwork. If the *dioptric system* is employed, eight powerful lenses are fixed in a frame, their axis being in the same plane, and meeting in a common focus, in which the lamp is placed. Various methods have been devised for preventing a loss of the rays which pass above and below the lenses. When it is not a revolving light, the number of lenses ought to be, practically, infinite, that the light may be thrown to every part of the horizon. Thirty-two lenses have been used; but far more successful results are obtained by using a cylindric belt of glass, whose figure is generated by the revolution of the largest vertical outline of a powerful double convex lens round its focus. This belt is aided above and below by a series of prismatic rings or zones, which throw most of the remaining light also in a proper direction. The light is generally produced by an argand burner; and, as the dioptric system requires a more powerful lamp, a series of concentric burners is used—the number of these, with a first-class light, being four. Gas is sometimes employed, but all attempts to apply the Drummond or voltaic light have failed. *Red* is the only coloured light which causes a lighthouse to be recognised at a sufficient distance. Lighthouses are distinguished also by the *time of revolution* of their light. Some of them have a *flashing light*: that is, the flashes and eclipses succeed each other so rapidly as to give rise to the appearance of scintillations. An *intermittent light* is one that is suddenly eclipsed and as suddenly revealed, exhibiting an appearance very different from a revolving light. Sometimes there are two lights, one over or beside the other, or one *red* and the other *white*. Of late years magneto-electricity has been employed as the illuminating agent. the light thus produced being much more intense than any that can be obtained from a manageable number of oil-lamps or argand burners. At Dungeness, on the coast of Kent, there is a light of this kind. A small steam engine is employed to cause a number of soft iron cores, surrounded by coils of wire, to rotate past a series of large permanent magnets. The streams of electricity thus generated are collected and conveyed by a wire into the middle of the illuminating apparutus in the tower of the lighthouse. It is there made to pass between two points of charcoal, and in the act of doing this it produces a continuous spark of great brilliancy.

LI'GHTNING (from *light*), in Meteorology, a flash of light suddenly appearing in the atmosphere, and commonly disappearing in the same instant; sometimes attended with clouds and thunder. Lightning is produced by the passage of electricity from one body to another. Thunder is the explosion of clouds charged with it; and lightning is to thunder what the *flash* is to the *report* of gunpowder. Sometimes the electricity passes from one cloud to another; sometimes from a cloud to the earth, or *vice versâ*. The different forms of the flashes of lightning are all found in electric sparks; and the ordinary electrical experiments have all been performed with electricity drawn from the clouds.

LI'GHTNING CON'DUCTORS, metallic points elevated above the highest parts of buildings, and communicating by good and insulated conductors with the ground, or, which is better, with the nearest water. They are intended gradually to convey to the ground that atmospheric electricity which might, if transmitted suddenly, injure the building and its inmates. [See ATMOSPHERIC ELECTRICITY.]

LIGHTS, NOR'THERN. [See AURORA BOREALIS.]

LIG'NIN (*lignum*, wood: *Lat.*), a hard secondary deposit in vegetable cells, forming their wood or ligneous fibre. It is considered to be a modification of cellulose. It forms the chief part of the trunks of trees.

LIG'NITE (same *deriv.*), in Geology, *wood-coal*, fossil wood carbonized. It is chiefly found in strata of the tertiary era, and in some places there are large deposits of it. The lignites of Bovey Tracey, in Devonshire, are dug for fuel. Near Bonn, on the Rhine, there is a lignite deposit from which the pigment called umber is obtained. Lignite is wholly composed of land plants, and land and freshwater shells are found amongst them.

LIG'NUM VI'TÆ (the wood of life: *Lat.*), the wood of an American tree, the *Guiacum officinale* of botanists, nat. ord. *Zygophyllaceæ*. It attains the height of forty feet, and measures from fifteen to eighteen inches in diameter; having a hard, brittle, brownish bark, not very thick. The wood is firm, solid, ponderous, very resinous, of a blackish-yellow colour, and a hot aromatic taste. It is imported into England in large pieces of four or five hundredweight each, and, from its hardness and beauty, is in great demand for various articles of turnery, and for ships' blocks, &c. The wood, gum (called *Guiacine*), bark, fruit, and even the flowers, possess certain medicinal virtues.——Of Pegu, *Melanorrhœa usitata*.——BASTARD, *Sarcomphalus laurinus*.——NEW ZEALAND, *Metrosideros scandens*.——WHITE, *Badiera diversifolia*.

LIG'ULA (a slip or strip: *Lat.*), in Botany, a membranous appendage at the apex of the sheathing petiole of grasses. The florets of some composite plants, such as the daisy and dandelion, are said to have *ligulate* or strap-shaped corollas.

LIG'URITE, a mineral occurring in oblique rhombic prisms, of an apple-green colour occasionally speckled. As a gem, it resembles the *Chrysolite*.

LI'LAC (*lilach: Turk*), a well-known shrub with fragrant flowers, a native of Persia. It belongs to the genus *Syringa*, nat. ord. *Oleaceæ*.

LILIA'CEÆ (*lilium*, a lily: *Lat.*), in Botany, a nat. order of bulbous-rooted herbaceous plants, distinguished from the *Amaryllis* order by having the ovary above the base of the calyx, and from the *Iris* order by having six stamens. It includes a great number of plants with handsome flowers, such as the true lilies, the tulips, day lily, squills, lily of the valley, asphodels, and aloes. To this order also belong the asparagus, onion, and garlic, as well as the dragon tree.

LIL'Y (*lilium: Lat.*; from *leirion: Gr.*), in Botany, a genus of plants with a bulbous and perennial root, the flower of which is six-petalled and campanulate. The lily is reckoned by Pliny the noblest flower next to the rose; and, according to Dioscorides, it was a royal flower.——*Lily of the Valley*, a plant of the genus *Convallaria*, with a monopetalous, bell-shaped corolla.

LIMB (*limbe: Fr.*; from *limbus*, a border: *Lat.*), in Astronomy, the utmost edge or border of the body of the sun or moon.——In Botany, the expanse of the leaf, as distinct from the stalk. Also the broad upper part of a petal, as distinguished from the lower narrow part.

LIME (*Leim: Ger.*), in Mineralogy, a very useful earth, existing in great abundance in nature. It is usually combined with carbonic acid in the forms of limestone, marble, and chalk, which, when burnt, become lime. It consists of oxygen and a metallic base called calcium. It is the basis of the bones, shells, and other hard parts of animals. Sprinkled with water, it heats, falls into powder, and becomes a hydrate; the same effect takes place gradually in the air. It is white, very difficult to be fused, and highly luminous when raised to a high temperature. It is more soluble in cold than in hot water, but very little in either. It has an alkaline action on vegetable colours, and absorbs carbonic acid from the atmosphere; its solution in water being rendered milky by this gas, for which, therefore, it serves as an excellent test. Its combination with sulphuric acid is known by the name of *gypsum*, or *sulphate of lime*; combined with fluoric acid, it constitutes fluate of lime, or *Derbyshire spar*. Lime is much used by tanners, skinners, &c., in the preparation of their leather; by soap-boilers, for rendering the alkaline carbonates caustic by removing their carbonic acid, and thus causing their ready combination with oils and fats; and by sugar-bakers, for refining their sugar.——*Lime-water* is used for medicinal purposes, being given internally in spasms, diarrhœa, convulsions of children, &c., and is externally applied to burns and ulcers.——LIME, the fruit of the *Citrus Limonium*, a tree of the orange order. It abounds with an acid juice.

LIME TREE or LINDEN, the *Tilia europæa* of botanists, nat. order *Tiliaceæ*. Russian mats are made from the bast or inner bark of this tree.

LIM'IT (*limito*, I bound: *Lat.*), in Mathe matics, a determinate quantity, to which a variable one continually approaches.

LIMITA'TION (*limitatio*, a fixing: *Lat.*) OF ACTIONS AT LAW, the time beyond which actions cannot be brought. When they are for the purpose of recovering land, they must be brought within twenty years. Personal actions of trespass on the case, or debt on simple contract, or for arrears of rent, must be commenced within six years after the cause of action; actions of assault, menace, imprisonment, and the like, are limited to four, and actions on the case for *verbal* slander to two. But the right of action, in the case of debt, may be revived by an express acknowledgment on the part of the debtor.

LIMO'GES ENAM'EL, a species of enamel practised at Limoges, in France, in the fifteenth century. In the time of Francis I, Leonard Limousin was the most celebrated practiser of the art; and John Landin, in the reign of Henry IV. One of the peculiarities of Limoges enamelling was the use of a transparent colour with small globules having the effect of gems.

LIM'PET, the common name of molluscs with low, conical, univalve shells, belonging to the genus *Patella*. Three species are found adhering to rocks and stones on our coasts.

LINE (*linea: Lat.*), in Geometry, a quantity having length without breadth or thickness. Lines are either *curves* or *right lines*.——LINES, in Fortification, whatever is placed on the surface of the field, as a trench, a row of gabions, &c. They are most commonly made to shut up an avenue or entrance to some place, and are distinguished into *lines of approach*, of *defence*, of *communication*, &c.——LINE, in Genealogy, a series or succession of relations, from a common progenitor.——A SHIP OF THE LINE, in Naval affairs, any vessel of war large enough to be drawn up in the line of battle; that is, having not less than two decks.——TROOPS OF THE LINE, in Military affairs, regular troops, in distinction from the militia, volunteers, &c.——MERIDIAN LINE, in Geography, an imaginary line drawn through the two poles of the earth and any part of its surface, being part of a great circle of the sphere.

LIN'EAR (*linearis*, pertaining to a line: *Lat.*), in Botany, an epithet for a leaf of the same breadth throughout, except at the extremities.——LINEAR NUMBERS, in Mathematics, such as have relation to length only: thus, a number which represents one side of a plane figure. If the plane figure be a square, the linear number is called a *root*.

LIN'EN (*linon*, lawn: *Fr.*), cloth made of flax. In common linen, the warp and woof cross each other at right angles; if figures are woven in, it is called *damask*. The species of goods which come under the denomination of linen, are table-cloths, sheeting, cambric, lawn, shirting, towels, &c. The chief countries in which linens are manufactured are Russia, Germany, Switzerland, Holland, Scotland, and Ireland. In the middle ages, linen and woollen cloth formed the only materials for dress; and fine linen was held in very high estimation. In more ancient times, linen formed the dress of the Egyptian priests, who wore it at all their religious ceremonies.

LING (*linghe: Dut.*), the *Molva vulgaris* of ichthyologists, a fish allied to the cod, which inhabits the northern seas. The ling deposits its spawn in June, and is in perfection from February to May. It is salted in great quantities, both for exportation and home consumption.

LIN'GUA FRAN'CA, the dialect spoken along the European and African coast of the Mediterranean. It is a corrupt Italian, mingled with other languages.

LIN'IMENT (*linimentum*, from *linio*, I besmear: *Lat.*), in Medicine, a semi-fluid ointment, or a saponaceous compound, used for rubbing on painful joints. Also, spirituous and other stimulating applications, employed externally.

LINNÆ'AN SYS'TEM, a scientific arrangement of all natural objects, as animals, plants, and minerals, into three kingdoms, subdivided into classes, orders, genera, and species, with a description of their generic and specific characters. It received this appellation from Charles Linné (Latinized Linnæus), the celebrated Swedish naturalist. [See a sketch of the life of LINNÆUS, in the *Biographical Treasury*.]

LIN'NET (*linot: Fr.*; from *linaria: Lat.*), the *Linota cannabina* of ornithologists, a singing bird of the finch family.

LIN'SEED (*lein*, flax: *Ger.*), the seed of the flax plant. It yields, by pressure, a large quantity of oil which when purified forms excellent lamp-oil.

LIN'SEY WOOL'SEY, cloth made of linen and wool mixed together.

LINT (*linteus*, made of linen: *Lat.*), in Surgery, linen scraped into a soft woolly substance, fit for applying to wounds, either simply, or when covered with unctuous substances. It was formerly made by hand, but it is now made by machinery.

LIN'TEL, in Architecture, a piece of timber that lies horizontally over doorposts and window-jambs.

LI'NUM (*Lat.*; from *linon: Gr.*), in Botany, a genus of plants, nat. order *Linaceæ*, containing the flax-plant. [See FLAX.]

LI'ON (*Fr.*; from *leo: Lat.*), a quadruped of the genus *Leo*, strong, fierce, and rapacious; sometimes called the king of beasts, from its combined activity, strength, and majesty of deportment. Lions are now found only in unfrequented parts of Asia and Africa. They are about eight feet from the nose to the rump, and have a tail about four feet; their colour is a pale brown, or tawny yellow, and the male has a bushy mane. The male of the species known as *Leo Goojratensis* is however without a mane. The lion of Africa is the finest and most ferocious of the genus. Their muscular strength is prodigious; their roar and fierceness terrible; but, when brought up tame, and unused to attack and defence, they allow their keepers to play with them, and are often kind to small animals placed in their dens. From the earliest times this animal has been celebrated for grateful affection, dauntless courage, and merciful forbearance; but modern naturalists deny him all these excellent qualities. The lioness brings forth from three to four cubs at a birth; and suckles them for a year, at which time their colour is a mixture of reddish and grey, with a number of brown bands. The male attains maturity in seven, and the female in six years. The strength of the lion is such, that a single blow from his paw is sufficient to destroy most animals.

LI'ONCEL (*Fr.*), in Heraldry, a small lion; the term by which lions are blazoned, when there are several in one escutcheon.

LIP'OGRAM (*leipo*, I omit; and *gramma*, a letter: *Gr.*), a writing in which some one letter is wholly omitted.

LIPPITU'DO (*Lat.*, from *lippus*, blear-eyed), in Medicine, the disease called *blear-eyes.* It consists in a puriform exudation from the margin of the eyelids, which often causes them to adhere together after sleep.

LIQUEFAC'TION (*liquefacio*, I cause to melt: *Lat.*), in Chemistry, the conversion of a solid into a liquid, by the sole agency of heat.

LIQUEUR' (*Fr.*), a name for various agreeable spirituous drinks, in which some aromatic infusion generally predominates and gives to it a name. Some are simple *liqueurs*, as *noyau*, anise-water, &c. Others have more saccharine and spirituous matter, as the *anisette, curaçoa*, &c. And a third kind are the creams, or superfine liqueurs, such as *rosoglio, maraschino*, &c.

LIQ'UID (*liquidus*, liquid: *Lat.*). Fluids have been divided into two classes: *elastic*, and *non-elastic*—or those which do not sensibly diminish in bulk when subjected to pressure. The first class are airs or gases, the second liquids: hence we may define a *liquid* to be a fluid not sensibly elastic, the parts of which yield to the least pressure, and move easily on each other.——In Grammar, a letter which has a smooth flowing sound, or which is easily pronounced after a mute; *l, m, n*, and *r*, are liquids.

LIQ'UORICE, the inspissated juice of the rhizomes or underground stems of two leguminous plants belonging to the genus *Glycyrrhiza*, cultivated in Spain, Sicily, and Calabria. It is frequently called Spanish juice, and is much used as a demulcent pectoral. A large quantity is used by brewers and tobacco manufacturers. About 1400 tons are annually imported into this country.

LIST (*lice: Fr.*), in Archæology, the enclosure within which knights held their jousts and tournaments. Hence, *to enter the lists* is to engage in any contest.

LIT'ANY (*litaneia*, from *litaneuo*, I pray: *Gr.*), a solemn form of supplication to God. Roman Catholic litanies are either addressed to a number of saints, who are successively invoked, as in the litany of the saints, or to a particular saint.

LIT'ERATES, in Ecclesiastical affairs, a name given to those who are admitted to ordination by the bishop, without having taken a university degree.

LITERA'TI (*Lat.*), in general, denotes men of learning.——In Antiquity, those who were branded with any letters by way of ignominy.

LIT'ERATURE (*literatura: Lat.*), in a general sense, comprehends all human knowledge preserved in writing. In a more usual sense, it excludes positive science; in a still more limited sense, it comprises only what is known by the term *Belles lettres* [which see]. In some cases, it has a peculiar meaning: thus, the phrase, 'literature of the middle ages,' means the aggregate of works written during the middle ages; 'medical literature,' whatever of note has been written on medicine; &c.

LITH'ARGE (*lithos*, a stone; and *arguros*, silver: *Gr.*—from being obtained in purifying silver), in Chemistry, impure protoxide of lead which has been fused.

LITH'IA (*lithos*, a stone: *Gr.*), an alkali, found in a mineral called petalite, of which the basis is a metal called *lithium*.

LITHI'ASIS (*Gr.*, from same), in Medicine, stone in the bladder or kidney.

LITH'IC A'CID (same *deriv.*), *uric* acid, the substance which constitutes the most common kind of urinary calculus.

LITH'IUM is a very sparingly distributed metal, obtainable from the fused chloride by electrolysis. It is the lightest element in nature, and floats upon every liquid; its specific gravity being only 0·59, that is about half as heavy as water. It is white and lustrous, but rapidly oxidises on contact with the air. It is so soft that it may be squeezed between the fingers. Heated to redness in the air, it takes fire and burns with a brilliant white flame. At 324° F. it melts, and volatilizes at a higher temperature.

LITH'OCARP (*lithos*, a stone; and *karpos*, fruit: *Gr.*), petrified or fossil fruit.

LITHOCHRO'MICS (*lithos*, a stone; and *chrōma*, colour: *Gr.*), the art or process of painting in oil upon stone, and of taking impressions on canvas; an ingenious invention of a French artist. It was afterwards improved upon by Senefelder, the inventor of lithography.

LITHODEN'DRON (*lithos*, a stone; and *dendron*, a tree: *Gr.*), a name for coral, which is so called from its resembling a branch.

LITHOG'RAPHY (*lithos*, a stone; and *grapho*, I write: *Gr.*). [See ENGRAVING.]

LITHOL'OGY (*lithos*, a stone; *logos*, a discourse: *Gr.*), that branch of science which treats of rocks in their mineralogical aspect. It is sometimes termed *Petrology* (*petros*, a rock: *Gr.*).

LITHONTRIP'TICS (*lithos*, a stone; and *tribo*, I wear away or consume: *Gr.*), medicines which are supposed to have the power of preventing or dissolving *calculi* in the urinary passages.

LITHOT'OMY (*lithotomia*: from *lithos*, a stone; and *temno*, I cut: *Gr.*), in Surgery, the operation of cutting into the bladder, for the purpose of removing a calculus or stone.

LITH'OTRITE (*lithos*, a stone; and *tribo*, I wear away: *Gr.*), an instrument for breaking calculi in the bladder, and reducing them to small particles, so that, being passed with the urine, *lithotomy* may be rendered unnecessary.

LITHOT'RITY (same *deriv.*), the operation by which a calculus is broken or pulverized in the bladder.

LIT'MUS, the blue dye obtained from some lichens belonging to the genus *Roccella*, which are imported from several islands in the North Atlantic. They are sometimes called *turnsole*, and afford a dye called *archil*. The feeblest acid will redden a paper tinted blue with litmus; and hence litmus paper is a very delicate test for the presence of an acid.

LI'TRE, a French measure of capacity, being a cubic décimètre—that is, a cube, each of whose sides is 3·937 inches. It contains 61·028 cubic inches, and is therefore rather less than our imperial quart, which contains 69·3185.

LIT'URGY (*leitourgia*, from *leitourgeo*, I perform public duties: *Gr.*), a name given to those set forms of prayer which have been generally used in the Christian church. The liturgy of the church of England was composed in the year 1547, since which time it has undergone several alterations, the last of which was at the restoration of Charles II.

LIV'ER (*leber: Ger.*), in Anatomy, a large viscus, of a deep red colour, situated under the diaphragm, which secretes bile, and transmits it to the duodenum and gall-bladder. In the human body, the liver is divided into two principal lobes, of which that at the right-hand side is by far the larger. The liver also secretes starch, or a starch-like substance, which becomes converted into sugar on exposure to the air.

LIV'ERSTONE, in Mineralogy, a stone or species of earth of the barytic genus, of a grey or brown colour, which, when red-hot, emits the smell of an alkaline sulphuret.

LIV'ERY (*livrer*, to deliver: *Fr.*), a suit of clothes made of different colours and with trimmings. It serves to distinguish the servants of various families of rank. At tournaments, the cavaliers wore the livery of their mistresses; and persons of rank formerly gave liveries to persons not connected with their household, to engage them in their quarrels.——LIVERY OF SEISIN, in Law, signifies delivering the possession of lands, &c., to him who has a right to them. This was formerly indispensable to the creation or transfer of a freehold estate.

LIV'ERYMAN, a freeman of the city of London, admitted member of some one of the ninety-one city companies, by which he enjoys certain privileges. The common council, sheriff, and other superior officers of the city are elected from among the liverymen; who are so called because entitled to wear the livery of their respective companies.

LIV'ERWORT, the popular name of some cryptogamic plants which grow in damp places in all parts of the world. They belong to the natural order *Hepaticæ*; they have been employed in liver complaints (hence the name), but they are now believed to be inert.

LIXIVIA'TION (from next), in Chemistry, the process of extracting alkaline salts from ashes, by pouring upon them water, which, in passing through them, dissolves out the salts.

LIXIV'IUM (a lye to wash with: *Lat.*), in Chemistry, *lye*; water impregnated with alkaline salts dissolved out from wood ashes.

LIZ'ARD (*lizarde: Fr.*). [See LACERTA.]

LLA'MA, in Zoology, a genus of South American mammals belonging to the family of camels. There are two wild species, and two species or varieties in a state of domestication. Of the former, the *Guanaco* (*L. guanacus*), inhabits the plains in the temperate part of South America; whilst the *Vicuña* (*L. vicugna*) frequents the Andes. The former is an elegant animal, with a long slender neck and fine legs, living in small herds of from six to thirty in a herd. It is wild and wary, but falls a prey in large numbers to the Indians and the puma. Of the domesticated forms, the *llama* has whitish hair and long legs, whilst the *alpaca* has blackish hair and short legs The fine silky hair of the latter has been largely imported of late years and manufactured into a textile fabric. Living animals have been conveyed to Australia, where it is proposed to breed them.

LLOYDS', an association of underwriters (or insurers of ships), shipowners, and merchants, who are established at the Royal Exchange, London. They have agents all over the world, who forward to head quarters the earliest news of the departure, the arrival, the loss or damage of vessels. There are about 1900 subscribers who pay an entrance fee of 25 guineas, and an annual subscription of 4 guineas. If underwriters or insurance brokers, the subscription is 10 guineas. The management is vested in a committee of nine members. The name originated in the fact of a man, called Lloyd, keeping a coffee-house, at which persons connected with shipping were in the habit of meeting. 'Lloyd's Register of British and Foreign Shipping' is a distinct association, the object of which is to ascertain the character and condition of ships by the examination of competent persons.

LOAD, a name given by traders to quantities of various articles: thus, a load of unhewn timber consists of 40 cubic feet; a load of squared timber 50 cubic feet; a load of inch boards 600 square feet; a load of bricks 500; a load of lime 32 bushels; a load of sand 36 bushels.

LOAD'STONE (*lædan*, to lead: *Sax.* It is more correctly spelled *lodestone*), magnetic iron ore. It is usually in the state of an oxide.

LO'AMY SOIL (*laam*, loam: *Sax.*), a soil in which alumina, called *clay* by the agriculturist, prevails. It is heavy or light, as the alumina is in larger or smaller quantity. Generally speaking, loamy soils are more productive than sand or chalk, but in every case much depends on the subsoil.

LOAN (*hlan: Sax.*), a sum of money lent to another, generally on the security of a promissory note or bond, the guarantee of a third party; or the possession or assignment of property by *bill of sale*. Sometimes it is effected by governments on the pledge of certain taxes set apart to pay the interest; this is called a *public loan*. The practice of borrowing money to defray the extraordinary expenses in time of war, which has been adopted in Great Britian for some time past, has given rise to the *national debt* [which see]. Where there is a well-founded system of credit, statesmen think it most advantageous to guarantee the regular payment of the stipulated interest, and leave the payment of the capital at the pleasure of the state; which is called the *funding system*.

LOBE (*lobus: Lat.*), in Anatomy, any fleshy protuberant part, as the lobes of the lungs, lobes of the ears, &c.——*Lobed* or *lobate*, divided into parts distant from each other, with convex margins.

LOB'STER (*Sax.*), a well-known crustacean, the *Homarus vulgaris* of naturalists. When fresh from the water, the shell is of a blue colour, but it turns red on being boiled. It is said that the lobster is in the habit of casting its claws, when alarmed by a violent thunderstorm or the firing of cannon. On being seized by one of its legs, it will throw it off and make its escape, leaving the limb behind Immense quantities, probably 800,000 lobsters, are annually brought into the London market, and as many as 25,000 have arrived in one day; the major part are taken on the coast of Norway. Two other crustaceans are called Lobster; these are the Spiny Lobster, (*Palinurus vulgaris*), and the Norway Lobster (*Nephrops norvegicus*), but neither is so much esteemed as the common lobster.

LO'CAL (*localis: Lat.*), pertaining to a fixed or limited portion of space.——LOCAL ACTIONS, in Law, such as must be brought in the particular county where the cause arises.——LOCAL COLOURS, in Painting, such as are natural and proper for each object in a picture.——LOCAL MEDICINES, those destined to act upon particular parts. ——LOCAL MILITIA, a temporary armed force, embodied for the defence of the country, and required to serve only within certain limits.—LOCAL PROBLEM, in Mathematics, that which admits of innumerable solutions.

LOCK (*loc: Sax.*), a piece of mechanism, requiring much art and nicety in contriving and varying its springs, bolts, and different parts, according to the uses for which it is intended. **Locks** are of various forms, but the principle on which they are all constructed is the application of a lever (the key) to an interior bolt, by means of a communication from without; and the security of locks depends upon the impediments (*wards*) which may be interposed betwixt this lever and the bolt, and the impediments to the movement of the bolt (*tumblers, &c.*), which are to be thrown out of action by the key. Locks are known to be of great antiquity, because sculptures of what are similar to those now used in Egypt have been discovered on the great temple of Karnac, whence Denon infers they were known in Egypt about four thousand years since. Abundance of ancient keys, some of them esembling many used in the present day, may be seen at the British Museum.——LOCK, the barrier or works of a canal, which confine the water where the change of level takes place; it is furnished with gates at each end, which separate the higher from the lower level. When a boat passes up the canal, the lower gates are opened, and the boat passes into the lock, after which the gates are shut. A sluice, communicating with the upper part of the canal, is then opened, and the lock rapidly fills with water, elevating the boat on its surface. As soon as the lock is filled to the highest water-level, the upper gates are opened, and the boat, being now on the level of the upper part of the canal, passes on its way. The reverse of this process is performed when the boat is descending the canal. The amount of elevation and descent made by the locks of a canal is termed the *lockage*.

LOCOMO'TION (*loci motio*, change of place: *Lat.*), the art or power of moving from place to place. The chief obstacles which oppose locomotion, or change of place, are gravity and friction, and the various kinds of mechanism which are intended to assist locomotion are contrivances for obviating the effects of these. No piece of inert mechanism is so favourably adapted as the wheel carriage, for moving weights over the common ground, with its ordinary asperities and inequalities of substance and structure.

LOCOMO'TIVE (same *deriv.*), or LOCOMO'TIVE EN'GINE, a steam-engine, which moves itself, at the will of the person in charge of it; being either attached to a wagon or carriage inseparably, or capable of connection with the carriage or train of carriages intended to be drawn by it. The former is the arrangement when the machine is designed for ordinary roads; the latter when for railways. The first locomotive was used in 1804, at Merthyr-Tydvil, and was in many respects like those employed at present. Engineers, in the infancy of steam locomotion, were firmly impressed with the idea that an engine could not be made to progress, by mere friction, between the wheels and the rails; they believed that, in all cases, the wheels would revolve without causing progressive motion, as in practice they are found to do when the rails have been rendered extremely slippery by frost or rain. Hence they invented many most ingenious but unnecessary contrivances to overcome a difficulty which existed only in their own imaginations. Locomotive engines consist essentially of a boiler, cylinders, excentrics, cranks, &c. The *boiler* is a cylinder about 12 feet long, placed on its side, having a *fire-box* at one end and a *smoke-box* at the other, the smoke-box leading into the chimney. The fire and smoke boxes are connected by means of about 300 brass tubes, of 2¼ inches external diameter. The smoke and heated air pass through these, and communicate a vast quantity of caloric to the water in which they are immersed; and the *heating surface*, which is increased also by the fire-box being surrounded with water, may amount altogether to about 2000 square feet, 150 of which are due to the fire-box. A *steam* dome, placed on the upper part of the boiler, affords a space in which the steam deposits the particles of water with which it becomes mechanically mixed by the violent ebullition; and thus the introduction of water along with the steam into the cylinders, technically termed *priming*, is prevented. Priming is highly mischievous, and sometimes causes the bottom to be knocked out of a cylinder, or the piston-rod to be bent. As a fly-wheel to regulate the motion, or carry a crank over the *dead points*, is inadmissible, two cylinders at least are required, and that number is rarely exceeded. Their pistons sometimes act on the driving wheels, and sometimes on the axle belonging to the latter. The driving wheels are about eight feet in diameter. That each piston may be capable either of a direct or reverse action on its crank—that is, that the train may be moved with equal facility in either direction—there is a pair of excentrics for each cylinder, each pair being so connected with its own slide valve, by means of what is called the *link motion*, that either excentric can be made instantaneously to act on the valve, by means of a handle, the other excentric being by the same movement thrown out of action; and the same handle regulates the link motions of both the cylinders simultaneously, so that both engines (for a locomotive really consists of two engines) are sent forward or reverse by the same act of the driver. The steam is turned on or off by the *regulator*, which consists of two circular plates fixed in the end of a pipe which is within the boiler and which forms a communication between the steam space of the boiler and the cylinders, these plates have apertures which, when they are brought into correspondence—by turning a handle—allow the steam to pass from the boiler to the cylinders, but when the solid parts of one close the apertures in the other, the steam is intercepted. The boiler is supplied with water by two *force-pumps*, worked in the usual way, or by *injectors*, a self regulating contrivance now very commonly used. The *waste* steam is turned into the chimney, where, by the rarefaction it causes, it increases the draught, and just in proportion as it is required to be effective. The whole is placed on six wheels, and a tender with fuel and water is either attached to or drawn after it. This fuel is, in these countries, coke, or a mixture of coke and coal; in some parts of Europe, and most parts of America, it is wood, which, not giving so hot a fire, does not allow such speed. A constant supply of oil is conveyed to all parts of the machinery, for the purpose of lubrication, by very simple contrivances. When the locomotive is intended to move a heavy load, engineers do not depend on the friction between only the *driving* wheels and the rails, but unite these wheels with others by means of bars. A powerful engine with its water will weigh about 36 tons; it will evaporate about 350 cubic feet of that fluid in an hour, and will convey a load of about 230 tons at a speed of 40 miles an hour. Attempts have been made to introduce locomotives on ordinary roads. But, from the complication, unavoidable delicacy, and therefore costliness of the machinery—on account of the injury done to it by the shaking and concussions—and from the serious obstacles presented by ruts and slight acclivities, it has not yet been found possible to work them to any extent with punctuality and economy. They are found, however, to answer well, in certain cases, for drawing heavy loads.

LOC'ULAMENT (*loculamentum*, a receptacle: *Lat.*), in Botany, the cell of a pericarp in which the seed is lodged. Thus we say of a pericarp, it is *unilocular*, *bilocular*, &c.

LO'CUM TE'NENS (holding a place: *Lat.*), a deputy or substitute; one who supplies the place of another, or executes his office.

LO'CUS (a place: *Lat.*), in Geometrical Analysis, the line traced by a point, which varies its position according to some determinate law. When the *locus* was a straight line or a circle, the ancient geometers termed it *plane*; but, when it was one of the conic sections, *solid*. The moderns distinguish *loci* into orders, according to the dimensions of the algebraic equations by which they are represented.——LOCUS IN QUO, in Law, the place where anything is alleged to be done, in pleadings, &c.——LOCUS PARTITUS, a division made between two towns or counties, to determine where any land or place in question lies.

LO'CUST (*locusta*: *Lat.*), a voracious insect, somewhat resembling the common grasshopper. The common European species is the *Locusta migratoria* of entomologists, placed by them in a family of orthopterous insects, belonging to the section *Saltatoria* (*salto*, I leap: *Lat.*), or those furnished with hind legs formed for leaping. Locusts are at times so numerous in Africa and the south of Asia, that they do immense injury to vegetation, literally devouring every thing green; and when they migrate they fly in clouds, darkening the air by their numbers. Happily for mankind, this calamity is not frequently repeated, for it is the inevitable precursor of famine and its horrible accompaniments. Even when dead, they are still productive of evil consequences; since the putrefaction which arises from their inconceivable number is so great, that it is justly regarded as one of those desolating pestilences which almost depopulate whole districts of country. Sometimes, though not often, they appear in Europe, and produce the same effects. In the year 591, an army of unusually large locusts ravaged Italy; and being at last cast into the sea (as seems for the most part to be their fate), a pestilence, it is alleged, arose from their stench, which carried off vast multitudes of men and beasts. In the Venetian territory, likewise, in 1478, more than 30,000 persons are said to have perished in a famine chiefly occasioned by the depredations of locusts. In Barrow's Travels it is stated, that in Southern Africa the whole surface of the ground might literally be said to be covered with them for an area of 2000 square miles. The water of a very wide river was scarcely visible on account of their dead bodies that floated on the surface. The larvæ are much more voracious than the perfect insects; and when they are on a march during the day, it is utterly impossible to alter the direction in which they move, which is generally with the wind. Much controversy has arisen regarding the 'locusts and wild honey,' which were the food of John the Baptist in the wilderness. But wild honey is found in the clefts of the rocks of Judæa as abundantly as in the caves of Hindustan. And if we refer to the book of Leviticus (xi. 22), we shall find that locusts constituted a common food among the Jews; the different kinds which they were permitted to eat being there specified.

LO'CUST-TREE, the *Hymenæa Courbaril* of Linnæus. It belongs to the *Leguminosæ*, and is distinguished no less for its valuable wood than for the beauty of its foliage and its fragrant white flowers. The leaves are pinnate, and the leaflets very thin and smooth. The wood is compact, hard, capable of receiving a fine polish, and has the property of resisting decay longer than almost any other. It grows very rapidly in the south-western states of America, sometimes reaching to the height of eighty feet.

LODE (*lædan*, to lead: *Sax.*), among miners, a metallic vein; or any regular vein or course, whether metallic or not. Those lodes which contain the ores of metals are said by the miners to be *alive*, but those which contain only stony matters are called *dead lodes*.

LODGED (*loger*, to dwell: *Fr.*), in Heraldry, a term for a buck, hart, &c., when lying on the ground; answering to *couchant*, which is applied to a lion or other beast of prey.

LODG'MENT (*logement*: *Fr.*), in Military affairs, a work raised with earth, gabions, fascines, &c., to cover the besiegers from the enemy's fire, and to prevent their losing a place which they have gained, and are resolved, if possible, to keep.

LOG (*lock*: *Ger.*), in Navigation, usually a piece of board, forming usually the quadrant of a circle of five or six inches radius; it is about a quarter of an inch thick, and so balanced with lead nailed to the circular part, that it floats perpendicularly, with about two-thirds immersed. The *log-line* is a thin cord, one end of which is fastened to the log, and the other is wound round a reel in the gallery of the ship. The log thus poised keeps its place in the water, while the cord is unwound from the reel by the motion of the vessel. The velocity of the latter is known by the number of knots on the line run out while the glass is running down [see KNOT]. There are other kinds of log, but their principle and mode of use are similar.——LOG-BOARD, two boards shutting like a book, and divided into columns, for the hours of the day and night, the direction of the wind, the course of the ship, &c., in which an account of the ship's way is marked.——LOG-BOOK, the book into which the contents of the log-board are transcribed.——LOG-REEL, a reel in the gallery of a ship, on which the log-line is wound.

LOGARITH'MIC, or LOGIS'TIC, an epithet for a peculiar curve. It is so called from its utility in explaining and constructing logarithms, on account of its ordinates being in geometrical progression.

LOG'ARITHMS (*logos*, proportion; and *arithmos*, number: *Gr.*), the *exponents* of a series of powers and roots. When the logarithms form a series of numbers in arithmetical progression, the corresponding natural numbers form a series in geometrical progression. Thus,

Arithmetical: 0, 1, 2, 3, 4, 5, 6, &c.
Geometrical: 0, 2, 4, 8, 16, 32, 64, &c.

The terms of the arithmetical progression show what powers of the root (in this case 2) will be equal to the corresponding terms in the geometrical. Thus 4 is the *second* power of 2; 32 the *fifth* power, &c. The upper line, therefore, contains the logarithms of the lower; and logarithmic tables furnish the decimals corresponding to the intermediate numbers in the lower line. A table of logarithms of all numbers, to a certain limit, made according to an assumed root, or *base*, is called a *logarithmic system*. The most common is that of Briggs, in which the base is 10; hence 1 is the logarithm of 10, 2 of 100, 3 of 1000, 4 of 10,000, &c.; and the logarithms of the intermediate numbers are of intermediate values. The use of logarithms in trigonometry was discovered by John Napier, a Scottish baron, and made known by him in a work published at Edinburgh in 1614. Logarithmic tables are of great value, not only in trigonometry, astronomy, &c., but to all who have to make calculations with large numbers. For, to multiply numbers, we add their logarithms; to divide them, we subtract their logarithms; to raise them to powers, we multiply their logarithms by the exponents of the powers; and to extract any roots, we divide their logarithms by the exponents of the roots. [See EXPONENT.] Logarithms belonging to any one system—that is, belonging to a system having any given base—may be changed into those of any other system by means of a constant factor.

LO'GIC (*logikos*, belonging to the reason: *Gr.*) has been variously defined. Whately says it is the science as well as the art of reasoning. John Mill defines it as the science of the operations of the understanding, which are subservient to the estimation of evidence; that it is both the process itself of proceeding from known truths to unknown, and all intellectual operations auxiliary to this. Other writers restrict logic within much narrower limits, and define it as the science of the necessary laws of thinking. In this last sense reasoning is confined to what is termed ratiocination, a form of inference of which the syllogism is the general type. So understood, logic owes its first exposition to the master mind of Aristotle. All syllogistic reasoning supposes two propositions, called *premises*—both expressed, or one expressed and the other understood—from which the conclusion to be arrived at is deduced. In many cases, it is evident that, if the premises be true, the conclusion drawn from them must be true also; but in many others, the premises may be true, and yet the conclusion be false. In the former there is, but in the latter there is not, a necessary connection between the premises and the conclusion. 'Every man is an animal; John is a man; therefore John is an animal,' is correct reasoning. 'Every man is an animal; an angel is not a man; therefore an angel is not an animal,' is incorrect reasoning: the conclusion may be true, but it does not follow from the premises. This will be more evident from another example:—'Every man is an animal; a horse is not a man; therefore a horse is not an animal.' Here the conclusion is false, though it follows just as much from the premises as the former. Every proposition either affirms or denies something; hence propositions are either *affirmative* or *negative*. Every proposition either affirms or denies something regarding an entire class, or regarding some member or members of it; hence propositions are either *universal* or *particular*. [See ENTHYMEME, SYLLOGISM, &c.]

LOGOG'RAPHY (*logos*, a word; and *grapho*, I write: *Gr.*), a mode of printing in which the types form whole words instead of letters. By this method, the process of composing would seem to proceed with more expedition and less liability to err. It has been used to a certain extent, but the plan never came into general use, and it has long since been abandoned altogether, from an idea that more time was lost than gained by it.——Also a system of reporting, adopted during the French revolution, and intended to supersede short-hand writing; but it was not found to answer so well. Twelve or fourteen reporters being seated round a table, the first took down the first three or four words, and touched his neighbour, who took down the next three or four words, and touched his neighbour, who did the same; and thus the process continued to go round until the speech was ended. When the slips were filled, and placed parallel to each other, they formed a page.

LOG'OGRIPH (*logos*, a word; and *griphos*, a fishing-net: *Gr.*), a kind of riddle, which consists in some elision or mutilation of words; being of a nature between an enigma and a rebus.

LOG'WOOD, an important article of commerce, much used in the arts, is derived from a low, crooked, prickly tree, found in great plenty at Campeachy, in the bay of Honduras, and denominated *Hæmatoxylon Campechianum*, nat. order *Leguminosæ*. It is very dense and firm in its texture, exceedingly heavy, so as to sink in water, of a deep red colour, and capable of receiving a fine polish. It yields its colour both to spirituous and watery menstrua, but more readily to the former. Acids render its decoction brighter and paler; alkalis give it a purplish or violet colour; the salts of iron make it a dark violet blue; gelatine forms with it a reddish precipitate. In 1857, 39,568 tons were imported, the value of which was 236,080*l.*

LOINS (*longe*: *Fr.*), in Anatomy, the two lateral portions of the umbilical region of the abdomen; or the space on each side of the vertebræ, between the lowest of the false ribs and the upper part of the haunch-bone: called also the *reins*.

LOL'LARDS (*lallen*, to sing in a low murmuring tone; and the common affix *hard*; *Ger.*), a sect of early Reformers in Germany and England, the followers of Wickliffe. The name was originally given to a class of persons in Germany and the Netherlands, who, in the 14th century, undertook spiritual offices in behalf of the sick and the dead, and were greatly beloved by the people, who had become alienated from the secular and regular clergy, on account of their indifference and neglect.

LOM'BARDS, a name formerly given to bankers, because the people of Lombardy first followed this branch of commerce. Hence the name of *Lombard Street*, so long noted for its numerous banking houses.

LOMENTA'CEÆ, in Botany, a division of the cruciferous order, formed of plants having seed-vessels, which divide transversely into single seeded cells.

LOMENT'UM (bean meal: *Lat.*), in Botany, a legume which does not open at the sutures, but divides transversely into one-seeded portions, as in the genera *Ornithopus* and *Coronilla*.

LON'DON CLAY, a member of the Lower Eocene formation, consisting of a very tenacious clay, usually of a blueish-grey colour. In the valley of the Thames it has a maximum thickness of about 480 feet. It is supposed to have slowly accumulated at the bottom of a deep ocean, but in the neighbourhood of land. The fossils bespeak a warm climate. They consist of the bones of elephants, reptiles, and fish, about 150 species of shells, and many fruits and seeds. A large part of London, both north and south of the river, is built upon this clay. It composes the greater part of Highgate Hill, and Shooters Hill.

LONGEV'ITY (*longævus*, aged: *Lat.*), length or duration of life; generally designating great length of life. Confining ourselves to modern times, the evidence in support of statements as to extraordinary length of life is scanty. Henry Jenkins is said to have lived to the age of 169 years, the Countess of Desmond to 148, and Thomas Parr to 152. Dr. Van Oven has given seventeen instances of lives alleged to exceed 150 years. Physiologists have often speculated upon the possibility of extending the span of human existence much beyond the present average, and it has been confidently asserted that one hundred years is the natural extent of the life of man. Presuming a healthy constitution to begin with, and the non-occurrence of injurious accidents, four general conditions are required to the attainment of long life, viz. good air, to oxygenate the blood; a sufficient amount of aliment to supply waste, but not more than is needed; and a proper amount of exercise for body and mind.

LONGIM'ETRY (*longus*, long: *Lat.*; and *metron*, a measure: *Gr.*), the art of measuring lengths or distances, both accessible and inaccessible.

LON'GITUDE (*longitudo*, length: *Lat.*), in Geography, the distance in degrees of any place from a first meridian, as that of Greenwich, taken east or west. These degrees diminish in actual length as the pole is approached, a degree of longitude at the equator being 69·1 miles; at latitude 10° but 68·1; at 20° but 65·0; at 40° but 53·05; at 50° but 44·54; and at 60° but 34·66, &c. The British parliament, in 1714, offered a reward of 20,000*l.* for an accurate method of finding the longitude at sea, within one-half of a degree; but this act was repealed in 1828. Chronometers are now made with extraordinary accuracy, and have sometimes been used for the determination of longitude upon land, as well as at sea, with great success; but, nevertheless, astronomical observations furnish the most exact methods of obtaining it.——LONGITUDE, in Astronomy, an arc of the ecliptic intercepted between the beginning of Aries and the point of the ecliptic cut by the circle of longitude belonging to any star. The longitude of a star is found by means of its right ascension and declination.

LONG-PRIM'ER, the name of a printing type, somewhat larger than is generally used for a newspaper, being between bourgeois and small-pica.

LONICE'RA, in Botany, a genus of plants, nat. ord. *Caprifoliaceæ*, including some of the species of honeysuckle. The wild English species of honeysuckle, however, belong to the genus *Caprifolium*. The *Lonicera grata*, or evergreen honeysuckle, is the most beautiful of that genus: it grows without any culture in North America; and has strong branches, covered with a purple bark, which are ornamented with bright green leaves embracing the stalks, and continuing their verdure all the year. The flowers are powerfully aromatic; they first appear in June, and then, in a constant succession, till the frost commences.

LOOK'ING-GLASS. [See MIRROR.]

LOOM, a frame of wood or metal, by which the process of weaving is performed.——The words *loom* (*leoman*, to loom, or appear at sea: *Sax.*) and *looming* are also used to express what we understand by the term *mirage*. Thus, when a ship, seen at a distance, appears larger than it really is, and indistinct, it is said she *looms*; of a mountain, under similar circumstances, it is said *the land looms high*.

LOOM'-GALE, a gentle gale, in which a ship can carry her topsails atrip.

LOOP'HOLES, in Fortification, small holes in the walls of a castle, &c., through which arrows were discharged.——In a ship, small apertures in the bulkhead, and other parts of a merchant ship, through which small arms are fired at an enemy.

LORD (*hlaford*, a ruler: from *hlaf*, a loaf; and *ford*, to give: *Sax.*), a title of courtesy given to all British and Irish noblemen, from the *baron* upwards; to the eldest sons of earls; to all the sons of marquises and dukes (see COURTESY TITLES); and, as an honorary title, to certain official characters; as the *lord* mayor of London, the *lord* chamberlain of the king's household, the *lord* chancellor, the *lord* chief justice, &c. *Lord* is also a general term, equivalent to *peer*.——LORD, in Law, one who possesses a *fee* or *manor*. This is the primitive meaning of the word; and it was in right of their fiefs that, originally, *lords* sat in parliament.——In Scripture, a name for the Supreme Being. When LORD, in the Old Testament, is printed in capitals, it is the translation of the Hebrew word for JEHOVAH. It is also applied to Christ, to the Holy Spirit, to kings, and to prophets.

LORDS, HOUSE OF, is composed of the peers of England, of Great Britain, and of the United Kingdom; of the 16 representative peers (but not the other peers) of Scotland; of the 28 representative peers (but not the other peers) of Ireland; and of the lords spiritual, who consist of 2 English archbishops and 24 bishops, and 4 representative Irish bishops. Lord Redesdale, writing of the peerage, describes that body first, as possessing individually titles of honour giving them respectively rank and precedence; secondly, as being individually hereditary counsellors of the crown; thirdly, as being collectively (together with the spiritual lords) when not assembled in parliament, the permanent council of the crown; fourthly, as being also collectively (together with the spiritual lords), when assembled in parliament, a court of judicature [see APPEAL]; and fifthly, as having for a long time formed, with the Commons, when convened in parliament, the Legislative Assembly of the kingdom, by whose advice, consent, and authority, with the sanction of the Crown, all laws have been made. Three lords of parliament, whether spiritual or temporal, are sufficient to constitute the house. The Lord Chancellor is *ex officio* speaker of the house, and takes his seat on the woolsack when the house is sitting. A peer cannot take his seat until he is 21 years old, nor until he has taken certain oaths. In voting the peers say 'Content' or 'Not content.' The House of Lords is the tribunal for trying criminal charges against peers, and the Lords then say 'Guilty' or 'Not Guilty, on my honour.'

LORI'CA (a coat of mail: *Lat.*), in Roman Antiquity, a cuirass, brigandine, or coat of mail, which was made of leather, and set with plates of various forms, or rings like a chain.

LORICA'TION (same *deriv.*), the covering a glass or earthen vessel with a coat or crust of a matter capable of resisting the action of a strong fire and sustaining a high degree of heat.

LOR'IMER (*lorimer*: *Fr.*; from *lorum*, a thong: *Lat.*), in Archæology, a name given formerly to those who made spurs, bits, and other articles of iron for horses.

LO'RY, the popular name of birds forming the sub-family, *Loridæ*, of the parrot family. Red predominates in their plumage. Lories are docile and familiar; they very easily learn to speak, and are remarkable for their attachment to their owners.

LO'TION (*lotio*, a washing: *Lat.*), in Medicine and Pharmacy, a liquid intended for application to any external part of the body.

LOT'TERY (*loos*, a lot: *Ger.*), a scheme for the distribution of prizes by chance; or the distribution itself. The drawing of the first public lottery in England was on Jan. 11th, 1569; and, according to Stow, it continued till the 6th of May following. This took place at the west door of St. Paul's Cathedral, and the prizes consisted of a large quantity of royal plate and trinkets, the produce of which, it was stated, would be used 'for the reparation of the havens and strengths of the realm, and such other public good works;' but the proceeds, it is believed, were notwithstanding applied to private purposes. Licenses for various kinds of lotteries were granted occasionally from that period, till at length 'state lotteries' became a source of revenue to the government; and by means of them, money was raised for the British Museum, Westminster bridge, &c. But the temptations thus thrown in the way of all descriptions of persons produced evidently demoralizing effects, and many reasons were urged in parliament for their discontinuance; till at last the evils resulting from this species of gambling became so palpable, that government consented to its abolition in 1826. From the very nature of a lottery, since those who establish it propose to make more or less by it, the prizes could not be equivalent to the cost of all the tickets. A person would, therefore, certainly lose who should buy them all; and the more he should buy, the greater would be his chance of loss. In every case, the risk must exceed the chance of success.

LO'TUS (*Lat.; from lotos: Gr.*), a shrub, the fruit of which is a small farinaceous berry, of a delicious taste, which the natives of Africa make into a sweet cake.——The ancients gave the name to an herb and a tree, each differing from the plant to which we apply it. The herb is a species of *Nelumbium;* the tree lotus is supposed to be the *Rhamnus Lotus*. The former, which we are informed by Herodotus was a lily, abounding in the Nile, was that which was venerated by the Egyptians. It was also a sacred plant in India, where, from the mode of its vegetation, it was adopted as an emblem of fertility. The fruit is conjectured to be the bean which Pythagoras forbad his followers to eat. However, it is collected by the poor Egyptians, with whom it is an article of food. It was an ancient superstition that if a stranger ate this fruit he straightway forgot his own country.

LOUIS-D'OR, a French gold coin, which received its name from Louis XIII., who first coined it in 1641. The value of the old *louis-d'or* was 24 francs; that of the new *louis*, usually called a *Napoleon*, is 20 francs.

LOU'IS, ST., KNIGHTS OF, the name of a military order in France instituted by Louis XIV. in 1693.

LOUSE, the name of certain parasitic insects belonging to the order ANOPLURA. They infest man and other animals. The species of the genus *Pediculus* have six legs, two eyes, and a suctorial mouth.

LOUVRE, a palace at Paris measuring 576 feet by 538 feet, enclosing a court 394 feet square. The oldest part was erected in the time of Francis I., but the greatest portion of the existing edifice was built in the reign of Louis XIV., Perrault being the architect. It has been lately connected with the Tuileries, and the combined buildings form the most splendid pile in Paris. In the Louvre are collections of paintings, and museums of Egyptian, Greek, and Latin antiquities.

LOV'E-APPLE, or TOMATO, the fruit of the *Solanum lycopersicum*. It is so much esteemed by the Portuguese and Spaniards, that it is an ingredient in almost all their soups and sauces, and is deemed cooling and nutritive.

LOW'ER EM'PIRE, the Roman and Eastern empires, after the removal of the latter to Constantinople; and the Eastern until its fall.

LOX'IA, in Ornithology, a genus of conirostral passerine birds. The *Loxia curvirostra*, or common cross-bill, is about the size of a lark. Its favourite food consists of the seeds of the pine; and pine woods are always its principal haunts. It has the habits of a parrot; and in North America it builds on the highest firs, attaching its nest to the trunk by means of the exuded resin.

LOXODROM'IC CURVE (*loxos*, oblique; *dromos*, a course: *Gr*). [See RHUMB.]

LOZ'ENGE (*losange: Fr*), in Geometry, a quadrilateral figure, having two opposite angles acute, and two opposite obtuse.——In Heraldry, the escutcheon which is used to contain the coats of arms of all maidens and widows.——In Pharmacy, a medicine made to be kept in the mouth, and which was originally in the form of a lozenge.

LUB'BER'S HOLE (*lummel*, a lubber: *Ger.*), in a ship, the vacant space between the head of a lower mast and the edge of the top. It is so termed from a supposition that a *lubber* (a contemptuous name for one who does not know a seaman's duty) will not like to trust himself up the futtock shrouds, but will prefer that way of getting into the top.

LU'BRICATE (*lubrico*, I make slippery: *Lat.*), a word often used in Medicine, signifying to make smooth or slippery. Thus, mucilaginous and saponaceous preparations are said to *lubricate* the parts to which they are applied. It is also employed in engineering, to express the supplying of oil to machinery for the diminution of friction.

LU'CERN (*lucerne: Ger.*), the *Medicago sativa*, a well-known leguminous plant, affording one of the artificial 'grasses' of the farmer. It was highly esteemed by the ancients; and is found by the moderns most effective in nourishing and fattening cattle.

LU'CIFER (*lux*, light; and *fero*, I bring: *Lat.*), the morning star; called when an evening star, *Hesperus*. These names are now used only in poetry.

LU'CIFER MAT'CHES. The matches used for the purpose of ignition by means of a flint and steel consisted of very small pieces of wood, the ends of which were coated with sulphur. As early as 1673, a bit of sulphur wrapped in paper, and ignited by friction, was sometimes used to set fire to the sulphur match. But the earliest form of our present *lucifers* consisted in matches tipped with a composition consisting of chlorate of potash, sugar, gum, and a little vermilion. When these were dipped into a small bottle containing sulphuric acid, they instantaneously ignited. The first lucifer matches, properly so called, were tipped with a mixture containing chlorate of potash, sulphuret of antimony, and starch; and were ignited by being drawn across sand-paper. Phosphorus was then substituted for sulphuret of antimony, and nitre for chlorate of potash; which produced quiet ignition instead of detonation; and either no sulphur, or very little, was employed. The wood was split into very fine pieces by machinery; and wax taper, touch-paper, &c., were substituted in some instances for wood. The manufacture is, at present, carried on in England and Germany on a very large scale. The use of phosphorus is very injurious to the workmen, as it causes a most horrible disease of the jaws, which ends in total loss of the bone. This would be entirely prevented by employing *amorphous* phosphorus, which answers admirably for the purpose.

LUCIFE'RIANS, in Ecclesiastical History, the followers of Lucifer, bishop of Cagliari, in the 4th century; a sect which maintained the carnal nature of the soul, and that there is no place for repentance for such as fall.

LUCIM'ETER (*lux*, light: *Lat.;* and *metron*, a measure: *Gr.*), an apparatus for measuring the intensity of light proceeding from different bodies.

LUCUL'LITE, in Mineralogy, a black limestone, often polished for ornamental purposes, and said to have been first used by Lucullus, the Roman consul.

LU'DI (*Lat.*), in Antiquity, public exhibitions among the Greeks and Romans for the display of skill and the entertainment of the people. [See GAMES.]

LUFF (*luft*, the wind: *Sax.*), the foremost edge, or leach, of a fore and aft sail.——*Keep your Luff!* in Navigation, an order to the helmsman to put the tiller on the lee-side, for the purpose of making the ship sail nearer to the wind. A ship is said to *spring her luff*, when she yields to the helm by sailing nearer to the wind.——*Luff round!* the order to throw the ship's head up in the wind.——LUFF-TACKLE, a large tackle not destined for any particular place in the ship, but moveable at pleasure.

LUG'GER, a vessel carrying three masts, with a running bowsprit, upon which she sets lug-sails, and sometimes has topsails adapted to them.——LUG-SAIL, a square sail bent upon a yard that hangs obliquely to the mast at about one fourth of its length.

LUKE, ST., GOSPEL OF, a canonical book of the New Testament, distinguished for fulness, accuracy, and traces of extensive information. Some think it was properly St. Paul's, and that when the apostle speaks of his gospel, he means what is called St. Luke's. Irenæus says that St. Luke digested into writing what St. Paul preached to the gentiles; and Gregory Nazianzen tells us that St. Luke wrote with the assistance of St. Paul.

LUMBA'GO (*Lat.;* from *lumbus*, the loin: *Lat.*), in Medicine, a rheumatic affection of the muscles about the loins.

LUM'BAR RE'GION (same *deriv.*), in Anatomy, the posterior portion of the body, between the false ribs and the upper edge of the haunch-bone.

LUM'BRICAL MUS'CLES (from next), in Anatomy, certain muscles of the fingers and toes, so named from their resembling a worm.

LUM'BRICUS (*lumbricus*, an intestinal worm: *Lat.*), a genus of worms, of which the earth-worm is the type. This is sometimes nearly a foot in length, and is composed of upwards of 120 rings. The species is very abundant, and their castings constitute a rich soil.

LUMP'-FISH, or LUMP SUCKER, the *Cyclopterus Lumpus*, a thick fish having the back sharp and elevated; the belly flat, and of a crimson colour; and along the body five rows of sharp bony tubercles. The lump-fish swims edgewise, and is enabled to adhere with great force to any substance to which it attaches itself. It is frequently taken on the British coasts.

LU'NACY (*luna*, the moon: *Lat.*), the condition of an insane person who has lucid intervals; it was formerly supposed to depend on phases of the moon.——In Law, it includes all who are affected with any species of insanity supervening since birth; those born without reason being *idiots*. The sovereign is supposed to have the custody of idiots and lunatics, which he delegates to the keeper of the great seal, to whom applications for commissions of lunacy are directed. Lunatics are maintained by an allowance out of their own estate; or when they have none, in public asylums. If a criminal is acquitted of a crime, on account of his being insane at the time of its commission, he is committed to public custody.

LU'NAR CAUS'TIC, in Chemistry, *nitrate of silver* fused at a low heat.

LU'NAR DIS'TANCE, in Astronomy, the angular distance between the apparent centres of the moon and certain heavenly bodies, such as they would appear to an observer at the centre of the earth.

LU'NAR MONTH, the time required by the moon to complete a revolution about the earth, and return to the same position relatively to some celestial body, or point in space, with which her motion is compared. The proper lunar month is the same as the *lunation*, or synodic month, and is the time which elapses between two consecutive new or full moons. The *periodic* or *synodic* month is the revolution with respect to the moveable equinox, and consists of 29 days, 12 hours, 44 minutes, 2·84 seconds. The *anomalistic* month is the time in which the moon returns to the same point of her moveable elliptic orbit: its length is 27 days, 13 hours, 18 minutes, 37·4 seconds. The *sidereal* month is the interval between two successive conjunctions with the same fixed star: its length is 27 days, 7 hours, 43 minutes, 11·54 seconds. The *nodical* month is the time in which the moon makes a revolution with respect to her nodes, the line of which is moveable: its length is 27 days, 5 hours, 5 minutes, 36·6 seconds. These mean motions are subject to periodic and secular variations.

LU'NAR YEAR. [See CALENDAR.]

LUNA'TION, the time in which the moon passes through all her phases.

LUNE, or LUNU'LE (*luna*, the moon; or *lunula*, a little moon: *Lat.*), in Geometry, a plane in the form of a crescent or half-moon, enclosed by the circumferences of two circles that intersect each other.

LUNETT'E (*Fr.*), in Architecture, an aperture for the admission of light in a concave ceiling, as the upper lights of the naves of St. Peter's at Rome, and St. Paul's in London.——In Fortification, an enveloped counterguard, or elevation of earth made beyond the second ditch; or a covered place before the curtain, consisting of two faces that form an angle inwards.

LUNGS (*lunge: Ger.*), in Anatomy, two viscera situated in the chest, by means of which our blood is oxygenated. The substance of the lungs is of four kinds, viz. vesicular, vascular, bronchial, and parenchymatous. The vesicular substance is composed of the air-cells; the vascular invests those cells like a network; the bronchial is formed by the ramifications of the bronchia throughout the lungs, having the air cells at their extremities; and the spongy substance that connects these parts is termed the *parenchyma*. To the touch they are soft and elastic; and of all the organs, they have the least specific gravity. Their air-cells expose a very large surface for the purification of the blood, by means of the oxygen of the air, which is not prevented, by the interposition of their membranous coverings from uniting with the carbon of the blood.

LUNIS'TICE (*luna*, the moon; and *sto*, I stand: *Lat.*), in Astronomy, the farthest point of the moon's northing and southing, in her monthly revolutions.

LU'NULAR, or LU'NULATE (*luna*, the moon: *Lat.*), in Botany, resembling a crescent: shaped like the new moon.

LU'PINE (*lupinus: Lat.*), in Botany, a genus of leguminous plants, chiefly annuals, bearing digitate leaves and papilionaceous flowers, which are usually disposed in a terminal raceme. The legumes of some species are used as food.

LU'PULIN (*lupulus*, the hop: *Mod. Lat.*), the fine yellow powder of hops. It has a penetrating aromatic odour, and is found to consist of minute resinous grains, which attach themselves to the fingers and render them rough.

LU'PUS (a wolf: *Lat.*), in Astronomy, the *Wolf*, a constellation of the southern hemisphere.

LURCH'ER (*lurcor*, I eat voraciously: *Lat.*), a variety of the *Canis familiaris*, a dog more used by poachers than sportsmen, having a narrow body, stout legs, straight tail, and long rough hair.

LU'SIAD, The, is the only Portuguese poem that has gained a European celebrity. It was written by Luiz de Camoens, who died in 1579, the first edition having appeared seven years previously. It was entitled *Os Lusiadas*, the Lusitanians, that is, the Portuguese, the subject being the conquests of that nation in India. It is divided into ten cantos, containing 1102 stanzas, in *ottava rima*. The voyage of Vasco de Gama is described, and his proceedings in India. Three cantos are taken up with an account of Europe, Portugal, and the deeds of the Portuguese monarchs, supposed to be related by De Gama to an Indian king. The gods of the ancient mythology are introduced, aiding or opposing his designs, whilst he addresses his prayers to the God of the Christians. Nereids and syrens are introduced, whilst in other passages we have the Roman Catholic worship of the Virgin—so confused and unintelligible is the supernatural element of the poem. It has been translated into English, and into several other European languages, but it has never been popular out of Portugal.

LUSTRA'TION (*lustratio*, from *lustro*, I purify, *Lat.*), in Antiquity, a ceremony of purification which the Romans performed on their fields, armies, and people, at various times, but particularly after the numbering of the people by the census every *lustrum*, or five years.

LUS'TRE (*Fr.*), a term very generally used in modern works on mineralogy. The lustre of minerals is of five kinds: 1. *splendent*, that is, when in full daylight, it can be seen at a great distance; 2. *shining*, when at a distance the reflected light is weak; 3. *glistening*, when the lustre is only observable at no greater distance than an arm's length; 4. *glimmering*, when the surface held near the eye in full daylight presents a number of shining points; 5. *dull*, when the surface has no brilliancy.

LUS'TRUM (*Lat.*, strictly speaking, a purification of the people after the completion of a census), in Roman Antiquity, a general muster and review of all the citizens and their goods, which was performed by the censors every fifth year, and followed by a solemn *lustration*. In course of time the *lustra* were not celebrated so often, for we find the fifth lustrum celebrated at Rome only in the 574th year of that city.

LU'SUS NATU'RÆ (a freak of nature: *Lat.*), something out of the ordinary course of nature.

LUTE (*liutio: Ital.*), a stringed instrument of music, containing at first only five strings, to which were afterwards added six more. It was formerly much used. The strings are struck with the right hand, and the stops are pressed with the left

LUTE, or LU'TING (*lutum*, clay: *Lat.*), in Chemistry, a paste, made of potter's clay, sand, and other materials, and used for closing up the necks of retorts, receivers, &c., in chemical experiments.

LU'THERANISM, the doctrines of Martin Luther, the German reformer, which constitute the creed of nearly all the Protestants in Germany. Luther was an Augustine friar, who separated from the church of Rome about the year 1515, and took the lead in the reformation. He held consubstantiation [which see]; used wafers in the administration of the Lord's Supper; allowed images in churches; encouraged private confession of sins; insisted on justification by faith alone; held that God, foreseeing man's actions, predestined him to happiness or misery according as they were good or bad—a doctrine which differs from that of Calvin, who maintained that God predestined man by his own mere will. The Lutherans of the present day consider themselves at liberty to dissent from these tenets, as they are answerable to God alone for their religious opinions.

LUXA'TION (*luxatio*, from *luxo*, I dislocate: *Lat.*), in Surgery, the dislocation of a bone from its proper cavity or articulation, so as to impede or destroy its motion or office

LUX'URY (*luxuria: Lat.*), an unrestrained indulgence in the pleasures of the table, in costly dress, equipage, &c. Amongst the Romans, luxury prevailed to such an extent that several laws were made to suppress, or at least to limit it. Apicius laid aside ninety millions of sesterces, besides an enormous revenue, for no other purpose than to be sacrificed to luxury; finding himself involved in debt, he looked over his accounts, and though he had the sum of ten millions of sesterces still left, he poisoned himself for fear of being starved to death. Instances might be adduced of great luxury amongst the Greeks; but the extravagance and luxury of both Greeks and Romans appear to be eclipsed by some of our own country. One instance of this kind will suffice. In the 10th year of the reign of Edward IV. (1470), George Nevill, brother to the earl of Warwick, at his instalment into the archiepiscopal see of York, entertained most of the nobility and principal clergy, when his bill of fare was 300 quarters of wheat, 350 tuns of ale, 104 tuns of wine, a pipe of spiced wine, 80 fat oxen, 6 wild bulls, 1004 wethers, 300 hogs, 300 calves, 3000 geese, 3000 capons, 300 pigs, 100 peacocks, 200 cranes, 200 kids, 2000 chickens, 4000 pigeons, 4000 rabbits, 204 bitterns, 4000 ducks, 200 pheasants, 500 partridges, 2000 woodcocks, 400 plovers, 100 curlews, 100 quails, 1000 egrets, 200 rees, 400 bucks, does, and roebucks, 1500 hot venison pasties, 4000 cold ditto, 1000 dishes of jelly parted, 4000 dishes of jelly plain, 4000 cold custards, 2000 hot custards, 300 pikes, 300 breams, 8 seals, 4 porpoises, and 400 tarts. At this feast the earl of Warwick was steward, the earl of Bedford treasurer, and Lord Hastings comptroller, with many more noble officers; there were 1000 servitors, 62 cooks, and 515 menial apparitors in the kitchen. But it must not escape our observation, that, after his extreme prodigality, this man died in the most abject but unpitied poverty

LYCAN'THROPY (*lukos*, a wolf; and *anthrōpos*, a man: *Gr.*). In ancient times, men were supposed, for certain periods, to be transformed by herbs into wolves. This superstition was continued down to a more recent period, but the transformation was attributed to sorcery. These supposed human wolves were called by the French *loups garous*; by the Saxons, *were-wolves*; and by the Germans, *wehrwölfe*: all the terms having the same meaning. The prevalence of such foolish ideas among the peasantry gave rise to the species of madness termed *lycanthropy*, in which the patient believed himself to be a wolf, and imitated the actions of that animal. This species of insanity seems to have vanished with the superstition which gave rise to it.

LYCE'UM (*Lukeion*, a famous gymnasium at Athens: *Gr.*), in Grecian Antiquity, an academy situated upon the banks of the Ilissus at Athens, near the temple of Apollo Lyceus. It contained porticos and promenades, where Aristotle taught philosophy From their walking there every day till the hour of anointing, he and his followers were called *peripatetics*.

LY'CIUM (the *box-thorn: Lat.*), in Botany, a genus of plants, nat ord. *Rhamnaceæ*. The species are shrubs, and consist of the different varieties of *box-thorn*.

LYCOPO'DIUM (*lukos*, a wolf; and *pous*, a foot: *Gr.*—from the shape of its extreme branches), or CLUB MOSS, a genus of cryptogamic plants allied to the ferns, the spores of which, when ignited, burn off in a flash. They are used in melodramatic pieces, &c., at the theatres.

LYCOP'SIS (bugloss: *Lat.*; from *lukos*, a wolf; and *opsis*, an appearance: *Gr.*—on account of the flowers having the appearance of a grinning mouth), in Botany, a genus of plants, nat. ord. *Boraginaceæ*. The species are annuals, consisting of various kinds of bugloss.

LYD'IAN MOOD, in Music, a term given to an effeminate kind of music, used first by the Lydians.

LYD'IUS LA'PIS, or LYD'IAN STONE, in Mineralogy, a stone of a greyish-black colour, which is found in Bohemia and other parts of Germany, and also in Scotland. When polished, it is used as a touchstone for determining the purity of gold and silver. It was used for that purpose among the ancients, from whom it received this name, because it was found only in the Tmolus, a river of Lydia.

LYMPH (*lympha*, water: *Lat.*), in Anatomy, a colourless fluid, or clear limpid secretion from the blood, which is carried by the lymphatic vessels into the thoracic duct, where it mixes with the chyle. Its constituents appear to be albuminous water and a little salt

LYMPHAT'ICS (same *deriv.*), in Anatomy, absorbent vessels, which carry the lymph from all parts of the body, and terminate in the thoracic duct.

LYNX (*lunx*: *Gr.*), a cat-like animal belonging to the tribe of *Felidæ*. There are several species, besides the European one. They form the genus *Lyncus* of zoologists, and are recognizable by the tufts of hair at the tips of the ears. The caracal and chaus of Asia, and the wild cat of the Canadians, are lynxes. The last is said to be extremely fond of odours, particularly that of castoreum, and this is frequently employed for its capture by the trappers. The lynx was said to be sacred to Bacchus, whose chariot was fabled to be drawn by it, but it seems probable that the panther was intended to be designated.——LYNXES, ACADEMY OF (*Academia dei Lincei*), Rome, the oldest scientific body in Europe. The allusion of the name is to the watchfulness and keen-sightedness of the lynx. Galileo was one of the founders.

LY'RA (*Lat.*), in Astronomy, a constellation in the northern hemisphere.——In Anatomy, a portion of the brain, having somewhat the appearance of a lyre.

LY'RATE, or LY'RATED (next), in Botany, an epithet for a leaf that is divided transversely into several rounded lobes, the lower ones smaller and more remote from each other than the upper, and the last large and rounded.

LYRE (*lyra*: *Lat.*; from *lura*: *Gr.*), a musical instrument of great antiquity, used by the Egyptians and Greeks. It is supposed to have had, at first, only three strings; afterwards it had eleven. It was played with a *plectrum*, or stick of ivory or polished wood, and sometimes with the fingers. The *lyre* is attributed by poets, painters, and statuaries, to Apollo and the Muses. It is said to have been originally formed of a tortoise-shell, whence it is sometimes called *testudo*.

LYR'IC (*lyricus*, pertaining to the lyre: *Lat.*), an epithet originally applied to what was sung or recited with an accompaniment on the lyre, but it is now applied to odes, ballads, and other verses, such as may be set to music. *Lyric poetry* was originally employed in celebrating the praises of gods and heroes, and its characteristic was sweetness It was much cultivated by the Greeks, particularly by Anacreon, Alcæus, and Sappho; but, among the Romans, Horace was the first and principal lyric poet.

M

M, the thirteenth letter of the English alphabet, is a liquid and labial consonant, pronounced by closing the lips. It is sometimes called a *semi-vowel*, as the compression of the lips is accompanied with a humming sound through the nose It was used by the Romans as an abbreviation for Marcus, Manlius, Martius, &c., and to denote 1000, for which, also, it is employed by the moderns. We use it as an abbreviation for *Magister*, as A M. *Artium Magister* (Master of Arts); *Medicinæ*, as M D. *Medicinæ Doctor* (Doctor of Medicine), *Mundi*, as A.M. *Anno Mundi* (in the year of the world); *Meridiem*, as A M *Ante Meridiem* (before midday or noon), and P.M *Post Meridiem* (afternoon). MS stands for *Manuscript*, and MSS for *Manuscripts* In medical prescriptions, M. stands for *Manipulus*, a handful, and sometimes for *Misce* (mix) and *Mistura* (a mixture). The French use M. for *Monsieur*, and MM. for *Messieurs*.

MAB, in northern Mythology, the queen of the imaginary beings called *fairies;* so fancifully described by the sportive imagination of Shakspeare, in Romeo and Juliet.

MAC, an Irish and Scotch word, signifying a son, frequently prefixed to the beginning of surnames, as Macdonald or M'Donald It is synonymous with the *Fitz* of the Normans, and *son* of the English.

MACAD'AMIZING, a method of making roads, first generally introduced by Mr. Mac Adam. It consists in breaking the stones so small that they may form with the earth a solid smooth mass

MACARO'NI or MACCARO'NI (*Ital.*). In Commerce, it is known as Genoese paste, and is in a tubular or pipe form, of the thickness of goose-quills. It is a favourite article of food with the Italians, especially the Neapolitans.——A term of contempt for a fop or coxcomb.

MACARON'IC or MACARO'NIAN (last), an appellation given to a burlesque kind of poetry, made up of a jumble of words of different languages, of Latin words modernized, or of native words ending in Latin terminations.

MACAW', the name of birds belonging to the sub family, *Arainæ*, of the parrot family. They are distinguished by having tails longer than their bodies, and by their strong beaks being hooked at the point.

MAC'CABEES, two apocryphal books of Scripture, containing the history of Judas and his brothers, and their wars against the Syrian kings in defence of their religion and liberties. The first book of the Maccabees, as a history, comes nearest to the style of the sacred historians The second begins with two epistles sent from the Jews of Jerusalem to the Jews of Egypt and Alexandria, to exhort them to observe the feast of the dedication of the new altar erected by Judas on his purifying the temple. The Jews never considered either of these to be canonical; they are, however, on the canon of the Roman Catholic church. There are two other books of the Maccabees which have never been considered as canonical by any church.

MACE (*masse*: *Fr.*; from *macis*: *Lat*), a thin coat called by botanists an *arillus*, covering the nutmeg, which is the nut or stone of a tropical tree, the *Myristica officinalis*. It is of an oleaginous nature and a yellowish colour, in flakes of an inch and more in length, which are divided into a multitude of ramifications. It is extremely fragrant, and of an aromatic and agreeable flavour.——MACE (*masse*, a lump: *Fr*), an ornamented staff, borne as an ensign of office before a magistrate. Originally the mace was a club or instrument of war, made of iron, and much used by cavalry.

MACERA'TION (*maceratio*, from *macero*, I make soft by steeping: *Lat.*), in Chemistry, the process by which the constituents of bodies are obtained, by soaking them in fluids. It differs from *digestion* only as the latter operation admits the application of heat.

MACH'IAVELISM, the principles inculcated by Machiavelli, an Italian writer, secretary and historiographer to the republic of Florence. The term is used to denote political cunning and artifice, intended to forward arbitrary power. 'Del Principe,' the work in which he recommends rulers to adopt the ways both of the lion and the fox, was written for the private perusal of the Medicis, and was not published until 1532, after the author's death.

MACHICOLA'TION (*mache*, something that catches fire; and *couler*, to drop down: *Fr.*), in Gothic and castellated Architecture, a parapet projecting beyond the face of the walls, and supported by arches springing from large corbels or consoles. The apertures between the arches and the walls were used for pouring down boiling water, melted lead, &c., upon the assailants.

MACHI'NE (*mēchanē*: *Gr.*). All machines are intended either to transmit or modify power: no combination of mechanical elements can produce it; on the contrary, the most perfect must destroy more or less of it by friction and inertia. The objects of machinery are to change mass into velocity, and *vice versâ*; to change the direction of a force; to change its nature by transforming it; for example, from a reciprocating rectilinear into a rotatory, and *vice versâ*; to distribute a vast power, such as that of a great steam-engine, in a multiplicity of channels, and render it capable of producing the most delicate effects, as in the cotton-manufacture, &c. Among the extraordinary capabilities of machinery is the production of some effects which human art, unaided by machinery, could never achieve. For instance, the same power which twists the stoutest cable, and weaves the coarsest canvass may be employed, with equal advantage, in spinning the gossamer thread of cotton, and entwining, with fairy fingers, the meshes of the most delicate fabric.

MACK'EREL (*makrele*: *Ger.*), in Ichthyology, the *Scomber Scomber*, a well known migratory fish, esteemed as an article of food, and possessing, when alive, great symmetry of form and brilliancy of colours. The mackerel is easily taken by a variety of baits, and always most easily during a gentle breeze, which is hence termed a *mackerel-breeze*.

MAC'LE, in Mineralogy, a name given to *chiastolite*, or hollow spar. It consists chiefly of silica and alumina, with a little oxide of iron.

MACLUR'ITE, a mineral, called after Maclure. It is a silicate of magnesia, with traces of potash, oxide of iron, and fluorine, and is imperfectly crystalline. Its colour is a brilliant pale green.

MAC'ROCOSM (*makros*, large; and *kosmos*, the world: *Gr.*), the *universe*, or the visible system of worlds; opposed to *microcosm*, or the world of man.

MACROSCEL'IS (*makros*, long; and *skelos*, a leg: *Gr.*), a genus of insectivorous mammals, allied to the moles and urchins. They are natives of Africa, possess long noses, and long hind legs. The elephant shrew of Algeria is the best known species.

MAC'ULÆ (*Lat.*), dark spots appearing on the luminous faces of the sun, moon, and even some of the planets. Sir W. Herschel supposed a luminous stratum to be sustained far above the level of the sun by a transparent elastic medium in which clouds float, and that some portions of the luminous stratum, and even of the clouds which would reflect a part of the light, are in certain instances removed by local agitations, &c., so as to produce these spots. The lunar spots are caused by shadows of its mountains, by vast caverns, and the unequally reflecting materials of which portions of it are composed. The planets have permanent spots in the shape of belts, &c. The diurnal revolutions of the sun and planets have been discovered by means of their spots.——MACULÆ, in Medicine, any discolorations in the surface of the body, or its different parts, which appear in the form of spots.

MAD'DER (*madere*: *Sax.*), the root of the *Rubia tinctorum*, or dyer's madder: a most important article, on account of the fine red colour it affords. It was undoubtedly known to the ancients. The madder plant has no pretensions to beauty; it externally resembles the *bed-straws*, to which it is allied. The root is the only part generally used, though the East Indian *munjeet* consists entirely of stalks, but it is very inferior. Its dye-stuff is extracted by water. The dye is of a complicated character, but its chief ingredients are *Alizarine* and *Purpurine*. The infusion is of a dirty red colour, but it is rendered bright and permanent by an aluminous mordant. Madder can be imported more profitably than it can be cultivated in England; it thrives best in a warm climate

MAD'NESS (*maad*, distracted in mind: *Sax.*), a dreadful kind of delirium, without fever, in which the patient raves or is furious. Melancholy and madness may be considered as diseases nearly allied. They differ only in degree, and with respect to the time of appearing: melancholy being the primary disease, of which madness is the complement. Both these disorders indicate a weakness of the brain, which may proceed from an hereditary predisposition; from violent disorders of the mind, especially long-continued grief, sadness, anxiety, dread, and terror; from close study, and intense application to one subject; from the use of narcotic and stupefying drugs; and from great excess or uncurbed indulgence in any passion or emotion. The treatment of madness is partly physical, partly mental. The leading indications under the first head are:—To diminish vascular or nervous excitement when excessive, as in mania; to increase them when defective, as in melancholia. In the mental treatment, it is necessary to inspire the unhappy victims with a certain degree of awe, from a conviction of superior power, and at the same time seek to gain their confidence by steadiness and humanity, while we endeavour to amuse them without making our design apparent. In former times, persons labouring under this fearful malady were subjected to every kind of inhumanity, as necessary for their cure or management; the enlightenment of modern times has put an end to this treatment, and the protection of the legislature has been specially extended to them.

MADON'NA (my lady: *Ital.*), a term applied in Italy to the Virgin, and hence to her pictures and statues.

MAD'REPORE (*madré*, spotted: *Fr.*; and *porus*, a pore: *Lat.*), the popular name of numerous tropical corals, none of which are hard enough to take a polish. The 'Brain Stone' is a madrepore.

MAD'RIGAL (*Fr.*), in Italian, Spanish, and French poetry, a short amorous poem, composed of a number of free and unequal verses, confined neither to the regularity of the sonnet, nor to the subtlety of the epigram, but containing some tender and delicate thought.

MAESTO'SO, in Music, an Italian word signifying *majestic*, and used as a direction to play the part slowly, and with grandeur.

MAGAZI'NE (*magasin*: *Fr.*), in Commerce, a warehouse for all sorts of merchandise.——In Literature, a periodical work containing miscellaneous matter. The earliest publication of this kind in England was the *Gentleman's Magazine*, which first appeared in 1731, and still flourishes.——In Military affairs, a store-house for arms, ammunition, or provisions.

MAGELLAN'IC CLOUDS, in Astronomy, three whitish cloud-like patches in the heavens near the south pole. They take their name from Magellan (or rather Magalhaens) the Portuguese navigator. They consist partly of large tracts and ill-defined patches of irresolvable nebulæ, nebulosity of every degree of resolvability, and perfectly ascertained stars, and partly of regular and irregular nebulæ, properly so called, globular clusters of various degrees of resolvability, and clustering groups. The larger one, which is four times the size of the other, contains altogether 919 stars, nebulæ, and clusters. These objects are of great complexity in their details. They are regarded as systems *sui juris*, and have nothing analagous in our hemisphere.

MAGGIO'RE, in Music, an Italian epithet signifying *greater*.

MAG'GOT (*magthe*: *Sax.*), the larva of the common blow-fly, hatched from the eggs in a few hours. On its changing to a pupa, the skin dries round it, and in ten days the fly emerges.

MAG'IC (*mageia*: *Gr.*), properly signifies the doctrine of the Magi; but the latter being supposed to have acquired their extraordinary skill from familiar spirits or other supernatural information, the word *magic* acquired the signification it now bears, viz. the power of performing wonderful things by the aid of demons. The *magicians* of antiquity were, in most cases, acquainted with certain not generally known properties and affinities of bodies, and were hence enabled to produce effects calculated to astonish the vulgar; and these surprising results, which were, in reality, due to natural causes, procured them credit in their pretensions to supernatural and miraculous power. Amongst civilized nations the belief in magic has died out except in a few sequestered places.——NATURAL MAGIC, the application of natural philosophy to the production of surprising though natural effects.

MAG'IC LAN'TERN, an optical machine, invented by Kircher, by means of which figures are represented on an opposite wall or screen in a dark room. This contrivance consists of a powerful lamp, within a closed lantern, and in the focus of a concave reflector, which is placed behind it. In front of the lamp is fixed a powerful hemispherical illuminating lens, and in front of this, in a sliding tube, a convex lens, or a system of lenses. Painted slides can be moved immediately in front of the illuminating lens. The strong light from the lamp, rendered more powerful by the illuminating lens, is transmitted through the painted slides; the resulting coloured rays are concentrated by the lens, or system of lenses, to a focus on a screen, &c., and greatly enlarged images of the figures on the slides are produced—the room being of course darkened; these images may be seen by persons at either side of the screen, which is of linen, &c. As the images on the screen must have an increase of light proportioned to their increased size, a very strong light is necessary; and hence gas, the oxyhydrogen lime light, &c., are occasionally employed. The slides admit of infinite variety, and they may be very effectually used to illustrate astronomy, &c.; they may even contain thin slices of wood, the wings of insects, &c., and thus may be a source not only of amusement, but of the most refined and useful instruction.

MA'GIC SQUARE, in Arithmetic, a square figure formed by a series of numbers, so disposed in parallel and equal rows, that the sum of those in each line, whether perpendicular, horizontal, or diagonal, is the same number. Thus,

1	16	11	6
13	4	7	10
8	9	14	3
12	5	2	15

MA'GISTRATE (*magistratus*: *Lat.*), any public civil officer to whom the executive power of the law is committed, either wholly or in part.

MAG'MA (any pressed or kneaded mass: *Gr.*), the name given to any crude mixture of mineral or organic matters, in a thin pasty state. Strictly speaking, it is what remains after the fluid parts have been expressed.——In Geology, the melted matter out of which the igneous rocks of our globe have been formed.

MAG'NA CHAR'TA (the great charta: *Lat.*), in English History, the Great Charta of Liberty, obtained by the English barons from king John, in 1215. The barons consisted of the whole nobility of England; their followers comprehended all the yeomanry and free peasantry, and the accession of the capital was a pledge of the adherence of the citizens and burgesses. John had been obliged to yield to this general union, and conferences were opened, on the plain called Runnymede, on the banks of the Thames, near Staines, in sight of the forces of each. At length the preliminaries being agreed on, the barons presented heads of their grievances and means of redress; and the king directed that the articles should be reduced to the form of a charter, in which state it issued as a royal grant. To secure the execution of this charter, John was compelled to surrender the City and Tower of London to be temporarily held by the barons, and consented that the latter should choose twenty-five of their number, to be guardians of the liberties of the kingdom, with power, in case of any breach of the charter, or denial of redress, to make war on the king, to seize his castles and lands, and to distress and annoy him in every possible way till justice was done. Many parts of the charter were pointed against the abuses of the power of the king as lord paramount; the tyrannical exercise of the forest laws was checked, and many grievances incident to feudal tenures were mitigated or abolished. But besides these provisions, it contains many for the benefit of the people at large, and a few maxims of just government applicable to all places and times.

MAGNE'SIA (*Magnēsia*, a city in Asia Minor: *Gr*.), in Chemistry, the oxide of MAGNESIUM, a white tasteless substance, with a slight alkaline reaction, usually obtained by exposing the carbonate to a full red heat. In combination with other substances it is an abundant earth. The well-known Epsom Salt is a sulphate. The carbonate is the *Magnesia alba* of pharmacy. In the state of a silicate it is a principal ingredient in STEATITE, MEERSCHAUM, SERPENTINE, and JADE. Every ton of seawater is said to contain about two pounds weight of magnesia.

MAGNE'SIAN LI'MESTONE, in Geology, a rock composed of the carbonates of lime and magnesia, and a principal member of the PERMIAN group, the uppermost member of the Palæozoic series. The DOLOMITE of the continent is a magnesian limestone. In England this rock constitutes an extensive series of beds, lying immediately above the coal measures. Their imbedded organic remains show that they were deposited in the sea. The lime resulting from the calcination of magnesian limestone has an injurious action on vegetation, because, having less affinity than common lime for carbonic acid, it remains longer in a caustic state.

MAGNE'SITE, in Mineralogy, *Rhomb spar*, the native carbonate of magnesia; it is found with serpentine and other magnesian rocks.

MAGNE'SIUM, a white, lustrous, malleable metal, which fuses at a red heat and oxidizes in hot water. When heated in the air it burns brilliantly with a pure white flame, and leaves magnesia behind. Its specific gravity is only 1·75. It is therefore extremely light, and 12½ cubic inches of it are required to balance one cubic inch of platinum. The intensity and actinic power of the light emitted by ignited magnesium wire have caused it to be employed in photography. The spectrum of ignited magnesium vapour has such points of resemblance to that of the sun as to lead to the supposition that this metal exists in the solar atmosphere.

MAG'NET, NAT'URAL (*magnēs: Gr.*), the *loadstone*, one of the many combinations of iron and oxygen; it consists of two oxides with a little quartz and alumina [see LOADSTONE]. Its colour depends on the relative proportions of its constituents, but it is generally dark grey, with a dull metallic lustre. It attracts iron in all states, except as oxide; formed into a bar and suspended freely, it will arrange itself parallel with the magnetic meridian; it will magnetize steel permanently, and soft iron while near it. Being supposed by the earlier navigators always to point to the north pole of the earth, it was termed the load-stone, or leading stone. Its use has long been superseded by the artificial magnet, which is far more powerful and convenient.

MAGNET'IC NEED'LE, a magnetized bar of steel moving freely on a centre, and showing the direction of the *resultant* of the magnetic forces, at the place where it is. [See COMPASS.]

MAGNET'IC PYRI'TES, native black sulphuret of iron. It has magnetic properties.

MAG'NETISM, that science which investigates the phenomena exhibited by natural and artificial magnets, and the laws by which they are governed. Some of the properties of the magnet were known to the ancients, but they were not acquainted with its directive power, that is, its tendency to assume a certain position when at liberty to do so. If a light bar of steel be suspended horizontally by a silk thread, or balanced on a pivot, and then magnetized, it will, except at the magnetic equator, lose its horizontal position, making an angle with the horizon called the *angle of dip*, and will no longer rest in every position, but will assume one in a direction north and south, but making a small angle with the plane of the terrestrial meridian, termed the *angle of variation*. These two angles are subject to perpetual but slight changes. The *magnetic equator* seems to cross the terrestrial at four points. The lines at which the angles of dip are equal are called *magnetic parallels*. There are probably no precise points which can be called *magnetic poles*. The earth being a great magnet, its poles are rather regions than points. Even in the ordinary artificial magnet, the poles are diffused over comparatively large spaces. The earth is most probably an *electro-magnet*, magnetized by the electric currents continually circulating round it, and which are due to evaporation, &c. The lines formed by points on the earth's surface, at which the variation is equal, are called *lines of* *equal variation.* The rapidity with which a needle vibrates, if drawn from its natural position, is a measure of the intensity of magnetism at that time and place; and this intensity is subject to constant change. A magnet, if placed in iron filings will attract them in quantities large at its poles, and diminishing towards the centre, to which none adhere. The poles of a magnet will attract pieces of soft iron; and these, as long as they are in contact with the magnet, will themselves be magnetic, and will attract other pieces of iron or iron filings. If soft iron be brought *near* a magnet, it will be magnetized, and, as long as it is near it, will attract iron filings, &c. The interposition of paper, glass, &c., will not cause the magnetic influence to be intercepted; if a magnetized bar of steel be placed under a sheet of paper, iron filings scattered over the paper will arrange themselves in *curves* over the poles. When soft iron is removed from the magnet, it instantly ceases to be magnetic; steel is not so powerfully magnetized, but, on removal, it retains more or less of the magnetism. If a magnetized bar is broken, two magnets will result, and the fractured ends will be opposite poles. Each pole of a magnet is attracted by one pole of another magnet, and repelled by the other pole. A magnet may be made by striking a bar of steel on one end while it is in the direction which a needle would assume if at liberty, or by rubbing each end continually in the same direction with one pole of a magnetized bar. Iron rods or bars acquire polarity by standing long in one position; magnetism is destroyed by a red heat. If discs of various metals are put in rapid rotation, they will become magnetic, since they will deflect the needle—an effect not due to vorticity produced in the air, since it is more powerful *in vacuo.* Magnetic attraction and repulsion vary inversely as the squares of the distance.

MAG'NETISM, AN'IMAL, a sympathy supposed to exist between the magnet and the human body. The origin of the term was a fancied analogy between the action of the mineral magnet and that of the animal energy, or *vis vitæ,* to which these effects were attributed, but its results have been ascribed to excitement and morbid sensitiveness. It originated thus:—A German physician, named Mesmer, in 1772, attempted cures with the mineral magnet, and excited some sensation in Vienna; but at length declared that the effect was produced, not by the magnet, but by a mysterious power in his own person, and that this power was related not only to the magnetic power, but to the attraction dispersed throughout the universe. From Vienna he went to Paris, where he gained many proselytes to his pretended discovery. The government at length appointed a committee, among whom was Dr. Franklin, to investigate the pretensions of Mesmer; and the result of their inquiries appeared in a memoir, by M. Bailly, which condemned animal magnetism. After the lapse of half a century, it has again revived, and numbers of eminent persons are among its votaries. Though Mesmer is considered to be its discoverer, it was undoubtedly practised by many persons, and in various forms, long before him.

MAGNE'TOGRAPH (*magnes,* a magnet; *grapho,* I write, *Gr.*), an apparatus for registering the variations of the phenomena of terrestrial magnetism. It can be made self-recording.

MAGNETOM'ETER, an instrument or apparatus for determining the elements of terrestrial magnetism, as to direction and force. When adapted for determining the declination of the needle, it is called a *declinometer;* and when for the inclination and vertical force, it becomes an *inclinometer.*

MAG'NIFYING POW'ER (*magnus,* great; and *facio,* I make: *Lat.*), in Optics, the enlargement of the angle under which an object is seen. It is effected in telescopes and microscopes by producing an image of the object, then viewing the image by another glass, and thus enlarging the angle, which becomes greater on account of the smaller distance of the image from the eye.

MAG'NITUDE (*magnitudo,* greatness: *Lat.*), whatever is made up of parts locally extended, or has dimensions; as a line, surface, solid, &c. The apparent magnitude of a body is that measured by the visual angle, formed by rays drawn from its extremes to the centre of the eye; so that all objects seen under the same or equal angles appear equal, and *vice versâ.*

MAGNO'LIA, in Botany, a genus of trees and shrubs, natives of North America and Asia; nat. ord. *Magnoliaceæ.* The *Magnolia grandiflora,* or the great magnolia, is the principal species. It is a native of Florida, and is remarkable for its large evergreen leaves and white flowers, which are conspicuous at a great distance. Two others of the species also deserve particular notice. One is the *Magnolia macrophylla,* the leaves of which are between two and three feet long, and the flowers upwards of a foot in diameter. The petals are from six to nine in number, and the three exterior ones have a purple spot at the base. It grows in the south-western parts of the Alleghanies. The other is the *Magnolia glauca,* or beaver-wood, a beautiful shrub, with leaves and flowers much smaller than any of the rest of the genus. The flowers are very elegant, and diffuse a delightful fragrance; the leaves and wood have also a strong aromatic taste. [See TULIP TREE.]

MAG'PIE (*Mag,* for *Margaret,* as *Poll* is used with a parrot; and *pie,* from *pica: Lat.*), in Ornithology, the *Pica caudata,* a well-known chattering bird, resembling in its habits and manners the other birds of the crow family, to which it belongs. It has a black bill, wings, and tail; but the two latter are variegated with white, green, purple, and blue, of different shades. When taken young, magpies readily become domesticated, and learn to repeat many words and sentences, as well as to imitate every noise within hearing.

MA'HA RA'JAH, MA'HA RA'NEE, titles in the East Indies, signifying Great Rajah and Great Queen.

MAHOG'ANY, the wood of a tree, the

Swietenia Mahogani of botanists; nat. order *Cedrelaceæ*, growing in America and the West Indies. The trunk of this majestic tree is often 40 feet in length, and 6 feet in diameter; and it divides into so many massy arms, and throws the shade of its shining green leaves over so vast an extent of surface, that few more magnificent objects are to be met with in the vegetable world. The principal importations of mahogany into Great Britain are made from Honduras and Campeachy. It was first brought to England in 1724. A single tree, cut into three logs, has been sold for 1800*l.* 20,000 tons per annum are imported—a quantity obtained from about 16,000 trees. There are many different sorts of mahogany, some of very inferior character. It answers well for ship-building; but it is not approved of at Lloyd's, in consequence, it is said, of its not being always possible to ascertain whether or not a good kind has been employed. The mahogany which was used in the line-of-battle ship *Gibraltar* was made into furniture after being in use 100 years.

MAHOM'ETANS, or MOHAM'MEDANS, believers in the doctrines and divine mission of Mahomet, the warrior and prophet of Arabia, whose creed maintains that there is but one God, and that Mahomet is his prophet; and teaches the use of prayer, washings, &c., almsgiving, fasting, sobriety, pilgrimage to Mecca, &c. Besides these they have some negative precepts and institutions of the Koran, in which several things are prohibited; such as usury, the drinking of wine, all games that depend upon chance, the eating of blood and swine's flesh, and whatever dies of itself, is strangled, or is killed by accident or by another beast. These doctrines and practices Mahomet established by the sword, by preaching, and by the Alcoran or Koran, which contains the principles of his religion; and he and his followers met with such success as in a few years to convert half the known world. [See ALCORAN.]

MAI'DEN (*magd*, a maid: *Ger.*), an instrument formerly used in Scotland for beheading criminals. It consisted of a broad plate of iron about a foot square, very sharp at the lower part, and loaded above with lead. At the time of execution it was raised to the top of a frame about ten feet high, with a groove on each side for it to slide in. The prisoner's neck being fastened to a bar underneath, and the sign given, the maiden was released, and instantly severed the head from the body. It was the prototype of the French guillotine. ——MAIDEN ASSIZE, an assize in which no person is condemned to death.

MAIL (*maille: Fr.*), a coat of steel network or scales, formerly worn for defending the body against swords, lances, &c. It was of two sorts, chain and plate mail; the former consisting of iron rings, each having four others inserted into it; the latter, of a number of small plates of metal, laid over one another like the scales of a fish, and sewed down to a strong linen or leathern jacket.——In ships, a square machine, composed of rings interwoven like net-work, used for rubbing off the loose hemp on lines and white cordage.

MAILED (*maculatus*, spotted: *Lat.*), in Heraldry, a term for speckled, as the feathers of hawks, partridges, &c.

MAIM, or MAY'HEM, in Old English Jurisprudence, any injury which rendered a person less fit to defend himself in fight; and differing, therefore, from that which merely disfigured. Cutting and stabbing, 'with intent to murder,' and 'with intent to maim or disfigure,' are now distinct offences.

MAIN (*magne: Old Fr.;* from *magnus*, great: *Lat.*), in Military and Naval affairs, a word prefixed to many others, and signifying *principal*, as, the *mainguard, mainmast, mainsail*, &c.

MAIN'PRIZE (*main*, a hand; and *prise*, a taking: *Fr.*), in Law, the receiving into friendly custody, security being given for his forthcoming on a day appointed, a person who might otherwise be committed to prison. The writ of mainprize is obsolete.

MAIN'TENANCE (subsistence: *Fr.*), in Law, an unlawful maintaining or supporting a suit between others, by stirring up quarrels, or interfering in a cause in which the person has no concern. But it is no maintenance where a person gives a poor man money out of charity to carry on a suit.——CAP OF MAINTENANCE, a cap of dignity, anciently belonging to the rank of duke. The name, also, of the lord-mayor's fur cap.

MAIZE, or INDIAN CORN, a plant of the genus *Zea*, the native corn of America. The root is fibrous; the stems rise to the height of from four to ten feet; and, like other grasses (for it belongs to the natural family *Graminaceæ*), they are furnished with knots at intervals. The styles are very numerous, six to eight inches long, and hang down like a silken tassel from the extremity of the foliaceous envelope; the seeds or grains are rounded externally, angular and compressed at the sides, and tapering towards the base, and are disposed in several longitudinal series. Maize is now very extensively cultivated, not only in America, but throughout a great part of Asia and Africa, as also in several countries in the south of Europe. In many of the provinces of France it forms almost exclusively the sustenance of the inhabitants. The spikes or ears are gathered by hand; the husks, when perfectly dry, are stripped off, and, together with the stalks, laid by for winter fodder, while the ears are conveyed to the granary. Next to wheat, it is considered the most nutritious grain.

MA'JESTY (*majestas: Lat.*), a title given commonly to kings. It was first used in England in the reign of Elizabeth, instead of '*highness*.'——*Apostolical Majesty*, a title bestowed on Stephen, duke of Hungary, A.D. 1000, by Sylvester II.; reconferred on the empress queen Maria Theresa, in 1758, and now borne by the emperors of Austria.——*Catholic Majesty*, a title conferred on Ferdinand and Isabella of Spain, in 1491, by Alexander VI., and now borne by the Spanish sovereign.——*Most Chris* *tian Majesty*, a title bestowed on Louis XI. of France, in 1469, by Paul II.——*Most Faithful Majesty*, a title conferred on John V. of Portugal, by Benedict XIV., and borne by the kings of that country.

MAJOL'ICA WARE, a ceramic manufacture so termed, probably from having been first made in Majorca. It was made in Spain by the Moors, but Italy was the place of its full development. The best was made at Faenza. The ware was formed of red earth, coated with a white glaze, and then painted upon with bright colours. The specimens most prized possessed a peculiar metallic opalescent lustre, which cannot be imitated by modern manufacturers. The ware made at Gubio has been termed *Raphael ware*, under the erroneous notion that this painter had worked upon it.

MA'JOR (greater: *Lat.*), the title of several military officers; as, *major-general*, the officer next in rank to a lieutenant-general. The *major of a regiment*, an officer immediately inferior to a lieutenant-colonel. There were no majors in regiments until the beginning of the 17th century; and there are still none in the artillery or engineers.——MAJOR, in Logic, the first proposition of a regular syllogism, containing the principal term.——In Music, an epithet applied to those modes in which the third is four semitones above the key-note, and to intervals consisting of four semitones. *Major* and *minor* are applied to concords which differ from each other by a semitone.

MAL'ACHITE (*malachē*, the mallow flower: *Gr.*), in Mineralogy, the blue and green carbonate of copper, found frequently crystallized in long slender needles. It takes a good polish, and is often manufactured into vases and other ornaments.

MALAC'OLITE (*malakos*, soft; and *lithos*, a stone: *Gr.*), in Mineralogy, a variety of *Augite*, of a dark green colour.

MALACOL'OGY (*malakia*, the Aristotelian name for the molluscs, or animals inhabiting and forming shells: from *malakos*, soft; and *logos*, a discourse: *Gr.*), the natural history of the *molluscs*, which see.

MALACOPTERY'GIANS (*malakos*, soft; and *pterux*, a wing: *Gr.*), an order of fishes comprehending those that have a bony skeleton and fins without spinous rays. If ventral fins are present they are abdominal

MALACOS'TOMOUS (*malakos*, soft; and *stoma*, a mouth: *Gr.*), an epithet for those fishes destitute of teeth in the jaws, vulgarly called *leather-mouthed;* as the tench, carp, bream, &c.

MALA'RIA (*Ital.*), a state of the atmosphere or soil, or both, which, in certain localities, in the warm season, produces a fever more or less violent, according to the nature of the exposure. The country of the *mal' aria*, in Italy, extends from Leghorn to Terracina, about 200 miles, and from the sea to the Apennines, from 25 to 30 miles, besides being found in other particular places. The city of Rome has been gradually invaded by it; so that not only the whole of ancient Rome has been deserted, but even the finest parts of the modern city, particularly those which are least inhabited, have become unsafe. Even in the time of Horace, Rome was deserted, two months in the year, on account of malaria.——It has been found from observation, that although standing waters, when clear and free from smell, and all running waters, are considered perfectly salubrious, they may, in fact, be nearly as injurious as those that are putrid and stagnant; and that, besides marshes, fresh and salt meadows, and wet pasture lands generally, all woods, coppices, thickets, rivers, lakes, ponds, ornamental waters, pools, ditches, plashy and limited spots of ground generally, send forth more or less of this noxious vapour; that wherever, in short, any chemical compound of the vegetable elements is wetted, or held in solution by water, there the poison in question may be, or will be, produced, provided the temperature be sufficiently high; that the smallest surface coming under any of the above denominations is sufficient to produce malaria.

MAL'ATES (*malum*, an apple: *Lat.*), in Chemistry, salts formed by the union of malic acid with different bases. The malates of potash, soda, and ammonia are deliquescent.

MALE SCREW, in Mechanics, a screw that has the spiral thread on the outside of the cylinder.

MAL'IC A'CID (*malum*, an apple: *Lat.*), in Chemistry, an acid which is present in the stalks of garden rhubarb, and the juice of many fruits, especially apples and pears. It may be obtained also from the *Sorbus aucuparia*, or mountain ash, and has therefore been called *sorbic acid*.

MALLEABIL'ITY (*malleus*, a hammer: *Lat.*), that property of metals, on account of which they are capable of extension by the hammer, and of being worked into forms. It is opposed to *brittleness*.

MAL'LEUS (same *deriv.*), in Anatomy, a bone of the internal ear, attached to the *membrana tympani*, and somewhat resembling a hammer in shape.

MAL'LOW (*malva: Lat.*), plants of the genus *Malva*, of which several species are wild in Britain. [See MALVACEÆ.]

MALM'SEY (*malvoisie: Fr.;* from *Malvasia*, a town in European Turkey, near which it was produced), the name of a species of grape, and also of a luscious kind of wine prepared from it. The most celebrated Malmsey was made in Madeira.

MALT (*mealt: Sax.*), grain, usually barley, which has been induced to germinate, and the germination suddenly checked, the object being to convert the starch of the grain partially into sugar. The grain is first steeped in water and then spread out on floors, to the depth of three or four inches, when it germinates. This goes on for some days, the grain being frequently turned, and then the germination is stopped by being transferred to a malt kiln.——*Malt kilns* are chambers having numerous holes in the floor, through which the heat ascends from a furnace below, and dries the malted grain that is laid upon it.

MAL'THA (a mixture of pitch and wa

for caulking ships: *Gr.*), a mineralogical name for a mineral pitch. A cement composed of this, with wax plaster and grease, was used by the Romans for coating their walls. Pitch, melted with lime, was employed by them for covering the interior of their aqueducts. The pavements termed *asphaltic*, used by us, are of a similar composition.

MA'LUM IN SE (a thing bad in itself: *Lat.*), an offence at common law: in distinction from *malum prohibitum;* such as smuggling.

MALVA'CEÆ, a natural order of exogenous plants, abounding in mucilage, and frequently having a tough fibre in the bark. The seeds are placed round a common axis. To this order belong the common mallow, the hollyhock, and the COTTON plant (*Gossypium*), as well as the various species of Hibiscus, several of which are cultivated for their flowers. One species yields SUN hemp. *Abelmoschus esculentus*, a plant of this order, which is cultivated extensively in Africa, on account of its seeds, called Ochro and Gobbo, which are used in soups.

MALVERSA'TION (*Fr.*), in Law, misbehaviour in an office, employ, or commission: such as breach of trust, extortion, &c.

MAM'ALUKES, or **MAM'ELUKES** (*memalik*, a slave: *Arab.*), male slaves imported from Circassia into Egypt by the rulers of that country. They were instructed in military exercises, but soon exhibited a spirit of insubordination; assassinating the sultan Turan Shah, and, in 1258, appointing Ibegh, one of their own number, sultan of Egypt. They were at length conquered by Selim I., and Cairo, their capital, was taken by storm, after they had governed Egypt 263 years. During the French invasion of Egypt by Buonaparte, the Mamelukes formed a fine body of cavalry, and for a time seriously annoyed the invaders, though many afterwards joined them. Mohammed Ali, the pacha of Egypt, annihilated their power, by destroying 470 of their principal leaders, in 1811, by treachery.

MAM'MAL, or **MAM'MIFER** (*mamma*, a teat; and *fero*, I bear: *Lat.*), in Zoology an animal the female of which has breasts for suckling its young.

MAMMA'LIA (*mamma*, a teat: *Lat.*), the most highly organized class of vertebrate animals, the females of which possess mammary glands, and suckle their young. Their chief anatomical character consists in their having lungs, which are suspended freely in a thoracic cavity, and separated from the abdomen by a perfect diaphragm. Their heart contains four distinct cavities. Their brain consists of a cerebrum, cerebellum, and medulla oblongata. They all bring forth their young alive. The teeth indicate the kind of food: to cut flesh the molars must be trenchant and serrated; for bruising grains, they must have flattened crowns. Those having hoofs are termed *ungulate;* the others *unguiculate.* The ungulate must be herbivorous, and therefore have molars with flattened crowns, since the formation of their feet would not permit them to seize living prey. The mammalia have been divided into two classes, the Placentalia and Implacentalia. Class I. The *Placentalia*, or those having a placenta or a vascular chorion, by which the fœtus is attached to the uterus, is divided into—1. The *Bimana*, or two handed, whose posterior extremities are used only to keep them in an erect position, and for the purpose of locomotion. They comprehend the different varieties of man. 2. The *Quadrumana*, or those having four hands; whose hinder extremities, in some instances, resemble hands more than the anterior—the thumb being sometimes wanting, or incapable of being opposed to the other digits. They comprehend the ape, monkey, &c. 3 The *Cheiroptera*, or those having the anterior extremities so modified as to serve for wings, the fingers being lengthened, and connected together by a thin membrane. They comprehend the different kinds of bats. 4. The *Insectivora*, or insect-eaters They comprehend the shrew, mole, hedgehog, &c. 5. The *Carnivora*, or flesh-eaters. Their teeth are well adapted for tearing, dividing, and bruising flesh. Those which tread on the sole of the foot are termed *plantigrades;* and those which run on the last joints of the toes, *digitigrades.* They comprehend the dog, cat, bear, seal, &c. 6. The *Cetacea*, or whale tribe. They live in the sea, or large rivers. The caudal fin is horizontal, not vertical, as in the true fishes. They comprehend the whale, porpoise, &c. 7. The *Pachydermata*, or thick-skinned. They are distinguished by the thickness of their skins, and comprehend the hippopotamus, elephant, horse, hog, &c 8. The *Ruminantia*, or those which chew the cud. They have cloven feet, want incisors, and have a stomach with four cavities. 9. *Edentata*, or those having imperfect dental apparatus. Their digits are generally sunk in large and crooked claws. They have no incisors, and sometimes no dental organs. They comprehend the sloth, anteater, armadillo, &c. 10. The *Rodentia*, or those animals which gnaw. They have two long chisel shaped incisors in each jaw, and no canine teeth, but a vacant space between the molars and incisors. The lower jaw has no horizontal motion, except from back to front, and *vice versâ.* The eminences on the crowns of the molars are transverse, so as to be opposed during the reciprocating motion of the lower jaw. The posterior are generally larger than the anterior parts, and hence they rather leap than walk. The brain is of an inferior type; the eyes are lateral. Some of them use their feet to convey their food to the mouth. They comprehend the rat, squirrel, rabbit, guinea-pig, &c. Class II. The *Implacentalia*, or those having no placenta or vascular chorion, are divided into—1. The *Marsupiala*, or pouched, which have the abdominal integument folded inwards, forming a depression containing the mammæ, or a pouch for the temporary shelter of their young. The fœtus is not attached to the uterus; it is prematurely born—in the great kangaroo after a gestation of only 38 days, at the end of which period it does not exceed an inch in length. It is then received into the pouch, where, adhering to the nipple, it remains for many months. 2. The *Monotremata*, or those having but one outlet for the excremental and generative products. They are ovo-viviparous; that is, extrude the living fœtus, more or less extricated from the egg coverings which had been developed within the body of the parent. They include only two genera, both found in Australia, the Ornithorhynchus and the Echidna. Another arrangement of the class is by a division into five orders. Order I. Primates, including man, the monkies, lemurs, and bats. Order II. Feræ, the rapacious beasts, including the feline family, with bears, moles, kangaroos, and seals. Order III. Cetacea, the whales, including dolphins and manatees. Order IV. Glires or rodents, including hares, mice, porcupines &c., Order V. Ungulata or hoofed beasts, including ruminating animals, horses, elephants, armadillos, and sloths.

MAM'MEE-TREE, in Botany, the *Mammea Americana*, a large and beautiful tree, belonging to the nat. ord. *Guttiferæ:* sometimes called the West Indian apricot, the fruit of which is highly esteemed for its sweet and very agreeable taste, accompanied with an aromatic, pleasant odour. The leaves are oval, six or eight inches in length; the flowers white, an inch and a half in diameter, and emit a delightful perfume; and the tree attains the height of sixty or seventy feet.

MAM'MILLARY (*mammilla*, a little teat: *Lat.*), pertaining to the breasts. Also, an epithet applied to two small protuberances, like nipples, found under the fore ventricles of the brain, and to a process of the temporal bone.

MAM'MOTH (*Tart.*), an extinct species of elephant entirely distinct from the existing species of Asia and Africa. It is found in all parts of Europe, Asia, and America, but only in the fossil state; and its remains have given rise to stories of giants. A mammoth, in complete preservation, was seen by Adams, a traveller in Siberia. The skeleton was 9 feet 4 inches high, and 16 feet 4 inches long; the tusks were 9 feet long. It is very different from the *mastodon*, a gigantic fossil animal of North America.

MAN, the *Homo sapiens* of zoologists, is placed as an animal in the family *Bimana* of the mammalian order *Primates*. He possesses two prehensive hands, with fingers protected by flat nails; two feet with single soles, a single stomach, and three kinds of teeth—incisive, canine, and molar. His position is upright; his food both vegetable and animal; his body without natural covering. Blumenbach divides mankind into five varieties. 1. The first occupies the central parts of the old continent, namely, Western Asia, Eastern and Northern Africa, Hindostan, and Europe. Its characters are the colour of the skin, more or less white or brown; the cheeks tinged with red; long hair, either brown or fair; the head almost spherical; the face oval and narrow; the features moderately marked; the nose slightly arched; the mouth small; the front teeth placed perpendicularly in the jaws; the chin full and round. This is called the *Caucasian*, from its supposed origin in the Caucasus. 2. The second variety has been termed the *Eastern*. The colour in this race is yellow; the hair black, stiff, straight, and rather thin; the head almost square; the face large, flat, and depressed; the features indistinctly marked; the nose small and flat; the cheeks round and prominent; the chin pointed, the eyes small. This variety comprises the Asiatics to the east of the Ganges and of Mount Beloor, except the Malays: it includes the Turks, Egyptians, Persians, Hindoos, the Tartars, Chinese, &c. 3. The *American* variety resembles the last described, in several points. Its principal characters are a copper colour; stiff, thin, straight, black hair; low forehead; eyes sunk; the nose somewhat projecting; cheekbones prominent; face large. This variety comprises all the Americans except the Esquimaux. 4. The fourth variety is called by Blumenbach the *Malay*, and described as of a tawny colour; the hair black, soft, thick, and curled; the forehead a little projecting; the nose thick, wide, and flattened; the mouth large; the upper jaw projecting This variety comprehends the Islanders of the Pacific ocean. 5. The remaining variety is the Negro. Its characters are, colour black; hair black and woolly; head narrow; forehead convex and arched; cheekbones projecting; nose large, and almost confounded with the upper jaw; the upper front teeth obliquely placed; the lips thick; the chin drawn in; the legs crooked. This race is found in Western and Southern Africa, and the great islands of the Pacific, generally in the interior. There are very great differences in the tribes included in this variety; witness the Negro, with the complexion of jet, and woolly hair; the Caffre, with a copper complexion and long hair; the sooty Papous, or New Guineaman; the native of Van Diemen's Land; and the Hottentot.——Man is the only animal which really possesses the powers of speech, by which he is enabled to communicate his thoughts; and this has led, in different tribes, to the invention of several hundred languages. He is also the only animal which possesses the muscles of laughter. ——MAN, a word variously used in nautical affairs: thus, *man-of-war*, a *merchantman*, &c. Also, '*man* a prize;' '*man* the topsail sheets;' '*man* the yards,' &c., signifying to supply either of these with the men necessary for the required purpose.

MAN'AKIN, the popular name of some small South American birds, forming the sub-family *Piprinæ*. They belong to the chatterers in the dentirostral section of the *Passeres*. *Pipra militaris*, a member of the typical genus, bears a crest of red feathers on its head.

MANA'TUS, or MANA'TEE (*manus*, a hand: *Lat.*), the Cow-fish, a genus of mammals, dwelling in water, and belonging to the order of *Cetacea*. The thick skin has a dark colour, and usually bears a few bristle like hairs. The skull is large and strong, without front teeth; the lips thick, fleshy, and bristly. The fore limbs or paddles are highly developed, with bones exactly answering to those of the human arm, the five fingers being present, but covered with inflexible skin. There are no rudiments of hind limbs. The body is terminated posteriorly by a horizontal semi-circular flat tail, but without a fin. The ears are small orifices; the eyes are also small. White milk flows from the breasts of the female when pressed. This harmless animal feeds on grass and aquatic plants. It is a rapid swimmer, and so cautious that it is not easily captured. Beneath the skin there is a thick layer of fat which yields abundance of oil. The flesh is said to be palatable, having a flavour between that of beef and pork. There appears to be several species. One, the *Dugong*, inhabits the rivers of Western Africa. Another is found in the West Indies and along the coast of Guiana. This is said to be from 12 to 20 feet long, and to possess nails at the extremities of the fore limbs. In the river Amazon there is a third species, which does not exceed 7 or 8 feet in length, and has no nails.

MANCHINEEL' (*mancinella: Span.*), the *Hippomane mancinella* of botanists, nat. ord. *Euphorbiaceæ*, a tree which grows in the West Indies to the size of a large oak. It is said to be death to sleep beneath its shade. A drop of the juice falling on the skin is known to form an ulcer. The tempting fruit, which looks like an apple, causes a burning sensation when applied to the lips.

MANDA'MUS (we command: *Lat.*), in Law, a writ issued from the Court of King's Bench, and directed to any person, corporation, or inferior court, commanding the performance of some special thing. It will not be granted unless there has been a distinct refusal to do that which is its object.

MANDARIN', a Portuguese term for the official order in China. There are nine classes of civil, and five of military mandarins, distinguished by buttons on their caps. The Chinese name for mandarin is *Kouon* (a public character). They are supposed to owe their offices entirely to merit.

MAN'DIBLE (*mandibula*, a jaw: *Lat.*), in Ornithology, the upper and under bill of birds —— Also, in Anatomy, a name for the jaw. [See MAXILLA.]

MAN'DOLINE, a musical instrument with four strings, something like a lute. It is still in use in Italy.

MAN'DRAKE (*mandragoras: Gr.*), the *Mandragora officinalis* of botanists, nat. ord. *Solanaceæ*. The forked root of this plant was thought to resemble the human form, and many superstitions were connected with it, such as the opinion that it uttered a shriek when torn out of the ground. It was used in love incantations. An acronarcotic poison resides in the juice, which was once employed in medicine, being reckoned amongst 'drowsy syrups.'

MAN'DREL, or MAN'DRIL (*mandrin: Fr.*), in Machinery, a revolving spindle, to which the turner fixes his work in the lathe.

MAN'DRILL, a baboon, the *Papio maimon* of naturalists, a native of Guinea, the largest, most brutal and ferocious of the class. It is blue-faced, and has very protuberant cheeks. The nose of the adult becomes red, and even scarlet, at the end. Its colour is a greyish brown. The male is as large as a man.

MANE'GE (a riding-school: *Fr.*), the art of breaking in and riding horses, or the place set apart for equestrian exercises. [See HORSE and HORSEMANSHIP.]

MA'NES (*Lat.*), in the pagan system of theology, a general name for the infernal deities. The ancients comprehended under the term *manes* not only Pluto, Proserpine, and Minos, but the souls of the deceased also. It was usual to erect altars and offer libations to the *manes* of deceased friends and relations; for the superstitious notion that the spirits of the departed had an important influence on the good or bad fortune of the living made people very cautious of offending them. When it was not known whether a corpse had been buried or not, a *cenotaph* was erected, and the manes were solemnly invited to rest there, from fear that otherwise they would wander about the world, terrifying the living, and seeking the body which they had once inhabited

MAN'GANESE, of a greyish-white colour, and of considerable brilliancy; it has neither taste nor smell, is of the hardness of iron, very brittle, and, when reduced to powder, is attracted by the magnet. Its spec. grav. is about 8 0. Being very difficult of fusion, it does not combine readily with many metals; but it shows considerable affinity to iron, occurring frequently combined with it in nature, and it is supposed to improve the quality of steel. Manganese is applied to no use in its metallic form. Its attraction of oxygen is so great, that exposure to the air is sufficient to render it red, brown, black, and ultimately friable, in a very short time. The black oxide (the binoxide) is used largely as a source of oxygen; mixed with oil, it takes fire of itself. It frees from colour glasses tinged with iron, and is therefore used in glass-making; it changes the iron into peroxide, and becomes itself protoxide, neither of which compounds imparts a colour; but, if added in excess, it produces an amber colour. It is also used to give a black colour to earthenware. Two of its compounds with oxygen possess acid properties, and are termed manganic and permanganic acids.

MAN'GEL-WUR'ZEL (*mangel*, defect; and *würzel*, root: *Ger.*), a species of beet much used as food for cattle, and valuable from its large size and hardy nature.

MAN'GO, the fruit of a tree, the *Mangifera indica* of botanists, nat. ord. *Anacardiaceæ*, which is a native of the East Indies, but now grows in most of the tropical regions. It is allied to the sumach, attains the height of 30 or 40 feet, and is highly productive. The fruit is kidney-shaped, of a most delicious flavour, and contains a flattened kernel enveloped in a stringy case. More than eighty varieties of mango are cultivated.

MANGOSTEEN′, the *Garcinia Mangostana* of botanists, nat. ord. *Clusiaceæ*, a tree which grows in the Straits of Malacca. The fruit is something like a small orange; it is of exquisite flavour, and particularly wholesome. The tree is elegant in its appearance, and grows to the height of about eighteen feet.

MAN′GROVE, a tree of the genus *Rhizophora*, which grows in tropical countries along the borders of the sea. Its branches are long, hang down towards the earth, and, when they have reached it, take root and produce new trunks. In this manner, immense and almost impenetrable thickets are formed, which are filled with vast numbers of crabs, aquatic birds, mosquitos, &c. The seeds are remarkable for throwing out roots, which vegetate among the branches of the trees while yet adhering to the footstalk. The soft part of the white mangrove is formed into ropes; the wood of the red mangrove is compact and heavy.

MA′NIA (*mainomai*, I rage: *Gr.*), in Medicine, a delirium unattended by fever, in which judgment and memory are impaired, and there is a particular dislike to restraint. It is either melancholy or furious. *Melancholy* mania is marked by dejection of spirits; *furious* mania, by violence, a dislike to individuals, and a repugnance to scenes before agreeable. An excess or deficiency of phosphorus in the composition of the brain has been shown to accompany madness and idiocy.

MANICHÆ′ANS, in Church History, a sect of heretics in the third century, the followers of a Persian named Manichæus, or Manes, who had been one of the Magi before he became a Christian. He attempted to combine the principles of the Magi with Christianity, and gave out that he was the Paraclete whom Christ had promised to send to his disciples. He was put to death by a king of Persia as a perverter of the true religion, i.e. that of the Magi. He taught that there are two principles, or gods, coeternal and independent of each other: the first *light*, the author of all good; the second, *darkness*, the author of all evil.

MANIFES′TO (*manifestum est*, it is evident: *Lat.*—from words with which the document usually commenced in former times), in Politics, a declaration of motives by a belligerent state, or by a general having full powers, previously to the commencement of hostilities. It is addressed to the public, and signed by the sovereign, &c., who sends it.

MA′NIOC, or **MA′NIHOT**, the Indian name of the *Jatropha Manihot*, a shrub belonging to the nat. order *Euphorbiaceæ*. The roots contain a nutritious starch, but combined with hydrocyanic acid, which, however, is easily dissipated by heat, or got rid of by washing. The crude flour or meal obtained from the root is called *cassava*. *Tapioca* is a preparation of the starch. The plant is indigenous in tropical America, and cultivated also in many parts of Asia and Africa. It grows rapidly, produces abundantly, and accommodates itself to almost any kind of soil.

MANIPULA′TION (*manus*, a hand: *Lat.*), a word signifying work done with the hands. It expresses, in pharmacy, the preparation of drugs; in chemistry, the preparation of substances for experiments; and in animal magnetism, the motion of the hands, by which the operator magnetizes those on whom he operates.

MANIP′ULUS (a handful; from *manus*, a hand: *Lat.*), in Roman Antiquity, a body of infantry, consisting of two hundred men, and constituting the third part of a cohort. It was so called from the handful of straw which was used originally as its standard.——Among physicians, the term *manipulus* signifies a handful of herbs or leaves, or so much as a man can grasp in his hand at once; which quantity is frequently denoted by the abbreviation *M* or *m*.

MAN′NA (*mano*, a gift: *Syr.*), a sweet juice or gum, which flows from many trees and plants in Syria, and also in Calabria, where it exudes from two species of the ash. Its smell is strong, and its taste rather nauseously sweet. It is incapable of producing alcohol by fermentation, is dissolved by water, and affords by distillation water, acid, oil, and ammonia. It is frequently employed in the *materia medica*, and forms a considerable article of commerce. A principle called *mannite*, a combination of carbon, hydrogen, and oxygen, crystallizing in tufts of slender colourless needles, is obtainable from manna.

MANOM′ETER, or **MAN′OSCOPE** (*manos*, rare; and *metron*, a measure, or *skopeo*, I examine: *Gr.*), an instrument used to show or measure the alterations in the rarity or density of the air. The manometer differs from the barometer in this, that the latter only serves to measure the weight of the atmosphere, or of the column of air over it; but the former indicates the density, or rather the elastic force which is considered proportional to the density.

MAN′OR (*maneo*, I abide: *Lat.*), a district subject to the jurisdiction of a court baron. In the feudal times, a grant of lands from the king carried with it a power of making laws, and holding a court of justice for the dependants of the territory. The baron might parcel out new manors, and these again might be subdivided into other manors. To put an end to this, in the reign of Edward I. it was enacted that buyers of lands should hold them by the same services, and of the same lord, as when in the hands of the seller. Hence every manor now in being must have existed at least in the time of Edward I. The union of several manors under one great baron or lord paramount, was termed an *honour*. There are said to be eighty honours in England.

MAN′SLAUGHTER, in Law, the unlawful killing a man without malice, either expressed or implied. It differs from murder, in not being malicious or deliberate; and from excusable homicide, in being done in some unlawful act. Manslaughter may be either *voluntary* or *involuntary*.

MAN'TELET (*Fr.*), in Fortification, a kind of moveable parapet, or wooden penthouse, used in a siege. Mantelets are cased with iron, and set on wheels, so as to be driven before the miners, when carrying a sap or trench towards a besieged place, to protect them from the enemy's small shot.

MAN'TIS (*mantis*, a diviner: *Gr.*), in Entomology, a genus of orthopterous insects, of which there are numerous species, distinguished by the singularity of their shape. The chief species in Europe is the *Mantis religiosa*, or *praying* mantis, so called because when sitting it holds up its two fore-legs as if in the attitude of prayer; whence vulgar superstition has held it as a sacred insect; and a popular notion has prevailed, that a child or a traveller who loses his way will be safely directed by observing the quarter to which the animal pointed, when taken into the hand. The mantis is of a predaceous disposition, living on smaller insects, which it watches for with great anxiety. It is also quarrelsome; and when several are kept with others of its own species in a state of captivity, they will attack each other with the utmost violence, till all but one are destroyed.

MANT'LING (*manteau*, a mantle: *Fr.*), in Heraldry, that appearance of flourishing, or drapery, that is represented about a coat of arms. It is supposed originally to have been the representation of a mantle, or military habit, worn by the cavaliers over their armour, to preserve it from rust.

MAN'UAL EX'ERCISE (*manualis*, belonging to the hand: *Lat.*), in the Military art, the exercise by which soldiers are taught the use of their muskets and other arms.

MAN'UFACTURE (*manus*, a hand; and *factura*, a making: *Lat.*), the operation of reducing raw materials of any kind into a form suitable for use, either by the hand or by machinery. Also any commodity made by the hand, or anything formed from the raw materials or natural productions of a country, as cloths from wool, and cotton or silk goods from cotton and silk, &c. Manufactures cannot thrive except where there is security for property, and where there is no danger of interference on the part of the government in the way of undue protection or vexatious restrictions. An abundant supply of the raw material is a great advantage to manufacture, particularly where it is of a bulky and ponderous nature. We should never have been distinguished for our manufactures in metals, unless we had possessed not only these, but an abundant supply of coal also. The favourable situation of a country and its climate have a great influence on its success in manufactures: when the heat or the cold is too great, men lose much of their energy.

MANUMIS'SION (*manumissio*, from *manumitto*, I let go from the hand: *Lat.*), among the Romans, the solemn ceremony by which a slave was emancipated, or liberated from personal bondage.

MANU'RE (*manœuvrer*, to work with the hand: *Fr.*; and hence to enrich the land), any substance, whether vegetable, animal, or mineral, mixed up with the soil, to accelerate vegetation, and increase the produce of crops; as the contents of stables and farm-yards, marl, ashes, lime, fish, salt, &c. It is intended to supply some element of vegetables which is wanting in the soil.

MAN'USCRIPTS (*manu scriptum*, written with the hand: *Lat.*), writings of any kind, on paper, parchment, or any other material. The study of ancient modes of writing is styled *Palæography* (*palaios*, old, *graphe*, writing: *Gr.*). There are many modes by which antiquarians are enabled to discover the probable date of a manuscript; and there are many manuscripts which have at the end a statement when and by whom they were written, though this is not always to be relied on. Since we have had the evidence of the manuscripts found at Herculaneum, we can decide with certainty that none of our manuscripts are older than the Christian era. It was the custom, in the middle ages, wholly to obliterate and erase writings on parchment, for the purpose of writing on the materials anew. These rewritten manuscripts were called *codices rescripti*, *rasi*, and *palimpsests* [which see]. The costliness of writing materials gave rise also to abundant abbreviation. The invention of printing put an end to the destruction of manuscripts, but not to the use of abbreviation, which continued long after, being common in Greek until within the last fifty years. Latin manuscripts prior to the age of Charlemagne (A.D. 800) are considered ancient. The *illumination* of manuscripts was common among the Romans, and flourished in these countries from the 5th to the 10th century. An attempt was made to introduce it again, at the revival of the arts, but the effort was unsuccessful. Some of the portraits and other paintings in illuminated manuscripts of great antiquity are very beautiful.

MAP (*mappa*: *Lat.*), a delineation of a country, according to a scale, in which the proportion, shape, and position of places are exactly preserved. The top is usually the north, the right hand the east, the left hand the west, and the bottom the south. When the cardinal points are otherwise arranged, a *fleur-de lis* points to the north. A terrestrial map is either *geographic*, that is, relates to land, or *hydrographic*, that is, relates to the sea—in which case it is usually called a *chart*. A map representing a small extent of country is called a *topographical* map. In maps three things are essentially requisite. 1. All places must have the same situation and distance from its great circles, as on the globe, that their parallels, longitudes, &c., may be distinctly seen. 2. Their magnitudes must be proportional to their real magnitudes on the globe. 3. All places must have the same situation, bearing, and distance, as on the earth itself. The degrees of longitude are numbered at top and bottom, and the degrees of latitude on the right and left sides.

MA'PLE, the name of several trees belonging to the genus *Acer*. The common maple is *Acer campestre*; the sycamore is *Acer pseudoplatanus*. The *Acer saccharinum*, or sugar-maple, in North America, is one of the most remarkable species. By tapping this tree early in the spring, the Americans procure a large quantity of sugar; one of an ordinary size yielding in a good season from twenty to thirty gallons of sap. It is this tree that yields the ornamental wood known as bird's eye or mottled maple. The wood of the common European maple is much used by turners; and on account of its lightness is frequently employed for musical instruments, particularly for violins.

MAR'ABOUT CRANE, the *Leptoptilos Marabou* of ornithologists, inhabits Senegal, in Africa. The head and neck are nearly naked, and there is an external pouch in front of the neck. The beautiful marabout plumes are obtained from this bird.

MARANATH'A (*Syr.*), amongst the Jews, was a form of threatening, cursing, or anathematizing, and was looked upon as the most severe denunciation they had. The word is said to signify *the Lord will come;* that is, to take vengeance.

MARAN'TA, in Botany, a genus of plants, nat. order *Marantaceæ*. The species are perennials, and among them is the *Maranta arundinacea*, or Indian arrow-root, the root of which contains the starch known by this name.

MARAS'MUS (*maraino*, I make to waste away: *Gr.*), in Medicine, an atrophy or consumption; a wasting of flesh without fever or apparent disease.

MAR'BLE (*marbre: Fr.*), in Mineralogy and Geology, the several varieties of carbonate of lime, which have more or less of a granular and crystalline texture, and capable of taking a polish.——In Sculpture, several compact or granular kinds of stone, susceptible of a fine polish. The *Pentelic* and *Parian* were the white marbles most valued by the ancients. The marble of Luna, in Etruria, was whiter than even the Parian. The quarries of Carrara, in Italy, almost supply the world with white marble.

MAR'CASITE, in Mineralogy, white iron pyrites; a sulphuret of iron.

MARCH (*Martius*, literally belonging to *Mars*, the god of war: *Lat.*), the third month of the year, according to the calendar of Numa and Julius Cæsar; but in the calendar of Romulus it stood first, as it did among ourselves until the change in the style in 1752. It is said to have been named by Romulus, in honour of his supposed father Mars.——MARCH, in Military affairs, the movement of a body of troops from one place to another; or the measured and regular pace of a soldier, according to a certain form and time.——In Music, any piece adapted to a soldier's march.

MAR'CHES (*mearc*, a border or limit: *Sax.*), borders or confines, particularly the boundaries between England and Wales, and between England and Scotland. The office of the 'lords-marchers' was originally to guard the frontiers. Several titles of honour, in this and other countries, are derived from their original possessors having been appointed governors of *marches* or frontiers.

MARCO'SIANS, a sect of heretics in the second century, so called from their leader Marcus, who represented the Deity as consisting not of a trinity but a quarternity, viz., the Ineffable, Silence, the Father, and Truth.

MAR'GARATE (next), in Chemistry, a compound of margaric acid with a base.

MARGAR'IC A'CID (*margarites*, a pearl: *Gr.*), in Chemistry, one of the solid proximate principles of fats. It has a pearly lustre, is insoluble in water, but dissolves in hot alcohol, and is deposited from it by cooling. It resembles stearic acid, but is more fusible, melting at 140° Fahr.

MARGRA'VIATE (*mark*, a frontier; and *graf*, a count: *Ger.*), the territory or jurisdiction of a *margrave*, who was originally a lord or keeper of the marches or borders. It is now a title of nobility in Germany, &c.

MAR'IGOLD, a plant of the genus *Calendula*, bearing a yellow flower. There are also several plants of other genera bearing this name; as the African marigold, of the genus *Tagetes;* corn marigold, of the genus *Chrysanthemum;* marsh marigold, of the genus *Caltha*, &c.

MARI'NE (*marinus: Lat.*), pertaining to the sea; as marine productions, &c. Also a general name for the navy of a kingdom or state; comprehending likewise all that relates to naval affairs, as the building, rigging, arming equipping, navigating, and employing ships.

MARI'NES (same *deriv.*), soldiers raised for naval service, and trained to fight both on shipboard and on land. They are clothed and armed in the same way as infantry of the line. No commissions in the corps are obtained by purchase, and the officers rise by seniority, the highest grade being colonel commandant. They are commanded by a lieutenant-general and a major general, who are naval officers, holding these additional titles.

MA'RIOTTE'S LAW, in Pneumatics, the law discovered by Boyle, but commonly attributed to Mariotte, that, 'the elasticity or pressure of gases is directly proportional to their density, and therefore inversely proportional to the space they occupy.'

MARK, ST., THE GOSPEL OF, a canonical book of the New Testament, the second in order. It is said that St. Mark wrote his gospel at Rome, whither he accompanied St. Peter, in the year of Christ 44. Tertullian, and others, pretend that St. Mark was no more than an amanuensis to St. Peter, who dictated this gospel to him; others assert that he wrote it after St. Peter's death. Nor are the learned less divided as to the language in which it was written; some affirming it to have been Greek, and others Latin. It however seems plainly intended for Christian converts from paganism, and is distinguished from the other evangelical writings by its brevity, passing over much that relates to the character of Christ as Messiah.——MARK, a money of account, or a coin. The English mark is two-thirds of a pound sterling, or 13*s.* 4*d.* The Hamburg mark is 1*s.* 4*d*

MARL (*mergel: Ger.*), a species of calcareous earth, being a mixture of carbonate of lime and clay, used in agriculture for enriching barren land. When it consists chiefly of lime, it acts like that substance; when its principal ingredient is alumina or clay, it acts partly as lime, but chiefly by altering the texture of the soil. All sandy soils are improved by it. All solid marls crumble by exposure to the atmosphere, usually in the course of a year. Beds of marl frequently contain organic remains.

MAR'LINES (*marling: Belg.*), a sea term for lines of untwisted hemp, well tarred, to keep the ends of the ropes, &c., from unravelling.——MARLINE-SPIKE, a small iron spike, used to open a rope when a sail is to be sewed to it, &c.

MAR'MALADE (*Fr.*; from *marmelo*, a quince: *Portug.*), the pulp of quinces boiled into a consistence with sugar; or a confection of plums, apricots, quinces, and other fruits, boiled with sugar.

MAR'MOSETS, a family of small monkeys peculiar to tropical America. In their manner of climbing they are more like squirrels than monkeys. ['The nails, except those of the hind thumbs, are long and claw-shaped, like those of squirrels, and the thumbs of the fore extremities are not opposable to the other fingers. They have two molar teeth less in each jaw than the *Cebidæ*, the other family of American monkeys. The body is long and slender, clothed with soft hairs; and the tail, which is nearly twice the length of the trunk, is not prehensile.'—H. W. BATES.] The countenance is mobile, expressive, and intelligent. In captivity the eyes are full of curiosity and mistrust, and observe every movement of those near them. They are fed both on fruits and insects. In some species the fur is marked with bars; others carry manes. The marmosets are great favourites with the ladies of Brazil. Of one, a timid sensitive thing, seven inches long, we are told that its owner constantly carried it in her bosom, and fed it from her mouth. Although it allowed its mistress to fondle it freely, it shrank back nervously on the approach of a stranger, the whole body trembling with fear, whilst through chattering teeth it uttered its twittering notes of alarm.

MAR'MOT (*marmotte: Fr.*), the *Arctomys alpinus* of zoologists, a rodent animal, about the size of a rabbit, inhabiting the higher region of the Alps and Pyrenees. When these animals (which live in societies) are eating, they post a sentinel, who gives a shrill whistle on the approach of any danger, and they all retire into their burrows, which are well lined with moss and hay. In these retreats they remain, in a torpid state, from the autumn till April. The *prairie dog* of North America belongs to the same genus.

MA'RONITES, a sect of Christians dwelling in the neighbourhood of Mount Lebanon, and so called from Maro, their first bishop, in the seventh century. They embraced the doctrine of Monotheletism (that although there were two natures, there was but one will in Christ), but they became reconciled to the church of Rome in the twelfth century. They are nominally under the Pope's supremacy, but the priests elect their own spiritual chiefs, and they are at liberty to marry. There is a college at Rome for the gratuitous education of young Maronites.

MAROO'NS (hog-hunters: *Span. Amer.*), the name given to revolted negroes in the West Indies and in some parts of South America. In many cases, by taking to the forests and mountains, they have rendered themselves formidable to the colonies, and sustained a long and brave resistance against the white population.

MARQUE, LETTER OF, a power granted by a state to its subjects, to make reprisals on the subjects of a state with which it is at war.

MAR'QUIS, or MAR'QUESS (*mark*, a frontier: *Ger.*), a title of honour, next in dignity to that of duke, first given to those who commanded the marches, or borders and frontiers of a kingdom. Marquises were not known in England till Richard II., in the year 1387, created Robert De Vere marquis of Dublin. The wife of a marquis is styled a *marchioness*. The marquis's coronet is a circle of gold set round with four strawberry leaves, alternating with as many pearls on pyramidal points of equal height.

MAR'RIAGE (*mariage: Fr.*). With the most ancient inhabitants of the East the bride was obtained by presents made, or services rendered, to her parents; and to this day the same practice prevails among the Circassians and the poorer Turks and Chinese. Both men and women, among the Athenians, cut off their hair before marriage, and consecrated it to some god or goddess, under whose protection they had more immediately placed themselves; and all virgins, before they could enter upon that state, were consecrated to Diana. Previous to the actual marriage of the parties contracted, sacrifices were offered up, and the gall of the victim was always thrown behind the altar, intimating that anger and malice should have no admission. Among the Romans there was no particular age determined for marriage, but all espousals were to be consummated by the nuptials within two years. The man always, at the time of entering into contract, sent a plain iron ring to the woman as a pledge of affection.——LAW OF MARRIAGE. Parties may, as they please, be married either by the superintendent-registrar or in a place of worship licensed for the purpose. They may be married after the publication of banns, or without them by special or ordinary license, or by the superintendent-registrar's certificate with or without license. If the marriage is solemnized at the office of the superintendent-registrar it must take place in his presence and that of some registrar of the district, and two other witnesses, with open doors, between the hours of eight and twelve in the forenoon. Marriages in Ireland and Scotland are valid if made in the form required in those countries. Marriages are void if contracted within the prohibited degrees, or where there is a prior existing marriage, and in cases of lunacy or incapacity. It is dissolved by the divorce court on proof of adultery. [See ADULTERY.] Bigamy or polygamy is a felonious offence. A wife committing any felony, except murder or manslaughter, in company with her husband, is not responsible for it; but she is, in such circumstances, indictable for high treason. In neither civil nor criminal cases, with the exception of treason, are husband and wife allowed, in ordinary circumstances, to give evidence against each other. Should the husband die intestate, the wife is entitled to half his personal property if there is no issue; if there is, to one-third. The husband is liable for all debts contracted by the wife before marriage, except those incurred during a former marriage; but his responsibility is ended by his or her death. He is not liable for debts incurred by her during marriage, unless they are contracted with his consent, either expressed or implied. He is not liable for his wife's debts, even for necessaries, if he turn her away for adultery, if she abandon him, or if they separate by mutual agreement. The will of a bachelor, or a widower not having children, is revoked by subsequent marriage and birth of issue. The warrant of attorney, given to an unmarried woman, is revoked by her marriage; also her will.

MARS (in Mythology, the god of war), in Astronomy, one of the superior planets, moving round the sun in an orbit between those of the earth and Jupiter. His mean distance from the sun is about 142,000,000 miles. He performs his mean sidereal revolution in very nearly 687 days. At the beginning of this century his orbit was inclined to the ecliptic at an angle of 1° 51′ 6″. His diameter is about 4100 miles. He revolves on his axis in 24h. 39m. 21s. The outlines of continents and seas may be distinctly discerned on his surface. His reddish colour is most probably due to an ochreous soil, and his seas, by contrast, appear green. [See COLOURS, ACCIDENTAL.] His poles seem very white, no doubt from snow, as the whiteness is greatest after the long polar winter, and it disappears after long exposure to the sun.

MARSH (*marécage: Fr.*), a tract of low land, usually or occasionally covered with water; or very wet and miry, and overgrown with coarse grass and sedges. Land occasionally overflowed by the tides is called a *salt marsh*.

MARSH-MAL'LOW. [See ALTHÆA.]

MAR'SHAL (*maréchal: Fr.*), in its primary signification, means an officer who has the charge of horses; but it is now applied to officers who have very different employments.——MARSHAL OF THE QUEEN'S BENCH, an officer who had the charge of the prison formerly in Southwark; but his office has been abolished, that of *Keeper of the Queen's Prison* having been substituted for it.——EARL-MARSHAL, the eighth officer of state; an honorary title, and personal until made hereditary by Charles II. in the family of Howard. He is at the head of the college of Heralds.——FIELD-MARSHAL, a military officer of the highest rank.——In the United States of America, a *marshal* is a civil officer, appointed by the president and senate, in each judicial district; answering to the sheriff of a county in England.——MARSHAL OF FRANCE, the highest military rank in the French army. It first appears in the reign of Philip Augustus: it ceased after the deposition of Louis XVI., and was revived by Napoleon.

MAR'SHALLING (last), in Heraldry, the arranging of several coats of arms belonging to distinct families in one escutcheon or shield, together with their ornaments.

MAR'SHALSEA (*maréchaussée: Fr.*), formerly a prison in Southwark. The Queen's Bench, Fleet, and Marshalsea prisons, used for the confinement of debtors and criminals, by authority of the superior courts at Westminster, the High Court of Admiralty, &c., are now consolidated into one. ——MARSHALSEA, a court instituted to hear causes between the king's household and others, and having jurisdiction twelve miles round Whitehall; but now abolished.

MARSU'PIALS (*marsupion*, a purse: *Gr.*), an order of mammals, including the KANGAROOS of Australia and the OPOSSUMS of America. They must be placed near the base of the mammalian scale, and show in their structure various points of connection with reptiles. One of the most remarkable parts of their structure is the possession of an external pouch, which serves as a lodgment for the young, that are always prematurely born. They vary greatly in their habits and food.

MARTEL'LO TOW'ERS, a number of towers erected along different parts of the coasts of Great Britain and Ireland, as a defence against the threatened invasion of France by Napoleon Buonaparte. They are circular, with very thick walls, and bomb-proof roofs. One traversing gun was mounted on each, in working which the men were protected by a lofty parapet. They derived their name from the fact that the Italians, in past ages, built towers on their coasts, where they gave warning of the approach of pirates by striking a bell with a hammer, whence such towers were styled *Torri de Martello.* They have for some time served as stations for the use of the coast-blockade force.

MAR'TEN (*martes: Lat.*), the *Martes Foina*, an animal of the weasel tribe; one of the prettiest of the beasts of prey which are found in Great Britain. It has a small head, an agile body, and lively eyes. These animals are very destructive to poultry, eggs, &c.; they also feed on rats, mice, moles, and sometimes on grain. The pine marten (*Martes abietum*) inhabits the woods of North America and Europe, and is much esteemed for its fur, which is used for trimmings. About 100,000 skins of this animal are said to be annually collected in the fur countries.

MAR'TIN. [See HIRUNDO.]

MAR'TINETS (*Fr.*), in a ship, small lines fastened to the leech of a sail, reeved through a block on the topmast head, and coming down by the mast to the deck. Their use is to bring the leech of the sail close to the yard for the purpose of being furled.——In Military language, a *martinet* signifies a strict disciplinarian.

MAR'TINGALE (*Fr.*), in the manège, a

thong of leather fastened at one end of the girths under the belly of the horse, and at the other end to the musrol, passing between the fore legs: it is intended to keep him from rearing.——Also, a sea term for a rope extending from the jib-boom to the end of the bumpkin.

MART'LETS, in Heraldry, little birds, like swallows, but with short tufts of feathers instead of legs. It is the difference or distinction of a fourth son.

MAR'TYR (*martūs*, literally a witness: *Gr*.), any innocent person who suffers death in defence of a cause rather than abandon it. In the Christian sense of the word, it is one who lays down his life for the Gospel, or suffers death for the sake of his religion. Those who boldly asserted their belief, but were not visited with the extreme punishment of death, were termed *confessors*.

MARTYROL'OGY (*martūs*, a martyr; and *logos*, a description: *Gr*.), a catalogue or list of martyrs, including the history of their lives and sufferings. Many of the ancient martyrologies, like those used at present in conventual establishments, were filled with fictions.

MAR'VEL of PERU, the popular name of a Mexican plant, the *Mirabilis dichotoma* of botanists, nat. ord. *Nyctaginaceæ*. It has handsome flowers which show a great tendency to sport as to colour.

MA'SONRY (*maçonnerie: Fr.*), that branch of the building art which consists in hewing or squaring stones, &c., and in properly laying them. Several kinds of masonry were in use among the ancients:—the *reticulatum* (*rete*, a net: *Lat.*), arranged in diagonal courses like the meshes of a net; the *incertum* (*incertus*, irregular), in which the stones of the same course were not required to be of the same height, nor the joints, though flat, perpendicular; the *isodomus* (*isos*, equal; and *domos*, a collection of building materials: *Gr.*), in which the courses were equal in height; the *pseudisodomus* (*pseudēs*, false: *Gr.*), in which the courses were of unequal height; the *emplectum* (*empleko*, I interweave: *Gr.*), in which the faces were wrought, the centre being filled up with rubble; *diatoni* (*dia*, through; and *teino*, I stretch: *Gr.*), or bond stones, being used by the Greeks with this kind of work. It is highly important, in every kind of masonry, that the vertical joint of one course should not fall on or very near that of the course under it.

MA'SONS (*maçons: Fr.*), or **FREE AND ACCEPTED MASONS**, a term applied to a fraternity of great antiquity, and so called probably because the first founders of it were persons of that occupation. It is generally understood that they are bound by an oath of secrecy not to reveal anything that passes within the society, and the members throughout the world are known to each other by certain secret signs. It professes to be founded on the practice of social and moral virtue, and inculcates 'brotherly love, relief, and truth.' [See FREEMASONRY.]

MASQUE, a theatrical drama, or gorgeous histrionic spectacle, much admired at the courts of princes during the 16th and 17th centuries. According to Holinshed's Chronicle, the first masque performed in England was at Greenwich, in 1512. Shakspeare, as well as Beaumont and Fletcher, have frequently introduced masques into their plays. James I. carried the glory of the masque to its height. It had before consisted of music, dancing, gaming, a banquet, and a display of grotesque personages and fantastic dresses; but it now assumed a higher character.——In Architecture, certain pieces of sculpture representing hideous forms, which serve to fill up vacant spaces.

MASQUERA'DE (*mascherata: Ital.*), an exhibition, in which persons wearing masks meet together and represent different characters.

MASS, in the Church of Rome, the prayers and ceremonies used at the celebration of the eucharist; or, in other words, at the supposed consecrating of the bread and wine into the body and blood of Christ, and offering them, so transubstantiated, as an expiatory sacrifice for the living and the dead. It derives its name from the words '*ite, missa est concio*' (go, the assembly is dismissed: *Lat.*), of which the words '*ite, missa est*' are still retained, being pronounced at its close. It was arranged in its present form by Gregory I., in the 6th century. *Low masses* are those in which only one person officiates. In *high masses*, the officiating priest is assisted by the deacon, subdeacon, &c.; the ceremonies are more numerous, and it is accompanied with music. The masses of the religious orders usually differ more or less from those of the secular clergy. Masses said in certain places, or by certain persons, have *indulgences* attached to them by grant from the pope, and are therefore deemed more efficacious; they are applicable, generally speaking, to both the living and the dead.——**MASS** (*masse: Ger.*), the quantity of matter in any body; its amount is obtained by multiplying the volume into the density. The mass multiplied by the constant force of gravity constitutes *weight*.——In the Fine Arts, a large quantity of light or shade.

MASSE'TER (*massētēr*, from *masaomai*, I chew: *Gr.*), a short thick muscle, which raises the lower jaw, and aids in moving it backwards and forwards, in the act of chewing.

MAS'SICOT, the yellow oxide of lead. It is prepared by calcination of white lead, the carbonate of the metal: by further calcination, it becomes *minium*, or red lead.

MAS'SIVE (*massif: Fr.*), in Mineralogy, having a crystalline structure, but not a regular form.——Among builders, an epithet given to whatever is particularly heavy and solid: thus a massive column is one too short and thick for the order whose capital it bears, &c.

MASSO'RA, or **MASO'RA** (tradition: *Heb.*), a critical work amongst the Jews, containing remarks on the verses, words, letters, and vowel-points of the Hebrew text of the Bible. The Jewish Rabbis or doctors who drew it up were called *Massorites*. Before their time, the sacred books had no breaks or divisions into chapters or verses; and in consequence of the errors which had crept in during the Babylonish captivity, it was found necessary to ascertain and fix the reading of the Hebrew text; which they did, and also divided the canonical books into twenty-two, and these twenty-two books into chapters, and the chapters into verses.

MAST (*Ger.*), a long, upright piece of timber, raised from the keel, through the deck of a vessel, to which the yards, sails, &c., are fixed; the whole being supported by an ingenious combination of ropes, adapted to be used as a means of ascent for the purpose of adjusting the sails. The *mainmast* is the largest mast in the ship, and in large ships is divided into lower, top, top-gallant, and royal, the *foremast* is the next in size, standing near the stem of the ship; the *mizenmast*, the smallest of the three, stands between the mainmast and the stern.——**Mast**, the fruit of the oak and beech.

MAS'TER (*maître: Fr.; from magister: Lat.*), in Law, the name of several officers who preside in their various departments. ——**Master at-arms**, in a ship of war, he who has charge of the small arms, and exercises the petty officers, &c.——**Master of Arts**, the second degree taken at Cambridge and Oxford, to which candidates are not admitted until they are of seven years' standing. In the foreign and Scotch universities it is the first degree ——**Master of the Ceremonies**, an officer attached to all European courts, whose duty is to regulate matters of state ceremony and etiquette. ——**Masters in Chancery**, assistants to the lord chancellor and master of the rolls. There were, including the master of the rolls and accountant general, twelve masters in *ordinary*, of whom the master of the rolls was chief. They are now abolished, with a reservation of the rights, duties, and privileges of the accountant-general as one of them. Masters *extraordinary* were appointed to act in the country, beyond twenty miles from London ——**Master of the Horse**, an officer of the crown, who has the charge of the royal stud, and is over the equerries and other officers attached to that part of the regal establishment.——**Master of the Rolls**, a patent officer, who has the custody of the rolls of parliament, patents which pass the great seal, the records of chancery, commissions, deeds, &c. He hears causes in the Rolls-chapel.——**Master**, in a merchant-vessel, the same as captain; but in a ship of war an officer who inspects the provisions and stores, takes care of the rigging and ballast, and navigates the ship under the directions of his superior officer. ——**Master of the Wardrobe**, an officer under the lord chamberlain, who has the care of the royal robes.

MAS'TIC, or **MAS'TICH** (*mastikē: Gr.*), a solid and transparent resin, of a pale yellow or whitish colour, principally brought from the island of Chios, in drops or tears, the form in which it naturally exudes from the *Pistacia atlantica* and *P. lentiscus*, two trees belonging to the nat. ord. *Anacardiaceæ*. It is used for strengthening the gums and sweetening the breath.——In Architecture, a species of cement used for plastering walls. It contains a large quantity of linseed-oil, and becomes hard in a few days.

MAS'TIFF (*mæst*, greatness; and *tæve*, a dog: *Goth.*), in Zoology, the *Canis Molossus*, having a large head, with pendent lips and ears, and distinguished by vigilance, strength, and courage. English mastiffs were held in such high estimation at ancient Rome, that an officer was appointed for the purpose of breeding them, and sending to the imperial city such as he thought capable of sustaining the combats in the amphitheatre.

MAS'TODON (*mastos*, the breast; and *odous*, a tooth: *Gr.*), in Natural History, a genus of mammiferous animals resembling the elephant and mammoth, but found only in a fossil state. There are no traces, within the period of tradition or history, of their existence. They derive their name from the conical projections on the surfaces of their molar teeth.

MAS'TOID (*mastos*, a breast; and *eidos*, form. *Gr.*), in Anatomy, an epithet for those processes of bone which resemble the nipple of a breast.

MASTOL'OGY (*mastos*, a breast; and *logos*, a description. *Gr.*), that branch of zoology which treats of mammiferous animals.

MATE (*maet: Dut.*), an officer who is assistant to the captain of a merchant-vessel on shipboard. Large ships have a first, second, and third mate. In ships of war, the master has *mates* selected from the midshipmen; the boatswain, carpenter, gunner, &c., have each their mates.

MATE'RIALISM (*materia*, matter: *Lat.*), the doctrine held by those who maintain that man does not possess a spiritual part distinct from his body, and hold that what others call soul or spirit is only the result or effect of the organization of matter in the body.

MATE'RIA MED'ICA (medical stuff: *Lat.*), a term used to denote all those substances which are employed in the prevention of diseases and the restoration of health.

MATHEMAT'ICS (*mathēmatikē*, from *mathein*, to learn. *Gr.*), the science which has for its object the indirect measurement of magnitudes. It proposes to determine magnitudes by each other according to the precise relations that exist between them. Mathematics are to be regarded less as a constituent part of natural philosophy than as having become the true basis of the whole of natural philosophy; though, strictly speaking, they are both. The science is of less value for the knowledge of which it consists, important as that knowledge is, than as being the most potent instrument that the human mind can employ for investigating the laws of natural phenomena. It is divisible into two great sciences: Abstract mathematics, or the calculus in its most extensive sense; and Concrete mathematics, which are composed of general geometry and rational mechanics. The concrete part is founded upon the abstract, which, in its turn, becomes the basis of all natural philosophy. It is the business of concrete mathematics to discover the equations of phenomena. Hence it depends on the character of the objects examined, and varies with the phenomena. The process is therefore special, and its character experimental, physical, phenomenal. Abstract mathematics, on the other hand, are entirely independent of the nature of the objects, and are concerned only with their numerical relations. Their process is general; their character purely logical and rational. They are an immense extension of logic to a certain order of deductions; and it reaches from the simplest numerical operations to the highest combinations of transcendental analysis. The object is to discover unknown quantities by the known, using, as its starting point, that which is the limit of concrete mathematics; the knowledge of the precise relations, that is, the equations between different magnitudes which are considered simultaneously. If all phenomena were capable of being reduced to questions of numbers, the whole domain of natural science would be brought within the reach of mathematics; but such is the increasing complexity of phenomena, as they become special, and such the narrowness of human capacity, that the difficulty of discovering suitable equations, except in the case of the simplest and most general phenomena, is insurmountable. [See ALGEBRA.]

MAT'INS (*matin*, the morning: *Fr.*), the first part of the daily service, particularly in the Roman Catholic church, in which it, as well as lauds, may be said the afternoon preceding the day to which it belongs.

MAT'RASS (*matras: Fr.*), or CUCURBIT, a long straight-necked chemical glass vessel used for digestion and distillation; being sometimes bellied, and sometimes gradually tapering into a conical figure. The matrass is superseded in a modern chemistry by the flask. *Florence flasks*, in which sweet oil is imported, are, on account of their thinness (which renders them not likely to break when heated) and their cheapness, extremely convenient in chemical processes on a small scale.

MATRICULA'TION (*matricula*, the *dim.* of *matrix*, a public register: *Lat.*), the act of admitting any person to be a member of an English university.

MA'TRIX (the womb: *Lat.*), in Metallurgy, the bed or mould of earth, &c., in which any mineral substance is found. It is called also a *gangue*. A mould, or whatever gives form to anything; as, in Printing, the mould or form in which the type or letter is cast.——In Coining, the steel die, on which are engraved the figures, arms, &c., with which the coin is to be stamped.

MATROSS', one of those who, in a train of artillery, were next to the gunners, and assisted them in loading, firing, and sponging the guns. They carried firelocks, and marched with the store waggons as guards and assistants.

MAT'TER (*materies: Lat.*), that which is the object of our senses; we can never know more than its *sensible properties*. It does not necessarily come under the cognisance of *all* our senses: thus we cannot see the colourless gases. Its essential properties are, *divisibility*, or the capability of being separated into parts; *impenetrability*, the impossibility of two different quantities of matter occupying the same place at the same time; *porosity*, the separation of its particles by small pores or empty spaces; *compressibility*, a capability of being made to occupy a smaller space—the consequence of porosity; *extension*, the occupation of some definite portion of space; *mobility*, the capability of being moved from one place to another; and *weight*, or the mutual attraction existing between every one of its particles and the earth—a consequence of that great law by which every portion of matter attracts every other, at least within certain very great distances, that attraction being inversely as the square of the distance. Matter is usually divided by philosophical writers into three kinds or classes—solid, liquid, and aeriform. *Solid* substances are those whose parts firmly cohere or resist compression, as wood or stone. *Liquids* are those which have free motion among their parts, and yield to any force, as water, wine, &c. *Aeriform* substances are elastic fluids, called vapours and gases, as air, oxygen, &c.

MATTH'EW, ST., GOSPEL OF, a canonical book of the New Testament. St. Matthew is generally thought to have composed his gospel in Judæa, at the request of those he had converted; and it is thought he began it in the year 41, eight years after Christ's resurrection. It was written, according to the testimony of all the ancients, in the Hebrew or Syriac language, which was then common in Judæa; but the Greek version of it, which now passes for the original, is as old as the apostolical times.

MAT'URANT (*maturo*, I ripen: *Lat.*), in Pharmacy, a medicine or application which promotes suppuration.

MAUL'STICK (*mahlstock*, from *mahlen*, to paint: *Ger.*), a painter's stick, on which he rests his hand when he paints.

MAUN'DAY THURS'DAY, the Thursday in Passion week, or that which is next before Good Friday. The word is supposed by some to be derived from the Saxon *maund*, a basket, because on that day princes used to give alms to the poor from baskets. Others think it was called *Maunday* or *Mandate* Thursday, from *mandatum* (a command: *Lat.*), on account of the command which Christ gave his disciples to commemorate him in the Lord's supper, which he this day instituted; or from the new commandment that he gave them to love one another, after he had washed their feet as a token of his love towards them.

MAUSOLE'UM, a general designation for any superb and magnificent monument of the dead, adorned with rich sculpture, and inscribed with an epitaph. In a more confined acceptation, it expresses a pompous monument in honour of some emperor, prince, or very illustrious personage; but it properly and literally signifies that particular monument constructed out of the native rock by Artemisia to the memory of her husband Mausolus, king of Caria, whence it derives its name. This monument was so superb that it was reckoned one of the wonders of the world. It was formed, B.C. 353, at Halicarnassus, in Asia Minor. Its pyramid of 24 steps was crowned by a marble chariot, and 36 columns were placed around it. The base formed a parallelogram that measured 472 feet. Five sculptors of the highest eminence were employed to enrich it with statuary and carvings. Some of the sculptures are now in the British Museum.

MAX'ILLARY BONES (*maxilla* a jawbone, *Lat.*), in human anatomy, the bones in which the teeth are lodged. In the adult the upper jaw is formed of one bone, but it consists of several elements in children; and in monkeys and other quadrupeds one of these elements remains permanently distinct. The lower jaw in the infant consists of two branches joined at the middle, but in the adult it is composed of a single bone. The animal visage is distinguished from man's by the elongation of the jaw-bones. [See FACIAL ANGLE.] In fishes the upper jaw is sometimes wanting, as in the eels; it is occasionally formed by a single pair of bones, but often by two pairs of bones, called the maxillary and premaxillary bones. The lower jaw is called the mandible. Amongst insects, the term *maxillæ* is applied to the hinder or inferior pair of jaws; each carries a jointed organ called a *palpus*.

MAX'IM (*maxime: Fr.*), an established proposition or principle; in which sense, according to popular usage, it denotes nearly the same as *axiom* in philosophy and mathematics. Maxims are self-evident propositions, and the principles of all science; for on these, and definitions, all demonstrative knowledge depends.

MAX'IMA and **MIN'IMA** (the largest and smallest quantities: *Lat.*), terms used in analysis to signify, not the greatest and least values of a variable quantity, but the values it has at the instant when it ceases to increase and begins to decrease, and *vice versâ*. A variable, therefore, may have several maxima and minima.

MAY, the fifth month in the year, reckoning from January; and the third, beginning with March, as was the practice of the ancient Romans, &c. This month derives its name from Maia, the mother of Mercury, to whom sacrifice was offered on the first day of it. The month of May is, in the Roman Catholic church, specially devoted to the Virgin; and many Roman Catholics even term it, in the ordinary business of life, the *month of Mary*.

MAY'-FLY, a name given to several insects, but most correctly to the *Ephemera vulgata*, a neuropterous insect, plentiful in the beginning of summer, and used as a bait in fishing, especially for trout.

MAY'OR (*major*, greater: *Lat.*), the chief magistrate of a city or municipal borough, who, in London, Dublin, and York, is called lord mayor. [See COMMON COUNCIL.]

MEAD (*meth: Ger.*), an agreeable sweet kind of wine, made of honey and water, boiled and fermented.

MEAD'OW, in its general signification, means pasture or grass-land, annually mown for hay; but the term is more particularly applied to lands that are too moist for cattle to graze upon in winter without spoiling the sward. In America, the word *meadow* is applied particularly to the low ground on the banks of rivers, consisting of a rich mould or an alluvial soil, whether grass-land, pasture, tillage, or woodland.

MEAD'OW-ORE, in Mineralogy, conchoidal bog-iron-ore.

MEAD'OW-SWEET, in Botany, a plant of the nat. ord. *Rosaceæ*, and genus *Spiræa*, with crumpled leaves, something like those of the elm, growing in meadows. Its flowers are white and fragrant.——**MEADOW-RUE**, a plant of the nat. ord. *Ranunculaceæ*, and genus *Thalictrum*.——**MEADOW-SAFFRON**, a plant of the nat. ord. *Melanthaceæ* and genus *Colchicum*.——**MEADOW-SAXIFRAGE**, a plant of the nat. ord. *Umbelliferæ*, and genus *Peucedanum*.

MEAN (*medianus*, middle: *Lat.*), a middle state; called *arithmetical* when it is half the sum of two extremes; *geometrical*, when it is the square root of the product of two extremes; and *harmonical*, when it is equal to twice the product of the extremes divided by their sum.——*Mean distance of a planet from the sun*, in Astronomy, a right line drawn from the sun to the extremity of the conjugate axis of the ellipsis in which the planet moves; and this is equal to the semi-transverse axis. It is so called because it is a mean between the planet's greatest and least distance from the sun.——*Mean motion*, that by which a planet is supposed to uniformly traverse its orbit, and which is always proportional to the time.——*Mean time*, or *equal time*, that which is measured by an equable motion, as that of a clock.

ME'ASLES (*maselen: Teut.*), in Medicine, *Rubeola*, a well-known disease. Persons of all ages are liable to its attacks; but it is more common in young children, and rarely affects an individual a second time. The symptoms are a swelling and inflammation of the eyes, hoarseness, cough, drowsiness, and, about the fourth day, an eruption of small red spots. Even when violent, the measles are not necessarily of a putrid tendency, although such a disposition sometimes prevails.

MEAS'URE (*mesure: Fr.*; from *mensura: Lat.*), any given quantity, by which, as a *unit*, the length, breadth, thickness, and capacity of other things may be estimated, or proportioned, for the convenience and regulation of trade and commerce. Formerly, every province, and almost every place of importance, had its own measures, which proved a most perplexing hindrance to commercial intercourse. In modern times many attempts at uniformity were made in the United Kingdom; and at length, by an act of parliament, which came into operation Jan. 1, 1826, the London measures and weights were declared to be the standards for measures and weights throughout the realm. They are founded on the *standard yard*, which was declared by law to bear the same proportion to the length of a pendulum vibrating seconds of mean time, in the latitude of London, in a vacuum at the level of the sea, as 36 inches bear to 39·1393 inches; so that, if lost or injured, it might be easily replaced. This standard has since been lost, having been destroyed by the fire which consumed the two houses of parliament, in 1834. It is highly desirable that a decimal system of measures, as well as weights, should be adopted amongst us, on account of the facility with which calculations are made under that system.——MEASURE, in Arithmetic, &c., a quantity contained in another some number of times, without a remainder: thus, 7 is a measure of 21.——MEASURE, in Music, the interval which the person who beats time takes between the rising and falling of his hand, in order to render the movement quicker or slower, according to the nature of the subject.——MEASURE, in Poetry, a certain number of syllables metrically arranged.

MECHAN'ICS (*mēchanē*, a machine; from *mēchos*, an expedient: *Gr.*), that branch of practical science which treats of the effects of powers or motive forces, and their action on bodies, either directly or by means of machines and engines. The term *mechanics* includes *statics*, or the laws which relate to bodies in equilibrium; and *dynamics*, or those which relate to bodies in motion. When the bodies under consideration are in the fluid state, the term *hydromechanics* might be employed, which would include *hydrostatics*, or the laws relating to fluids at rest; and *hydrodynamics*, or the laws relating to fluids in motion, with *hydraulics*, or the laws which govern machinery moved by water. The terms *aerostatics* and *aerodynamics* have been used to indicate those branches of science which relate to elastic fluids at rest, and in motion; and they likewise ought to be included under the general term *aeromechanics*.——The *mechanical powers* are six simple machines, to which all others, how complex soever, may be reduced, and of which, or their combinations, all others are composed. These are the *lever*, the *pulley*, and the *wheel and axle*, all reducible to the *lever*; the *inclined plane*, the *wedge*, and the *screw*, all reducible to the *inclined plane*. The forces which may be employed to give motion to machines are called *mechanical agents*, or *prime movers*. They are water, wind, steam, gunpowder, the strength of man and other animals, &c. *Water* acts by its weight, and by the velocity which it acquires from falling in consequence of its weight. *Wind* acts by its volume or mass and its velocity. Both these agents are variable, and both act in a straight line. *Heat*, as given out by combustible materials, produces steam, or gives motion to air by making it lighter, and causing it to expand. *Steam*, as usually employed, generates a motion, which is alternately in one direction and the opposite. The *strength of animals* is commonly made to act upon some point of resistance, by drawing, pushing, or pressing; and produces variable motions, naturally in a straight line, but sometimes in a curve.

MECHO'ACAN (from that province of Mexico whence it is brought), *white jalap*, the root of the *Convolvulus Mechoacanna*. It is a purgative, and was formerly used for jalap.

MECON'IC A'CID (*mēkōn*, the poppy: *Gr.*), the acid with which morphia is combined in opinion. When pure, it is in small white crystals. Its salts are termed *meconates*.

MED'AL (*médaille*: *Fr.*), a piece of metal in the form of a coin, intended to convey to posterity the portrait of some great personage, or the memory of some illustrious action. Ancient coins, though, strictly speaking, not medals, are included under the term. The parts of a medal are the two sides, one of which is called the face, or *obverse*, containing the head, and the other the *reverse*. On each side is the area, or field, which forms the middle of the medal; the rim, or border; and the *exergue*, or plain circular space just within the edge; and on the two sides are the type, or the figure represented, and the legend, or inscription. Egyptian medals are the most ancient; but the Grecian far excel all others in design, force, and delicacy. Those of the Romans are beautiful, the engraving fine, the invention simple, and the taste exquisite They are distinguished into consular and imperial: the *consular* medals are the most ancient, but those of copper and silver do not go farther back than the 485th year of Rome, and those of gold no farther back than the year 546. [See MONEY.] Among the *imperial* medals, a distinction is made between those of the upper and lower empire. The first commenced under Julius Cæsar, and continued till A.D. 260; the lower empire includes a space of nearly 1200 years, and ends with the taking of Constantinople. The use of medals is very considerable; they often throw great light on history, in confirming such passages as are true in old authors, in reconciling such as are discrepant, and in recording such as have been omitted. In this case, a cabinet of medals may be said to be a body of history. It was, indeed, an excellent way to perpetuate the memory of great actions, thus to coin out the life of an emperor, and to put every exploit into the mint—a kind of printing before the art was invented. Nor are medals of less use in architecture, painting, poetry, &c.; for a cabinet of medals is a collection of pictures in miniature, and by them the plans of many of the most important buildings of antiquity are preserved.——*Impressions of medals.* The following is a very easy method of taking the impressions of medals and coins. Melt a little isinglass-glue with brandy, and pour it thinly over the medal, &c., so as to cover its whole surface; let it remain on for a day or two till it is thoroughly dry and hardened, when it may be easily removed, and will afford an excellent impression.

MEDAL'LION (*Fr.*), a medal of an unusual size, supposed, in ancient times, to have been struck by the emperors for their friends, and for foreign princes and ambassadors.

MED'ICINE (*médecine*: *Fr.*; from

cina: Lat.), the art which treats of the means of preserving or restoring health. It is founded on the study of man's physical and moral nature, in health and in disease. It has struggled at all times, and continues to struggle, with favourite theories; and has, with the slowness which marks all important advances in human knowledge, but lately emerged from some of the prejudices of many ages, and will doubtless long continue subject to others. Hippocrates, who lived about the middle of the fifth century before the Christian era, is the earliest author on medicine whose writings have been preserved. He was a man of very superior medical acquirements, and, by the consent of posterity, he has been styled the Father of Medicine. Two other lights of ancient medicine were Celsus, who wrote in Latin in the first century after Christ, and Galen, who practised at Rome, but wrote in Greek, his native language, in the second century of our era.

MEDI'ETAS LIN'GUÆ (a moiety of the stranger's tongue: *Lat.*), in Law, a jury consisting of half natives and half foreigners, which is empannelled in cases of felony or misdemeanour, where the party to be tried is a foreigner.

ME'DIUM (*Lat.*), in Philosophy, the space or region through which a body in motion passes to any point. Thus, air is the medium in which bodies move near our earth; water, that in which fishes live and move; and we likewise speak of a resisting medium, a refracting medium, &c.——MEDIUM also denotes the means or instrument by which anything is accomplished, conveyed, or carried on. Thus money is the *medium* of commerce; bills of credit or bank-notes are often used as media of trade in the place of gold and silver; and intelligence is communicated through the medium of the press.

MED'LAR (*mæd*, mead: *Sax.*—from its fruit being used in that liquor), the fruit of the *Mespilus Germanica*, a plant cultivated in our gardens for its fruit, which, before it is perfectly ripe, has an extremely sharp and astringent taste. Medlars do not ripen on the tree, but are gathered in autumn, and kept till they approach a state of decomposition, before they are considered fit to be eaten.

MEDUL'LA (*Lat.*), in Anatomy, the marrow, a soft oleaginous substance contained in the cavity of the bones. Anatomists, for many ages, took it to be a mere shapeless and irregular mass of matter; but it is found in reality to consist of a number of fatty substances, contained in minute vesicles of a membranaceous structure, in which it is secreted from the arterial blood, in the same manner as the fat of the rest of the body.——MEDULLA CEREBRI, or medullary substance, the interior white portion of the brain.——MEDULLA OBLONGATA, the lower and medullary part of the cerebrum and cerebellum; it extends to the great foramen or hole in the occipital bone of the cranium, where it gives origin to the spinal marrow and to the nerves of the brain.——MEDULLA SPINALIS, the spinal marrow, a continuation of the medulla oblongata of the brain It is enclosed in a kind of bony canal, formed by the vertebræ, and in this is continued from the head to the extremity of the os sacrum.——MEDULLA, in Botany, the pith.

MEDUL'LARY RAYS (same *deriv.*), in Botany, the vertical plates of cellular tissue, which radiate from the centre of the stem of exogenous plants through the wood to the bark; they cause the appearance called *silver grain.*——MEDULLARY SHEATH, a thin layer of vessels which surround the pith of exogenous plants. It serves to connect the middle part of the stem and the leaves by means of its spiral vessels.

MEDU'SA, one of the three sister Gorgons, who incurred the displeasure of Minerva, and had her beautiful hair changed by the goddess into serpents. It was fabled that Perseus succeeded in beheading Medusa, and that the serpents which infest Africa sprang from her blood. He had protected himself during the exploit with Minerva's ægis, and the head was placed in the centre of the shield, where it retained the power it had, when living, of turning the beholder to stone.——MEDUSA, in Zoology, a genus of marine animals belonging to the class *Acalephæ*—popularly known as sea-blubbers and jelly-fish The members of the family *Medusadæ* are shaped something like an umbrella, and have various appendages hanging from the upper side. Ships at sea frequently pass amongst vast numbers of them. They have a stomach or digestive cavity excavated in the centre of the disc. They swim by muscular contraction of the margin of the disc. A very large portion of them consists of water, which drains away if they are placed on a filter; the solid parts of one weighing ten pounds do not exceed two drachms Many of them are phosphorescent, but the organs which emit the light have not been discovered. Most of them sting and inflame the hand, and the cause of this property is equally unknown.

MEER'SCHAUM (foam of the sea: *Ger.*), a fine sort of Turkish clay, consisting of hydrate of magnesia combined with silex, which, when first dug, is soft, and makes a lather like soap. From this clay, pipes are made in Germany, of various forms. It assumes a beautiful brown colour after it has been used by the smoker for some time.

MEGALOSAU'RUS (*megas*, great; and *sauros*, a lizard: *Gr.*), the name given to an extinct genus of gigantic lizards. Remains have been found in the Stonesfield slate, near Woodstock, a member of the lower oolite.

MEGAPO'DIDÆ, the family of *Mound Birds*, which see.

MEG'ASCOPE (*megas*, great; and *skopeo*, I examine: *Gr.*), an optical instrument for the examination of bodies of large dimensions.

MEGATHE'RIUM (*megas*, great; and *thērion*, a beast: *Gr.*), a genus of extinct animals allied to the sloths, of which remains have been found in the post-tertiary beds of both North and South America. The South American species was 13 feet long, 8 feet high, and had feet a yard in length. It was a ponderous animal, that probably fed on the roots of plants, which its great strength enabled it to tear out of the ground.

MEL'ANITE (*melas*, black: *Gr.*), the *Black Garnet*, a mineral of a velvet-black colour, found in the basalt of Bohemia, and in a rock at Frescati, near Rome.

MELIS'SA (a bee: *Gr.*—because abounding in honey), in Botany, a genus of plants, nat. ord. *Labiatæ*, including the different species of balm.

MEL'LITE (*meli*, honey; and *lithos*, a stone: *Gr.*), the *Honeystone*, a mineral found first in Thuringia. It is yellow and crystallized, and consists of mellitic acid and alumina. The name has been given also to a yellow mineral which occurs in very minute crystals in the fissures and cavities of lava, and the composition of which is not yet known.——**Mellitic Acid**, procured from mellite, is a compound of carbon and oxygen with water.

MEL'ODRAMA (*melos*, a song; and *drama*, a drama: *Gr.*), a dramatic performance in which music is intermixed; or that species of drama in which the declamation of certain passages is interrupted by music. If only one person acts, it is a *monodrama*; if two, a *duodrama*. It differs from the opera and operetta in this, that the performers do not sing, but declaim, and the music only fills the pauses, either preparing or continuing the feelings expressed by the actors. Melodramas are generally romantic and extravagant.

MEL'ODY (*melōdia*: from *melos*, a song; and *ōdē*, an ode: *Gr.*), in Music, the agreeable effect of different sounds, ranged and disposed in *succession*; so that melody is the effect of a single voice or instrument, by which it is distinguished from harmony.

MEL'ON (*Fr*; from *melo*: *Lat*), the fruit of a plant, the *Cucumis melo*, belonging to the nat. ord. *Cucurbitaceæ*. There are many varieties in cultivation. Its native country is Asia. The *Water melon* is the fruit of the *Cucurbita citrullus*, another plant of the same nat. ord. As the fruit is cool and refreshing, it is cultivated extensively in warm countries.

MEM'BRANE (*membrana*: *Lat.*), in Anatomy, a broad nervous and fibrous substance, which serves as a covering for different parts of the body, particularly the brain and the viscera. The membranes differ in thickness, according to the smallness of their fibres, or the number of their planes. These latter are termed *laminæ*, and are distinguished into internal, external, and medial. Small portions of membranes, especially when they are very thin, are called *pellicles*; and some membranaceous laminæ are united together by the intervention of a particular substance, composed of these pellicles, and called the *cellular* or spongy substance.

MEMBRANOL'OGY (*membrana*, a membrane: *Lat.*; and *logos*, a discourse: *Gr.*), that branch of anatomy which treats of the membranes of the body.

MEM'OIRS (*mémoires*: *Fr.*), a species of history, written by persons who had some share in the transactions they relate; answering to what the Romans called *commentarii* (commentaries). They furnish the reader with interesting individual anecdotes, and often expose the most secret motives, or disclose the whole character of events, which may be barely hinted at in books of general history.——Also, short essays on particular subjects.

MEM'ORY (*memoria*: *Lat.*), that faculty of the mind by which it retains the knowledge of past impressions, a faculty which differs greatly in different individuals, and in the same individual at different ages, but in all it may be much improved by cultivation.——*Local memory*, among orators, is but the associating the different heads to be treated of with the objects before the speaker's eyes; so that, by only looking around him, he is put in mind of what he is to say.——*Artificial memory* (*memoria technica*) signifies a method of assisting the memory by some artificial contrivance, as that of forming certain words the letters of which shall signify the date or era to be remembered. [See **Mnemonics**.]

MENACH'ANITE, in Mineralogy, ferruginous oxide of titanium; so called from having been found in the vale of Menachan, in Cornwall

MEN'DICANTS (*mendico*, I beg: *Lat.*), a term applied to several orders of monks who live on alms, or beg from door to door.

MENDO'SA SUTU'RA (a false joining: *Lat.*), in Anatomy, a scaly joining together of bones, as in those of the temple.

MENIS'CUS (*mēniskos*, a half moon: *Gr.*), in Optics, a lens, convex on one side, and concave on the other, and on which the two surfaces would meet if continued, wherein it differs from a concavo-convex lens, in which the two surfaces would not meet if continued.

MEN'IVER (*menu vair*: *Fr.*), the old name of the ermine.

MENOL'OGY (*mēn*, a month; and *logos*, a discourse: *Gr.*), in the Greek church, a brief calendar of the lives of the saints, or list of those whose lives are not written. It is the same as *martyrology* in the Roman Catholic church.

MEN'SA (a table: *Lat.*), in Archæology, denotes all patrimony or goods necessary for a livelihood.

MENSA'LIA (pertaining to the table: *Lat.*), such parsonages or spiritual livings as were intended to provide for the tables of religious houses: they were called by the canonists *mensal benefices*.

MEN'STRUUM (*mensis*, a month: *Lat.*), in Chemistry, any fluid which dissolves a solid body. In the language of the older chemists, it meant some preparation which could operate effectually only at some particular period of the moon or month.

MENSURA'TION (*mensuratio*, from *mensuro*, I measure: *Lat.*), the art or process of ascertaining the lengths or contents of lines, surfaces, or solids; it is also applied to determine the heights, depths, or distances of bodies and objects. It therefore includes longimetry, or the art of measuring lines; planimetry, or the method of measuring surfaces; and stereometry, or the art of measuring solids. The mensuration of a plane superficies, or surface, lying level between its several boundaries, is easy. The surface of any *parallelogram* is the product of one side and its perpendicular distance from the opposite side. The surface of a *triangle* is its base multiplied by half its height, or its height by half its base: the height of a triangle is taken by means of a perpendicular to the base, let fall from the apex or summit. The surface of a *sphere* is equal to the perimeter of its great circle multiplied by its diameter. The surface of a *trapezoid* is half the sum of its parallel sides, multiplied by their perpendicular distance. The surface of any *irregular figure* may be found by dividing it into triangles, measuring them separately, and adding the resulting areas together. The solid contents of a *cube* are found by cubing one of its dimensions. The solid contents of any *prism* are obtained by multiplying the surface of one base by its perpendicular distance from the other. The solid contents of a *pyramid* are found by multiplying the base by one-third of the altitude. The solid contents of the *frustum of a pyramid* are found by multiplying half the sum of the surfaces of the upper and lower bases by the perpendicular distance between them, or the solid contents of the original pyramid, minus that of the part cut off. The solid contents of a sphere are found by multiplying the surface by one-third of the radius.

MEN'THA (*Lat.*; from *mintha* · *Gr.*), in Botany, a genus of plants, nat. ord. *Labiatæ* or *Lamiaceæ*, including the species of mint.

MEPHIT'IC (*mephitis*, a bad smell · *Lat.*), a term equivalent to *noxious*, *pestilential*, or *poisonous*, and applied generally to vapours of that description. Carbonic acid and sulphuretted hydrogen may be considered as mephitic gases. These are emitted from the ground in some places in such quantities that living beings are killed in a few minutes. The celebrated Grotto del Cane, near Naples, is one of these places; and another is a small valley called Guevo Upas, or the Valley of Poison, in the interior of Java. This place is thus described by a traveller:—On arriving at the foot of the mountain we left our horses, and scrambled up the side. When within a few yards of the valley we experienced a strong, nauseous, sickening, and suffocating smell; but on coming close to the edge, this smell ceased. We were now lost in astonishment at the awful scene below us. The valley was about half a mile in circumference, oval, the depth from thirty to thirty-five feet, the bottom quite flat and without vegetation, the whole covered with the skeletons of human beings, tigers, deer, and many other beasts and birds. We could not perceive any vapour or opening in the ground, which appeared to be of a hard sandy substance. We descended to within eighteen feet of the bottom; here we did not experience any difficulty in breathing, but a sickening, nauseous smell. A dog was fastened to the end of a bamboo, and sent in; in 14 seconds he fell on his back; he did not move his limbs, but continued to breathe 18 minutes. Another dog walked in to where the other dog was lying; in 10 seconds he fell on his face, and never moved his limbs afterwards, though he continued to breathe for 7 minutes. A fowl died in a minute and a-half.

MERCA'TOR'S CHART or PROJECTION, a chart, in which the parallels of latitude and the meridians are represented by straight lines perpendicular to each other. The sphere is thus represented, not as it can be seen from any one point, but as an eye would see it if carried successively over every part of it. The form of every small piece of land is truly represented, but the scale of representation varies greatly in different regions, the polar parts being much enlarged. It was invented by George Kaufmann, usually called *Mercator* (Kaufmann, *Ger.*, and mercator, *Lat.*, signifying the same thing—a merchant), who was born in 1512. This projection is universally adopted in nautical charts, and its advantage is, that the rhumb, or sailing course between two points, is a straight line. The degrees of longitude are all equal; but the degrees of latitude marked on the meridian form a scale of which the distances go on increasing from the equator towards the poles. This is done for the purpose of maintaining the proper proportion between the degrees of latitude and the degrees of longitude, which are rendered greater than they should be. Such a compensation causes the *rhumb*, or line representing the ship's course, to make the same angles with the different lines of the chart that it does in reality with the different lines of the sphere; while, at the same time, it is a right line. And since, by keeping the lines which represent meridians parallel, the degrees of longitude have been rendered too large, in the ratio of the radius to the secant of the latitude, the degrees of the meridian are made also to increase towards the poles, as the secant of latitude increases. Hence, though the distances are distorted, the latitude, longitude, and bearings of places, are represented truly on Mercator's chart.

MER'CURY (in Latin, *hydrargyrum*; from *hudôr*, water; and *arguros*, silver: *Gr.*), a metal found chiefly as a sulphuret, and sometimes native. It is white, and very brilliant; becomes solid at 38° below zero, and boils at 662°. It is not affected by the atmosphere at common temperatures, but is changed into red oxide by heating it to near its boiling point. Its spec. grav. is 13·5. It forms two oxides—the black protoxide, and the red peroxide; two chlorides—the protochloride or *calomel*, and the perchloride or *corrosive sublimate*; and two sulphurets—the black protosulphuret, and the bisulphuret, *cinnabar* or *vermilion*. It combines also with iodine, &c.——MERCURY, in Astronomy, a small planet that emits a bright light; though, on account of its proximity to the sun, it is seldom seen by the inhabitants of the earth. Its mean distance from that luminary is about 36,000,000 miles, or a little more than one-third of the earth's distance. Its mean sidereal revolution is performed in about 88 mean solar days. Its diameter is about 3140 miles. Its orbit is inclined to the ecliptic at an angle of 7° 0′ 9″. On account of its being so small, and so near the sun, its surface cannot be clearly distinguished. Sometimes, in the evening, it may be seen crossing the sun's disc, under the form of a black spot—which passage is called the *transit of Mercury*, and is in reality an annular eclipse of the sun. On account of its rapid motion, the Greeks called this planet after the name of the swift messenger of the gods, and represented it by the figure of a youth with wings at his head and feet.

MER'CY-SEAT, in Scriptural Antiquities, a table, or cover, lined on both sides with plates of gold, and set over the ark of the covenant; on each side of which was a cherub of gold, with wings spread over the mercy-seat

MERID'IAN (*meridies*, midday: *Lat.*—because it is noon at any place when the sun is on its meridian), in Astronomy, a great circle of the celestial sphere, passing through the poles of the earth, and also the zenith and nadir, crossing the equinoctial at right angles, and dividing the sphere into two equal parts, or hemispheres, the one eastern and the other western.——In Geography, the meridian is a great circle, passing through the poles of the earth, and any given place whose meridian it is; and it lies exactly under, or in the plane of, the celestial meridian. Meridians are various, and change according to the longitude of places, so that their number may be said to be infinite, for all places from east to west have their meridians The *first meridian* is that from which all the others are reckoned, and which, being totally arbitrary, has been variously chosen by different geographers; but most nations now assume the meridian of the place where they live, the capital of their country, or its chief observatory, for a first meridian; and from thence reckon the longitude of places, east and west. Thus, the British reckon from the meridian of Greenwich; the French from that of Paris; the Spanish from that of Madrid, &c. ——**MERIDIAN** of a globe, the brazen circle on which it turns, and by which it is supported. It is divided into 360 equal parts, called *degrees*. On the upper semicircle of the brass meridian, these degrees are numberd from 0 to 90, or from the equator towards the poles, and are used for finding the latitudes of places. On its lower semicircle they are numbered from 0 to 90, or from the poles towards the equator, and are used in the elevation of the poles.——**MERIDIAN LINE**, an arc, or part of the meridian of a place terminated each way by the horizon. The exact determination of this line is of the greatest importance in all cases relating to astronomy, geography, dialling, &c.——**MAGNETIC MERIDIAN**, a great circle which passes through the assumed magnetic poles, and in the plane of which the needle of the mariner's compass arranges itself. ——**MERIDIAN ALTITUDE** of the sun or stars, their altitude when in the meridian of the place where they are observed. Or it may be defined, an arc of a great circle perpendicular to the horizon, and comprehended between the horizon and the sun or star then in the meridian of the place.——**MERIDIONAL DISTANCE**, in Navigation, the difference of longitude between the meridian under which the ship is at present, and any other she was under before.

MER'LIN (*meerlin*: *Belg.*), the *Falco æsalon* of ornithologists. 'So bold as well as powerful,' says Yarrell, 'in proportion to his size is this little bird, that a male Merlin, not weighing more than six ounces, has been seen to strike and kill a partridge that was certainly more than twice his own weight.'

MER'LON, in Fortification, that part of a parapet which is terminated by two embrasures of a battery.

MER'MAID (*meer*, the sea; and *magd*, a maid: *Ger.*), an imaginary or fabulous creature, which seamen have described as having the head and body of a woman, with the tail of a fish *Mermen* also have been supposed to exist. The *dugong* and *manatee*, when seen at a distance, may have given rise to the idea of mermen and mermaids, &c.

ME'ROPS (*merŏps*: *Gr.*), in Ornithology, the *Bee-eater*, one of the insessorial birds

MER'ULA (*Lat.*), in Ornithology, the *Blackbird*, one of the dentirostral perchers.

MESEMBRYAN'THEMUM (*mesēmbria*, midday; and *anthos*, a flower: *Gr.*—because it expands its flowers at noon), in Botany, a large genus of plants, nat ord. *Ficoideæ* or *Mesembryaceæ*. The species are perennials, and consist of the different *Fig marigolds*, all natives of the Cape of Good Hope. The ice-plant belongs to this genus. All the species have fleshy leaves.

MES'ENTERY (*mesenteron*: from *mesos*, middle: and *enteron*, an intestine: *Gr.*), in Anatomy, a thick membrane, placed in the middle of the intestines. Its substance is composed of membranes, fat, vessels of all kinds, and a number of glands. In the upper part, it is connected with the three superior vertebræ of the loins; and in the lower, with the intestines, and particularly with the *jejunum* and *ileum*, to which it also gives their outer coat. The uses of the mesentery are, to support, connect, and retain in their place, all the intestines; and to sustain their sanguiferous and lacteal vessels

MES'MERISM. [See MAGNETISM, ANIMAL.]

MESNE (middle: *Fr.*), in Law, a lord of a manor, who has tenants holding under him, though he holds the manor of a superior.——**MESNE PROCESS**, an intermediate process which issues pending a suit, upon some collateral interlocutory matter Sometimes the term is used in contradistinction from *final process*, or *process of execution*, and then it signifies all such processes as intervene between the beginning and end of a suit.

MESOCO'LON (*mesokŏlon*: from *mesos*, middle; and *kŏlon*, the colon: *Gr.*), in Anatomy, that part of the mesentery, which, having reached the extremity of the *ileum*, contracts and changes its name; or the portion of the mesentery to which the *colon* is attached.

MES'OLYTE (*mesos*, middle: and *lithos*, a stone: *Gr.*), in Mineralogy, a hydrated silicate of alumina, lime, and soda; called also *Needlestone*.

MES'OTYPE (*mesos*, middle; and *tupos*, a form: *Gr.*), in Mineralogy, hydrated silicate of alumina and soda, called also *Natrolite*.

MESOZO'IC (*mesos*, middle; *zoe*, life: *Gr.*), a term applied by some geologists to that great division of strata containing the remains of the middle forms of life, which others denominate secondary.

MESS (*mese*: *Sax.*), in Military language, a sort of ordinary or public dinner, for the maintenance of which every officer who takes his meals there gives a certain proportion of his pay.——In Naval language, a particular company of the officers or crew of a ship, who eat, drink, and associate together; and the term *messmate* is applied to any one of the number thus associated.

MESSI'AH, a Hebrew word, signifying *the anointed*, and translated into Greek by the word *christos*, whence Christ: a title which the Jews gave to their great deliverer, for whose coming they still wait; and a name which Christians apply to Jesus Christ, as the person in whom the prophecies relating to the Messiah were accomplished. Among the Jews, anointing was the ceremony of consecrating persons to the highest offices and dignities; kings, priests, and sometimes prophets were anointed, thus, Aaron and his son received the sacerdotal, Elisha the prophetic, and David, Solomon, and others, the royal unction.

METAB'ASIS (*Gr.*, from *metabaino*, I go from one place to another), in Rhetoric, *transition*; a passing from one thing to another.

METACAR'PUS (*meta*, after; and *karpos*, the wrist: *Gr.*), in Anatomy, that part of the hand between the wrist and the fingers. It consists of five bones placed side by side. The inner part of the metacarpus is called the palm, and the outer the back of the hand.

METACH'RONISM (*meta*, after, and *chronos*, time: *Gr.*), an error in chronology, which places an event after its real time.

METAL (*metallon*: *Gr.*), a simple, fixed, opaque substance, possessing a peculiar lustre. The metals are all electro-positive; they differ much in their tenacity, malleability, ductility, hardness, volatility, and density, and in the facility with which they combine with non-metallic elements. There is a distinction to be made between malleability and ductility, since the metals which afford the finest wire do not always give the thinnest leaves. Some metals are found *native*, that is, uncombined. Some of their ores are reduced by heat alone: others require heat and a combustible. Some are reduced by deoxidizing agents, or by other metals which take their places in combination. Metals, in the state of oxides, are capable of uniting with acids. All earths, with perhaps one exception, are combinations of some metal with oxygen. When exposed to the action of oxygen, chlorine, or iodine, at an elevated temperature, the metals generally take fire, and, combining with one or other of these three elementary bodies in definite proportions, are converted into earthy or saline-looking substances, devoid of metallic lustre or ductility, and called *oxides*, *chlorides*, or *iodides*. Formerly only seven metals were known, or had been separated from the materials with which they were combined. And even these were discovered only on account of their being sometimes found native, or in a state of combination from which they were liberated without very great difficulty. Their names are copper, gold, iron, lead, mercury, silver, tin. Chemical research has added forty-four others:—Aluminium, antimony, arsenic, barium, bismuth, cadmium, cæsium, calcium, cerium, chromium, cobalt, columbium or tantalum, erbium, glucinum, indium, iridium, lanthanum, lithium, magnesium, manganese, molybdenum, nickel, niobium, norium, osmium, palladium, pelopium, platinum, potassium, rhodium, rubidium, sodium, strontium, tellurium, terbium, thallium, thorium, titanium, tungsten, uranium, vanadium, yttrium, zinc, and zirconium. [See these in their proper places, and CHEMISTRY.] The metals are all conductors of heat, and, at least in the solid form, of electricity.

METALEP'SIS (*Gr.*, from *metalambano*, I participate: *Gr.*), in Rhetoric, the continuation of a trope in one word, through a succession of significations; or the union of two or more tropes of a different kind in one word, so that several gradations or intervening senses come between the word expressed and the thing intended by it.

METAL'LIC VEINS, in Mineralogy, fissures across the solid strata of the earth, in which metallic ores are found. These were probably deposited in them from a state of vapour. Veins differ in their magnitude and position; some vary from sixty to one hundred feet wide in certain parts, and are not more than ten or twenty in others; they are commonly filled with what is called vein stuff, mixed with the metal; others are only a few inches wide. Those which are fissures or rents, are not perpendicular, but incline more or less, and are open from the surface of the earth to the depth of 20 to 30 fathoms. They are not the only repositories for metals; there are other deposits which are called flat or pipe veins, the solid rock forming the roof and bottom of the mine. These are irregular in their direction and magnitude, and appear like a series of small caverns, connected with each other. The top, bottom, and boundaries are lined, and sometimes filled, with spar, lead ore, &c., and the latter are found in nests, filling cavities in solid limestone, and even penetrating fossil shells. The rocks in which metallic veins are situated do not contain a particle of the metal which they enclose. Inconsiderable veins, which diverge from the principal, are called *slips*; and such masses of ore as are of considerable magnitude, but no great length, are called *bellies* or *stock-works*.

METALLOG'RAPHY (*metallon*, a metal; and *grapho*, I write: *Gr.*), a treatise on metallic substances.

MET'ALLOIDS, in Chemistry, a collective name sometimes given to those elementary bodies which are either transparent or non-lustrous, and bad conductors of electricity and heat, in contradistinction to the true metals, which are opaque, lustrous in a high degree, and good conductors of electricity and heat. Metalloids include not only the four elementary gases, but sulphur, phosphorus, arsenic, and other bodies.

MET'ALLURGY (*metallon*, a metal; and *ergon*, a work: *Gr.*), the art of obtaining metals from their ores, and preparing them for the various uses to which they are applied. It comprises the processes of *assaying*, *refining*, and *smelting*

METAMOR'PHIC (*meta*, indicating change; and *morphē*, form: *Gr*), a term applied to crystalline rocks which occur especially in the central ridges of mountain chains. It denotes that their structure has been changed since the time of their first deposition as sedimentary beds, by plutonic action

METAMOR'PHOSIS (*metamorphōsis*, from same: *Gr.*), the changing of something into a different form · in which sense it includes the transformation of insects, as well as the mythological changes related by the poets of antiquity——By the *metamorphoses of insects* are meant the successive transformations through which they pass, which, when the metamorphosis is complete, are from the egg to the caterpillar or larva state; to the chrysalis, pupa, or aurelia state; and lastly to the moth or butterfly form, when, having laid their eggs, they die

MET'APHOR (*metaphora*, from *metaphero*, I transfer: *Gr.*), in Rhetoric, the application of a word in some other than its ordinary sense, on account of some real or imaginary resemblance between two objects: thus, if we call a hero a *lion*, a shrewd crafty fellow a *fox*, and a minister a *pillar* of the state, we speak *metaphorically*.

METAPH'RASIS (*Gr.*, from *metaphrazo*, I translate), a bare or literal translation from one language into another

METAPHYS'ICS (*meta*, after; and *phusis*, nature, *Gr*), the science of the absolute, concerning itself only with essences and causes. It endeavours to treat of things as they are in themselves as distinct from their appearances to the senses.

MET'APLASM (*metaplasmos*, from *metaplasso*, I transform: *Gr.*), in Grammar, a transmutation or change made in a word by adding, transposing, or retrenching a syllable or letter.

METAS'TASIS (*Gr.*, from *methistamai*, I change my position), in Medicine, a translation or removal of a disease from one part to another.

METATAR'SUS (*meta*, after; and *tarsos*, the instep: *Gr.*), in Anatomy, the middle of the foot, or the part between the ankle and the toes: the *instep*. The *metatarsal bones* are the five longitudinal bones between the tarsus and the toes.

METATH'ESIS (*Gr.*, from *metatithēmi*, I place differently), a figure by which the letters or syllables of a word are transposed.——In Medicine, a change or removal of a morbid cause, without expulsion.

METEMPSYCHO'SIS (*Gr*, from *metempsuchoo*, I make the soul pass from one body into another), the doctrine of *transmigration*, which supposes that the soul of man, upon leaving the body, becomes the soul of some other animal. This was the doctrine of Pythagoras and his followers; and is still the prevailing doctrine in some parts of Asia, particularly in India and China

METEMP'TOSIS (*meta*, after; and *empipto*, I fall in with: *Gr.*), a term in Chronology, expressing the *solar equation*, or subtraction of a day, necessary to prevent the new moon from happening a day too late; or the suppression of the bissextile once in 134 years.

ME'TEOR (*meteōros*, aloft: *Gr.*), in Natural History, a phenomenon which occurs in the atmosphere. Meteors, in the most general sense of the word, may be reduced to four classes—*igneous* or *fiery* meteors, including fire-balls, falling stars, lightning, and St Elmo's fire; *luminous* meteors, as the aurora borealis, zodiacal light, parhelia or mock-suns, haloes, &c.; *aqueous* meteors, as clouds, rain, hail, snow, &c.; and *aerial* meteors, as wind and water-spouts. It will be seen that these phenomena are of very different natures, and owing to different causes. The only connection between them is that of a common medium; and we therefore refer to the separate articles for information concerning them; also to ELECTRICITY, METEORIC STONES, FALLING STARS, &c.

METEOR'OLITES (*meteōros*, aerial; and *lithos*, a stone: *Gr.*), *meteoric stones.* [See AEROLITES, and FALLING STARS.]

METEOROL'OGY (*meteōros*, a heavenly body: and *logos*, a discourse: *Gr*), the science which treats of the phenomena of the atmosphere. These may be classed under distinct heads, viz. the alterations that occur in the weight of the atmosphere; those that take place in its temperature; its changes as regards moisture; and those which arise from electric and other causes.——From chemistry, meteorology borrows *analysis*, to determine the composition of the air itself, and of the substances which it contains, or by which it is acted upon. From the laws of heat it ascertains the manner in which the different processes of evaporation, freezing, thawing, &c., go on, and how they affect the state of the atmosphere; the action of those invisible agents, light, heat, electricity, &c, and their extraordinary effects. From physics, meteorology takes the mechanical action of these and similar powers and substances; the weight and velocity of the air; the laws of the reflection, refraction, and motion of light, &c By these aids this science explains the formation, fall, or deposition of hail, snow, rain, dew, and frost; the action of thunder and lightning; the prevalence and properties of certain winds; the nature and causes of meteors, &c. All this, and more, is to be carefully studied by every one who would keep a meteorological register, from which, if carefully attended to, a body of principles may be derived that would go far to dispel a host of popular errors and delusions, and make the value of true meteorological science manifest to the most common observer.

METEOROS'COPY (*meteōros*, a heavenly body; and *skopeo*, I examine: *Gr.*), among the older astronomers, that part of science which treats of the distance of the stars and other celestial bodies: but now very properly restricted to what relates to the nature of meteors.

METHEG'LIN (*meth*, mead: *Ger.*), a liquor made of honey and water, boiled and fermented, often flavoured with spices.

METH'OD (*methodos*, literally a journey taken in search of anything: *Gr.*), a suitable and convenient arrangement of things or ideas. In Logic and Rhetoric, the art of disposing ideas in such a manner that they may be easily comprehended, in order either to discover the truth, or to demonstrate it to others. Method is essential to science, and without it business of any kind will fall into confusion. In studying a science, we generally mean by *method* a system of classification or arrangement of natural bodies according to their common characteristics; as the method of Ray, the Linnæan method, &c. The difference between *method* and *system* is this: *system* is an arrangement founded, throughout all its parts, on some one principle; *method* is an arrangement less fixed and determinate, and founded on more general relations.

METHOD'IC SECT (*methodos*, method: *Gr.*), a name given to certain ancient physicians, who conducted their practice by rules after the manner of Galen and his followers, in opposition to the *empiric sect*.

METH'ODIST (same *deriv.*), a term originally applied to a sect of physicians at Rome, who, under the name of *methodici*, practised only by theory. It is now used to designate the followers of Wesley and Whitfield, the former professing the doctrines of Arminius, and the latter of Calvin; and also several sects of Christians who have seceded from the Wesleyan denomination. In 1729, after the revolution, the brothers John and Charles Wesley, believing they perceived great lukewarmness in matters of religion, formed an association for the observance of more strict and rigid rules regarding the regulation of their time and studies and the practice of religious exercises. John Wesley, who took the most active part in this religious movement, having been ordained, officiated for some time in England; then visited North America. But, on his return, giving offence to some of the higher ranks of the clergy by his enthusiastic and declamatory mode of preaching, the churches were generally shut against him, which led him to become the founder of a new class of dissenters, without having at first intended it. He preached in dissenting chapels in London and elsewhere, and great success attended his exertions; having had recourse to lay preachers, who proved most efficient in forwarding his views, he was enabled to exercise superintendence over all his congregations. He required his followers to attend the established church, when they had no opportunity of hearing his preachers; but he differed in many points from what is generally considered to be the doctrines of the thirty-nine articles. According to his system of church government, each society is divided into *classes* of from twelve to twenty persons, one of whom is termed a *leader*. Each society has *stewards*, whose office is somewhat similar to that of *deacons* in the established church. The leaders, stewards, and minister hold once a week what is called the *leaders'* meeting. A number of these societies constitute a *circuit*, of which one of the ministers of the district is *superintendent*. The ministers, leaders, and stewards in the circuit hold a *quarterly meeting*, on which occasion the stewards deliver their collections to a *civil steward*. From five to fifteen circuits form a *district*, the ministers of which hold an annual *district meeting*: this assembly tries ministers, and suspends those whose conduct is proved to be immoral, whose doctrine is erroneous, or who are deficient in ability; and performs a number of other important duties. The *conference*, whose decisions are final, should consist, strictly speaking, of a hundred of the senior itinerant preachers; but it is generally composed of preachers elected at the previous district meetings, and of all the ministers who choose to attend, every one present at it having a right to vote. All regulations are framed by this body; funds are levied in its name; it appoints ministers to the stations they are to occupy; it appoints superintendents, &c. In 1850, the Wesleyan methodists, at home and abroad, amounted to upwards of two millions, and the total number of preachers was 6000. Various offshoots have taken place among them at various times; the earliest of which comprised the followers of Whitfield—at first the coadjutor, but afterwards the eloquent opponent, of Wesley.

METH'YL (*methu*, wine; *ule*, wood: *Gr.*), a hypothetical compound radical, the constituents of which are two atoms of carbon and three of hydrogen. It is the base of a large number of spirits and ethers, of which the best known is the hydrated oxide, wood naphtha or pyroxilic spirit. This was first obtained by the destructive distillation of wood. It is a volatile inflammable liquid, resembling spirit of wine.——**METHYLATED SPIRIT** is pure spirit of wine to which one-tenth of its volume of wood naphtha, otherwise pyroxilic spirit, has been added. (See the last article.) This, on account of its offensive odour and taste, prevents the compound being drunk, whilst it can still be employed in many of the useful arts, and it is therefore exempt from duty.

METOCHE' (*metochē*, a sharing: *Gr.*), in Architecture, the space between two dentils.

METON'IC CY'CLE, in Chronology, the period of nineteen years, or rather of 6940 days, in which the lunations of the moon return to the same days of the month; so called from its discoverer Meton, an Athenian, who lived about 400 B.C. On account of its great use in the calendar, the number of the year in this cycle is called the *golden number*.

METONY'MIA or **METON'YMY** (*metōnumia*: from *meta*, indicating change; and *onoma*, a name: *Gr.*), in Rhetoric, a figure of speech by which one thing is put for another: as the cause for the effect, the part for the whole, and the like. Thus, 'my friend keeps a good *table*,' instead of good *provisions*; 'that boy has a clear *head*,' meaning *intellect*.

MET'OPE (*metopē*: from *meta*, between; and *opē*, the hole in which a beam of the roof is inserted. *Gr.*), in Architecture, the interval, or space, between the triglyphs of the Doric frieze, which among the ancients were usually painted or adorned with carved work, representing the heads of oxen, &c.

METOPOS'COPY (*metōpon*, the forehead; and *skopeo*, I examine: *Gr.*), the study of physiognomy.

ME'TRE (*metron*, a measure: *Gr.*), in Poetry, a system of feet composing a verse: as *pentameter*, a verse of five feet; *hexameter*, a verse of six feet, &c. When the last syllable of the last foot is wanting, the line is *acatalectic*; when its two last syllables are cut off, it is *brachycatalectic*; when it has one superfluous syllable at the end, it is *hypercatalectic*.——METRE, a French measure equal to 39·37079 inches. It is the French standard of lineal measure; being the ten-millionth part of the distance from the equator to the north pole, as ascertained by actual measurement of an arc of the meridian.

METROCEL'IDES (*mētēr*, a mother; and *kēlis*, a stain: *Gr.*), in Medicine, marks or blemishes, supposed by some to be impressed upon the child by the mother's imagination.

METROP'OLIS (*Gr.*: from *mētēr*, a mother; and *polis*, a city), a word used by Greek writers to indicate the parent state whence colonies have sprung. Also, the chief city of a province, in the latter ages, of the Roman empire. The church having adopted the secular division of the Roman empire into provinces, an episcopal see was established in every such city, and its bishop was termed a *metropolitan*.——In modern use it means the capital or principal city of a country or province, as London or Paris.

MEZ'ZANINE (*mezzano*, middle: *Ital.*), in Architecture, a low story introduced between two higher ones.

MEZ'ZO, in Music, an Italian word signifying *half*. Thus *mezzo forte*, *mezzo piano*, *mezzo voce*, imply a middle degree of *piano* or soft, &c. By *mezzo soprano* is understood a compass of voice between the soprano or treble and counter-tenor.

MEZZOTIN'TO (half tinted: *Ital.*), a particular manner of engraving. [See ENGRAVING.] By an artificial disposition of the shades, and different parts of a figure, on different plates, mezzotintos are printed in colours, so as to represent actual paintings.

MIAS'MA (*Gr.*, from *miaino*, I taint), the contagious effluvia of any putrefying bodies, rising and floating in the atmosphere, and considered to be noxious to health. The term is specially applied to *marsh miasma*, the *malaria* of the Italians. One of the most powerful correctors of miasmatic effluvia is chloride of lime.

MI'CA (*mico*, I glitter: *Lat.*), called also *talc*, *glimmer*, and *Muscovy glass*, is a mineral of a foliated structure. It consists of a number of thin laminæ adhering to each other; and has long been used as a substitute for glass, particularly in Russia. Its chief constituents are silica, alumina, potash, and oxide of iron. It is one of the substances which constitute *granite*.

MI'CAH, a canonical book of the Old Testament, written by the prophet Micah; in which the writer censures the reigning vices of Jerusalem and Samaria, and denounces the judgments of God against both kingdoms.

MICH'AELMAS, or FEAST OF ST. MICHAEL, a festival observed on the 29th of September. One of the quarterly days for paying rent.

MI'CROCOSM (*mikros*, small; and *kosmos*, world: *Gr.*), a name given by some writers to man, on account of a supposed correspondence between the qualities of his nature and those of the universe.

MICROG'RAPHY (*mikros*, small; and *grapho*, I write: *Gr.*), the description of objects which are too minute to be seen without the help of a microscope.

MICROM'ETER (*mikros*, small; and *metron*, a measure: *Gr.*), an instrument fitted to telescopes or microscopes for the purpose of measuring small angles with precision.

MI'CROSCOPE (*mikros*, small; and *skopeo*, I examine: *Gr.*), an optical instrument consisting of an arrangement of lenses which enables the observer to see an object, or its true image, nearer than with the naked eye, and magnified accordingly. Microscopes are either simple or compound. By the former we look directly at the object; by the latter at its magnified image. The increase of apparent magnitude obtained by the employment of lenses is proportional to the difference of the distance of an object from the lens and the distance at which it can be seen without such assistance. This latter distance (the distance of distinct vision of minute objects with the naked eye) varies in different persons, and at different periods of life. Some authors adopt ten inches as the standard, under ordinary circumstances, and its decimal character makes it a convenient multiplier or divisor. The microscope has been greatly improved of late years, and it is extensively employed by medical men in the investigation of healthy and diseased structure, and by naturalists in the examination of the minute structure of animals, vegetables, and minerals. So many and so important are the discoveries that have been made by its means, that several branches of science have been entirely changed.——The *solar* *microscope* consists of a common microscope connected with a reflector and condenser, the former being used to throw the sun's light on the latter, by which it is condensed so as to illuminate the object placed in its focus. This object is also in the focus of the microscopic lens, which transmits a magnified image of it to a wall or screen. The principle of the *lucernal microscope* is the same, except that a lamp giving a very strong light—generally that obtained from the flame of oxygen and hydrogen thrown on lime—is used, instead of the sun, to illuminate the object.

MID'DLE A'GES, a term used by historians to denote that period which begins with the final destruction of the Roman empire, and ends with the revival of letters in Europe, or, according to some writers, with the discovery of America; *i. e.* from the eighth to the fifteenth century. They ought rather to be considered to terminate with the invention of printing. In general, it may be said, the middle ages embrace that period of history in which the feudal system was established and developed, down to the most prominent events which necessarily led to its overthrow.

MID'SHIPMAN, in the British navy, a sort of cadet, whose duty it is to second the orders of the superior officers, and assist in the necessary business of the vessel, whether aboard or ashore. No person can receive a commission, without having served a certain number of years in the royal navy in this capacity, unless he has been mate of a merchantman, and passed some years of actual service either in the navy or in the merchant service.

MID'SUMMER, the summer solstice. The 24th of June is Midsummer-day, which is also a quarter-day.

MIGRA'TION OF BIRDS (*migratio*, from *migro*, I change my abode: *Lat.*), the annual passage of birds from one country to another in quest of food and a mild climate. Thus, the swallow and many other species migrate into southern climates during our winter, and return in the spring; whilst other species, like the Snow Bunting and the Bohemian Waxwing, come to us for the winter and fly northwards in the spring. Ornithologists have observed that, on the old continent, birds migrate in autumn to the south-west, and in spring towards the north-east; yet the courses of rivers and chains of mountains exercise considerable influence on the direction of their flight. On the new continent the points of direction are not the same. Captain Sir E. Parry has satisfied himself that the birds of Greenland go to the south-east. It is remarkable, also, that the young of certain species do not make the same journey as the old birds; they go more to the south, so that it is very common to find, in the south of Europe, only the young birds of a certain species, whilst the older ones remain more to the north. In other species the females go farther south. Mr. White, in his *Natural History of Selborne*, says, 'It does not appear to me that much stress may be laid on the difficulty and hazard that birds must run in their migrations, by reason of vast oceans, cross-winds, &c.; because, if we reflect, a bird may travel from England to the equator without launching out or exposing itself to boundless seas—and that by crossing the water at Dover, and again at Gibraltar.' Birds come to these countries, from those which are still colder, during the winter: thus many species of wild duck. Migration is not confined to birds: the musk ox, the reindeer, the Arctic fox, &c., are driven southward, by the rigours of a polar winter. But the animal most remarkable for emigrating is the Scandinavian lemming. [See LEMMING.]

MILE (*mille passuum*, a thousand paces: *Lat.*), a measure of length or distance, which, in England, contains 8 furlongs, or 1760 yards, or 5280 feet. Of such miles there are 69·121 in a geographical degree. But the nautical or geographical mile is the 60th of a degree.——The Roman mile was a thousand paces and equal to 1614 yards English measure, or about 11-12ths of our statute mile.

MIL'IARY GLANDS (*milium*, millet-seed: *Lat.*), in Anatomy, the small and extremely numerous glands which secrete the perspiration.——MILIARY FEVER, a malignant fever, so called from the eruption of certain pustules resembling millet-seeds.

MILI'TIA (military service: *Lat.*), a body of soldiers, regularly enrolled and trained, though not in constant service in time of peace, and thus distinguished from *standing armies*. In England the origin of this national force is generally traced back to Alfred. The most characteristic features of the English militia at present are, that a number of persons in each county may voluntarily enlist for five years, and are officered by the lord-lieutenants, and other gentlemen, under commission from the crown. The period for training and exercise is fixed, generally speaking, at twenty-one days annually. Where men cannot be raised by voluntary enlistment, recourse may be had to the ballot, from which all persons above thirty-five are exempt.

MILK (*milch*: *Ger.*), an animal fluid peculiar to females of the class *Mammalia*, secreted by appropriate glands, and designed to nourish their offspring in the early part of their life. This fluid, which is only produced from the body on occasion of suckling, is, notwithstanding, constantly formed. It is the proper sustenance of the animal itself: all the nutritive parts of food being formed into chyle, and chyle into milk. It is of an opaque white colour, a mild saccharine taste, and a slightly aromatic smell. When allowed to stand for some time, it undergoes spontaneous changes, and is resolved into its component parts, throwing up a white, thick, unctuous *cream* to its surface: the fluid beneath becoming thinner than before, and of a pale bluish colour. The proximate elements of milk are,—1. the *aroma*, or odorous volatile principle, called *butyrin*, which passes off, when it is fresh milked, in the form of visible vapour; 2. *water*, which constitutes the greatest part; 3. fatty matters, from which the cream is formed; 4. *curd*, which is the caseous matter that coagulates; 5. *sugar*, which, with the water, &c., forms the serum of milk , 6 some neutral salts, such as phosphate of lime, iodide of potassium, chloride of calcium, &c., which are accidental, not being found at all times, nor in all milk. Human milk is very sweet and thin ; the nearest in resemblance to this is the milk of asses, next that of mares, then that of goats, and lastly that of cows. *Rennet*, prepared of the juices of such animals as chew the cud, being mixed with milk, coagulates it into a uniform mass, which may be cut with a knife, and which spontaneously separates into *whey* and *curds*. When milk contained in wire-corked bottles is cautiously heated to the boiling point in a water-bath, the oxygen of the included small portion of air under the cork seems to be combined, and the milk will afterwards keep fresh for a considerable time: as green gooseberries and peas do by the same treatment. *Butter* and *cheese* are made of milk, by processes not necessary to describe in this place.

MILKY WAY, in Astronomy [See GALAXY.]

MILL (*mulē: Gr.*), a complicated engine, or combination of machinery, to effect purposes which require great force. The power employed is sometimes water, sometimes wind, and at others steam or horses. The principle is always the same ; a main shaft enters the works, to which wheels with cogs, or drums and bands, are affixed, other wheels are then connected with these in various directions, and the resulting force applied to any intended purpose. When corn is to be ground, large stones, cut in grooves, are made to work one against the other in such a matter as to break or pulverize the grain. There are also bark mills, paper mills, oil mills, silk, cotton, and flax mills, saw mills, &c.

MILLENA'RIANS, or CHILIASTS (*mille anni*, a thousand years: *Lat*; *chilias*, a thousand : *Gr.*), a name given to those who, in the primitive ages, believed that the saints will one day reign on earth with Jesus Christ a thousand years—an idea derived from Rev. xx. 6. The Millenarians held, that after the coming of Antichrist, and the destruction of all nations which will follow, there shall be a resurrection of the just alone ; that all who shall be found upon earth, both good and bad, shall continue alive—the good, to obey the just who are risen as their princes—the bad, to be conquered by the just, and to be subject to them ; that Jesus Christ will then descend from heaven in his glory ; that the city of Jerusalem will be rebuilt, enlarged, embellished, and its gates stand open night and day. The Millenarians founded their belief on the Mosaic history of the creation. Considering this history as a prototype of the fate of the world, and concluding from Psalm xc. that 1000 years make with God one day, they beheld in the six days of creation 6000 years of terrestrial labours and sufferings, and in the seventh the day of rest, a period of 1000 years, in which the reign of Christ should be established. This reign of 1000 years is usually styled the *millennium*. It has been expected by some in all ages of the church, from the second century, and it is the doctrine of many in modern times.

MIL'LEPEDE (*mille*, a thousand : and *pes*, a foot : *Lat.*), an articulated animal, having many feet. There are several species, some of considerable size.

MIL'LEPORE (*mille*, a thousand : and *porus*, a passage : *Lat.*), in Zoology, a genus of corals which have a surface perforated with small holes or pores. When in a fossil state, they are termed *milleporites*.

MIL'LET (*Fr.*; from *milium*: *Lat.*), a plant classed among the grasses, though some of its species attain a height of about 20 feet. The most common kinds are the Polish, the common German, and the Indian. In some parts of Europe, millet is used instead of rice or sago by the poorer classes; but it is more usually employed for feeding chickens. This climate is neither dry enough nor warm enough for its cultivation.

MIL'LING (*mulē*, a mill . *Gr.*), a process in coining, which consists in stamping the coin by means of a machine called a *mill*, in place of striking it with a hammer, the method formerly employed. This engine will coin 20,000 *blanks* in one day. The blanks are circular pieces of metal, of a proper size, thickness, and weight, and with flat smooth surfaces, suited to receive the impressions of the dies, which are of steel, and have engraved upon them the figures, &c to be stamped on the coins. The blank is fixed between the dies, and an impression is taken from both at once.——The word *milling* is applied also to the production of small transverse corrugations on the edges of the heads of screws, intended to make it more easy to turn them round by the fingers, and also to those on the *edges* of coins to prevent the fraudulent removal of the metal at the edge

MILL'-STONE, or BUHR STONE, in Mineralogy, a siliceous stone, occurring in large masses, with a straight fracture, but not so brittle as flint, though of the same hardness. It is feebly translucent, and of a greyish hue. Buhr stone is found in abundance only in the mineral basin of Paris and a few adjoining districts. It forms a part of a fresh-water formation.

MILT (*Sax.*), in Anatomy, the *Spleen*, a viscus situated in the left hypochondrium under the diaphragm. Also, the soft *roe* of fishes, or the spermatic part of the males

MIME (*mimos*, an imitator: *Gr.*), in ancient comedy, a person who acted any character by mere gestures, &c. When the acting consisted entirely in gestures, it was termed *pantomima*.

MIME'SIS (*Gr.*, from same), in Rhetoric, imitation of the voice and gestures of another person.

MIMO'SA, in Botany, a genus of leguminous shrubs, inhabiting the tropics, so called from the remarkable property possessed by several species, especially the *M. pudica*, of shrinking from the touch and giving signs, as it were, of animal life and sensation. This motion it performs by means of three distinct articulations, viz.

that of a single leaf to its pedicle, of the pedicle to its branch, and of the branch to the trunk or main stem.

MI'NA (*mna: Gr.*), a Grecian coin, of different values in different places. The Attic mina was valued at 100 drachmæ, or *4l.* 13*s.* 4*d.* Sixty of them were equivalent to a talent.——MINA, a Grecian weight, also equal to 100 drachmæ, or 15 oz. 83¾ grs.

MIN'ARET (*menarah*, a lantern: *Arab.*), a round tower or column, generally surrounded with balconies, and erected near the mosques in Mohammedan countries. The people are summoned to prayers by a crier stationed at the top, the use of bells not being permitted.

MIND (*gemind: Sax.*), the intellectual power in man. 'When the mind, says Locke, 'turns its view inwards upon itself, thinking is the first idea that occurs; wherein it observes a great variety of modifications, whence it frames to itself distinct ideas. Thus, the perception annexed to any impression on the body by an external object is called sensation; when an idea recurs without the presence of the object, it is called remembrance; when sought after by the mind, and again brought into view, it is recollection; when the ideas are taken notice of, and, as it were, registered in the memory, it is attention; when the mind fixes its view on any one idea, and considers it on all sides, it is called study.'

MINE (*Teut.*), a cavity under ground, formed for the purpose of obtaining minerals, and often very deep and extensive. The descent into it is by a pit, called a *shaft*, and the excavations which follow the minerals sought are called the *workings*. The art of *mining* includes the scientific knowledge requisite for opening and working mines, as well as preparing ores for use. The latter consists, in the first place, in breaking in pieces the larger masses, and then freeing them, by means of water, from the earth which adheres to them; in the separation of the coarser substances from the finer, by means of a sieve that moves up and down in water; in the breaking of the ore in stamping mills, and in the separation of the finely interspersed metal from the stone or earth with which it is surrounded, &c. It also includes the final purification of the ore, by means of acids, by amalgamation, by fusion, &c. The annual produce of the mines of Great Britain has been estimated, from an average of years and prices, at—

			£
Silver	10,000	lbs. troy	30,000
Copper	13,000	tons	1,300,000
Tin	5,500	,,	550,000
Lead	46,000	,,	950,000
Iron	1,250,000	,,	10,000,000
Coal	32,000,000	,,	12,000,000
Salt, &c.			1,000,000
	Total		£25,830,000

All minerals are part of the freehold of the soil, except gold and silver, which are said to belong to the crown; but no mine of copper or lead is a royal mine, even though silver is extracted from it. Mines, except those of coal, are not rateable for the relief of the poor; a quarry is. The difference between a mine and a quarry is supposed to consist chiefly in the way of working.——MINE, in the Military art, denotes a subterraneous passage under a wall or fortification, for the purpose of blowing it up. The gunpowder in the mine was ignited by means of a pipe or hose, made of coarse cloth, called a *saucisson*, extending from the chamber to the entrance of the gallery: to the end of it was fixed a match, that the miner who set fire to it might have time to retire before the fire reached the *chamber*, or place where the powder was lodged. But galvanism affords a safe and certain means of exploding mines at any moment, however distant they may be. The conducting wire from a galvanic battery is made to pass through the powder, within which is a portion of wire so thin as to become red-hot, or even to ignite when the electric current is transmitted through it. This explodes the mine. The mines of a fortress are called *countermines*, the gallery of which runs under the covered way along the outer margin of the fosse.

MINERAL'OGY (*minéral*, a mineral: *Fr.*; and *logos*, a description: *Gr.*), that branch of natural history which makes us acquainted with the properties and relations of minerals, and teaches us to characterize, distinguish, and class them, according to these properties.

MIN'ERALS (*Fr.*), the general name for all inorganic substances found in the earth, including metals, metallic ores, salts, earths, and bituminous substances. Of these various substances, many are composed of such elements, and exhibit such peculiarities of constitution, that it is difficult to distinguish them without having recourse to analysis.

MIN'ERAL WA'TERS are of various kinds, but generally so far impregnated with foreign matter as to give them a sensible flavour and a specific action upon the animal economy. They are usually divided into four classes: acidulous or carbonated, saline, chalybeate or ferruginous, and sulphurous. The *saline* springs consist, in general, of salts of soda and lime, or of magnesia and lime, with carbonic acid and oxide of iron; such are those of Pyrmont, Seidlitz, Epsom, &c. The *ferruginous* waters have a decidedly styptic taste, and are turned black by an infusion of gallnuts; their iron is sometimes in the state of an oxide held in solution by carbonic acid; it sometimes exists as a sulphate, and sometimes both as a sulphate and carbonate: among them are the waters of Spa, Vichy, Cheltenham, Tunbridge, &c. The *acidulous* waters are characterized by an acid taste, and by the disengagement of carbonic acid: of this kind are the waters of Bath, Buxton, Bristol, &c. The *sulphurous* waters are easily recognized by their disagreeable smell, and their property of tarnishing silver and copper, which is a consequence of their containing sulphuretted hydrogen: of this class are the waters of Aix-la-Chapelle, Harrogate and numerous others. Some mineral springs are hot or *thermal*.—*Artificial* mineral waters are produced in the laboratory of the chemist, and are either merely imitations of the natural waters, or composed of different ingredients so as to form compounds valuable for medicinal purposes, but not known to exist in nature.

MIN'IM (*minimus*, the least: *Lat.*), in Music, a note equal to two crochets, or half a semibreve.——MINIM, the smallest liquid measure; generally considered as a drop. A fluid drachm contains 60 minims.

MIN'IMS (same *deriv.*, on the supposition that humility was to be their distinguishing characteristic), a religious order in the church of Rome, founded by Francis de Paula, towards the end of the 15th century.

MIN'IMUM (the least: *Lat.*), the least quantity assignable in a given case; opposed to *maximum*, which see.

MIN'ION (*mignon*, a favourite: *Fr.*), the name given to a small kind of printing type (two sizes larger than the type used for this volume).

MIN'ISTER (*Lat.*), the pastor of a church duly authorized to perform religious worship in public, to administer the sacraments, &c.——In Politics, one to whom a sovereign prince entrusts the administration of affairs; as, a *minister of state*, the *prime minister*, or a *foreign minister*. In Great Britain, the words *ministers* and *ministry* are used as collective names for the heads of departments in the state, but the subordinate members are not so designated. In their separate offices the cabinet ministers stand thus:—1. first lord of the treasury; 2. lord high chancellor; 3. chancellor of the exchequer; 4. lord president of the council; 5. lord privy seal. 6. secretary for the home department; 7. secretary for foreign affairs; 8. secretary for the colonies; 9. secretary for war; 10 secretary for India; 11. first lord of the admiralty; 12. president of the board of trade; 13. postmaster-general; 14. chancellor of the duchy of Lancaster; 15 chief secretary for Ireland; 16. president of the poor law board. It is the prime minister (who is generally the first lord of the treasury) that receives the sovereign's order to form a ministry, or in other words to appoint men of his own sentiments to fill the chief offices. Those of the ministry who are peers sit in the house of lords; the others sit in the house of commons, in virtue of being elected members, which is considered indispensable, unlike those in the United States, who cannot be either representatives or senators. The English ministers are always supposed to be ready, particularly on receiving due notice, to answer questions in parliament, on matters relating to their respective departments.——FOREIGN MINISTER, a person sent from one government to another, and accredited to the latter, in order to transact public business in the name of his government. The term is usually employed, instead of ambassador, to indicate the representative of minor sovereigns. [See AMBASSADOR and DIPLOMACY.]

MIN'IUM (*Lat.*), the red oxide of lead, obtained by exposing the protoxide of that metal to a great heat with free access of air.

MIN'NESÄNGERS (*Ger.*; from *minne*, love, and *sänger*, a singer), a name given to the German lyric poets of the middle ages, on account of love being the chief subject of their poems, the ancient German word *minne* being used to denote a pure and faithful love. After the fashion of the Provençal troubadours, the minnesängers engaged in poetical contests for the gratification of princes and ladies of the court. Some among them were poor, and earned their living by reciting their songs from court to court; but most of them sang merely for pleasure, when their swords were unemployed.

MIN'NOW, the name of a small fresh-water fish, the *Leuciscus phoxinus* of ichthyologists, one of the *Cyprinidæ*.

MI'NOR (less: *Lat.*), in Law, one who is under the age of twenty-one.——MINOR, in Logic, the second proposition of a regular syllogism.——MINOR, in Music, a term applied to those modes in which the third is three semitones above the key-note, and to intervals consisting of three semitones.

MINOR'ITY (last), in Law, a state of being under the age of twenty-one. Also the smaller number of persons who give their votes on any questions, particularly in parliament; opposed to *majority*.

MIN'STER (*Ger.*; from *monasterium*, a monastery: *Lat.*), a term anciently applied to the church of a convent. It is frequently found as a termination; thus Westminster, Leominster, &c.

MINT (*mynet*, money: *Sax.*), a place where the national coinage is stamped. The royal mint received its constitution of superior officers in the 18th year of Edward II. The contrivances used in it were long of a rude description, and it continued to carry on its operations within the Tower of London, until new buildings were erected for it on Tower Hill, in the early part of this century. The chief officers of the mint are, the master, deputy master, comptroller, king's assay-master, clerk of the papers, clerk of the irons, and superintendent of machinery, who constitute the *mint board*. The precious metal to be coined is first alloyed and then cast into small bars, which are passed through rollers in order to be reduced to the exact thickness required. The sheets are then subjected to the action of the punching machines, which cut out circular discs called blanks. These are separately tested for weight and soundness. After the rim has been raised they are taken to the coining presses, which mill the edges and stamp both sides at the same stroke, all the time feeding itself with blanks. One press will coin from 4000 to 5000 pieces in an hour. In forming the dies that impress the figures on the coin, a matrix is cut by the engraver on soft steel, and after this has been hardened it will strike many dies. The machines employed are of highly ingenious construction. [See COINING.]——MINT (*mentha*: *Lat.*), in Botany, a genus of herbaceous plants, whose roots are perennial. There are many species, all of which contain much essential oil, and have an agreeable odour

To the taste they are bitter, aromatic, and pungent. The *Mentha piperita*, or peppermint, is the most powerful, and, on this account, is most generally used in medicine. The *Mentha viridis*, or spearmint, is milder, and more commonly employed for culinary purposes.

MIN'UET (*Fr.*), a dance in slow time and with short measured steps, which requires great dignity and grace of carriage; it is now seldom used.

MIN'UTE (*minutus*, small: *Lat.*), the sixtieth part of the degree of a circle, and denoted thus ('), as a second or sixtieth part of a minute is by ("). Also, the sixtieth part of an hour. We often speak both of *minutes* and *moments* in order to convey a meaning of time indefinitely short.——**MINUTE**, in Architecture, usually denotes the sixtieth part of the diameter of a column, and is the subdivision by which the smaller parts of the order are measured.——**MINUTE** is also used for a short memoir or sketch of a subject, taken in writing, a note to preserve the memory of something.

MINU'TIÆ (*Lat.*), the smaller particulars, or minute details of anything.

MINX, the *Putorius Lutreola* of zoologists, an animal allied to the weasel, inhabiting the northern parts of Europe and America. It can swim and dive well, and is generally to be found on the banks of rivers, where it preys upon small fish, frogs, rats, mice, &c. Its fur is fine, but not very valuable. When irritated, the minx exhales a fœtid musky smell.

MI'OCENE (*meion*, less; *kainos*, new: *Gr.*), in Geology, a division of the tertiary series of strata, more modern than the Eocene, and less modern than the Pliocene. It has been subdivided into the upper series, which are wanting in our islands, and the lower series, which include the Hempstead beds of the Isle of Wight. The latter are 170 feet thick, and comprehend marine, estuary, and fresh-water deposits, abounding in shells and other fossils.

MI'RAGE (*Fr.*), an optical phenomenon, produced by refraction, and which consists in the unusual elevation or apparent approximation of coasts, mountains, ships, or other objects, accompanied by inverted images of the same. The appearance commonly presented is that of a double image of the object in the air; one being in the natural position, the other inverted, so as to resemble an object and its inverted image in the water. Mirage arises from the unequal refracting power of the lower strata of the atmosphere; and may be produced whenever the rays of light meet, in an oblique direction, the surface of a less refracting medium than that in which they were previously moving. They are thus turned back into the original medium in the same direction in which they would be impelled by a reflection taking place at the common surface of the two mediums. Most extraordinary forms of this phenomenon have been described by travellers.

MIR'ROR (*miroir*: *Fr.*), in Optics, the polished surface of any metal or silvered glass, which reflects the rays of light falling upon it, and presenting images of objects. Mirrors are either *flat*, as looking-glasses; *concave*, for the purpose of making the rays of light convergent; or *convex*, for the purpose of rendering them divergent. The objects viewed in convex mirrors are diminished, but are seen in an erect position, and appear to emanate from a point behind the mirror: this point is said to be a *negative* or *imaginary* focus, because the rays are not actually collected at it, as by a concave mirror, whose focus is called *real*. It is probable that brazen mirrors were the first kind used; but silver reflects the best, though it is too expensive a material for common use.

MISCH'NA, or **MIS'NA** (*shanach*, he repeated: *Heb.*), that part of the Jewish *Talmud* on which the *Gemara* is a commentary. It consists of traditions and explanations of Scripture. The Jews pretend, that when God gave the written law to Moses, he gave him also another, which was preserved by the doctors of the synagogue without committing it to writing, till, through their dispersion, they were in danger of departing from the traditions of their fathers: when it was judged proper to transfer it to books.

MISDEMEAN'OUR, in Law, a minor offence, or one of less magnitude than that which is designated a felony.

MISERE'RE (have mercy: *Lat.*), a title given to the 51st psalm, usually called the psalm of mercy, on account of the words with which it commences in the Latin version.

MIS'LETOE, or **MIST'LETOE** (*mistelta*, from *mistle*, birdlime; and *tan*, a twig: *Sax.*), the *Viscum album*, a parasitical plant found on the branches of many kinds of trees in the north of Europe. The misletoe was held sacred by the Druids, because they had an extraordinary reverence for the number *three*; and not only the berries, but the leaves of the misletoe, grow in clusters of three united on one stalk. Its growing upon the oak, their sacred tree, was doubtless another cause of its being venerated. When the end of the year approached, the Druids marched with great solemnity to gather the misletoe of the oak, in order to present it to Jupiter (Taranis), inviting all to assist them at this ceremony, with these words: 'The new year is at hand: gather the misletoe.' Until recently, it has not been found on the oak for many centuries.

MISNO'MER (*mis*, from *miss*: *Ger.*, wrongly done; and *nomen*, a name: *Lat.*), in Law, the misnaming a person, or mistaking his name. The Christian name should always be perfect, but the law is not so strict in regard to surnames, a small mistake in which will be overlooked. It has been observed that a mere misspelling is not a misnomer, if the name so spelled have the same sound as the real one. At present, no indictment or information is abated by any plea of *misnomer*: the court merely orders an amendment to be made.

MISPRIS'ION (*mépris*, negligence: *Fr.*) in Law, any high offence under the degree of what is capital, but bordering upon it.

——***Misprision of treason*** is a bare knowledge and concealment of treason, without participation in it. Misprisions are called *negative*, when they consist in the concealment of something that ought to be revealed; and *positive*, when they consist in the commission of something which ought not to be done.

MIS'SAL (*missale*, a mass-book: *Mod. Lat.*), in the Roman Catholic church, the book which contains the prayers and ceremonies of the mass. Some early missals are beautifully executed, and are objects of bibliomania.

MISTS (*Sax.*), or **FOGS**, are formed by particles of moisture densely congregrated in the air. [See CLOUDS, FOGS, &c.]

MITE (*miete: Ger.*), a name given to several minute animals which are placed by zoologists in the neighbourhood of spiders. The *Acarus domesticus*, or common cheese mite, is so small that it is scarcely visible to the naked eye, except by its motion.——**MITE**, in Commerce, a small coin formerly current, equal to about one third part of a farthing. The piece of money called, in Scripture, a *mite*, was the quarter of a denarius, or about seven English farthings.

MITHRA'IC, an epithet applied to anything connected with the Persian god *Mithras*, whose worship was introduced at Rome, where altars were raised to him, some of which are preserved in collections of antiquities. The god was usually represented, in sculptures, as a man plunging his dagger into the neck of a prostrate bull, upon which he has placed his knee, whilst he holds a horn in one of his hands.

MITH'RIDATE, a celebrated medical confection, whose active ingredient was opium: invented by Democrates, physician to Mithridates, king of Pontus. It was supposed to be an antidote against the effects of all poison and contagion.

MI'TRA (*mitra*, a headband: *Gr.*), in Antiquity, a cap or covering for the head, worn by the Roman ladies, and sometimes by the men, but it was looked upon as a mark of effeminacy in the latter, especially when it was tied upon their heads. Amongst the Greeks, the *mitra* was a girdle worn below the cuirass, to defend from missiles.——**MITRA**, a genus of marine univalve shells.

MI'TRAL VALVES (from being like *mitres* in shape), in Anatomy, two valves situated in the left ventricle of the heart, at the ingress of the pulmonary vein, serving to hinder the return of the blood from the heart into the veins.

MI'TRE (*mitra*, a headband: *Gr.*), an ornament worn on the head by bishops and certain abbots on solemn occasions; being a sort of cap, pointed, and cleft at top. The high-priest among the Jews wore a mitre or bonnet on his head. The inferior priests had likewise their mitres, but in what particulars they differed from that of the high priest is at this time uncertain. Some writers contend that the ancient bishops wore mitres; but there is no mention of the mitre as an episcopal ornament before A.D. 1000. It is scarcely ever worn by the bishops of the established church, though it forms part of their coats of arms.

MIT'TIMUS (we send: *Lat.*), in Law, a writ for transferring records from one court to another. Also a precept or command in writing, under the hand and seal of a justice of the peace, or other proper officer, directed to the gaoler or keeper of a prison, for the receiving and safe keeping of an offender charged with any crime, until delivered by due course of law.

MIXED FE'VER, one that is intermediate between an inflammatory, or low fever, and a typhus fever.

MIX'TURE (*mixtura*: *Lat.*), in Pharmacy, a liquid medicine which contains not only extracts, salts, and other substances soluble in water, but powders, &c., which are insoluble.

MIZ'EN MAST (*mezaen*: *Dut.*), the mast, next the stern, which supports the after sails.

MNEMON'ICS (*mnēmonikos*, belonging to memory: *Gr.*), a systematic method of communicating assistance to the memory.

MOAT (*motte*, a mound: *Fr.*), in Fortification, a deep trench or ditch, dug round the ramparts of a fortified place, to prevent surprises. The brink of the moat next the rampart is called the *scarp*; and the opposite one, the *counterscarp*.

MO'CHA-STONE, in Mineralogy, *dendritic agate*; a mineral, in the interior of which appear delineations of shrubs which are destitute of leaves, and are either of a brown, black, or green colour. In some cases these may have been produced by the filtration of the oxides of iron and manganese.

MOCK'ING-BIRD, the *Mimus polyglottus*, or mocking thrush, a dentirostral passerine bird. It builds its nest in trees near the dwellings of man, and feeds upon fruits. Although this bird is inferior to most of the feathered tribe in America in brilliancy of plumage, it is much sought for on account of its wonderful imitative powers. Its own natural song is bold, full, and exceedingly varied; but in addition to the fulness and melody of its original notes, it has the faculty of imitating those of all other birds from the humming-bird to the eagle. In measure and accent it faithfully follows its originals, while in force and sweetness of expression it greatly improves upon them. A bystander might suppose that the whole of the feathered tribes had assembled together in a trial of skill, each striving to produce its utmost effect, so perfect are the mocking-bird's imitations.

MODE (*modus*, a manner: *Lat.*), in Metaphysics, the manner of a thing's existence, which is either simple or mixed. *Simple* modes are only repetitions of the same simple idea; thus, by adding units together, in distinct separate collections, we come by all the several modes of numbers, as a *dozen*, a *score*, a *thousand*, &c. *Mixed* modes, on the contrary, are compounded of simple ideas of different kinds, as *beauty*, which consists in a certain composition of colour and figure, causing delight in the beholder. ——*Essential*, or *inseparable modes*, are attributes without which the substance cannot subsist.——*Non-essential*, or *separable modes*, are attributes affecting created substances, and affixed to them in certain circumstances, as coldness in water, &c.——**Mode**, in Music, a regular disposition of the piece in relation to certain principal sounds, which are called the *essential chords* of the bass, or the essential sounds of the *mode*. The difference between a mode and a key is, that the octave is called a *mode* with regard to the manner of dividing it, but a *key* with regard to its pitch or place in the scale.——The word *mode* is applicable also to particular acts, or a series of acts, or to the common usage of a place or people.

MOD'EL (*modulus*, a measure of anything: *Lat.*), an original pattern, or the shape or design of anything in miniature. The term is particularly applied to an artificial pattern, made in wood, stone, plaster, or other material, which is intended to secure the more accurate execution of some great work, and to afford an idea of the effect to be produced. Living models, for the purpose of studying the play of the muscles, the varieties of expression, and the relative proportions of the human form, are provided in all academies for painting.

MODERA'TOR (*Lat.*), a person who presides at a public assembly, to propose questions, preserve order, and regulate the proceedings. Thus the president of the annual assembly of the church of Scotland is styled the *moderator*.

MODIFICA'TION (*modificatio*: from *modus*, a state; and *facio*, I make: *Lat.*), in Philosophy, a change in the state of anything. Quantity and quality are accidents which modify all material substances. According to Spinosa's system, all the beings that compose the universe are only so many different modifications of one and the same element: and it is the different arrangement and situation of their parts that make all the difference between them.

MODIL'LION (*modiglione*: *Ital.*), in Architecture, an ornament in the cornice of the Ionic, Corinthian, and Composite orders, a sort of bracket serving to support the projection of the larmier or drip.

MO'DIUS (*Lat.*), a Roman dry measure for all sorts of grain, containing 32 *heminæ* or 16 *sextarii*, or one-third of the *amphora*, amounting to an English peck.

MO'DO ET FOR'MA (in the manner and form: *Lat.*), in Law, words frequently used in pleadings, &c., and particularly in a defendant's answer, in which he denies having done what is laid to his charge, as affirmed by the plaintiff.

MODULA'TION (*modulatio*, from *modulor*, I modulate: *Lat.*), in Music, the art of composing in accordance with the laws prescribed by any particular key, or of changing the mode or key. Also the regular progression of several parts through the sounds that are in the harmony of any particular key, as well as the proceeding naturally and regularly from one key to another.

MOD'ULE (*modulus*, the *dim.* of *modus*, a measure: *Lat.*), a measure applied in architecture; it consists of a semidiameter of the column, and is divided into 30 minutes.

MO'DUS (*Lat.*), an equivalent in money, or other valuable consideration, given to the minister or vicar by the owners of land in lieu of tithes. The whole phrase is *modus decimandi*, though *modus* alone is generally used.

MO'DUS OPERAN'DI, a Latin phrase, signifying the way or method in which an operation or performance of any kind is effected.

MOGUL', GREAT, the chief of an empire founded in Hindostan, by Baber, in the 15th century. The last legitimate sovereign bearing this title was Shah Allum; and the empire terminating at his death in 1806, nearly all his immense possessions fell into the hands of the East India Company.

MO'HAIR (*moire*: *Fr.*), the hair of a goat, *Capra angorensis*, which inhabits the mountains in the vicinity of Angora in Asia Minor. It is white and silky, forming long curls on the animal. There is a considerable importation of it into this country, where it is manufactured into various articles, mixed with other fibres.

MO'HAIR-SHELL, in Conchology, a peculiar species of *Voluta*, resembling on the surface mohair, or a close web of the silkworm.

MOHAM'MEDANS. [See **Mahometans**.]

MO'HUR, an East Indian gold coin. The mohur of Bengal is worth 1*l.* 13*s.* 8*d.*, that of Bombay 1*l.* 10*s.* 1*d.*

MOI'DORE, a Portuguese coin, equal to 27*s.* sterling.

MO'IETY (*moitié*: *Fr.*), a half part; a term frequently used by lawyers.

MOLA'RES (*Lat.*, from *mola*, a mill), or **Dentes Molares**, *Molar teeth*, in Anatomy, the large teeth, sometimes called grinders. In man they are distinguished as pre-molars and true or permanent molars. The first are two in number, at each side of each jaw. They are next the canine teeth, and are changed by children like the front teeth. The true molars are not changed; there are three on each side of each jaw.——**Molar Glands**, two salivary glands, situated on each side of the mouth.

MOLE (*moles*: *Lat.*), a mound or massive work, formed of large stones laid in the sea by means of coffer-dams, &c., extended in a right line, or as an arc of a circle, before a port, which it serves to defend from the violence of the waves; thus protecting ships in a harbour. The word is sometimes used for the harbour itself. Among the Romans, a kind of mausoleum, built like a round tower on a square base, insulated, encompassed with columns, and covered with a dome. Thus, the *Moles Hadriani*, now the Castle of St. Angelo, at Rome.——**Mole**, a spot or mark on the skin, or a small excrescence of the cuticle.——**Mole** (*mæl*: *Sax.*), in Zoology, the *Talpa Europæa*, a small animal, from five to six inches in length, which, in search of worms or other insects, forms a road just under the surface of the ground, raising the soil into a little ridge. Its conformation enables it to burrow with great ease, and such rapidity that its passage through the earth has been compared to swimming. It has no external ears, and its eyes are so minute, and so concealed by its fur, as to have given rise to a belief that it is formed without these im-

MOUN'TAINS. The principal mountain chains of the globe are the Andes, in South America, with a length of 4500 miles; the Stony mountains, in North America, 7000 miles long; the Altai chain, in Asia, 5000 miles long; the Himalayan chain, 1900 miles long; and the Ural mountains, which divide Asia and Europe, 1500 miles long. The altitude of the highest mountains bears a very inconsiderable proportion to the mass of the globe; and its spherical form is very slightly altered by all the chains and groups which mark its surface. The highest Asiatic mountain is Deodunga, in the Nepal Himalayas, 29,000 feet; the highest South American mountain is the Nevado de Sorata, in the Bolivian Andes, 25,000 feet; the highest mountain in North America is the volcano of Popocatepetl, in Mexico, 17,717 feet; the highest elevation in Africa is Geesh, in Abyssinia, 15,000 feet; whilst the highest European mountain is Mont Blanc, 15,739 feet. Ben Nevis, in Inverness-shire, is the loftiest summit in the British Islands, 4380 feet. The greatest heights to which men have ascended on mountains appear to be, 19,400 feet on Chimborazo by Humboldt, and 19,000 feet in the Sikkim Himalaya by Dr J D Hooker. It must not be assumed that mountain chains have been thrown up by a few paroxysmal efforts; on the contrary, several of them afford evidence that their upheaval was a slow process, the rise, *en masse*, being assisted and accompanied by the injection and ejection of melted matter. The changing character of the vegetation as we ascend mountains is well known. Humboldt has painted the effect of the increasing rarity of the air and cold upon plants on the slopes of the Andes On leaving the burning plains, where palms, bananas, and other tropical plants luxuriate, he entered the region of forest trees and tree ferns, and then passed into that where shrubs abounded In the stormy regions above, grasses alone flourished, and higher still the rocks were bare of all save lichens, until the line of perpetual snow was reached, and all vegetation terminated.

MOUNT'ING, in the Mechanic Arts, anything that serves to raise or set off a work. ——**Mounting**, in Military affairs, signifies going upon a duty; thus, *mounting a breach* is running up to it, and *mounting guard* is going upon guard, but *mounting a cannon, mortar*, &c., is the setting it properly on its carriage.

MOURN'ING (*murnan*, to mourn: *Sax*). The colours used as badges of grief are different in different countries. In Europe, the ordinary colour for mourning is black; in China, as with the ancient Spartan and Roman ladies, it is white; in Turkey, it is blue or violet; in Egypt, yellow; in Ethiopia, grey. The kings of France and cardinals mourn in purple. Some have attempted to trace the associations which caused the adoption of the various colours to natural causes. Thus black, which is the privation of light, is supposed very appropriately to denote the privation of life; white is an emblem of purity; yellow is the colour of leaves when they fall, and represents that death is the end of all human hopes, &c. In the East, to cut the hair was considered a sign of mourning; among the Romans, on the contrary, it was deemed a mark of sorrow to let it grow. The duration of mourning varies in different countries, being always longer in proportion to the nearness of relationship. Among the ancients, as among the moderns, public mournings were common on the death of a distinguished public benefactor; and with the Greeks and Romans it was the custom, during the term prescribed for mourning, to lay aside all ornaments of dress, to abstain from the bath and other indulgences

MOUSE (*mus: Gr.;* from *mush*, to filch. *Sansk.*), a small animal belonging to the rodent genus *Mus*, which also includes the rats. The species of mice are very numerous, and are found all over the globe.

MOUTH (*muth: Sax.*), in Anatomy, a cavity or aperture in the head of any animal, by which the food is received, the voice uttered, and the inspiration or expiration of the air is performed. It consists of the lips, the gums, the insides of the cheeks, the palate, the salivary glands, the uvula, and tonsils.——In Architecture, the same as *cavetto*.

MO'VEMENT (*mouvement: Fr.*), in Horology, the train of wheelwork of a clock or watch ——In Military affairs, the regular orderly motion of an army for some particular purpose.——In Music, the progress of sounds from grave to acute, or from acute to grave

MU'CIC A'CID, in Chemistry, the same as *Saclactic Acid*, so called because obtained from sugar of milk; but all the gums equally afford it.

MU'CILAGE (*Fr.*), in Chemistry, a viscous substance of more or less consistence; as, a solution of gum, or any tenacious liquid ——**Mucilaginous Glands**, in Anatomy, glandules or kernels about the joints, that secrete a mucilaginous liquor, which serves to lubricate many of the internal cavities, some are small, some crowded together.

MU'COUS MEM'BRANE (*mucosus*, slimy: *Lat.*), the membranous lining of the canals and cavities of the body, which have an external opening. It answers to, and is a continuation of, the external skin of the body. It consists of four layers, the innermost of which in some parts bears cilia.

MU'CRO COR'DIS (the point of the heart: *Lat.*), in Anatomy, the lower pointed end of the heart.

MU'CRONATE (*mucronatus*, sharp-pointed: *Lat.*), in Botany, an epithet for a sharp-pointed leaf terminating like a dagger.

MU'CUS (*Lat.*), a fluid in the animal body, secreted by the mucous membrane, and best exemplified by that from the nasal membrane. It covers the lining membranes of all the cavities which open externally, such as those of the mouth, nose, lungs, intestinal canal, urinary passages, &c., serving to moisten and defend them. It is viscid; apparently becomes fluid in water, but is not dissolved by it. It may be repeatedly dried and moistened without sensibly changing its properties. When boiled in water it becomes tough, but on cooling regains its former condition; less than one per cent. of it gives a ropiness to water. It is said to consist of the scales of the *epithelium*, or cuticle, which continually wear off, and mix with a watery secretion. ——MUCOUS FEVER, a term frequently used by medical writers to express those fevers in which nature is endeavouring to rid herself of an abundance of pituitous, mucous, and serous matter. Catarrhal fevers of all kinds are comprehended under the term.

MUEZ'ZIN, or MUED'DIN, among the Mahometans, the crier who announces the hours of prayer from the minaret, and reminds the faithful of their duty.

MUF'TI (*Turk.*), a doctor of the law of the Koran. The mufti of Constantinople, or Sheikh-ul-Islam, is the chief functionary of the Turkish church, and represents the sultan in spiritual matters, as the grand vizier does in temporal. He decides in all doubtful questions of their law.

MUGGLETO'NIANS, a religious sect, which arose in England about the year 1561. They were so denominated from their leader, Ludowic Muggleton, a tailor, who, with his associate Reeves, asserted that they were the two last witnesses of God mentioned in the Revelations.

MULAT'TO (*Span.*; from *mulus*, a mule: *Lat.*), the offspring of a European and a negro. The mulatto is of a deep tawny or yellow colour, with frizzled or woolly hair, but resembles the European more than the African. The offspring of a white and mulatto is called a *quadroon;* of a white and quadroon, a *muster;* of a white and muster, a *mustafina;* after which, they are said to be whitewashed, and are considered Europeans. The offspring of a mulatto and negro is called a *cabre;* of a cabre and negro, a *griffe;* after which, generally speaking, there is no distinction but negro. The descendants of Europeans and American Indians are called *mestizos* in Spanish America. In Brazil they are termed *Mamelucos*. In some parts of South America, the term *Creole* is applied to the offspring of negroes; in others, to those persons who are born in the country of Spanish parents.

MUL'BERRY (*maulberre: Ger.*), the fruit of trees belonging to the genus *Morus*, nat. ord. *Moraceæ*. The *Morus nigra* has been introduced into Britain from Italy, and is cultivated on account of its fruit, the common black mulberry. The white mulberry (*Morus alba*) is cultivated in France and Italy for its leaves, which are the food of silkworms. The red mulberry (*Morus rubra*) is one of the most valuable of American trees, from the properties of the wood. It grows to the height of sixty feet and upwards, with a trunk six feet in circumference. The wood is fine-grained, compact, strong, and solid; and is used for knees, floor-timbers, &c., in ships, as well as for many other purposes where strength and durability are necessary.

MULCH (*muld*, dust: *Goth.*), a term used by gardeners for rotten dung, or the like, thrown upon beds of young plants, to preserve them from the ill effects of cold or drought.

MULE (*mulus: Lat.*), a hybrid animal, usually generated between an ass and a mare, and sometimes between a horse and a she-ass; but the latter is every way inferior to the former. Mules are hardy, sure-footed animals, and, in the mountainous parts of Spain and Italy, are far more useful than horses, being capable of carrying equally heavy burdens, and enduring long-continued fatigue. Mules have been much employed, both in ancient and modern times. The Roman ladies had equipages drawn by mules; and at this day, in Spain, they are generally used with the coaches of the nobility.——The term is sometimes applied also to other hybrids, besides those produced between the horse and the ass. ——MULE, in Manufactures, the name given to a contrivance, invented by Crompton about the year 1777, for producing finer yarn than was spun by the machines previously in use. At present, the *mule* is employed in the fabrication of the most delicate articles; thread has been produced by it of such fineness that what was made from a pound of cotton has been sufficient to reach 167 miles.

MUL'LER (*mouleur: Fr.*), a stone held in the hand, and used by painters and apothecaries for grinding colours, &c., on another stone.

MUL'LET (*mullus: Lat.*), a name given to fishes belonging to two ichthyological genera, the grey mullet (*Mugil*), and the red mullet (*Mullus*). Red mullets were held in such estimation by Roman epicures that they were sometimes sold for their weight in silver. It is recorded that 240*l.* were paid for three fishes, of unusual size, by a Roman epicure. The roes are known in Italy under the name of *botargo* ——MULLET (*molette*, the rowel of a spur: *Fr.*), in Heraldry, a star-shaped ornament, added to the family arms by the third of the junior branches.

MUL'LION (*moulure*, a moulding: *Fr.*), in Architecture, the post, or bar, dividing the lights in a window. Vertical mullions are termed *munnions;* those which are horizontal, *transoms*.

MULTILAT'ERAL (*multus*, many; and *latus*, a side: *Lat.*), polygonal; in Geometry, a term applied to those figures which have more than four sides and angles.

MULTILOC'ULAR (*multus*, many; and *loculus*, a compartment: *Lat.*), in Botany, having many cells; as, a multilocular pericarp.

MULTINO'MIAL (*multus*, many; and *nomen*, a name: *Lat.*), in Mathematics, a term applied to such roots as are composed of many names, parts, or members.

MUL'TIPLE (*multiplex*, manifold: *Lat.*), in Arithmetic, a number which contains some other, called its measure, more than once: thus 6 is a multiple of 2, containing it thrice, and 12 is a multiple of 6, 4, and 3, containing the first twice, the second thrice, &c.——MULTIPLE RATIO or PROPORTION, that which exists between multiples. If the less term be an aliquot part of the greater, the ratio of the greater to the less is called a *multiple* ratio; and that of the less to the greater a *sub-multiple* an arithmetical operation by which is found the sum of one number (the multiplicand) taken as many times as there are units in another (the multiplier); thus 10 multiplied by 5 is increased to 50. The result of the operation is the *product*.——CROSS MULTIPLICATION, otherwise called duodecimal arithmetic, an expeditious method of multiplying things of several species or denominations, by others likewise of several species, &c. [See DUODECIMALS.]

MUL'TIPLYING GLASS, in Optics, a glass with several plane sides, each of which presents a separate picture of an object. Its effect is due to the rays of light, which issue from the same point, undergoing different refractions, so as to enter the eye from every surface in a different direction.

MUL'TIVALVE (*multus*, many; and *valvæ*, the leaves of a door: *Lat.*) in Conchology, a term sometimes applied to those shells that consist of more parts than two, such as the Chitons and the Pholades. The multivalves do not form a natural division of molluscs.

MUL'TURE (*moulture : Fr.;* from *molo*, I grind: *Lat.*), in Scotch Law, the payment given to the proprietor of a mill for grinding corn.

MUM (*mumme: Ger.*), a malt liquor much used in Germany. It is made of the malt of wheat, with a small proportion of oatmeal and ground beans.

MU'MIA (*Arab;* from *mum*, wax), in Mineralogy, a sort of bitumen or mineral pitch, which is soft and tough, like shoemaker's wax, when the weather is warm, but brittle, like pitch, in cold weather. It is found in Persia, where it is highly valued.

MUM'MY (last), a dead body preserved by antiseptics, according to methods practised by the ancient Egyptians. The processes for this purpose were very various: some of the mummies which have been opened having been dried by vegetable and balsamic substances, others by salt or natron. In the former case, aromatic gums or asphaltum were used; and those so treated are generally in good preservation. Those dried with saline substances are of a black, hard, smooth appearance; on exposure to the air they attract moisture, and become covered with a saline substance. The bodies are rolled up in bandages of silk and linen, which are sometimes 1000 yards in length. The coffin is usually of sycamore, cedar, or pasteboard; the case is in one piece, covered within and without by paintings, representing funeral scenes, and a great variety of other subjects: the cover, which is also in one piece, is ornamented in the same manner, and contains, also, the face of the deceased in relief, painted, and often gilded. The Egyptians embalmed, not only the human species, but all the animals held sacred by their religion. We are not to imagine that Egypt was the only place in which the preservation of the bodies of the dead was attended to. In every country the custom of embalming has been occasionally practised; a large number of mummies have been discovered in the environs of Durango, in Mexico. They are in a sitting posture, but have the same wrappings, bands, and ornaments as the Egyptian. In the British Museum considerable space is allotted to the Egyptian mummies. There are some mummies produced naturally, by the peculiar conditions of the soil and atmosphere, which dry the animal tissues so rapidly, that the body is preserved from putrefaction.

MUMPS (*mumpelen*, to nibble: *Dut.*), the common name of the disease called by medical practitioners *Cynanche parotidea*, or a swelling of the parotid glands. It seems, occasionally, to be the effect of cold, and children are more subject to it than adults. It is often epidemic, and by some is thought contagious.

MUN'DIC (*mwndig*, from *mwn*, a mine: *Wel.*), in Mineralogy, a Cornish name for *iron pyrites*.

MUNICIP'AL (*municipalis*, belonging to a town: *Lat.*), in the Roman civil law, an epithet which signifies invested with the rights and privileges of Roman citizens. Thus the municipal cities were those whose inhabitants were capable of enjoying civil offices in the city of Rome; though the greater part of them had no suffrages or votes there.——In modern times, *Municipal law* relates to the citizens and inhabitants of a state, and is thus distinguished from *political* law, *commercial* law, and the *law of nations*. *Municipal officers* are those elected in cities and boroughs, under the Municipal Corporation Reform Act, for the purposes of local government.

MU'NIMENTS (*munimentum*, a defence: *Lat.*), in Law, the writings relating to a person's inheritance, by which he is enabled to defend his title to his estate; or, in a more general sense, all manner of evidences, such as charters, feoffments, releases, &c., but more especially those belonging to public bodies.——MUNIMENT ROOM, a small strong room in a cathedral, college, or university, destined for keeping the seal, charters, &c.

MUNI'TION (*munitio: Lat.*), the provisions with which a place is furnished in order for defence; or that which follows a camp for its subsistence.——MUNITION SHIPS are those that have naval or military stores on board, and attend or follow a fleet to supply ships of war.

MUN'JEET, a species of madder, produced in various parts of India, and used in dyeing: the red which it produces being nearly the same as that produced from European madder.

MU'RAL ARCH (*muralis*, belonging to a wall: *Lat.*), the segment of a large circle, fixed in the meridian against the wall of an observatory, for measuring the meridian altitudes, or zenith distances, of heavenly bodies.

MU'RAL CIR'CLE (same *deriv.*), or MURAL QUADRANT, in Astronomy, a large instrument, fixed in the meridian, for the purpose of measuring the distances of stars from the pole or zenith. It is attached to a stone wall or pier of solid masonry. As its purpose is to measure angular distances in the meridian, its axis must be truly horizontal; also the plane of its circle vertical and in the meridian; the line of sight must be at right angles to the axis, and parallel to the plane of the circle. Entire circles are susceptible of more accurate division than quadrants, and are much less liable to derangement. Troughton's, in Greenwich observatory, is six feet in diameter; it was placed there in 1812, and has shown that a good mural circle is the most important instrument in an observatory.

MURA'LIS CORO'NA (a mural crown: *Lat.*), among the ancient Romans, a crown, consisting of a circlet of gold, indented and embattled, bestowed on him who first mounted the wall of a besieged place, and there planted a standard.

MUR'DER (*meurtre: Fr.*), in Law, the wilful and felonious killing a person from premeditated malice; provided the party wounded or otherwise hurt die within a year and a day after the crime is committed. To constitute murder in law, the person killing another must be of sound mind, and the act must be done with malice prepense and aforethought; but malice may be implied as well as expressed.

MU'REX (*Lat.*), a genus of univalve molluscs, from some species of which the ancients obtained a purple dye. The animals feed on other molluscs. About 200 species are known, some of which are curiously spined. *Murex tenuispina* is a shell of this kind, well known to collectors.

MU'RIACITE, an anhydrous sulphate of lime, containing a little common salt.

MU'RIATES, in Chemistry, salts composed of what was formerly called muriatic acid, but now termed hydrochloric acid, and a base. The salts are called chlorides, that is, combinations of chlorine, the radicle of the acid, with the metallic or other bases of the oxides; water being formed, during the combination, by the union of the hydrogen of the muriatic acid with the oxygen of the oxide. Common salt (chloride of sodium) is the most abundant of these compounds, which from it are termed *haloid* (*hals*, the sea; and *eidos*, form: *Gr.*).

MURIAT'IC A'CID (*muria*, brine: *Lat.*), called also, and more correctly, *hydrochloric acid*, is a combination of hydrogen and chlorine. It is the *spirit of salt* of the shops, and is obtained by acting on common salt with strong sulphuric acid. Water is decomposed; its hydrogen goes to the chlorine of the chloride, and forms hydrochloric acid; and its oxygen goes to the sodium, forming soda, which, combining with the sulphuric acid, forms sulphate or bisulphate of soda. Muriatic acid is a gas, without colour, but of a penetrating taste and smell; it does not support combustion, is intensely sour, and is absorbed in large quantities by water, unless that fluid is hot, or is saturated with common salt. It is liquefied by a pressure of about 40 atmospheres, that is, a pressure of 600 lbs. to the square inch. The ordinary muriatic acid is a strong solution of this gas in water, which may be made to contain 480 volumes of it; or, in other words, one cubic inch of water will absorb 480 cubic inches of the gaseous acid.

MU'RICATED (*muricatus*, pointed: *Lat.*), in Botany, having the surface covered with short hard excrescences.

MUR'RAIN (*Fr.*), the popular name of a malignant epizootic influenza, to which cattle are subject, and which sometimes makes great havoc among them. It appears in the form of an extremely inflammatory œdema, generally confining itself to one of the hind quarters of the animal. It is most common in spring and autumn, and usually attacks young cows. The side affected becomes discoloured and swollen; there is lameness and inability to move, a peculiar emphysema over different parts of the body, but particularly the spine; and all the symptoms of putrid fever which usually appear in diseases of a typhoid character, manifest themselves. Gangrene speedily supervenes, and few animals survive more than ten or twelve hours. It is known by different names in different places. Abundance of fresh air, with plentiful fumigation by means of chlorine or chloride of lime, and the immediate removal of the infected, are the best preservatives against it.

MURR'HINE VA'SES (*murrhina vasa*: from *murrha*, the material of which they were made—supposed to be fluor spar: *Lat.*), splendid antique vessels, made of a material the nature of which is not certainly known, and equally distinguished for the beauty of their execution and the costliness of their material. They were brought by Pompey from Asia to Rome, after his victory over Mithridates, and were of great value.

MUS (a mouse: *Lat.*), in Zoology, a genus of rodent animals comprehending the rats and mice.

MUSA'CEÆ, in Botany, a nat. ord. of endogenous plants, natives of warm countries, containing five genera, *Strelitzia* and *Heliconia*; two of these genera have remarkably handsome flowers. The Traveller's Tree, a splendid palm-like plant, belongs to the genus *Ravenala*. To the genus *Musa* belong the BANANAS and PLANTAINS. All the species abound with a strong fibre; that of *Musa textilis* forms Manilla hemp.

MUS'CA (a fly: *Lat.*), in Entomology, a genus of dipterous insects.——MUSCA INDICA, in Astronomy, a southern constellation.

MUS'CADINE, MUS'CADEL, MUSCATEL', or MUSCAT' (*muscadin: Fr.*; from *musca*, a fly: *Lat.*—because flies are very fond of the grape), a rich kind of wine, the produce of a peculiar variety of grape, the growth of Italy and the south of France.

MUS'CÆ VOLITAN'TES (flies flitting about: *Lat.*), certain dark spots, which seem to flit before the eyes of many people on looking at the sky, a candle, or other bright object; and so called from their resembling flies.

MUS'CLE (*musculus: Lat.*). What we call flesh is for the most part composed of muscle. It consists of bundles of fibres, united by areolar or cellular tissue. When torn into its ultimate fibres, there are found to be two kinds, one termed organic or unstriped muscle, the other voluntary or striped muscle. The former consists of solid elongated fibres, thicker in the middle than at the ends. The latter is composed of slender fibrillæ, each inclosed in a sheath, and marked transversely by alternate light and dark spaces. On closer examination with the microscope, a fibrilla is seen to consist of a number of cells placed end to end, each of them containing a cavity filled with some highly refracting substance. When the fibril is in a state of contraction, the dark space presents a nearly square shape; but in the ordinary state of relaxation, the dark spaces are longer than wide. The two kinds of fibrils have the same chemical composition. The diameter of these fibrils differs greatly in the muscle of different animals. Nerves, blood-vessels, and other vascular tissue, ramify amongst, and are supported by, the muscular tissue.——*Muscular motion* is of three kinds, voluntary, involuntary, and mixed. The *voluntary motions* of muscles proceed from an exertion of the will; thus the mind directs the arm to be raised or depressed, the knee to be bent, the tongue to move, &c. The *involuntary motions* of muscles are performed by organs, without any attention of the mind, as the contraction and dilatation of the heart, arteries, veins, absorbents, stomach, intestines, &c. The *mixed motions* are those which are in part under the control of the will, but which ordinarily act without our being conscious of their acting; and are perceived in the muscles of respiration, the intercostal and abdominal muscles, and the diaphragm. When a muscle acts, it becomes shorter and thicker; both its origin and insertion are drawn towards its middle. When a muscle is wounded or otherwise irritated, it contracts independently of the will; this power is called *irritability*, and it is a property peculiar to, and inherent in, the muscles. If the nerve belonging to a muscle is cut, the powers of the muscle are first disturbed, and then cease; but if electricity be transmitted through the nerve before rigidity supervenes, the action of the muscle will, to a certain extent, be recalled; and hence the nervous fluid and electricity are supposed to be identical. The intensity of muscular contraction, that is, the degree of power with which the fibres draw themselves together, is regulated by the action of the brain. Muscles consist of fibrine with some albumen, and the gelatine and fat derived from the cellular membrane; also hæmatosine, osmazone, and the other constituents of the blood: hence they constitute the most nutritious species of animal food.

MUSCOVA'DO, unrefined sugar, or the raw material from which loaf sugar is procured by refining. Muscovado is obtained from the juice of the sugar-cane by evaporation and draining off the liquid part called *molasses*.

MU'SES (*musæ: Lat.*), in the poetry of the ancients, personifications of the various branches of knowledge in which human genius displays itself. They were beautifully said to be the daughters of Jove and Mnemosyne, or Memory; and they were represented as companions of Apollo upon Parnassus. They were said to be nine, namely:—Clio, to whom was attributed the invention of history; Melpomene, the inventor of tragedy; Thalia, of comedy; Euterpe, of the use of the flute; Terpsichore, of the harp; Erato, of the lyre and lute; Calliope, of heroic verse; Urania, of astrology; and Polyhymnia, of rhetoric.

MUSE'UM (*mouseion*, literally a seat of the muses: *Gr.*), a place set apart as a repository for curious, valuable, and interesting objects connected with the arts and sciences, more especially such as relate to natural history. The term was originally applied to a study, or a place devoted to learned men, in the royal palace of Alexandria, by Ptolemy Philadelphus, who founded a college, and gave salaries to the several members, adding also an extensive library, which was one of the most celebrated in the world.——The British Museum in London is a very extensive and magnificent building, and the noblest collection of curiosities in the world. In the year 1753, parliament having passed an act for purchasing the museum of Sir Hans Sloane, and the collection of manuscripts of Lord Oxford, called the Harleian Library, for the use of the public, twenty-six trustees were appointed and incorporated to provide a repository for these and some other collections, which repository was to be called the British Museum. The collections were placed originally in Montague House, the residence of the Dukes of Montague in Bloomsbury. Since that time vast gifts and purchases have been made, in every department of science, literature, and art. The old ducal mansion has been replaced by noble buildings, and the convenience of the public has been studied in every possible way; so that for extent and usefulness it is altogether unrivalled. It is rich in natural history, particularly in mineralogy. It possesses the marbles brought by Lord Elgin from Greece, the Townley marbles, a magnificent collection of Egyptian antiquities, with those brought from Nineveh; also the Hamilton and Portland vases, &c. Its library contains a vast number of books and manuscripts. [See LIBRARY.] Its new reading-room is the finest and most convenient structure of the kind in the world, being a rotunda of 140 feet in diameter, 106 in height, and capable of accommodating 300 readers in the most perfect manner.——The museum of the Vatican is the most celebrated in Italy; that of Florence is considered the next; after which is the Museo Borbonico at Naples. On the continent, galleries of pictures are termed museums (*musées*); and, as such, that of the Louvre ranks very high.

MUSH'ROOM (*mousseron: Fr.*), the popular name of some edible cryptogamic plants of a soft structure. They belong to the order of fungi. Since many *fungi*, closely resembling mushrooms in appearance, are of a poisonous quality, the greatest caution should be used by those who provide them. If a mushroom have an offensive smell, a bitter, astringent, or styptic taste, or is even of unpleasant flavour, it is certainly unfit for food. Colour, figure, and texture cannot be relied on; but the pale or sulphur yellow, bright or blood red, and the greenish, are generally poisonous. The safe kinds have mostly a compact brittle texture; the flesh is white; and they grow more readily in open places than in damp or shady spots. The mushrooms used in sauces are the *Agaricus campestris* and the *A. arvensis*. It is singular that the former species is considered pernicious in Italy.

MU'SIC (*mousikē: Gr.*), the science of sounds, considered as capable of producing melody, and agreeably affecting the mind by a due disposition, combination, and proportion. It treats of the number, time, division, succession, and combination of sounds. It is divided into *theoretical* music, which inquires into the properties of concords and discords, and explains their combinations and proportions for the production of melody and harmony; and *practical* music, which is the art of applying the theory of music in the composition of all sorts of pieces, tunes, and airs. Music is also either vocal or instrumental. *Vocal* music is the melody of a single voice, or the harmony of two or more voices in concert; *instrumental* music is that produced by one or more instruments. Every musical production ought to be expressive of feelings, and, through them, of ideas; but though music of some kind exists wherever the human species is found, it does not follow that every good piece of music must please all men alike, or be understood equally by all; because music is an art requiring cultivation of the mind and heart to appreciate it fully. As civilization advances, music, as a science, gains new admirers.—The Jews were fond of music in their religious ceremonies, their feasts, their public rejoicings, their marriages, and their mournings. The music of the temple was performed by the families of Asaph, Heman, and Jeduthun, the Levites, whose whole business was to learn and practise this agreeable art; and abundant provision was made for them, that they might not be prevented from pursuing their musical studies by the cares of life. Kings and great men among the Jews cultivated music, and David made a very great proficiency in it. Indeed, music reached a high perfection among the Hebrews, and part of their religious service consisted in chanting solemn psalms, with instrumental accompaniments. —The invention of the lyre is ascribed to Hermes Trismegistus, the Mercury of the Egyptians, which is a proof of its antiquity; but a still greater proof of the existence of musical instruments amongst them at a very early period is drawn from the figure of an instrument said to be represented on an obelisk, erected, as is supposed, by Sesostris at Heliopolis. The Greeks, we know, were exceedingly fond of music. It had a considerable share in their education; and so great was its influence over their bodies as well as their minds, that it was thought to be a remedy for many disorders.

MU'SICAL GLAS'SES. [See HARMONICA.]

MUSK (*musc: Fr.*), a dry, light, and friable substance, of a dusky black colour, tinged with purple; it is of a very strong odour, and is agreeable only when in small quantity, or moderated by mixture with some other perfume. It is imported into England from China; but an inferior kind is brought from Bengal, and a still worse description from Russia. From its being a very high-priced article, it is often adulterated, and most usually with dried blood, a substance it very much resembles in appearance.——The *Moschus moschiferus*, or Thibet musk-deer, from which the perfume is obtained, in size and figure resembling a small roebuck. It has no horns; the hair of the body is long, and stands erect; the tail short; the ears long and narrow; the hoofs black; and the tusks, which are nearly two inches long, project considerably. The male is furnished with a small bag, about the size of a hen's egg, hanging from the abdomen, in which is contained the musk. As this animal is naturally timid, it lives on the cliffs and summits of lofty mountains; and in running, leaping, and climbing, displays astonishing agility.

MUSKETOO'N, a species of ancient musket, shorter, thicker, and wider in the bore, than that in ordinary use. It was common in the time of Louis XIV. and subsequently.

MUSK'-OX, the *Ovibos moschatus;* an animal of the ox tribe, which inhabits the most barren parts of North America, to the north of the 60th parallel. It is much smaller than the common ox. Its horns are very broad at the base, covering the forehead and crown of the head, but each curving downwards between the eye and ear, until about the level of the mouth, when they turn upwards. The colour of the hair is generally brown; on the neck and between the shoulders, it is long, matted, and somewhat curled, causing the animal to appear humped; on the shoulders, sides, and thighs, it is of such a length as to hang down below the middle of the leg. The legs are short and thick, and furnished with narrow hoofs. When lean, the flesh smells strongly of musk.

MUSK'-RAT, called in Canada, the *Musquash*, the *Ondatra zibethicus* of naturalists, a rodent animal allied to the beaver, which yields an oily fluid, having the perfume of musk. The colour of its body is a reddish-brown, the belly and breast of an ash colour. The hair is soft and glossy, and beneath it is a thick coat, which is much used in the manufacture of hats. An immense number of skins are annually imported into this country. They live on the banks of small rivers; and where the banks are high they form large and extensive burrows, which have entrances below the surface of the water, and gradually ascend till they terminate in a chamber above the level of high water.

MUSK'-ROSE, a sort of rose from which a highly odorous oil is extracted at Tunis.

MUS'LIN (*mousseline: Fr.*), a fine sort of cotton cloth, which bears a downy nap on its surface. This nap the French call *mousse*, as resembling moss; whence the name *muslin*. Muslins are made in the greatest perfection in Asia; but the nations of Europe imitate the manufacture with great success. The extreme lightness of the finer kinds produced in the East is admirable. But some derive the word from Moussul, a city in Asiatic Turkey.

MUS'SEL, the popular name of several

species of bivalve molluscs. The sea mussels belong to the genus *Mytilus*. Immense quantities of these mussels are collected on our coasts for food. At times they are deleterious, and persons have occasionally died from eating them. The animal anchors itself by a byssus. The *horse mussels* belong to the genus *Modiola*; some of them burrow, others spin a nest. The *river mussels* belong to the genus *Unio*. They secrete an inferior kind of pearl, and these were formerly collected from the mussels of the Scotch rivers. The *swan mussels*, which resemble the last, but with a slight difference in the shell. A single female has been computed to contain 600,000 young.

MUS'SULMAN (the dual of *moslem*, of which the plural is *muslemina*, literally resigned to God: *Arab.*), or MOS'LEM, a follower of Mahomet. This word signifies, in the Turkish language, a true believer.

MUST (*mustum: Lat.*), the juice of the grape, which by fermentation is converted into wine.

MUS'TARD (*moutarde: Fr.*), the ground seeds of some species of cruciferous plants belonging to the genus *Sinapis* It is a powerful stimulant, which is often taken internally, and is used externally in cataplasms

MUSTE'LA (a weasel: *Lat*), in Zoology, a genus of carnivorous animals, including the common weasel and the ermine

MUS'TER-ROLL (*mustern*, to inspect: *Ger*), in a Military sense, a list of the officers and men in every regiment, which is delivered to the muster-master, inspecting field-officer, or whoever is appointed to examine it.

MUTE (*mutus*, dumb: *Lat.*), in Law, a person that remains speechless when he ought to answer or plead. Such a person is now considered to plead *not guilty*, which is entered by the proper officer; in former times he was compelled to answer by torture.——MUTE, a dumb officer of the seraglio, usually employed as an executioner.——One of those employed to stand before a house in which there is a corpse.——In Grammar, a letter that is written but not pronounced, as the vowel *e* at the end of many English words, in some of which, however, it changes the pronunciation of the preceding vowel, rendering it long; thus, *bite*. The *e* mute was formerly added more generally to the end of words, particularly of nouns. Mutes also are consonants which emit no sound without a vowel; as *b*, *p*, *t*, *d*, *k*, with *c* and *g* hard.——MUTE, in Mineralogy, an epithet for minerals which do not ring when they are struck.

MU'TINY (*mutin*, a mutineer: *Fr.*), an insurrection of soldiers or seamen, or an open resistance to the authority of their commanders. Any attempt to excite opposition to lawful authority, or any act of contempt towards officers, or disobedience of commands, is by the British mutiny act declared to be mutiny, and is punishable by the sentence of a court-martial.

MYOG'RAPHY or MYOL'OGY (*muon*, a muscle; and *grapho*, I write; or *logos*, a discourse: *Gr.*), that part of anatomy which treats of the muscles of the human body

MYR'IAD (*murias*, ten thousand: *Gr.*), the number of ten thousand; or, in poetical language, an innumerable multitude.

MYRIAME'TRE (*murias*, ten thousand, *Gr.*; and *mètre*), a French measure containing ten thousand mètres; equal to 10936·13 yards, or two of the old leagues.

MYRIAP'ODA (*murias*, ten thousand; *poda*, feet: *Gr.*), in Zoology, a class of invertebrate animals, which are wingless and possess one or two pairs of feet to each ring of the body. They have antennæ, and are all terrestrial. They are divided into two sections:—1. *Chilopoda*, the centipedes, &c. 2. *Chilognatha*, the scolopendra, &c.

MYR'IARE, a French superficial measure of ten thousand *ares*, or 1,000,000 square mètres.

MYRICINE' (*murikinos*, belonging to the myrtle: *Gr.*—on account of wax being the product of some of the species), in Chemistry, one of the proximate principles of bee's wax, obtained by boiling in alcohol.

MYRIOLI'TRE (*murias*, ten thousand: *Gr.*; and *litre*), a French measure of capacity, containing ten thousand litres, or 610,280 cubic inches, that is, very nearly 355 cubic feet.

MYRIORA'MA (*murias*, ten thousand; and *orama*, a view: *Gr.*), a moveable picture, capable of forming an almost endless variety of picturesque scenes, by means of several fragments or sections of landscapes on cards, which may be placed together in numberless combinations.

MYRME'LEON (*murmos*, an ant; and *leōn*, a lion: *Gr.*), a genus of neuropterous insects, including the *ant lion*.

MYROB'ALAN (*murobalanos; from muron*, ointment; and *balanos*, any glandular fruit: *Gr.*), a dried fruit brought from the East Indies; the produce of trees belonging to the genus *Terminalia*, nat. ord. *Combretaceæ* The Hindoos use it both in medicine and in calico printing. It has an unpleasant bitter taste; produces, with iron, a durable black dye and ink; and with alum, a very full, though dark, brownish yellow.

MYRRH (*murrha: Gr; from mer*, to be bitter: *Heb.*), a fragrant, bitter, aromatic gum-resin, issuing by incision, and sometimes spontaneously, from the trunk and larger branches of a shrub growing on the Abyssinian coast, called by botanists *Balsamodendron Myrrha*, nat. ord. *Amyridaceæ*. Myrrh is light and brittle; does not melt when heated; burns with difficulty; and yields oil by distillation.

MYRTA'CEÆ, a natural order of trees and shrubs, the greater number of which may be recognised by the leaves being opposite, and marked with transparent dots, and their having a vein running parallel with the margin. The common MYRTLE is a shrub of this order, which contains some fruit-bearing trees, such as the Pomegranate, Rose Apple, and Guava. The trees producing cloves, all-spice, and cajeput oil, belong to the order, as well as the Eucalypti of Australia, the Stringy barks and Gum trees of the colonists, some of which are 200 feet high. Several yield oils which are likely to be useful in medicine. Those singular flowering shrubs, the Bottle brushes, which are natives of Australia, belong to Myrtaceæ.

MYR'TLE (*murtos : Gr.*), in Botany, a fragrant shrub, of the genus *Myrtus*, which, among the ansients, was sacred to Venus. The common myrtle is a native of Asia, but has become naturalized in Europe. It has been celebrated from remote antiquity on account of its fragrance and the beauty of its evergreen foliage. Myrtle wreaths adorned the brows of bloodless victors, and were used as the symbol of authority by magistrates at Athens.——MYRTLE WAX, a concrete oil, or vegetable wax, the product of plants of the genus *Myrica*, more commonly known by the name of *Candleberry myrtle*, nat. ord. *Myricaceæ*.

MYS'TERIES (*mustērion : Gr.*), or MIR'ACLES, in the middle ages, were a favourite kind of dramatic spectacles or entertainments, represented at solemn festivals. They were very common previous to the '*Moralities*' [which see]; and were called *Mysteries* and *Miracles*, because they taught the mysterious doctrines of Christianity, and represented the miracles attributed to the saints and martyrs. At first the ecclesiastics were both the authors and the performers of them.

MYS'TERY (same *deriv.*), something secret or concealed, impossible or difficult to comprehend. The Eleusinia, or sacred rites of Ceres, solemnized at Eleusis, were called, by way of eminence, *the Mysteries ;* and with such superstition were they concealed, that if any person divulged any part of them, he was thought to have called down some divine judgment on his head, and it was accounted unsafe to abide under the same roof with him; Horace, indeed, declares that he would not put to sea in the same ship with one who revealed the mysteries of Ceres. The whole religion of the Egyptians was mysterious, and both their doctrines and worship wrapped up in symbols and hieroglyphics.——The religion of the *Jews* was likewise full of mysteries; their laws, nay, their whole constitution and nation, were mysterious.

MYS'TICS (*mustikos*, secret: *Gr.*), those whose tendencies in religion are towards a more direct communication with God than is afforded by revelation; not through the medium of the senses, but through the inward perception of the mind. Thus the *quietism* of Madame Guyon, Fenelon, &c., sought for revelation in a species of ecstasy. The Illuminati in Germany, the followers of Swedenborg, &c., were mystics.

MYTH (*muthos*, a story: *Gr.*), originally signified a current narrative, and nothing more. Afterwards it came to mean an ancient tradition, without authentic basis, and sometimes known to be untrue. [See the next article.]

MYTHOL'OGY (*muthologia*, literally a telling of fables: *Gr.*), the collective body of the traditions of any people regarding its gods and other supposed preternatural beings. Whether mythological fables are to be considered as allegorical expositions of truth, or as founded on historical facts, which have been varied and exaggerated by tradition, embellished by poetry, and purposely altered by cunning, they still retain their interest for the student of human nature, to whom it is almost as important to study the wide aberrations of mankind in their search for truth as their successful attempts to attain it. Grote, who considers the Grecian myths to be a special product of the imagination and the feelings, radically distinct both from history and philosophy, thinks that they 'were originally produced in an age which had no records, no philosophy, no criticism, no canon of belief, and scarcely any tincture of astronomy or geography; but which, on the other hand, was full of religious faith, distinguished for quick and susceptible imagination, seeing personal agents where we look only for objects and connecting laws; an age, moreover, eager for new narrative, accepting with the unconscious impressibility of children all which ran in harmony with its preexisting feelings, and penetrable by inspired prophets and poets in the same proportion that it was indifferent to positive evidence To such hearers did the primitive poet or story-teller address himself. It was the glory of his productive genius to provide suitable narrative expression for the faith and emotions which he shared in common with them, and the rich stock of Grecian myths attests how admirably he performed his task. As the gods and the heroes formed the conspicuous object of national reverence, so the myths were partly divine, partly heroic, partly both in one.' At a later time, when the Grecian mind was more developed, the same writer says, that 'while the literal myth still continued to float among the poets and the people, critical men interpreted, altered, decomposed, and added, until they found something which satisfied their minds as a supposed real basis. They manufactured some dogmas of supposed original philosophy, and a long series of fancied history and chronology, retaining the mythical names and generations, even when they were obliged to discard or recast the mythical events. The interpreted myth was thus promoted into a reality, while the literal myth was degraded into a fiction.

N

N, the fourteenth letter and eleventh consonant of the English alphabet, is an imperfect mute, or semi-vowel, because part of its articulation may be continued for any length of time; it is also a liquid, and a nasal letter, the sound being formed by forcing the voice strongly through the mouth and nostrils, and, at the same time, intercepting it, by applying the tip of the tongue to the fore part of the palate, with the lips open. It has one sound only, and after *m* is silent, or nearly so, as in *hymn*, *condemn*. Among the ancients, N, as a numeral, stood for 900; and with a dash over it, for 9000. N. or No. is an abbreviation for *numero*, number; also for *north;* for *Nota*, as N. B. *nota bene* (mark well); for *New*, as N. S. *New Style;* for *Non*, as N. L. *Non liquet* (the cause is not a clear one); for *Notarius*, as N. P. *Notarius Publicus* (notary public); *Nem. con.*, *nemine contradicente* (no one contradicting); *Nem. dis.*, *nemine dissentiente* (no one dissenting), &c.

NA'BOB (*nawâb;* from *naib*, a deputy: *Ind.*), the governor of a province, or commander of an army, under the Moguls. During the decay of the empire of the Moguls, some of the nabobs became independent; and remained so, until their dominions were conquered by the English. In popular language, the word is applied to those Europeans who have amassed a large fortune in India, and live in splendour.

NAC'ARAT (*nacar*, mother-of-pearl: *Span.*), a crape or fine linen fabric, dyed fugitively of a pale red colour, which ladies sometimes rub upon their faces, to give them a delicate tinge of pink.——A marine shell-bearing mollusc, belonging to the genus *Pinna*, which has a byssus that affords silky fibres, woven by the Italians into various articles.

NA'CRITE (*nacré*, pearl: *Fr.*), in Mineralogy, a substance of a pearly lustre; a silicate of alumina and potash, found crystallized in granite.

NA'DAB (a prince: *Heb.*), the sovereign pontiff or high-priest of the Persians, whose dignity and office are very similar to those of the mufti among the Turks.

NA'DIR (*nazeer*, opposite: *Arab.*), in Astronomy, that point of the heavens which is diametrically opposite to the zenith, and directly under the place where we stand. The *zenith* and *nadir* are the two poles of the horizon.

NA'HUM, or PROPHECY OF NAHUM, a canonical book of the Old Testament. Nahum, the seventh of the twelve minor prophets, was a native of Elkoshai, a small village of Galilee. The subject of his prophecy is the destruction of Nineveh, which he describes in the most lively and pathetic manner, his style being bold and figurative.

NA'IADS (*Naiades;* from *nao*, I flow: *Gr.*), in Mythology, water-nymphs, or deities that preside over brooks and fountains. They are represented as beautiful women, having their heads crowned with rushes, and reclining against an urn, from which water is flowing.

NAI'ANT (*nageant*, swimming: *Fr.*), in Heraldry, an epithet for fish that are borne across the escutcheon as if swimming.

NAIL (*nägel: Ger.*), a horny excrescence growing at the ends of the fingers and toes of men and animals. When nails are compressed, curved, pointed, and extended beyond the digit, they are called *talons* or *claws*. When they encase the extremity of the digit like a box, they are called *hoofs*. The substance of the nail is that of the skin, hardened, but firmly connected with it; for this reason, it is extremely sensible at its root, where it is yet tender; but at the apex, where it is perfectly hardened, it is capable of being cut without pain.——NAILS, in Building, &c., small spikes of iron or other metal, generally with a head, formed for driving into, and fastening together, boards, &c. Of these there are numerous kinds; and of such importance is the manufacture become, that several patents have lately been taken out for improved nail-making machinery, as well as for nails made by hand labour.——NAIL, a measure of length containing the sixteenth part of a yard.

NAIS'SANT (being born: *Fr.*), in Heraldry, a term applied to any animal issuing out of the midst of some ordinary, and showing only its head, shoulders, fore feet and legs, with the tip of its tail.

NAÏ'VETÉ (*Fr.*), absence of artifice. The essential meaning of the word is, a natural, unreserved expression of sentiments and thoughts, without regard to conventional rules, and without weighing the construction which may be put upon the language or conduct. When it is genuine, it implies a guileless simplicity of heart, unimpaired by the chilling experience of society; but when affected, it is pre-eminent hypocrisy, and a good judge of human nature will infallibly detect it.

NAME (*nomen: Lat.*), a word by which men have agreed to express some idea, or which serves to signify a thing or subject spoken of. Names are either proper or appellative. *Proper* names are those which represent some person or place, so as to distinguish it from all others of the same species. Names of persons are either *Christian names*, being given us at baptism, or *surnames;* the first is intended for the distinction of individuals, the second for the distinction of families. The Romans usually had three names: the *prænomen*, answering to our Christian name; the *nomen*, that of the tribe; and *cognomen*, that of the family; to these was sometimes added the *agnomen*, derived from some peculiarity in the character of the individual. All are exemplified in the names Publius Cornelius Scipio Africanus. We do not use either a *clan-name* or an *agnomen*.

NANKEEN′ or **NANKIN′**, a sort of cotton cloth, of a firm texture, which takes its name from *Nankin*, in China, where it was originally manufactured. It is now imitated in most other countries where cotton goods are woven; but none is equal to that made in the East, on account of the natural colour of the cotton (the *Gossypium religiosum*) being reddish, while we are compelled to dye what we manufacture.

NAPH′THA (*Gr.*), or ROCK-OIL, in Mineralogy, one of the thinnest of the liquid bitumens, the thicker kinds being called *Petroleum*. It issues from the earth, is of a light brown or yellowish colour, and is found on the borders of springs round the shores of the Caspian Sea. It feels greasy, has a bituminous smell, easily takes fire, and is so light as to float on water. The city of Genoa is lighted by means of a naphtha spring at Amiano, in the state of Parma. The term naphtha is also given to one of the products of the distillation of coal. It inflames at a low temperature, and is too dangerous to be used in lamps.

NAPH′THALINE (last), a white and highly volatile substance, which may be extracted by distillation from coal tar. Its vapour condenses into white flaky crystals. It is a compound of carbon and hydrogen, and, with sulphuric acid, forms *sulpho-naphthalic* acid

NA′PLES YEL′LOW, a fine pigment, employed not only in oil-painting, but also for porcelain and enamel It has a fresh, brilliant, rich hue. Of late years chromate of lead has very much superseded its use.

NARCIS′SUS (*narkissos*, from *narkē*, torpor: *Gr.*—on account of the effects produced by its smell), in Botany, a genus of plants, nat. ord. *Amaryllidaceæ*, including daffodils, jonquils, tazettas, &c.

NARCOT′ICS (*narkōtikos*; from *narkē*, torpor: *Gr.*), soporiferous medicines, which, by causing stupefaction, take away the sense of pain. They seem to act first as stimulants; in large doses they produce tranquillity of mind, torpidity, and even coma. They are distinguished from mere *sedatives*, which produce no preliminary excitement. *Opium* is a narcotic; *henbane*, a sedative.

NAR′COTINE (same *deriv.*), in Chemistry, the pure narcotic principle of opium.

NARD (*nardos*: *Gr.*; from *nerd*: *Heb.*), a species of aromatic oil, with which the ancients anointed themselves at their feasts.

NAR′WAL, or **NAR′WHAL** (*Narwall*: *Ger.*), in Zoology, the *Monodon monoceros*, a cetaceous animal. [See MONODON.]

NA′SAL (*nasus*, the nose: *Lat.*), an epithet sometimes applied to the letters *m* and *n*, because their sound partly depends upon the nose.—NASAL BONES, two small bones in the face, forming the osseous portion of the nose.

NASTUR′TIUM (*Lat.*: as if *nasi-tortium*, a torment of the nose, from its pungent smell), in Botany, a genus of cruciferous plants, including the common water-cress. The name is commonly given to the Indian cresses, plants of the nat. ord. *Tropæolaceæ*.

NATA′LIS, or **NATA′LIS DI′ES** (literally a birthday: *Lat.*), the day on which the birth of any one is commemorated; but the term was used by the ancients more particularly to signify the anniversary of the birthday of a deity, an emperor, or a distinguished person. On such occasions, every Roman was dressed in white, wore a ring called the *annulus natalis*, offered sacrifices to the genius of the person whose birthday was celebrated, and terminated the whole with a feast.

NA′TIONAL DEBT, a sum borrowed by government, on the security of the existing taxes, which are pledged to the lender for the payment of the interest on the sum borrowed. Thus, at the Revolution, for the purpose of avoiding unpopular taxation, the English government borrowed of a company then incorporated under the name of the Bank of England; and, as the system was found convenient, this debt increased. The progressive augmentation of the national debt was as follows:—At the Revolution, in 1688, it was 664,263*l.*; at the accession of queen Anne, in 1702, 16,394,702*l.*; at the accession of George I., in 1714, 54,145,363*l.*; at the accession of George II., in 1727, 52,092,238*l.*; at the commencement of the American war, in 1775, 128,583,635*l.*, at the conclusion of the American war, in 1784, 249,851,628*l.*; at the commencement of the French revolutionary war, in 1793, 239,350,148*l.*; at the conclusion of the French revolutionary war, 840,850,491*l.*; on the 1st of February, 1817, when the English and Irish exchequers were consolidated, 840,850,491*l.* The debt cancelled from the 1st of February, 1817, to the 5th of January, 1850, was 49,041,153*l.*, leaving the remaining debt at 791,809,338*l.* 279,551 persons were receiving half-yearly dividends, from 5*l.* upwards; but the number of persons really having an interest in the national debt is very much greater, since, in the above enumeration, companies acting as factors or trustees for a great number are counted only as individuals. In 1856, the national debt, on account of the Russian war, had become 808,108,722*l.*; but since that time it has been reduced by a few millions.

NATIV′ITY (*nativitas*: *Lat.*), the day of a person's birth. The word is chiefly used in speaking of the saints, as the nativity of St. John the Baptist, &c. But when we say *the Nativity*, it is understood to mean that of Jesus Christ, or *Christmas-day*. Among the astrologers, it meant a *horoscope*, which see.

NA′TROLITE (*natron*; and *lithos*, a stone: *Gr.*), in Mineralogy, a hydrated silicate of soda and alumina, which occurs in small rounded fibrous masses, of a yellowish colour. It is called by some *prismatic zeolite*.

NA′TRON, native carbonate of soda, or mineral alkali. This substance was used by the Egyptians in large quantities when embalming. It is common in Egypt; and in Mexico and Columbia there are several natron lakes, from the bottom of which native mineral natron is dug up.——NATRON, the German name for soda, on which account sodium is termed *natrium*.

NAT'URAL (*naturalis : Lat.*), in Music, a character which contradicts a flat or sharp placed at the beginning of a stave or elsewhere, and causes the note to become what it would be if the flat or sharp were not used.——**NATURAL**, in Heraldry, a term used when animals, fruits, flowers, &c., are blazoned with their natural colours.

NAT'URALIST (*naturalis*, natural : *Lat.*), a person well versed in the study of nature and the knowledge of natural bodies, especially in what relates to animals, vegetables, and minerals.

NATURALIZA'TION (*naturalis*, by birth : *Lat.*), in Law, the act of placing an alien in the condition of a natural subject. On memorializing the home secretary, and taking a prescribed oath, aliens may acquire nearly all the rights of natural-born subjects, except that they cannot become members of the privy council, or of either house of parliament. [See ALIEN.] Naturalization of an alien by *act of parliament* has a retrospective effect. His son, for instance, born before his naturalization, may inherit, &c. This is not the case with naturalization by certificate of a secretary of state.

NAT'URAL HIS'TORY, in its most extensive sense, is the description of material existences composing the universe. But it is usually limited to the study of the animal, vegetable, and mineral objects of our globe. In this sense it includes zoology, botany, geology, and mineralogy, with their dependent sciences.

NAT'URAL OR'DERS OF ANI'MALS AND PLANTS, as opposed to artificial systems, are those in which beings are brought more nearly together, in proportion as they are related in structure and affinity. As more animals and plants become known, and as naturalists become better acquainted with their structure, existing arrangements will have to undergo repeated modifications. All the organs must be taken into consideration, and the affinity of any two or more beings will be determined by the agreement or disagreement, first in the more important organs, and then in the less important. The relative importance of organs is a matter that requires preliminary investigation.

NAT'URAL PHILOS'OPHY, or PHYSICS, a collection of sciences, treating of the laws of nature, the properties of bodies, so far as they are or may be considered to be destitute of life, and the action of these bodies upon each other. Under this head are comprehended astronomy, chemistry, electricity, galvanism, magnetism, mechanics, hydrostatics, pneumatics, optics, &c.

NA'TURE-PRINT'ING, an art whereby truthful impressions of leaves, mosses, feathers, embroidery, and other objects, may be obtained. It consists of pressing the object to be copied into a plate of soft metal, by which means an accurate mould is obtained, from which casts can be taken. Impressions can then be taken from these casts.

NAUMACH'IA (*Gr.*: from *naus*, a ship; and *machē*, a fight), the representation of a sea-fight, which among the Romans formed a part of the Circensian games. These mock sea-fights are supposed to owe their origin to the time of the first Punic war, when the Romans were first initiated in the knowledge of naval affairs. Afterwards they were intended both to entertain the populace and improve the seamen. They were frequently, like other shows, produced at the expense of individuals, to increase their popularity. Nero exhibited one, on an artificial lake, in which large marine animals were seen swimming about. At one given by Claudius, there were 19,000 combatants. The seats for the spectators, at these exhibitions, were arranged somewhat similarly to those in the amphitheatre—in which, indeed, as well as in other places of the same description, naumachiæ were sometimes exhibited, on a smaller but still very magnificent scale. The *naumachiarii*, or persons who fought on these occasions, were gladiators, slaves, criminals, &c., who were doomed to die, unless they were saved by the interposition of the people, or of the person presiding at the spectacle.

NAU'SEA (*nausia*, sea-sickness ; from *naus*, a ship : *Gr.*), in Medicine, a sickness of the stomach, accompanied by a sensation similar to that of sea-sickness, whence its name.

NAU'TILUS (*nautilos*, a sailor: *Gr.*), shell-bearing molluscs, allied to the cuttle fishes, in the class of Cephalopoda. The true nautilus (*N. pompilius*) has a shell formed of one continuous piece, rolled into a spiral form, and having its cavity divided into a great number of chambers by transverse partitions, each of which has a perforation, the various perforations being connected with each other by means of a pipe carried the whole length of the shell. The fossil species of nautilus, which are very numerous, are found in all geological formations. The *Paper Nautilus* (*Argonauta argo*) is a different animal, but belonging to the same class. Its shell is thin and translucent, but not chambered. The long arms are furnished with numerous suckers, by which it lays hold of its prey. The story of its floating on the sea in fine weather, driven along by the breeze acting on its sail-shaped arms, is a fable repeated from the time of Aristotle to this day.

NA'VAL AR'CHITECTURE (*navalis*, belonging to a ship : *Lat.*), or SHIP-BUILDING. The art of constructing vessels for the purposes of navigation was practised, after a rude manner, in Egypt. The Greeks are supposed to have derived their knowledge of it from the Carthaginians. But neither in Greece nor in Rome did naval architecture rise to what may be considered as the result of scientific knowledge. The crusades first gave the impulse to improvements in ship-building, which, notwithstanding, continued for some time at a low ebb. The states of Venice and Genoa were the first to increase the size of their vessels, but they were soon surpassed by the Spaniards, who first employed cannon. The Hanse towns made such progress that in the 14th century it was usual for them to let their ships out to foreign princes. In the reign of Henry IV., ships of considerable size began to be built in England, and they continued to increase in magnitude until the reign of Henry VIII., when the *Regent*, of 1000 tons burden, and the *Henry Grace Dieu*, which was larger, were built. From the reign of Charles II., the navy of Great Britain acquired great importance, and in consequence of the wars which have since been carried on in several reigns, it has risen to its present state.——**NAVAL STORES** comprehend all those articles made use of, not only in the royal navy, but for naval purposes generally; as timber and iron for shipping, pitch, tar, hemp, cordage, sail-cloth, gunpowder, ordnance and firearms of every sort, ship-chandlery, &c.

NA'VAL CROWN (*navalis corona*), a crown, among the Romans, given to him who first boarded an enemy's ship; it was a circle of gold representing the prow of a ship.

NAVE (*navis*, a ship: *Lat.*), in Architecture, the middle or body of a church, extending from the baluster or rail of the choir to the chief door.——**NAVE** (*nabe: Ger.*), that part in the middle of a wheel where the spokes are fixed.

NAVIGA'TION (*navigatio: Lat.*), the art and science by which, in open seas, ships are conducted from port to port. This is effected by the use of charts, and by keeping a journal of the courses from hour to hour, and the distance on each, by means of the log-line; also by observations on the sun, moon, and stars. Imperfect as were the means and knowledge of the ancients in this noble art, yet the Carthaginians, who superadded the greatest commercial enterprise to the greatest skill which had yet been attained, achieved the most brilliant results. They made the whole of the old world tributary to their city. Not contented with exploring every nook and corner of the Mediterranean, they left behind the limits which had bounded the excursions of their predecessors, visited the Atlantic coasts of Europe, the British isles, and, pursuing the grand idea which afterwards led the Portuguese to India, discovered a vast extent of the western coast of Africa. The art of navigation gained nothing for a long period after the fall of Carthage, and the invasion of the northern barbarians effectually extinguished the few gleams of science which had survived her destruction. Everything remained stationary for centuries, until the discovery of the magnet, and the invention of the mariner's compass which followed it. [See MAGNET, COMPASS, &c.]

NAVIGA'TION LAWS, a most important branch of maritime law, defining the peculiar privileges to be enjoyed by British ships, and the way in which they shall be manned; as also the conditions under which foreign ships shall be allowed to engage in the trade of this country, either as importers or exporters of commodities. As long ago as the reign of Henry VII., the importation of certain commodities was prohibited, except in ships belonging to English owners, and manned by English seamen. But a regard for our manufacturing and commercial interests led to the adoption of, first, what was called the 'reciprocity system' in our intercourse with other nations; to the total repeal of the navigation laws in 1850—except that trade from one part of any British possession, in Asia, Africa, and America, to another part of the same possession, must still be carried on in British ships, unless the legislature of such possession ask to be freed from this restriction; and, finally, to the adoption, in a very great degree, of the principles of free trade.

NA'VY (*navis*, a ship: *Lat.*), the whole naval establishment of any country, including the collective body of ships, officers, men, stores, &c. That part of the navy of Great Britain which is distinguished by the title of the *royal navy*, comprehends all ships of war and their crews, &c. The ministerial management of the royal navy of Great Britain is entrusted to seven lords commissioners for executing the office of the lord high-admiral of England, commonly known by the title of lords of the admiralty. Commissioners of the navy are officers whose department is wholly distinct from that of the admiralty. The number of those resident in London is eight, and there are others stationed in different parts of the empire. They superintend the dockyards, and provide the vessels which the admiralty requires for service. To the royal navy there also belong a victualling office, an office of sick and wounded seamen, and a pay office. Ships are classified according to the guns they carry. All those having 110 guns and upwards, or whose complements consist of 950 men or more, are *first-rate*. One of her majesty's yachts, and all ships having less than 110 guns, and not less than 80, and whose war complements consist of 750 men and upwards, are *second-rate*. The other royal yachts, and all yachts bearing the flag or pendant of an admiral, or captain superintendent of a dockyard; all ships whose complements are under 750, and not less than 620, and whose guns are from 70 to 80, are *third-rate*. Ships whose complements are under 620, and not less than 450, and whose guns are from 50 to 70, are *fourth-rate*. Ships whose complements are under 450, and not less than 300, and whose guns are from 36 to 50, are *fifth-rate*. All other ships having a captain, and whose guns are from 24 to 36, are *sixth-rate*. Steam vessels are assigned a rate by the lords of the admiralty. Troop-ships, surveying-ships, fire-ships, store-ships, or those used on a temporary service, do not receive a rate higher than the fourth.

NAZ'ARITE (*nazar*, to separate: *Heb.*), in the Jewish dispensation, one separated to the Lord by a vow. Nazarites were sometimes bound for their whole lives, at others only for a time. They were obliged to refrain from wine, to allow their hair to grow, to avoid coming into contact with a corpse, &c. The word *Nazarene* meant a very different thing; it was applied to the natives of Nazareth, and was used, in contempt, to indicate the first Christians. A sect of *Nazarenes* sprang up in the second century they endeavoured to ingraft the Jewish on Christian rites.

NEAP′-TIDES (*nepflod*, low: *Sax.*—a word used *only* in speaking of the tide), the tides in the second and last quarters of the moon. Also low tides, not so high or so swift as the spring-tides. They occur when the attractions of the sun and moon act at right angles, the difference of their effects only being left.

NEAT (an ox: *Sax.*), all kinds of *bovine* cattle; as the ox, cow, &c. *Neat's-foot oil* is an oil extracted from the feet of oxen; and *Neat's leather* is leather made of the hide of an ox.

NEB′ULÆ (*nebula*, a vapour: *Lat.*), in Astronomy, certain luminous spots in the heavens, many of which the telescope resolves into groups of stars, whilst others resist the power of the best instruments, although astronomers are led to think that irresolvable nebulæ are also groups of stars. Some nebulæ have very fantastic or complicated shapes, and most of them undergo great change in appearance, according to the power of the telescope with which they are viewed. Nebulæ have been thus classed: 1. Those that are resolvable into clusters of stars; some are globular, others elliptic, others of an irregular figure. 2. Such as lead the observer to suspect that they consist of stars, and would be resolved by telescopes of higher power. 3. True nebulæ, in which there is not the slightest appearance of stars, with the highest powers that can be directed to them 4. *Planetary nebulæ*, which have exactly the appearance of planets, and are of immense magnitude; their light must be most brilliant. 5. *Stellar nebulæ*, whose nebulous matter is greatly and suddenly condensed towards the centre; and 6. *Nebulous stars*, which are brilliant stars, surrounded by a perfectly circular disk or atmosphere of faint light. Upwards of 5000 nebulæ have been catalogued. [See MAGELLANIC CLOUDS.]

NECES′SITY (*necessitas: Lat.*), the cause of that which cannot be otherwise; or whatever is done by a power that is irresistible, in which sense it stands opposed to *freedom*. The schoolmen distinguish a physical necessity and a moral necessity; a simple or absolute necessity, and a relative one. *Physical necessity* is that which arises from the laws of nature, and which cannot be overcome without, for the occasion, setting those laws aside. *Moral necessity* is only a great tendency, such as that arising from a long habit, a strong inclination, or a violent passion. *Simple* or *absolute necessity* is that which has no dependence on any state or conjuncture, or any particular situation of things, but is found everywhere, and in all the circumstances in which the agent can be placed. *Relative necessity* is that which renders a person incapable of acting, or not acting, in those circumstances and that situation in which he is found; though in other circumstances, and in another state of things, he might, at pleasure, act or not act. When a man's actions are determined by causes beyond his control, he acts from *necessity*, and is not a free agent.

NECK (*nacken: Ger.*), in Anatomy, that slender part situated between the head and the trunk of the body. Its osseous part consists in the mammalia of seven cervical vertebræ. In birds there are from ten to twenty-three vertebræ in the neck.——In Architecture, the *neck of a capital* is the space above the shaft of a column, between the annulet of the capital above, and the astragal at the top of the shaft below.——NECK OF LAND, a long narrow tract projecting from the mainland; or a narrow tract connecting two larger tracts.

NEC′ROLITE (*nekros*, dead; and *lithos*, a stone: *Gr.*), in Mineralogy, fœtid felspar; a mineral which, when struck or pounded, exhales a fœtid odour like that of putrid flesh. It is found, in small nodules, in the limestone of Baltimore.

NECROL′OGY (*nekros*, a dead body; and *logos*, a catalogue: *Gr.*), a register of the deaths of benefactors in a monastery. Formerly, also, what is now called a *martyrology* was called a *necrology*.——A register of distinguished persons who die within a certain period (not a record of their lives and actions, for that is *biography*) is also known by this term.

NEC′ROMANCY (*nekromanteia*: from *nekros*, dead; and *manteia*, prophecy: *Gr.*), a sort of magic practised among the Jews, Greeks, and Romans, by which they attempted to raise the dead, or make them appear. The witch of Endor was a striking example of a bold and artful deception of this kind.

NECROP′OLIS (*nekros*, dead; and *polis*, a city: *Gr.*), the name given to some ancient cemeteries in the vicinity of large cities; and also to some of our modern ones.

NEC′TAR (*Gr.*), in Mythology, the supposed drink of the gods, which was imagined to contribute much towards their eternal existence. It was, according to the fables of the poets, a most delicious liquor, far exceeding anything that the human mind can imagine. It gave a bloom, a beauty, and a vigour, which surpassed all conception, and, together with *ambrosia* (their solid food), repaired all the decays or accidental injuries of the divine constitution.——Also a sweet wine of Scio.

NEC′TARINE (*nectareus*, sweet as nectar: *Lat.*), a fruit differing from the common peach, of which it is a variety, in having a smoother rind and a firmer pulp.

NECTA′RIUM, or NEC′TARY (*nectar*, honey: *Lat.*), in Botany, that part of the corolla which contains honey-like matter. It is very various in its figure; being sometimes only a hollow in a petal, sometimes a little squama or tubercle, and sometimes a plain tube. The term has been also vaguely applied to any part of a flower which has an unusual shape; for example, to the crown of Narcissus and the rings of filaments in the Passion flower.

NEE′DLE (*nedl: Anglo-Sax.*), a steel implement used in sewing, embroidery, &c. Needles are made from wire that is drawn into various sizes and cut into pieces that are flattened at one of their ends, in which the eyes are then formed with a punch; they are next filed at the points, hardened, and finally polished with emery powder. ——**Magnetic Needle**, in Navigation, a slender bar of steel magnetized, and moving freely on a pivot. It arranges itself in the direction of the magnetic force of the earth: one end or pole pointing to the north, and the other to the south. As only opposite magnetic poles attract each other, it is, in reality, the south pole of the needle which points to the north pole of the earth; though it is always called its *north* pole. [See Compass, Magnetism.]

NE EX'EAT REG'NO (let him not go out of the kingdom: *Lat.*), in Law, a writ directed to the sheriff, or to the party himself, to prevent him from leaving the kingdom. The writ lies where there is a suit in equity regarding a demand for which the plaintiff could not arrest at law.

NEFAS'TI DI'ES (inauspicious days: *Lat.*), an appellation given by the Romans to those days on which it was not allowed to administer justice or hold courts.

NEGA'TION (*negatio: Lat.*), in Logic, a denial.

NEG'ATIVE (*negativus*, that denies: *Lat.*), in general, something that implies a negation: thus we say, negative quantities, negative signs, negative powers, &c.——In Logic, an epithet applied to propositions in which the copula is negative.——**Negative Quantities**, in Mathematics, those which are *opposed* to positive. It is an error to state, as is sometimes done, that they are less than nothing; there is no such quantity as one less than nothing, and negative quantities are as real as positive. Thus, if money which I possess is considered to be a *plus* or *positive* quantity, money which I owe must be a *minus* or *negative* quantity. If seven miles towards the east are to be considered as *positive*, seven miles in the opposite direction, or towards the west, are *negative*. It is evident that any quantity of one kind will neutralize an equal quantity of the other; but that, if the quantities are unequal, what is left will be of that kind which was in excess. Thus, if I owe 5*l.*, and have 3*l.*, taking the 3*l.* which I have from the 5*l.* which I owe, 2*l.* of a debt will be left: that is, substracting minus 5 from plus 3, minus 2 will remain. The characters plus and minus (+ and −) have two different objects to fulfil: one being to show whether a quantity is positive or negative, the other to indicate whether it is to be added or subtracted. When no sign is expressed, the positive is always understood.——**Negative Electricity**, that state of bodies in which they are deprived of some portion of the electricity which they naturally contain; or, according to others, that in which they have free resinous electricity. [See Electricity.]——**Negative Pregnant**, in Law, is a negation which implies an affirmation. Thus, when a person denies having done a thing in a certain manner or at a certain time, as stated in the declaration, he implies that he did it in some manner.

NE'GRO (*niger*, black: *Lat.*), a variety of the human species deriving their name from one of their most striking characteristics, their black colour. Their native region seems to be the central portion of Africa; but the negro formation prevails also in Eastern and Western Africa, and, extending southwards, is most strongly marked in Guinea. The origin of the negroes, and the cause of this remarkable difference from the rest of the human species, have been the source of much argument among naturalists. In Africa itself many nations of Ethiopia are not black, nor were there any blacks originally in the West Indies. In many parts of Asia, under the same parallel with the African region inhabited by blacks, the people are merely tawny. It is affirmed that the degree of development of the *rete mucosum* and its pigment determines the power of resisting the excessive heat of the sun in tropical climates, as evinced by the negro (the type, in this respect, of the dark races), the European, and the Albino. It has long been the prevailing opinion among naturalists that the negro race is inferior, both in organization and in intellectual powers, to the European; and, whatever the cause whence it has arisen, negroes have never as yet distinguished themselves either as nations or individuals. Those African and other states in which the negro predominated, have been either devoid of civilization, or indebted to a foreign element for any civilization they possessed. And in a space of 4000 years, the race, whatever opportunities it may have had, has not produced one who has been eminently distinguished for his achievements, or his proficiency in any branch of human knowledge. Undoubtedly negroes have hitherto laboured under great disadvantages; for, from the earliest times, they seem to have been doomed to supply the more fortunate races with slaves; but the experience of the past indicates that, only by admixture with other races, and in proportion as they deviate from the true negro type, do they make any progress in civilization and enlightenment. Those, however, who hold the most extreme views on this point admit that education can do much in enlightening and improving them. [See Slave Trade.]

NEHEMI'AH, a canonical book of the Old Testament, so called from the name of its author. Nehemiah was born at Babylon during the captivity, and succeeded Ezra in the government of Judah and Jerusalem. He was a Jew, and was promoted to the office of cup-bearer to Artaxerxes Longimanus, king of Persia; and the opportunities he had of being daily in the king's presence, together with the favour of Esther the queen, procured him the privilege of being authorized to repair and fortify the city of Jerusalem, in the same manner as before its destruction by the Babylonians.

NEM. CON. and NEM. DIS. The former is a contraction for *nemine contradicente* (no one contradicting); and the latter, for *nemine dissentiente* (no one dissenting).

NEM'ÆAN GAMES, in Antiquity, celebrated games in Greece, deriving their name from Nemæa, a village between the cities of Cleonæ and Philus, in Argolis, where they were celebrated every third year. They were instituted in memory of Archemorus or

Opheltes; but, having been for some time interrupted, they were revived by Hercules, in honour of Jupiter, after his victory over the Nemæan lion. These games were of the same kind as the Olympian, and the victors were crowned with parsley.

NEOCO'MIAN, in Geology, a term applied to the lower portion of the Cretaceous series. It is divided into the lower **GREENSAND** group, which is well developed at Neufchatel (anciently Neocomum, in Switzerland, whence the name), and the **WEALDEN** beds of Kent and Sussex.

NEOL'OGY (*neos*, new; and *logos*, a word: *Gr.*), the introduction of new words into a language. The progress of science has of late years necessarily given rise to many *neologisms*; but the practice of coining new words to express old ideas cannot be too severely reprehended.——**NEOLOGY** is also the name given to the rationalist system of interpretation, which is applied by many German and English divines to the records of revealed religion.

NE'OPHYTE (*neophutos*: from *neos*, new; and *phutos*, grown: *Gr.*), a new convert or proselyte; a name given by the early Christians to such as had recently been converted from paganism.

NEOZO'IC (*neos*, new; *zoe*, life: *Gr.*), a term applied by some geologists to all the strata included in the secondary and tertiary epochs, in contra-distinction to the older or palæozoic strata.

NEPEN'THE (*nēpenthes*: from *nē*, not; and *penthos*, sorrow: *Gr.*), in Antiquity, a kind of magic potion, supposed to make persons forget their sorrows and misfortunes. It was the juice or infusion of a plant now unknown. We use the term figuratively, to express what gives rest and consolation to an afflicted mind.

NEPH'ELINE (*nephelē*, a cloud: *Gr.*), a mineral found mixed with other substances, primitive or volcanic, in small masses or veins. It is white or yellow. When thrown into nitric acid, its transparent fragments become *cloudy*. It is a double silicate of alumina and soda, and is known also by the name of *sommite*.

NE'PHRITE (*nephritēs*, like the kidney: *Gr.*), in Mineralogy, a sub-species of *jade*, occurring in granite and gneiss, remarkable for its hardness and tenacity. It is of a leek-green colour, and was formerly worn as a remedy for diseases of the kidneys. The Chinese are celebrated for the manufacture of articles from this substance. It consists of silica, alumina, and magnesia.

NEPHRI'TIS (*nephros*, the kidneys: *Gr.*), in Medicine, an inflammation of the kidneys. Hence *nephritics*, medicines proper for diseases of the kidneys, particularly for urinary calculi.

NEPHROT'OMY (*nephros*, the kidney; and *temno*, I cut: *Gr.*), the operation of extracting a stone from the kidney.

NE PLUS UL'TRA (*Lat.*), *no farther*, the extremity, or utmost extent to which anything can go.

NEP'TUNE (in Mythology, the god of the sea), the most remote planet at present known. For several years irregularities had been noticed in the motions of Uranus, which it was conjectured were caused by the disturbing force of some exterior planet. In 1846, M. Leverrier of Paris and Mr. Adams of Cambridge occupied themselves independently, and unknown to each other, in calculating the place of the theoretical planet, and the former having communicated the result at which he had arrived to Dr. Galle of Berlin, that astronomer, on the 23rd of September, 1846, discovered the planet since called Neptune, as a star of the eighth magnitude. This discovery is justly regarded as one of the greatest triumphs of modern astronomy. *Neptune* is 2800 millions of miles from the sun; its diameter is 39,790 miles; its mean sidereal period is 164¾ years, but the time of its revolution on its axis is not yet known; the inclination of its orbit (which is nearly circular) to the ecliptic, is 1° 46′ 59″. Some astronomers have suspected that it has a ring, and it certainly has at least one satellite; but, even with the most powerful telescopes, it is difficult to make any observation with regard to its satellites, physical constitution, &c.

NEPTU'NIAN, or **NEP'TUNIST**, one who adopts the theory that the substances of which the earth is composed were formed from an aqueous solution; opposed to the *Plutonic* theory, which attributes the earth's formation to the action of fire.

NE'REIDS (*Nērēides*: *Gr.*), in Mythology, *sea-nymphs*, daughters of Nereus and Doris, celebrated for their beauty, and represented as riding upon sea-horses, sometimes with the human form entire, and at others with the tail of a fish.

NE'RIUM (*nēros*, humid: *Gr.*), in Botany, a genus of plants, nat. ord. *Apocynaceæ*. The species are shrubs or trees, and include the oleander.

NERVES (*nervus*, a nerve: *Lat.*), long white medullary cords, which pass in pairs from the brain and the spinal marrow, as instruments respectively of sensation and volition; of which nine pairs proceed from the brain, and thirty-one from the spinal chord. They spread over the body like a fine network. Formerly the word *nerve* meant a *sinew*: this accounts for the opposite meanings of the word *nervous*, which sometimes signifies strong and sinewy; sometimes weak and irritable. The nerves are often interwoven; and some of them have rounded masses termed *ganglia*. There are two systems of nerves:—1. Those of *animal life*, or the *cerebro-spinal* nerves, which convey impressions from the brain to the voluntary muscles, and are the media of sensation and voluntary motion; they are connected with the brain and with the spinal chord. 2. Those of *organic life*, the *ganglionic* or great *sympathetic* nerves, which are connected with the brain and spinal chord, or with the cerebro-spinal nerves, by very small filaments, and are furnished with numerous ganglia. The cerebro-spinal nerves contain, generally enclosed in the same sheath, the *centripetal filaments*, which convey impressions from their extremities to the brain, in the way of pain, &c.; and the *centrifugal filaments*, which convey the influence of the will from the brain to the voluntary muscles.

NER'VOUS FE'VER, a low fever, in which nervous symptoms or sensorial debility are particularly prevalent.

NER'VOUS SYS'TEM, the arrangement within an animal, of the brain, spinal marrow, and nerves: constituting the means of perception, volition, and muscular action. In some of the lowest organized animals, the nervous system consists of mere filaments, which, in those a little higher, are connected with a nerveus ring surrounding the œsophagus; as organization advances, the ring gradually forms a brain, and ganglia are produced on the filaments. When the principal gangliated filaments are not parallel or symmetrical, the organization is that of the *heterogangliate* or molluscous animals. When there are two gangliated filaments, which are symmetrical, and run parallel along the ventral aspect of the body, they indicate the *homœogangliate* or articulate animals. When the brain is no longer a ring, but sends down the back a prolongation of its substance, termed the spinal marrow, the organization is that of the *myelencephalous* or vertebrate animals, the primary division of the animal kingdom. In articulate and vertebrate animals, the superficial portion of the ventral or spinal chord is 'sensitive,' the deep-seated 'motive.'

NESTO'RIANS, in Ecclesiastical History, the followers of Nestorius, patriarch of Constantinople, in the first half of the fifth century. He carefully distinguished the two natures of Christ, but affirmed that the human nature was inhabited by the divine, as a temple by its divinity. He asserted that the virgin was merely the mother of *Christ* or *man*. His opinions, which spread through Asia, were soon after counteracted by the opposite heresy of the Eutychians. [See MONOPHYSITE.] He was deposed by a council held at Ephesus in 431, and died in exile in upper Egypt.

NET, or **NEAT** (*nett*: *Ger.*; from *nitidus*, pure: *Lat.*), in Commerce, that which is without adulteration or deduction. Hence we say *neat wines*, &c.; and *net produce*, or that which a commodity has yielded, after all *tare* and charges have been deducted.

NETH'INIMS (given or offered: *Heb.*), among the Jews, the 'hewers of wood and drawers of water;' they were the descendants of the Gibeonites, condemned by Joshua; and of the Canaanites, who had surrendered themselves and were spared.

NET'TINGS, in a ship, a sort of gratings made of small ropes brought together with rope-yarn or twine, and fixed on the quarters, tops, &c., for various purposes—among others, to prevent boarding.

NET'TLE, the popular name of well-known plants of the genus *Urtica*, nat. ord. URTICACEÆ. The species are chiefly herbaceous, and are usually covered with extremely fine, sharp, tubular hairs, placed upon minute vesicles filled with an acrid and caustic fluid, which, by pressure, is injected into the wounds caused by the sharp-pointed hairs; hence arises the well-known stinging sensation when these plants are incautiously handled. The nettle is not so useless as it appears. The young leaves, when boiled, are a good substitute for cabbage; the fibres of the stem have been woven into coarse stuffs; jockeys mix the seed with the food of horses, in order to give them a sleek coat; and the roots, when washed, and mixed with alum or common salt, afford a yellow dye. It is a wholesome food for horned cattle when young.

NET'TLE-RASH, an eruption on the skin, resembling that produced by the sting of a nettle. It goes off, or changes its place, most usually in a few hours; and is relieved by bathing the part affected with very weak vinegar, and by the use of mild aperients.

NEURAL'GIA (*neuron*, a nerve; and *algos*, pain: *Gr.*), an acute, and generally intermittent, painful sensation along the course of the nerves. One of its most distressing forms is *tic douloureux*.

NEUROL'OGY (*neuron*, a nerve; and *logos*, a description: *Gr.*), in Medicine, a description of the nerves of animal bodies; or the doctrine of the nerves.

NEUROP'TERA (*neuron*, a nerve; and *pteron*, a wing: *Gr.*), an order of insects, composed of those possessing four membranous wings, traversed by a close network of veins. In some groups the organs of the mouth are rudimentary, but usually they form a complete biting apparatus. The abdomen has no terminal ovipostor, as amongst the Hymenoptera. The metamorphosis is sometimes complete, sometimes incomplete. To this order belong the Stone fly, May fly, the Dragon flies, Scorpion flies, and Caddice flies.

NEURO'SES (*neuron*, a nerve: *Gr.*), in Medicine, nervous disorders.

NEUROT'OMY (*neuron*, a nerve; and *temno*, I cut: *Gr.*), in Anatomy, the cutting or dissecting of the nerves.

NEU'TER (neither: *Lat.*), in Grammar, the gender of nouns which are neither masculine nor feminine.——NEUTER VERBS, by some grammarians called *intransitive verbs*, are those which govern nothing, and are neither active nor passive. When the action expressed by the verb does not pass to any object, the verb is said to be neuter; as, I *sleep*, we *walk*, they *stand* still.——NEUTER, the name given to the labourers of the honey-bee, before it was found that they were essentially females, though infertile.

NEUTRAL'ITY (*neutralis*, neutral: *Lat.*): in International Law, a nation which does not take part, directly or indirectly, in a war between other nations is said to be neutral. Certain rights and obligations towards the belligerents arise; and through the infraction of these, the neutral power frequently becomes involved in hostilities with one or the other of them. A neutral nation has the right to furnish either of the contending nations with all supplies which do not fall under the description of *contraband of war*, and to conclude treaties unconnected with the subject of the war; also, though this rule is sometimes set aside by the necessities of a powerful belligerent, to carry the property of any one of the hostile nations in its vessels, and under the security of its flag.

NEUTRALIZA'TION (same *deriv.*), in Chemistry, the combination of any two elements, but particularly of an acid and alkali, in such proportions that the properties of each are rendered inert. If either substance is in excess, its properties will be perceptible; which may be the case when the whole is really combined: thus we have both *acid* and *neutral* salts.

NEWS'PAPER. In the time of the Roman emperors, periodical notices of passing events, having the name of *acta diurna* (daily events), were compiled and distributed. The first newspaper published in modern Europe made its appearance at Venice in 1536, but the jealousy of the government would not allow of its being printed, so that, for many years, it was circulated in manuscript! It would seem that newspapers were first issued in England, by authority, in 1588, during the alarm occasioned by the approach of the Spanish armada to our shores, in order, as was stated, by giving real information, to allay the general anxiety, and to hinder the dissemination of false and exaggerated statements. From this era, newspapers, of one sort or other, have, with a few intermissions, generally appeared in London, sometimes at regular and sometimes at irregular intervals. For more than a century past they have gone on gradually increasing in size, as well as in commercial and political importance. In 1864 there were 1250 newspapers published in the United Kingdom; viz. in England 919, in Wales 37, in Scotland 140, in Ireland 140, and in the British Isles 14. There were 46 daily newspapers published in England, 1 in Wales, 9 in Scotland, and 14 in Ireland. No person may, under a penalty of 50*l.* per day, print or publish, or cause to be printed or published, any newspaper, until a declaration in writing has been delivered to the stamp office, or to the proper office of the district, stating the correct title of the newspaper, the true description of the house in which it is to be printed, and also of that in which it is to be published; the true names, &c., of every printer, publisher, and—with certain qualifications—every proprietor; signed by the printers and publishers mentioned in it, and by such proprietors as reside in the kingdom: and any false statement in it is a misdemeanor. And, under a penalty of 20*l.*, a copy of each publication must be delivered at the ordinary price to the head office of stamps, with the name and abode of the printer or publisher, written with his own hand, or by some person by his direction. And this, if required, must be produced, at any time within two years, as evidence in a court. Newspaper reporting has been brought to the highest degree of perfection. A staff of reporters is required for the House of Lords, and another for the House of Commons, by any journal which does not abridge or copy. As soon as one of them has attended for a certain short period, he retires to write out his notes and forward them to the compositors, being succeeded by another; so that, very frequently, one part of a speech is in type while a member is delivering the remainder. [See PRINTING.]

NEW STYLE, the method of reckoning the days of the year in accordance with the Gregorian calendar, which adjusts the odd hours and minutes by which the earth's revolution exceeds 365 days. [See CALENDAR.]

NEWTO'NIAN SYS'TEM, or **PHILOS'OPHY**, a phrase applied by some to the Copernican or solar system, which, however, was generally adopted before Newton's time; and by others principally to the laws of planetary motion, first promulgated by Kepler and Hooke; but strictly applicable only to certain geometrical and analytical demonstrations of those known laws, as developed by the genius and industry of Sir Isaac Newton, and chiefly to the theory of *universal gravitation*. The principal parts of the Newtonian philosophy are explained by the author in his 'Principia.'

NICE'NE CREED, a particular creed, or confession of faith, drawn up by the clergy in the council of Nice, in 325. It has been adopted by the church of England, and is printed in the Communion Service in the Book of Common Prayer.

NICHE (*Fr.*), in Architecture, a hollow or recess in a wall, for the reception of a statue or bust.

NICK'EL (a worthless person: *Ger.*), a metal which miners, being disappointed in not finding it to be copper, as they expected from the colour of its ore, in contempt called *kupfernickel* (worthless copper). It is white, ductile, and malleable; it may be drawn into wire, or rolled into plates, but a very small quantity of arsenic destroys its ductility. It is attracted by the magnet, and, like iron, may be magnetized. Its spec. grav., when hammered, is 8·82. It is somewhat more fusible than iron; is not affected by air or moisture at ordinary temperatures, but is slowly oxidized at a red heat. It is found in meteoric iron, but is obtained chiefly from kupfernickel, its sulphuret, and the ores of cobalt, with which it is associated. Its equivalent is 29·6. It forms salts with sulphuric and hydrochloric acids.

NICK'EL SIL'VER, an alloy frequently used in the manufacture of white metal spoons and forks, composed of 60 per cent. of copper, 17½ per cent. of zinc, and 22½ per cent. of nickel.

NIC'OL PRISM, a prism of Iceland spar, used in the examination of the phenomena of polarized light.

NIC'OTINE, in Chemistry, a highly poisonous alkaloid obtained from tobacco. It derives its name from *Nicotiana Tabacum*, the botanic term for tobacco; which was so called from Nicot, a Frenchman, who introduced it into France about the year 1560.

NICTA'TING, or **NICTITA'TING MEM'BRANE** (*nicto*, I wink: *Lat.*), a thin skin attached to the eyes of birds, and serving to clear them of extraneous matters.

NIDIFICA'TION (*nidus*, a nest; and *facio*, I make: *Lat.*), the act or operation of building a nest, and the hatching and feeding of young in the nest.

NI'DUS (a nest: *Lat.*), a term applied by naturalists to any place in which eggs are hatched or larvæ nursed, or in which seeds germinate.

NIEBELUN'GEN LIED, or **NIEBEL'UNGENS NOT**, a Teutonic epic poem of about 10,000 verses, probably written in the 13th century, although a much higher antiquity has been claimed for it. Possibly the stories of which it is composed had been passing for many ages through the mouths of the people. The poem relates the adventures of one Siegfried, son of a king on the Lower Rhine; but the chief heroes seem to be Attila king of the Huns, and Dietrich king of the Goths. There are dragons, dwarfs, enchanted maidens, magical swords, and all the other marvels of the dark ages. The poem has been rendered into modern German.

NIEL'LO WORK, an old method of ornamenting silver articles, by tracing thereon any kind of design with the graver, and filling up the lines with some hard black metallic paste or alloy. This was called *nigellum* (diminutive of *niger*, black: *Lat.*), and then *niello* by the Italians. In this way church plate, sword-hilts, clasps, and other articles were decorated, and such objects are eagerly sought for by collectors. Impressions taken by the old artists themselves with some black fluid on paper, as well as impressions on sulphur, are also to be found in the cabinets of the curious.

NI'GHTINGALE (*Nachtigall: Ger.*), in Ornithology, a migratory species of passerine birds, a type of the sub-genus *Philomela*. The nightingale is more remarkable for the sweetness of its note than for its beauty. It is of the size of the linnet, but in shape it more resembles the redbreast; the head is small; the eyes are large, and their iris pale; the beak is dusky, slender, and moderately long; the head, neck, and back are of a greyish-brown; the upper parts of the wings, and about the tail, have also a reddish tinge, and the throat, breast, and belly are of a pale ash colour. This bird is well known in the southern counties of England for the fineness of its tones, especially in the evening. The males arrive there sometimes in April, but more usually in May; the females, a week or ten days after the males. It is equalled only by the skylark in variety, compass, and execution; but the latter is greatly inferior in mellowness and plaintiveness, in which two qualities the woodlark alone approaches the nightingale. It is the constant theme of the eastern poets; and is represented by them as attached, in a most extraordinary degree, to the *rose*, their favourite flower. It is very generally believed that the nightingale will live but a very short time in a state of confinement; this, however, is a mistake.

NI'GHTMARE. [See INCUBUS.]

NI'GHTSHADE, or **DEADLY NIGHTSHADE.** [See ATROPA.]

NI'GHTSHADE, WOODY. [See BITTERSWEET.]

NI'HIL, or **NIL** (*Lat.*), nothing.——*Nil capiat per breve* (he is to receive no benefit from the writ), in Law, the judgment given against the plaintiff in an action, either in bar thereof, or in abatement of the writ.——*Nihil debet* (he owes nothing), the usual plea in an action of debt; but it is no plea in an action of covenant, in a breach assigned for non-payment of rent, &c.——*Nil dicit* (he says nothing), a failure of the defendant to put in an answer to the plaintiff's declaration, &c., by the day assigned for that purpose, which omission causes judgment to be had against him.——*Nihil habuit in tenementis* (he has no interest in the tenement), a plea that can be allowed only in an action of debt brought by a lessor against a lessee without deed.

NIM'BUS (a rain-cloud: *Lat.*), in Meteorology, a word used to express the combination of clouds which condense into rain. [See CLOUD.]——In Art, the circle of luminous rays, placed by painters round the heads of the persons they represented, as a mark of divinity or sanctity. The nimbus of any person of the Trinity is distinguished by four rays at right angles to each other, one of the rays being concealed by the head. The nimbus is sometimes square, lozenge-shaped, or triangular.

NI'SI PRI'US, in Law, a term often given to trials by jury in civil actions. By it is meant a commission directed to the judges of assize, empowering them to try all questions of fact issuing out of the courts of Westminster, that are then ready for trial; and as all causes are heard at Westminster, the clause is added in such writs, *Nisi priùs justiciarii domini regis ad assisas capiendas venerint*—that is, Unless before the day fixed the justices come thither to hold assizes—whence the writ, as well as the commission, have received the name.

NI'TRATE OF SIL'VER, in Chemistry, a compound of nitric acid and oxide of silver. It is prepared by dissolving as much pure silver as possible in pure nitric acid, evaporating the solution and crystallizing the nitrate. When melted and cast in a mould it is called lunar caustic, which is employed in surgery to destroy abnormal growths, reduce local inflammation &c. When swallowed, it is a powerful poison; the antidote is common salt, which, if used in time, converts it into an insoluble, and therefore a harmless chloride. It is an ingredient in marking ink [see INK], and a substance of great importance in photography, which see.

NI'TRATES, in Chemistry, salts formed of nitric acid with salifiable bases, as nitrate of potash, soda, &c.

NI'TRE (*nitron: Ger.*), *Saltpetre*, a salt termed by the chemists nitrate of potash. It is found on the surface of the ground in several parts of the world, but particularly in India, whence all the nitre used in Great Britain is obtained. It may be produced in 'nitre beds,' formed of a mixture of calcareous soil and animal matter. The earth containing it is collected and thrown into water, which dissolves out the salt; when the fluid clears, it is run off, and is evaporated by the heat of the sun. The nitre thus obtained is purified by solution and recrystallization. This salt crystallizes in six-sided prisms, containing no water of crystallization. It is soluble in seven parts of cold, and in less than its own weight of boiling water. It has a cooling saline taste, and is decomposed at a red heat. Medicinally it acts on the kidneys and on the skin. It is highly important as an ingredient in gunpowder, for which purpose nitrate of soda, though abundant, cannot be used, as it is slightly deliquescent. [See GUNPOWDER.] It is also one of the sources of nitric acid.

NI'TRIC A'CID, a compound consisting of one atom of nitrogen, and five of oxygen. In ordinary circumstances, it cannot exist except in combination at least with water: the nitric acid of the shops, termed *aqua-fortis*, is united with more or less of that fluid. It is colourless, unless it contains nitrous acid; exposed to the light, it gradually becomes of a yellow or reddish tint, according to the quantity of nitrous acid formed by decomposition of the nitric acid. It is intensely corrosive, produces painful sores if brought in contact with the animal body; and, though removed with great rapidity, stains the skin and nails yellow. It is a powerful oxidizing agent, dissolving most of the metals, after oxidizing them; but it is worthy of notice that when its spec. grav. is 1·485, it has not the least action on tin, though, if stronger or weaker, it oxidizes it rapidly, nitrous gas being evolved with almost explosive violence. It has very recently been obtained in the anhydrous state, which chemists long considered to be impossible; it is in the form of six-sided prisms, which are perfectly clear and colourless; they become very hot in water, and dissolve in that fluid without imparting to it any colour or disengaging any gas. Nitric acid is obtained by acting on nitrate of potash, or nitrate of soda, with sulphuric acid, and distilling off the acid which is set free.

NI'TROGEN (*nitron*, nitre; *gennao*, I produce: *Gr.*), an elementary gas, which forms about four-fifths of our atmosphere, the remaining fifth being oxygen. The two are mechanically mixed, not chemically combined. It is invisible and elastic. It immediately extinguishes animal life, whence its name *azote* (*a*, not; *zoe*, life: *Gr.*). It cannot support combustion, and a lighted candle immediately ceases to burn if placed in it. It has no taste. It is absorbed very sparingly by water, and is a little lighter than atmospheric air, its specific gravity being ·9718. It is capable of combining with oxygen, and with different proportions of this substance forms gaseous oxide of azote or nitrous oxide, nitric oxide, hyponitrous acid, nitrous acid, and nitric acid. Combined with hydrogen, it forms ammonia; and it enters into the composition of most animal substances.

NI'TRO-MURIAT'IC A'CID, in Chemistry, a compound of nitric and muriatic acids—the *Aqua regia* of the alchemists—which has the property of dissolving gold and platina. It is more correctly termed *nitro-hydrochloric* acid.

NI'TROUS OX'IDE, a gas which, if respired, produces a sense of exhilaration and intoxication. It is popularly called *laughing-gas*, because it causes a certain degree of pleasurable excitement, often accompanied by laughter, in those who inhale it. It is protoxide of nitrogen, and is obtained by heating nitrate of ammonia, which is resolved into this gas and water. If breathed too long, or if it is not quite pure, it may produce serious consequences when respired; even when pure, its effects are not the same with persons of different temperaments. The intoxication which it ordinarily produces is not followed by languor, or, generally speaking, by any bad effect.

NIZAM', the title of one of the native sovereigns of India. It was derived from Nizam-ul-Mulk, who, in the commencement of the last century obtained possession of the Mahometan conquests in the Deccan; and his successors assumed his name as a title of dignity.

NO'BILES (literally those who are known: *Lat.*), among the Romans, were such as possessed the *jus imaginum*, or the right of having the pictures or statues of their ancestors; a right which was allowed only to those whose ancestors had borne some curule office, that is, had been curule ædile, censor, prætor, or consul. For a long time, none but the *Patricii* were *nobiles*, because no person under that rank could bear any curule office. The first of any family who was raised to a curule dignity was termed *novus homo* (a new man), an upstart. Catiline reproached Cicero with being such. The Roman nobility, by way of distinction, wore a half-moon upon their shoes, especially those of patrician rank.

NOBIL'ITY (*nobilitas*: *Lat.*), rank conferred by express authority of the governing power. British nobility consists only of five degrees, viz. that of a duke, marquis, earl, viscount, and baron [each of which see under their proper terms]. In Britain these titles are conferred by the sovereign only, and by letters patent, which mark out the course of descent. The privileges of the nobility are very considerable; they are all esteemed hereditary counsellors of the crown, and are exempt from all arrests, unless for treason, felony, breach of the peace, condemnation in parliament, and contempt of the sovereign authority. They enjoy their seats in the house of peers by descent [see PARLIAMENT], and no act of parliament can pass without their concurrence; they constitute the supreme court of judicature, and even in criminal cases give their verdict upon their honour, without being put to their oath. An hereditary nobility is found in the infancy of most nations, ancient and modern. Its origin is to be attributed to various causes, for the most part to military tenures; in some cases, to the honours paid to superior ability, or to the guardians of the mysteries of religion. The priestly nobility of antiquity has everywhere yielded to the superiority of military chieftains. In France and Germany, the origin of hereditary nobility dates from the downfall of the Carlovingian dynasty; in England, from the conquest of the Normans, in the tenth and eleventh centuries; it afterwards spread over all Europe, for, since that time, dignities, as well as lands, have become hereditary. There is no nobility in the United States, Norway, or Switzerland.

NO'BLE in Numismatics, a gold coin, value 6s. 8d., struck in the reign of Edward III., and stamped with the impression of a ship, which emblem is supposed to have been commemorative of a naval victory obtained by Edward over the French at Sluys, in 1340.

NOCTILU'CA (something that shines by night: *Lat.*), a name given by some of the older chemists to *phosphorus.*——It is also the name of a phosphorescent marine animal of microscopic dimensions.

NOC'TURN (*nocturnus*, pertaining to night: *Lat.*), one of the parts into which the matins in the Roman Catholic breviary are divided. The matins generally consist of three nocturns, of which the first contains three lessons from Scripture, and three psalms; the second, three lessons constituting the life of the saint, with three psalms; and the third, three lessons from some homily on the gospel of the day, with three psalms. [See HOURS, CANONICAL.] On rare occasions there is but one nocturn, which is considered a great advantage; and seems generally meant as a privilege, since it occurs, ordinarily, in a great festival only, and the week following it is termed its *octave.*

NODE (*nodus*, a knot or prominence: *Lat.*), in Surgery, a tumour on a bone which causes great pain, and is often attended by caries or necrosis.——NODE, in Dialling, a point or hole in the gnomon of a dial, by the shadow or light of which are shown the hour of the day, the parallels of the sun's declination, &c.

NODES (same *deriv.*), in Astronomy, the two points in which the orbit of a planet intersects the ecliptic. That by which the planet passes from the south to the north side of the ecliptic is termed the *ascending node;* the other the *descending node.* The straight line which joins these two points, and is formed by the intersection of the plane of the planet's orbit and that of the ecliptic is called the *line of the nodes.* In all the planetary orbits, the line of the nodes has a retrograde motion from east to west; but it amounts to only a few seconds in a year. It is a necessary consequence of the mutual attraction of the heavenly bodies.

NO'LI ME TAN'GERE (touch me not: *Lat.*), in Botany, the specific name of a balsam, a British plant belonging to the genus *Impatiens.*——In Art, a name given to pictures, which represent Christ appearing to Mary Magdalen after the resurrection.

NOLLE PROS'EQUI (to be unwilling to prosecute: *Lat.*), a legal term signifying a proceeding in an action, by which the plaintiff undertakes not to proceed further. If entered before judgment, the plaintiff may bring another action for the same cause against the same defendant.

NOM'ADS, or NOM'ADES (*nomades*, from *nomos*, pasture: *Gr.*), a name given to nations whose chief occupation consists in feeding their flocks; and who have no fixed place of abode, but shift their residence according to the state of pasture. Nomadic tribes are seldom found to abandon their wandering life, until they are compelled to do so by being surrounded by those who reside in fixed habitations, or unless they can make themselves masters of the settlements of a civilized nation.

NOM'BRIL (the navel: *Fr.*), in Heraldry, the centre of an escutcheon.

NOM DE GUERRE (literally, a *war name*), a French term commonly used to denote an assumed or fictitious name.

NOME (*nomos*, from *nemo*, I distribute: *Gr.*), the name for those provinces into which Egypt was divided from the earliest period. In the time of Strabo they were 36 in number; 10 in the Thebaïd; 16 in the Heptanomis, or intermediate district; and 10 in the Delta.

NOMENCLA'TOR (*nomen*, a name; and the obsolete *calo*, I call out: *Lat.*), in Roman Antiquity, a slave who attended upon persons that stood candidates for offices, and prompted or suggested to them the names of all the citizens they met: in order that they might address them by name, which was esteemed an especial act of courtesy.

NOMENCLA'TURE (*nomenclatura*, from same: *Lat.*), a systematic classification of words, which designate the divisions and dependencies of a science.

NOM'INATIVE (*nominativus*, from *nomino*, I name: *Lat.*), in Grammar, the first case of nouns that are declinable. The nominative case is the subject of a proposition or affirmation; thus, in the sentence 'the house is repaired,' *house* is the nominative case of the noun.

NON (not: *Lat.*), a word used in the English language as a prefix only, for giving a negative sense; as in *non*-ability, *non* residence, *non*-payment, *non*-appearance, and the like.——*Non assumpsit* (he has not undertaken), in Law, a general plea in a personal action, by which a man denies that he has made any promise.——*Non compos mentis* (of unsound mind: *Lat.*), a phrase used to denote that a person is not of sound memory and understanding. A distinction is made between an idiot and one *non compos mentis*, the former being constitutionally destitute of reason, the latter deprived of that with which he was naturally endowed; but, in many cases, the law makes no distinction between the two.——*Non distringendo* (not distraining), a writ granted to prevent distraining.——*Non est inventus* (he has not been found), the answer made by the sheriff in the return of the writ, when the defendant is not to be found in his bailiwick.——*Non liquet* (it does not appear), a verdict given by a jury, when a matter is to be deferred to another day of trial.——*Non obstante* (notwithstanding), a clause in statutes and letters-patent, importing a license from the king to do a thing which at common law might be legally done, but, being restrained by act of parliament, cannot be done without such license.——*Non pros*, or *Nolle prosequi* (is unwilling to proceed further), a term made use of to signify that the plaintiff will proceed no further in his action, being convinced that he cannot support his cause. In criminal cases, it can be entered only by the attorney-general.

NON'AGE, the period of life preceding the time when a person, according to the laws of his country, becomes of age to manage his own concerns.

NON'AGON (*novem*, nine: *Lat.*; and *gōnia*, an angle: *Gr.*), in Geometry, a figure having nine angles and therefore nine sides.

NON-CONDUC'TOR, a substance or fluid which does not conduct or transmit another substance, or fluid, or motions, or which transmits them with difficulty. Thus, glass is a non-conductor of electricity; wool is a non-conductor of heat. [See ELECTRICITY, HEAT.]

NONCONFOR'MIST, one who refuses to conform to the rites and worship of the established church. The name was at first particularly applied to those clergymen who were ejected from their livings by the act of uniformity in 1662. [See DISSENTERS.]

NONES (*nonæ*, from *nonus*, the ninth: *Lat.*—because the ninth day before the *ides*), in the Roman calendar, the fifth day of the months January, February, April, June, August, September, November, and December; and the seventh of March, May, July, and October; these last four months having six instead of four days before the nones, because they alone, in the ancient constitution of the year by Numa, had thirty-one days each, the rest having only twenty-nine, and February thirty; but when Cæsar reformed the year, and made other months contain thirty-one days, he did not allot them six days of nones. The nones, like the calends and ides, were reckoned backwards.——NONES, one of the *canonical hours* of the Roman Catholic breviary, anciently appointed to be said at the *ninth* hour of the twelve into which the Romans divided the day, corresponding, at the equinoxes, with our three o'clock. It may be recited, at present, at almost any part of the day.

NON-JU'RORS, the adherents of James II., who refused to take the oath of allegiance to the government at the Revolution, when James abdicated and William and Mary were placed on the throne.

NON-NAT'URALS. Under this term, ancient physicians comprehended air, meat and drink, sleep and watching, motion and rest, the assimilated substances and excretions, and the affections of the mind; or, in other words, those matters which do not enter into the composition of the body, but at the same time are necessary to its existence.

NON-RESIST'ANCE, in English Constitutional History, unqualified obedience to every command, especially of the sovereign, whether he orders what is right or wrong.

NON'SUIT, in Law, the renunciation of a suit by the plaintiff. It is either *adjudged*, on account of some neglect, delay, &c., in the prosecution of the suit, or it is *voluntary*. It is usual to call on the plaintiff, when he is unable to make out a case to support his pleadings for want of the necessary evidence, and the jury are about to give a verdict, to choose a nonsuit. He does this by *withdrawing*, neither answering by himself nor another, when, previously to the delivery of the verdict, the crier *calls the plaintiff*. Except in certain cases, a nonsuit does not prevent the bringing of another action, for the same cause When a plaintiff is nonsuited, he is obliged to pay the costs of his adversary.

NOON (*non: Sax.*), *mid-day*, or twelve o'clock, called *apparent* as shown by a sun-dial, and *real* as shown by a clock.

NOR'THERN LIGHTS, the *Aurora Borealis*, which see.

NORTH POLE (*nord: Ger.*), in Astronomy, a point in the northern hemisphere of the heavens, ninety degrees every way distant from the equinoctial.——NORTH-POLE STAR, a star in the tail of *Ursa minor*, so called from its not being more than two degrees and a half distant from the pole.

NORTH'-WEST PAS'SAGE. The 'North Polar Expeditions' undertaken by the enterprising mariners of England, after the year 1496, when Cabot penetrated into Hudson's bay, had continued to increase in interest with every fresh attempt, till, at length, parliament offered a premium of 20,000*l.* to the first navigator who should accomplish the north-west passage, and 5000*l.* to the first vessel which should reach the north pole and pass it In 1819, the prince-regent offered prizes of from 5000*l.* to 15,000*l.* to those vessels which should advance to certain points in the Arctic seas; the British government having the year before fitted out two expeditions to the north pole. Captain Buchan, commanding the *Trent* and the *Dorothy*, was instructed to attempt a passage between Spitzbergen and Nova Zembla, over the pole into the Pacific, and Captain Ross, commanding the *Isabella* and the *Alexander*, to attempt the north-western passage from Davis's straits and Baffin's bay into the Frozen ocean, and thence into the Pacific. Captain Buchan, however, reached only 80° 32′ north of Spitzbergen, where he remained three weeks frozen in: while the chief geographical result of Captain Ross's expedition was the more accurate determination of the situation of Baffin's bay; for, although he sailed up Lancaster sound, he did not continue his progress far enough to discover that it was open. The British government, therefore, in 1819, sent out Lieutenant Parry, who had accompanied Captain Ross, on a second voyage into Baffin's bay. He penetrated with his vessels, the *Hecla* and *Griper*, through Lancaster sound into Barrow's strait, in which he examined Prince Regent's inlet, running in a southern direction, and the polar sea; and wintered in the harbour of an uninhabited island, which he called *Melville island* (74° 45′ lat.). As he had passed (Sept. 10) 110° W. long. of Greenwich, he was entitled to the first prize offered by parliament. With eleven companions he explored Melville island, and reached (June 6) the northern coast (75° 34′ 47″ lat. and 110° 36′ 52″ long.). Having gone as far as 113° 46′ 43″ long. and 74° 27′ 50″ lat., he returned, in consequence of the immense fields of ice, through Davis's straits to Britain. While Parry and Ross were seeking for a north-west passage into the polar sea, Captain Franklin was sent by the British government to penetrate to the northern coast of America by land, along Hudson's bay and Coppermine river. In May, 1824, government fitted out a third polar expedition for the discovery of a north-west passage through Prince Regent's inlet, under Parry and Lyon. Storms and icebergs drove the ships ashore, and it became necessary to abandon one of them, the *Fury*. In 1825, Capt. Franklin undertook a new journey overland, with the intention of sailing westerly from Mackenzie's river along the coast to Behring strait. At the same time Captain Beechey sailed in the *Blossom* by the way of Cape Horn, to discover an easterly passage round the Icy cape, or in Kotzebue sound. In six months Franklin reached the Northern ocean, near Garry's island (69° 30′ lat), and returned upon the Mackenzie to his winter quarters at Fort Franklin, on Great Bear lake. Both parties left their winter quarters June 21, 1826, and shortly after separated in 67° 38′ lat. and 133° 52′ W. long., Franklin descending the western arm of the Mackenzie, which runs along the foot of the Rocky mountains.—The admiralty now sent Captain Parry, in the *Hecla*, to reach the north pole. He took reindeer and ice-boats on board at Hammerfest, in Lapland; reached Spitzbergen May 27, 1827; left the *Hecla* there in the ice; sailed June 21, with two boats, through an open sea; left the boats on the 24th, and began (81° 12′ 51″) his journey over the ice to the north pole. But he reached only the latitude of 82° 45′ 15″; and the ice being everywhere broken, he was obliged to return.—In the spring of 1829, Captain Ross, chiefly through the liberal assistance of Felix Booth, Esq., sheriff of London, undertook a private expedition into the Polar seas, with a view to determine the practicability of a new passage by Prince Regent's inlet, which had been confidently said to exist. This voyage was perilous in the extreme; and no authentic intelligence was received of the expedition, from the 27th of July, 1829, the day it sailed from Wideford, in Greenland, where it had put in to refit, till August, 1833, when the commander and crew were discovered on the south shore of Lancaster sound, by Captain Humphreys, of the *Isabella*, of Hull, the very ship which Captain Ross had formerly commanded. Our space compels us to pass over the subsequent attempts to effect the discovery of the north-west passage, till 1845, when Sir John Franklin with a gallant crew volunteered on this perilous undertaking. On the return of the Arctic Discovery Squadron, under Captain Sir J. C. Ross, from its unsuccessful operations to discover Sir John Franklin, whose fate remained a mystery, in 1848 and 1849, it was at once determined by government to re-equip the *Enterprise* and *Investigator*, in order that they might resume the search by the way of Behring strait. Accordingly these two ships sailed from Plymouth on January 20th, 1850. They unfortunately did not succeed in finding Captain Franklin, but they saw, across the entrance of Prince of Wales's strait, the frozen waters of Melville sound, and thus obtained the object of so many expeditions. After spending a fourth winter in these desolate regions, Captain McClure returned to England, and received 10,000*l*., the reward which had been promised for the successful discovery of the north-west passage, together with the honour of knighthood. A record was subsequently found by Captain McClintock on the north-west coast of King William island, stating that on the 22nd of April, 1848, the *Erebus* and *Terror* had been abandoned in the ice, and that the survivors, 105 in number, were proceeding to the Great Fish river, under the command of Captain Crozier, Sir John Franklin having died on the 11th of June, 1847.

NOSOL'OGY (*nosos*, a disease; and *logos*, a discourse: *Gr.*), an arrangement of diseases, with names and definitions, according to the distinctive character of each class, order, genus, and species.

NOSTAL'GY (*nostalgeo*, I pine for my home: *Gr.*), home sickness, *le mal du pays*; a vehement desire to return to one's native country, attended with melancholy, want of appetite, and other symptoms indicative of a restless and unhappy state of mind.

NOS'TOC, cryptogamic plants, of which the commonest species is often called star-jelly. It is a trembling, gelatinous, substance, found on pastures, gravel walks, &c., in rainy weather; but it soon dries and shrivels up almost to nothing. Paracelsus, who, it is said, gave it the name, attributed wonderful properties to it. Being supposed to fall from the sky with meteors, it obtained, in Sweden, the name of 'sky-fall;' and in England, as well as some of the liverworts, that of 'witches' butter.' Some species form an article of food in China, and one was similarly employed in a late Arctic expedition.

NOTA'TION (*notatio*: *Lat.*), the recording of anything by marks, figures, or letters. Mathematical notation relates to number and quantity, or to operation. The system of numerical notation, now universally adopted by civilized nations, owes its admirable simplicity to the giving both an *absolute* and a *local* value to the characters. Thus, the absolute value of 5 is five: this is never changed. Its local value depends on its position with regard to the decimal point: thus 50· means five tens; 500· five hundreds, &c.: ·05 five hundredths; ·005 five thousandths, &c. These principles, with the power of combining the few characters employed, enable us to express the most enormous numbers with the greatest ease, and impart the utmost simplicity to the very language we use regarding them. This system, usually termed the *Arabic*, is far more perfect and convenient than that of any nation of antiquity, however enlightened. The symbols of quantity are arbitrary, but the letters of the alphabet are almost exclusively employed: the first, as a, b, c, &c., to indicate *known quantities*; and the last, x, y, and z, to indicate *unknown*. In selecting a letter, we sometimes choose it so as in some measure to assist our memory: thus we usually indicate momentum by M, velocity by V, &c.;

and different momenta with different M's: thus, one momentum by M, another by M′, or *m*, &c. *Symbols of operation* contribute much to simplicity and the saving of time: thus it is easier to write $a+b=c$, than *a* added to *b* is equal to *c*. In performing an operation, or verifying it, we proceed far more easily with symbols than we could possibly do if the various processes were described by words. There are many symbols used to indicate processes; but the following are the most common. + for addition; as $a+b$, *a* plus *b*, or *a* to be added to *b*. − for subtraction; as $c-d$, *c* minus *d*, or *d* to be subtracted from *c*. × for multiplication; as $x \times y$, *x* multiplied by *y*:—when the multiplication is supposed to be actually performed, the sign is omitted: thus, $x\,y$ means the product of *x* and *y*. ÷ for division, as $m \div n$, *m* divided by *n*:—when the division is supposed to be actually performed, the quantities may be put down thus, $\frac{m}{n}$. = for equality; as $p=q$, *p* is equal to *q*. Two dots indicate the ratio between two quantities; as $a:b$, *a* is to *b*. Eight dots indicate proportion; as $a:b::c:d$, *a* is to *b* as *c* is to *d*. √ is the radical sign, as $\sqrt{a}$, the square root of *a*, written also $a^{\frac{1}{2}}$; $\sqrt[4]{b}$, the fourth root of *b*, written also $b^{\frac{1}{4}}$, &c.

NOTE (*nota*, a mark: *Lat.*), in Music, a character which marks the pitch and the time of a sound. In general, under *notes* are comprehended all the signs or characters used in music, though in propriety the word only implies the marks which denote the degrees of gravity and acuteness to be given to each sound. [See MUSIC.]

NO′TICE (*notitia*, a knowledge: *Lat.*), in Law, a communication given, or received, which conveys the presumed or real knowledge required to affect the receiver with legal liabilities.

NOUN (*nomen*, a name: *Lat.*), in Grammar, a word that denotes any object of which we speak, whether it be animate, inanimate, or ideal; as *man*, *gate*, *mind*. Nouns form the basis of all language: thus we call a certain instrument a *saw*; the act of using it is *sawing*; and the verb is to *saw*.

NOVAC′ULITE (*novacula*, a razor: *Lat.*), in Mineralogy, the *Hone*, or *Turkey oil-stone*, a variety of argillaceous slate. It owes its power of whetting or sharpening steel instruments to the fine siliceous particles it contains. Various other stones are used as whetstones, such as mica slate, freestone, &c.

NOV′EL (*novella*: *Ital.*; from *novus*, new: *Lat.*), in Literature, a fictitious tale, or imaginary history of real life, generally intended to exhibit the operation of the passions, foremost among which is love. The novel and romance, though sometimes confounded, appear to be different. The former depicts life as it is in ordinary circumstances, and brings together incidents, any one of which has happened or may very fairly be supposed to have happened. Romances generally relate to periods long passed by; their incidents are often improbable, and sometimes impossible. The supposed adventures of chivalry form their favourite theme; and their scenes are most frequently laid in ancient castles and monasteries; they do not even reject the aid of imaginary beings, and of enchantment. Some of Sir Walter Scott's works hold in many respects an intermediate position: his delineation of real, though past manners, renders them novels; but the distant times of which he writes, and the wonderful, though perhaps always absolutely possible, incidents he so frequently introduces, bring them into the class of romances.——NOVEL (*novus*, new: *Lat.*), in Civil Law, a term used for the constitutions of several emperors. Those of Justinian are best known, and are generally understood by the term. They were so called, either from their producing a great alteration in the face of the ancient law, or because they were made on new cases, and, after the revisal of the ancient code, compiled by order of that emperor.

NOVEM′BER (*Lat.*, from *novem*, nine), the eleventh month of the Julian year, consisting of thirty days. It is the first winter month in the northern hemisphere, and the first summer month in the southern. Its name arose from its being the ninth month of the ancient Roman calendar.

NOV′ICE (*novitius*, fresh: *Lat.*), a person not yet skilled or experienced in an art or profession; among the Romans, it signified a recruit. The term is applied in monasteries to a religious person, in his or her novitiate, or year of probation, and who has not yet made the vows.

NOVI′TIATE, the period appointed for the trial of novices, or those who enter a monastery, in order to ascertain whether they have the qualifications necessary for living up to the rule to which they are to bind themselves by vow. The novitiate is generally very severe, the novice generally having to perform many menial offices about the convent, and to give an account of his most trifling actions to the master of the novices.

NU′CLEUS (a kernel: *Lat.*), anything round which matter has accumulated, or to which it is attached.——In Astronomy, the term *nucleus* is used for the body of a comet, otherwise called its head.——In ancient Architecture, *nucleus* signified the middle layer of a flooring, which consisted of a strong cement, over which they laid the pavement.

NUDE COM′PACT (*nudum pactum*, from *nudus*, naked: *Lat.*), in Law, a contract made without any consideration, and therefore not valid; the term is borrowed from the civil law.——NUDE MATTER, a bare allegation of something done.

NU′DITIES (*nuditas*, nakedness: *Lat.*), in Painting and Sculpture, those parts of the human figure which are not covered with drapery. The appearance of the covering being determined by the form of the body, it is essential to the painter, as well as the sculptor, to study the naked figure with the greatest attention.

NUG′GET (*niggot*, an old English word, perhaps a corruption of *ingot*), the miner's term for natural lumps of nearly pure gold. They are usually found in superficial accumulations of gravel, having been there deposited on the destruction of the parent rock. The largest nugget hitherto found weighed 184lb. 9oz. 6dwts., and received the name of the 'Welcome Nugget.' It was discovered in 1858, at a depth of 180 feet in drift matter at Ballarat, Victoria, and was sold for 10,500*l.* It was melted in London. Another, found at the same place, was named the 'Blanche Barkly,' and sold for 6905*l.* Several others have been found ranging in value from 3000*l.* to 6000*l.*

NU'ISANCE (*nuire*, to injure: *Fr.*), in Law, annoyances which are of two kinds, public and private. A *public nuisance* affects the king's subjects in general. A *private nuisance* is defined to be 'anything done to the hurt or annoyance of the lands, tenements, or hereditaments of another.' The remedy for public nuisances is by indictment or presentment; for private, by action of trespass on the case for damages; and the party annoyed may abate the nuisance by his own act, entering his neighbour's land, &c., if necessary for the purpose, but committing no riot.

NUM'BER (*numerus: Lat.*), in Arithmetic, an assemblage of several units or of several things of the same kind. *Cardinal* numbers express the amount, as 1, 2, 3, 4. *Ordinal* numbers denote the order, as 1st, 2nd, 3rd, &c. *Even* numbers are those which may be divided into two equal parts without a fraction being produced, as 6, 12, &c. *Uneven* numbers are such as leave a remainder after being divided by 2, as 5, 13, &c. A *rational* number is one commensurable with unity. A number incommensurable with unity is termed *irrational*, or a *surd.* A *square* number is the product of any number multiplied by itself, as 4, which is the product of 2 multiplied by 2. A *cubic* number is the product of a square number by its root: such is 27, as being the product of the square number 9 by its root 3. A *perfect* number is that whose aliquot parts added together make the whole number, as 6, 28, &c.: the aliquot parts of 6 being 3, 2, and 1=6; and those of 28 being 14, 7, 4, 2, 1=28, &c. An *imperfect* number is that whose aliquot parts added together make either more or less than the whole of it. *Homogeneal* numbers are those referred to the same units, those referred to different units being termed *heterogeneal.* Almost all civilized nations have chosen 10 as the common ratio of their numerical systems—that is, have made their systems of numbers *decimal.* This was not a matter of necessity; the only thing required was the selection for the common ratio of a number neither too small nor too large. Too small a ratio would require many places of digits to express even a moderate number, and too large a ratio would be laborious to the mind. It is unfortunate that our systems of money, weights, and measures not only do not follow the decimal system, but no one of them has even a common ratio.

NUM'BERS, the title of the fourth book of the Pentateuch, so called because it contains an account of the numbering of the people. It comprehends a period of the Israelitish history of about thirty-eight years.——NUMBERS, in Poetry, Oratory, Music, &c., are certain measures, or cadences, which render a verse, period, or song, agreeable to the ear. *Poetical numbers* consist in a certain harmony in the order and quantity of syllables constituting feet. *Rhetorical numbers* are a sort of simple harmony, less apparent than that of verse, but such as is perceived and affects the mind with pleasure.

NU'MERAL LET'TERS, the Roman capital letters which stand as substitutes for numerical characters: as I for 1, X for 10, L for 50, C for 100, &c.

NUMERA'TION (*numeratio: Lat.*), the art of reading any number expressed by characters; it is often confounded with notation, which is the art of expressing any number by characters.

NU'MERATOR (*Lat.*, from *numero*, I reckon), in Arithmetic, the quantity in the upper line of a fraction, denoting how many of the equal parts into which one or more integers are supposed to be divided, are taken. Thus, the 3 in ¾ shows that the integer having been divided into four equal parts, three of them are taken.

NUMISMAT'ICS (*numisma*, a coin: *Lat.*), or NUMISMATOL'OGY (*nomisma*, a piece of money; and *logos*, a description: *Gr.*), the science which has for its object the study of coins and medals of all nations, as an aid to history and a means of rectifying dates in chronology. The earliest coins are Phœnician, and were struck from dies unreversed, so that the inscription was reversed; but those struck by the ancient Greeks and Romans are most deserving our attention. The parts of a coin or medal are the *obverse*, or face, generally containing the bust, &c., of the sovereign in whose honour it was struck, or some emblematic design; and the *reverse*, containing various figures, &c. The words round the border constitute the *legend*, and those in the middle the *inscription*; when they occupy the lower extremity of the piece, and are separated from the rest by a horizontal line, they are termed the *exergue.* Coins struck in this country before the reign of Charles II. had their devices impressed by blows of the hammer. The lettering and milling on the edges of coins was invented to meet the fradulent practice of clipping and filing. The study of coins and medals is indispensable to archæology, and to a thorough acquaintance with the fine arts. They indicate the names of provinces and cities, and point out their position; and they afford representations of many celebrated places. They fix the period of events, and sometimes determine their character; and they enable us to trace the series of kings. They also give us the attributes and titles of different divinities, the utensils and ceremonies of their worship, and the costume of the priests. In fine, they afford information regarding many things connected with usages, civil, military, and religious; while they enable us to trace the epochs of different styles of art, and are of great assistance in our philological researches. [See MEDALS.]

NUM'MULITE (*nummus*, money: *Lat.*; and *lithos*, a stone: *Gr.*), the fossil remains of a small chambered shell, round and flat, like a coin. It was inhabited by an animal of very low organization, belonging to the group of *Foraminifera* [which see]. There is a calcareous formation of the eocene epoch, occurring in every quarter of the globe, and having occasionally a width of 1800 miles, with a thickness of some thousands of feet, which abounds to a surprising extent with several species of nummulites. This formation is found in the Alps, Pyrenees, Carpathians, and Himalayas. In the last-mentioned mountains nummulites have been seen at a height of 16,500 feet. The great pyramids of Egypt were built of nummulitic limestone.

NUN'CIO (*Ital.*; from *nuntio*, I inform: *Lat.*), an envoy sent by the pope on foreign missions which concern ecclesiastical affairs.

NUN'CUPATIVE WILL (*nuncupo*, I name: *Lat.*), in Law, a will or testamentary desire expressed verbally, but not put into writing. It depends merely on oral testimony for proof, though afterwards reduced to writing. Nuncupative wills are not now valid, unless they regard the personal estate of soldiers and seamen, or were executed before January 1st, 1838. *Nuncupative*, in a general sense, signifies that exists only verbally.

NUN'DINÆ (*nonus*, the ninth; and *dies*, a day: *Lat.*), in Antiquity, days set apart by the Romans for the country people to expose their wares and commodities for sale, very similar to our market or fair days. They were called *nundinæ*, because they were kept every ninth day.

NUN'NERY (*nonne*, a nun: *Ger.*), in the Roman Catholic Church, a religious house for *nuns*, or females who have bound themselves by vow to a single life.

NUR'SERY (*nourrice*, a nurse: *Fr.*; from *nutrix*: *Lat.*), in Gardening, a piece of land set apart for raising and propagating all sorts of trees and plants, to supply the garden or plantations.

NUT, in Botany, a one-celled fruit in which the pericarp becomes hard, and bracts surround the base. The immature ovary contains several ovules, but there is only one when the fruit is mature. The fruit of the hazel is a nut. The bracts are united into a cup in the acorn. The term *glans* is frequently applied to the nuts borne by the oak, beech, and chestnut trees.

NUTA'TION (*nutatio*, a nodding: *Lat.*), in Astronomy, the gyratory movement of the earth's axis, which, but for the precession of the equinoxes, would cause the pole of the equator to describe a small ellipse among the stars in about 19 years. The action of the sun and moon on the protuberant mass about the earth's equator tends to draw the plane of the latter towards that of the ecliptic—that is, to diminish the angle between them. The earth's rapid rotation on its axis prevents the inclination of the two planes from being permanently altered, but communicates a motion to the plane of the equator of such a nature that its pole describes a circle about the pole of the ecliptic, though with a velocity amounting to only 50'1" annually. It would therefore take 25,868' years to describe the whole circle. A similar action of the moon causes the pole of the earth's equator to revolve in nearly 19 years, in a small circle, about the pole of the moon's orbit, which does not coincide with the pole of the ecliptic, being always 5° 9' from it. The earth's pole, therefore, has a double motion—a slow one round the pole of the ecliptic, and a more rapid one round the pole of the moon's orbit, which itself moves round the pole of the ecliptic on account of the motion of its own line of nodes, in about 19 years. The path, therefore, described by the pole of the equator round the pole of the ecliptic is not simply an elliptic curve, but a gently undulated ring, and these undulations constitute each of them a nutation of the earth's axis. As the sun, at different positions of the earth in her orbit, on account of her different distances from it, has a different effect in altering the obliquity of the ecliptic, there is a semi-annual variation, depending on the sun alone, which is called the *solar nutation*; the combined action of the sun and moon is termed the *luni-solar nutation*.

NUT'GALLS, excrescences on the leaf of the oak. The Aleppo galls are imported for the use of dyers, calico-printers, &c. [See CYNIPS.]

NUT'HATCH, the *Sitta Europœa* of ornithologists, a climbing bird, inhabiting woods in England and on the continent of Europe. It runs along the trunk of a tree upwards and downwards with the same ease, and so smoothly that its motion is said more to resemble that of a mouse than that of a bird. Its popular name is derived from its habit of opening nuts to get at the kernel, by means of repeated blows of its bill, the nuts being first placed in a crevice in a tree.

NUT'MEG, the nut of the *Myristica moschata*, a tree growing in the Indian archipelago. The fruit is of the kind called a *drupe*, that is, a pulpy pericarp without valves, containing a nut, which is enveloped by a substance called mace. The nutmeg tree yields three crops annually. Several other species of the genus yield aromatic fruit of an inferior kind.

NUTRI'TION (*nutrio*, I nourish: *Lat.*), in the animal economy, is the assimilation of nutritive matter to our organs, or the repairing of the continual loss which the different parts of the body undergo. The motion of the parts of the body, the friction of those parts with each other, and especially the action of the air, would soon entirely destroy the body if the loss were not repaired by a proper diet, which being digested in the stomach, and afterwards converted into chyle, mix with the blood, and are distributed through the whole body for its nutrition. When the nutritive matter has been animalized, or assimilated to the body which it is designed to nourish, by the organs of digestion, absorption, circulation, respiration, and secretion, the parts which it supplies retain and incorporate it with their own substance. This nutritive identification is variously effected in the brain, muscles, bones, &c.; each of these appropriates to itself, by a true secretion, that which is found analogous to its nature, and rejects the heterogeneous particles. Thus, a bone is a secretory organ that attracts to itself phosphate of lime. It is the same in muscles with respect to fibrin, and in the brain with albumen; each part imbibes, and forms into a portion of its own structure, such juices as are of the same nature, in consequence of a power, of which the affinity of aggregation of the chemists gives us an idea, or perhaps furnishes us with a model. Every living body, without exception, seems to possess a faculty of decomposing the substances by means of which it is supported, and of giving rise to new products. The animal machine is therefore continually destroyed, and at one period of life does not, perhaps, contain any of those particles of which it was constituted at another.

NUX VOM'ICA (emetic nut: *Lat.*), the seeds of an East Indian tree, the *Strychnos nux vomica*, nat. ord. *Loganiaceæ*. They yield STRYCHNINE, which see.

NYCTALO'PIA (*nuktalopia: Gr.*), a malady of the eyes, commonly called night-blindness, under which the patient, though able to see by day, is unable to distinguish objects by artificial light, or in the twilight. It is supposed to proceed from a partial paralysis of the retina.

NYL'GHAU (*nyl gau*, a blue bull: *Hind.*), the *Portax tragocamelus* of zoologists, an Indian animal belonging to the antelope section of the bovine family. Its body, horns, and tail are not unlike those of a bull; and the head, neck, and legs are very similar to those of a deer. Its colour, in general, is ash or grey. Its horns are about seven inches long, and of a triangular shape. The female is much smaller than the male, more resembles the deer, and has no horns. It is the largest and finest of the antelope species. Its temper is vicious, and being both powerful and resolute it is not often made an object of chase.

NYMPH'A, or NYMPH (*numpha*, a nymph: *Gr.*), in Entomology, the second state of an insect passing to its perfect form —another name for the *pupa*, *chrysalis*, or *aurelia*.

NYMPHÆ'A (*Gr.*), in Botany, a genus of plants, nat. ord. *Nymphæaceæ*, including our white water lily. The *Victoria regia* belongs to the same order.

NYMPHS (*numphai: Gr.*), in Heathen Mythology, local goddesses; they were termed *Nereids* when belonging to the sea, *Naiads* when attached to fountains, *Dryads* when found in the woods, &c.

NYSTAG'MUS (*nustagmos*, from *nustazo*, I am sleepy: *Gr.*), in Medicine, a twinkling of the eyes, such as happens when a person is very sleepy.

O

O, the fourth vowel and the fifteenth letter in the alphabet, is pronounced by projecting the lips, and forming an opening resembling the letter itself. The English language represents no fewer than four sounds by the character *o*, exemplified in the words, *no*, *prove*, *for*, *not*. The French indicate the sound *o* (pronounced as in *no*) by various signs. The use of *o* is next in frequency to that of *a*. It is used particularly to express admiration, warning, pity, imploring; and, in general, as introductory to language expressive of great emotion, as *O!* or *oh!* With an apostrophe after it, *O* is a prefix in some Irish proper names, and seems to have had originally the force of the French *de*, the prefix *Mac* corresponding to *Fitz* in England. It stands for *Old*, as O. S. (*Old Style*), &c., but is not often used as an abbreviation.

OAK, a tree ranking among the most useful of temperate climates. More than eighty species are known; but the common European oak (*Quercus robur*) is a tree of the first consequence, on account of the qualities of its wood. It usually attains the height of from 60 to 100 feet, with a trunk from 6 to 12 feet, or more, in circumference; but it sometimes reaches to an enormous size. In 1810 an oak tree, which grew about four miles from Newport in Monmouthshire, and was felled for the use of the roya navy, contained 2416 cubic feet of sound and convertible timber. The main trunk was nine feet and a half in diameter. It was purchased, standing, for 405*l.*, and, when brought to market, realised nearly 600*l.* But the most magnificent oak ever produced in England was probably that dug out of Hatfield bog; it was about 120 feet in length, twelve in diameter at the base, ten in the middle, and six at the smaller end where broken off; the butt for sixty feet squared seven feet of timber, and four its entire length. From the solidity and durability of its wood, the oak is employed for a vast variety of purposes, and above all for ship-building. For supporting a weight, resisting a strain, and not splintering with a cannon-shot, it is superior to every other timber. Before the introduction of mahogany, it was very generally used for furniture. The oak timber imported from the continent and from America is very inferior to what is grown in this country. There are two varieties of British oak which are frequently considered distinct species, one having stalked fruit, the other unstalked fruit, and hence named *Quercus pedunculata* and *Quercus sessiliflora*. There was a common opinion that the latter affords a less valuable timber than the former, but this is now believed to be a mistaken notion, arising from omitting to notice the locality where the sessile flowered oak grew, for the timber of this tree is much affected by the soil in which it grows. The growth of the common oak, in general, is extremely slow, but it should be cut when it is between 50 and 70 years old. The flowers are monœcious, that is the stamens are in one flower, forming a sort of catkin, and the pistil in another. The *acorn* is the fruit of this tree, and, though now used only as the food of swine, in ancient times it formed an important article of nutriment to some of the northern nations, and, among others, to the rude inhabitants of the British isles. The oak is raised from the acorn, sown either where the tree is to stand, or in a nursery whence the young trees are transplanted. ——*Oak-bark* is used in tanning. In medicine, it is a strong astringent, and is therefore applied in hæmorrhages. Both the bark and the leaves are employed in hot-beds; and the leaves are now reckoned better for this purpose than the bark.

OAK'-GALLS, protuberances on the leaves of the oak, formed and inhabited by insects. They appear in April, and remain till June or longer. When opened, they are found to contain one insect only. It might appear that the parent fly, when she forms a gall for the habitation of her offspring, places it in an impregnable fortress. This is not the case; for it frequently happens that a fly which produces a worm of the carnivorous kind, pierces the gall and deposits her egg within it. This worm, when hatched, feeds upon the proper inhabitant; and finally, after devouring it, passes itself into the chrysalis state, and then, in the form of its parent fly, makes its way out of the gall.

OAK'UM (*œcumbe*, combings, refuse: *Sax.*), old ropes untwisted, and pulled out into loose hemp; used in caulking the seams, tree-nails, and bends of a ship, to stop or prevent leaks. That formed from untarred ropes is called white oakum.

OAR, a long piece of timber, flat at one end and round at the other, used to propel a boat or barge on the water. The flat part is called the *blade;* and the round end the *loom*, which terminates in the *handle*. The fulcrum is the hole in the gunwale called the *rowlock*, or the space between the pins called *thole-pins*. To *boat the oars* is to lay them in after rowing. To *feather the oar* is to hold the blade horizontally, so as not to catch wind. *To lie on the oars* is to suspend rowing for a short time; this is done also as a salute to persons of distinction when passing. To *ship the oars* is to fix them in the rowlocks; and to *unship the oars* is to throw them out of the rowlocks.

O'ASIS (*ouah: Copt.; wah: Arab.*), a fertile spot, situated in the midst of the uninhabitable deserts of northern Africa; the name is also applied to a cluster of verdant spots. In the desert of Sahara there are several oases, which serve as halting-places for the caravans. They are described as spots of exceeding beauty, but something is due to the striking contrast with the deserts around them: their fertility arises from springs of water. The Romans used them occasionally as places of banishment, on account of their being, though agreeable, as it were out of the world, and its being very difficult to escape from them. Some noble remains are found in the larger oases: thus the temple of Jupiter Ammon, at Siwah.

OAT, the *Avena sativa*, a plant of the nat. ord. *Graminaceæ*. When the seed or grain only is meant, the word is commonly used in the plural, *oats*. *Oatmeal* forms a considerable article of food for man in some countries; and oats are everywhere excellent food for horses and cattle. The oat is the hardiest of all the cereal grasses, growing luxuriantly in cold northern climates, and in mountainous districts, where neither wheat nor barley can be advantageously cultivated. In Scotland, it has long formed a principal part of the food of the people; and great quantities are sown in Ireland. Bruce has described a wild species which he met with at Aroossi, a small territory on the Nile. 'Wild oats,' says this traveller, 'grow up here, spontaneously, to a prodigious height and size, capable often of concealing both the horse and his rider, and some of the stalks being little less than an inch in circumference. They have, when ripe, the appearance of small canes.' Several kinds of oats are cultivated: the *potato oat* has long enjoyed the highest reputation in this country. The produce of oats varies greatly: not more than 20 bushels an acre are obtained from inferior ground; while 60, 70, and even 80, have been produced from good ground.

OATH (*ath: Sax.*), a solemn affirmation made in the presence of a magistrate or other person rendered competent by the law to administer it, in which the person sworn calls upon the Almighty to witness that his testimony is true: invoking his vengeance, and renouncing his favour, if what is said be false, or what is promised be not performed. A witness swearing falsely is subject to the penalties of perjury. By statute, all who hold offices of any kind under the government, members of the house of commons, ecclesiastical persons, members of colleges, schoolmasters, serjeants-at-law, barristers, &c., are required to take the oaths of allegiance, &c. The Quakers and Moravians—influenced by the sense which they attach to that text of Scripture in St. Matthew (v. 34) which says, 'Swear not at all,' and St. James's words (v. 12)—refuse to swear upon any occasion, even at the requisition of a magistrate, and in a court of justice, and they have been relieved from being compelled to do so by the legislature. Persons who cannot take an oath are declared by the existing law to be incapable of being witnesses; such are those who will not declare their belief in God, and in a future state of rewards and punishments, or who do not believe that perjury will be punished by the Deity; also those who are incapable of comprehending the nature of an oath. Declarations have been substituted for oaths, in a great number of cases; especially those relating to the customs, excise, and post-office. Oaths to perform illegal acts do not bind; nor do they excuse the performance of such acts. The Jews are sworn with their hats on.

OBADI'AH, or PROPHECY OF OBADIAH, a canonical book of the Old Testament, which is contained in one single chapter, and is partly an invective against the cruelty of the Edomites, and partly a prediction of the deliverance of Israel, and of the victory and triumph of the whole church over her enemies.

OBCOR'DATE (*ob*, down; and *cor*, a heart: *Lat.*), in Botany, shaped like a heart, with the apex downwards.

O'BEAH, a species of witchcraft practised among the negroes, the apprehension of which operating upon their superstitious fears, is frequently attended with disease and death.

OB'ELISK (*obeliskos*: a *dim.* of *obelos*, any pointed instrument: *Gr.*), in Architecture, a high quadrangular pillar, diminishing as it ascends, and terminating, not in a flat surface, but in a small pyramid. Obelisks are of Egyptian origin, and, according to Herodotus, were first erected in honour of the sun. It was formerly supposed that one of their uses was to find the meridian altitudes of the sun at different times of the year, serving instead of very large gnomons; but this opinion is now exploded, though it has been stated that Augustus erected one at Rome, in the Campus Martius, which marked the hours on a horizontal dial drawn on the pavement. Diodorus mentions two obelisks of Sesostris, placed before a Theban temple, which were 120 cubits high; and Herodotus, two others, 100 cubits high, one of which was erected before a temple at Sais, and the other before the temple of the sun at Heliopolis. In the plenitude of their power the Romans removed many of these relics, of times then ancient, from their original situations into Italy, and re-erected them there. One of these obelisks, now standing at Rome—that of St. John of Lateran—is 105 feet in height without the pedestal, and weighs 440 tons. The obelisk next in size was, on being brought from Egypt, placed in the Vatican circus by Caligula; but it now stands in the piazza of St. Peter's, and, including the pedestal, is 132 feet in height. The obelisk of Luxor, now at Paris, is 76 feet high. Cleopatra's Needle, an obelisk given to the British nation, but still lying in Egypt, is 63 feet long. The ancient Egyptians must have had an extraordinary knowledge of mechanics, to have been able to bring these and similar masses from the quarries, and elevate them to their respective positions; even in modern times, to do this is considered a wonderful feat of engineering.——In Printing, an *obelisk* (†) is used as a reference to a note in the margin or at the foot of the page.

OBE'SITY (*obesus*, fat: *Lat.*), a tendency to the formation of fat, which often amounts to a disease. There have been some very remarkable examples of obesity. The celebrated Daniel Lambert, who died at 40 years of age, weighed, a little before his death, 739 lbs. And there is, in the 'Philosophical Transactions,' an account of a girl, only 4 years old, who weighed 256 lbs.

O'BIT (*obitus*, death: *Lat.*), in the Roman Catholic church, a funeral solemnity, or office for the dead. In religious houses there is a register, in which are entered the *obits* of their founders and benefactors, which is thence termed the *obituary*.

OB'ITER DICTUM (spoken by the way: *Lat.*), amongst lawyers, an opinion of a judge not material to the point at issue.

OB'JECT-GLASS, in Optics, the glass of a telescope or microscope next the object. Its purpose is to form a picture which may be magnified by the eye-glass.

OBJECT'IVE CASE (*objectus*, an object: *Lat.*), in English and other grammars, a term used for the *accusative* case. The objective case is that of the noun to which the action refers. Thus, in 'I reminded the master,' *master* is in the accusative or objective case.—OBJECTIVE LINE, in Perspective, the line of an object, drawn on the geometrical plane, the representation of which is sought for in the draft or picture.——OBJECTIVE PLANE, any plane situated in the horizontal plane, the perspective representation of which is required.

OB'LATE (*oblatus*, offered: *Lat.*), in Ecclesiastical Antiquities, a person who, entering the monastic state, gave all his goods to the community. Also, one dedicated from early life by his parents to a religious order; or, a layman residing in a religious community, to which he had assigned his property, either for ever, or during his residence. Such persons were lay-brothers, and the form of their admission was putting the bell-ropes of the church round their necks, as a kind of dedication to its service. They wore a religious habit different from that of the monks. A layman who had made over to a community not only his property, but his person as a bondsman, was termed an *oblate*. Also, in France, an invalided soldier, recommended to a monastery for maintenance by the king, who had the privilege of naming several for that purpose.——OBLATE (*oblatus*, flattened: *Lat.*), in Geometry, an epithet for any figure that is flattened or shortened; as an *oblate spheroid*, such as our globe, which has its axis shorter than its middle diameter.

OBLA'TION (*oblatio*, an offering: *Lat.*), a sacrifice or offering made to God. In the canon law, oblations are defined to be anything offered by godly Christians to God and the church, whether moveables or immoveables. Till the 4th century, the church had no fixed revenues, the clergy wholly subsisting on voluntary oblations.

OBLIGA'TION (*obligatio*, a being bound: *Lat.*). In a Legal sense, *obligation* signifies a bond.

OBLIGA'TO (bound: *Ital.*), in Music, a term used with regard to those voices or instruments which are indispensable to the just performance of a piece.

OBLI'QUE (*obliquus*, slanting: *Lat.*), deviating from a perpendicular line or direction: as an oblique angle, &c., that which is not a right one.——OBLIQUE PLANES, in Dialling, are those which decline from the zenith, or incline towards the horizon.——OBLIQUE ASCENSION and DESCENSION, in Astronomy, those points of the equinoctial which rise and set with the sun, or any other point of the heavens in an oblique sphere.——OBLIQUE SAILING, is when a ship sails upon some rhomb between the four cardinal points, making an oblique angle with the meridian.

OBLIQ'UITY (*obliquitas: Lat.*), deviation from a right line; a direction which is neither parallel nor perpendicular: generally applied to the ecliptic, which deviates from the plane of the earth's equator, 23° 27′ 36·52″.

O'BOE. [See HAUTBOY.]

OB'OLUS (*obolos: Gr.*), a small Grecian silver coin, worth rather more than three-halfpence. It was this coin which was placed in the mouth of the dead, to pay Charon for their passage over the Styx.——OBOLUS, as a weight, the sixth part of a *drachma*.

OBO'VATE (*ob*, down; and *ovatus*, shaped like an egg: *Gr.*), in Botany, *obversely ovate*, or ovate inverted, a term for a leaf the narrow end of which is downwards.

OBSECRA'TIO (*Lat.*), in Roman Antiquity, a solemn ceremony performed by the chief magistrates of Rome, to avert any impending calamity. It consisted of prayers offered up to those gods whom they supposed to be enraged. So exact were they in observing the prescribed form on these occasions, that a person was appointed to read it over to him who was to pronounce it; and the most trifling omission was held sufficient to vitiate the whole solemnity.

OBSECRA'TION (last), in Rhetoric, a figure in which the orator implores the assistance of God or man.

OBSERV'ATORY (*observatio*, a watching: *Lat.*), a building fitted up with astronomical, magnetical, or meteorological instruments, for the purpose of making observations. We find astronomical observatories mentioned at a very early period; some of them existed in Chaldæa, ancient Persia, India, and China. The most celebrated modern ones are those at Greenwich, Paris, Berlin, St. Petersburg, Munich, Palermo, and Cambridge, U.S.; and the accuracy of their instruments is such, that the astronomers who use them are enabled to calculate to the 3600th part of a minute of time, and the 216,000th part of a degree. The first regular observatory erected in Europe was that of Tycho Brahe, in 1576. The Greenwich observatory was built in 1675, by order of Charles II. at the instance of Sir Jonas Moore and Sir Christopher Wren; the former being surveyor-general of the ordinance. The duty of making observations was first committed to John Flamsteed, a man who, as Halley expresses it, seemed born for the employment. In the year 1690, having provided himself with a mural arch, of seven feet diameter, well fixed in the plane of the meridian, he began to verify his catalogue of fixed stars, which hitherto had depended altogether on the distances measured with the sextant, after a new and very different manner, viz. by taking the meridional altitudes, and the moments of culmination, or, in other words, the right ascension and declination. In the space of upwards of forty years this astronomer collected an immense number of observations, which may be consulted in his 'Historia Cœlestis Britannica,' published in 1725; the principal part of which is the British catalogue of fixed stars. This observatory is situated on the highest eminence of Greenwich park, about 160 feet above low-water mark. The observations made here not only possess unrivalled accuracy, but have been the foundation of the most important work on practical astronomy ever published, viz. the Nautical Almanack, which Maskelyne commenced in 1767. There are many other observatories in the United Kingdom, both public and private. The instruments essentially necessary for an observatory are a *transit instrument*, and *sidereal clocks*, for observing right ascensions; a *circle*, for observing polar distances; a *barometer* and *thermometer*, for observing the state of the atmosphere, that the corrections for refraction may be made with accuracy. For the purpose of observing the moon still nearer to her conjunctions with the sun, an *altitude and azimuth instrument*, of extraordinary steadiness, was erected in the observatory at Greenwich, in 1847.—The places where meteorological and magnetic observations are carried on are also styled observatories. The Observatory of Kew, established and still supported by the British Association, is devoted to both these purposes.

OBSID'IAN, in Mineralogy, a glassy lava, of various colours, but usually black, and nearly opaque. It consists of silica and alumina, with a little potash and oxide of iron. Pliny says it received its name from Obsidius, who first found it in Ethiopia.

OBSID'IONAL COINS (from *obsideo*, I besiege: *Lat.*), in Numismatics, coins of various base metals, and of different shapes, struck in besieged places, as a substitute for current money. The oldest known are those struck at the siege of Pavia, under Francis I.

OBSIDIONA'LIS CORO'NA (a siege crown, from same *deriv.*), a crown or garland made of grass or herbs found on the spot, and given by the Romans to such generals as had delivered a Roman army or fortress besieged by the enemy.

OB'TURATORS (*obturo*, I stop up: *Lat.*), in Anatomy, muscles which fill up openings in the bones.

OCCIDEN'TAL (*occidentalis*, westerly; *Lat.*), *western*, in the direction of where the sun sets; opposite to *oriental*, or *eastern*, the direction in which the sun rises.——OCCIDENTAL, in German Sculpture, a term applied to those precious stones which are of an inferior kind.

OC'CIPUT (*Lat.*), in Anatomy, the hinder part of the head.——*Occipitis os*, called also *os memoriæ*, and *os nervorum*, that bone which forms the posterior and inferior part of the skull. It is of an irregular figure, convex on the outside, and concave internally; and is thicker and stronger than any other of the bones of the head, except the petrous parts of the *ossa temporum*.

OCCULTA'TION (*occultatio*, a hiding: *Lat.*), in Astronomy, the obscuration of any star or planet by the interposition of any other body, as the moon, &c. Like a solar eclipse, an occultation is confined to only a portion of the terrestrial globe, for the moon is not between the star and all parts of the earth. As the motion of the moon in her orbit is from west to east, the first contact or *immersion* must occur on her eastern limb; and the *emersion*, or reappearance, on her western. By analogy, a total eclipse of the sun is an occultation of that luminary.

OCCULT' SCI'ENCES (*occultus*, concealed: *Lat.*), a term applied to the imaginary sciences of former times—alchemy, astrology, but, above all, magic.

O'CEAN (*ōkeanos: Gr.*), the name given to that great mass of salt water which surrounds the land, covering nearly three-quarters of the globe. There is a good deal of disparity between the extent of the ocean in the two hemispheres, there being an excess of land in the northern hemisphere over that of the southern in the ratio of 11 to 4. It is remarkable that the line of the equator lies upon sea for five-sixths of its length. The ocean, though really continuous, is, for convenience of description, divided by geographers into five portions:—1. The Pacific ocean, which separates Asia from America, and is the largest of all—being of greater extent than the whole of the dry land; 2. the Atlantic ocean, having Europe and Africa on its eastern shore, and America on its western; 3. the Indian ocean, which washes the south of Asia and the south-eastern coast of Africa; 4. the Arctic ocean, which surrounds the north pole; and 5. the Antarctic ocean, which surrounds the south pole. Other smaller parts of this great connected body of water are termed *seas*. The bed of the ocean presents the same irregularities of aspect as the surface of the land. It is diversified by rocks, mountains, plains, and deep valleys. The greatest depth that has ever been sounded is 25,000 feet, and this was in the North Atlantic immediately to the southward of the Great Bank of Newfoundland. Laplace calculated the *mean* depth of the great oceans to be at least 21,000 feet. The level of the ocean, independently of the changes produced by the tides, is not everywhere the same—that is, it does not form a part of the same spheroid; but the difference is not so great, in some cases, as has been supposed. Gulfs and inland seas are affected according to their position with regard to prevailing winds. The level of the Red sea was found to be 32½ feet higher than that of the Mediterranean, which is supposed to be lower than the ocean. The waters of the gulf of Mexico are believed to be about two feet higher than those of the Pacific ocean. The Baltic and Black seas are lower in summer than in winter, on account of the smaller supply from the rivers and the greater evaporation. The temperature of the ocean (water being a bad conductor of heat) is much more uniform than that of the land; at a certain depth it probably remains always the same. Its usual tint is a bluish green, but in certain localities its colour varies from peculiar circumstances, the difference being considered due to animalcules, to marine vegetables, to the colour of the soil, and very often to that of the sky. The ocean holds in solution a number of saline matters, the most abundant being common salt, which constitutes very generally two-thirds of the whole. The saltness of the ocean is very uniform, but it diminishes near large masses of ice; and the southern ocean contains rather more salt than the northern. The mean spec. grav. of sea water near the equator is 1·02777. [See TIDES, SEA, &c.]

OCHLOC'RACY (*ochlos*, a mob; and *krateo*, I govern: *Gr.*), a form of government in which the multitude or common people rule.

O'CHRE (*ochra: Gr.*), a genus of earths slightly coherent, composed of fine, smooth, soft, argillaceous particles. It is of various colours, always due to oxide of iron, which is sometimes so considerable in quantity that the ochre may be reckoned an ore of that metal: thus in certain kinds of the native *red ochre*, called in England *reddle* and *red chalk*.

O'CHRO, the seeds of the *Abelmoschus esculentus*, a malvaceous plant cultivated in warm climates. They are mucilaginous and form an ingredient in soups.

OC'TAGON (*oktō*, eight; and *gōnia*, an angle: *Gr.*), in Geometry, a figure of eight sides and eight angles. When all the sides and angles are equal, it is called a *regular octagon*.——In Fortification, a place with eight bastions.

OCTAN'DRIA (*oktō*, eight; and *anēr*, a male: *Gr.*), the eighth class of the Linnæan system of plants, comprehending those which have hermaphrodite flowers, with eight stamens.

OC'TANT (*octans*, an eighth part or half quadrant: *Lat.*), an instrument for measuring angles; which, from the manner in which the rays are reflected, are double those indicated by the arc; and hence it answers the purpose of a *quadrant*.——OCTANT, in Astronomy, an aspect of two planets when they are distant from each other 45 degrees, or the eighth part of a circle.

OC'TAVE (*octavus*, the eighth: *Lat.*), in Music, the eighth interval in a scale, which, as it affords a sound agreeing very closely with the first, is denoted by the same letter of the alphabet. The most simple perception that we can have of two sounds is that of unisons; the vibrations beginning and ending together. The next to this is the octave, where the more acute sound makes precisely two vibrations, while the deeper makes one; consequently, the vibrations of the two meet at every vibration of the more grave. Hence unison and octaves pass almost for the same concord; hence also the proportions of the two sounds that form the octave are, in numbers or in lines, as 1 : 2, so that two cords or strings of the same material, thickness, and tension, one of which is double the length of the other produce the octaves. The number of upper and lower octaves, or the manner in which the several octaves of the scale are to be chiefly distinguished, is not absolutely determined, on account of the continually increasing compass of instruments.——**OCTAVE**, in the Roman Catholic church, a festival day and the seven days immediately following it; the last or eighth day being termed *the octave*, or *octave day*. The circumcision is the octave of Christmas-day. A festival is supposed, in that church, to last during its octave, and therefore the office and mass on every day during the octave are invariably those of the festival, unless a greater feast interferes, by occurring within the octave. In the Roman Catholic church, all great holidays have octaves.

OCTA'VO (same *deriv.*), in Printing, the form of a page which is made by folding a sheet into eight leaves, or sixteen pages. It is often written 8vo.

OCTO'BER (*Lat.*, from *octo*, eight), the tenth month of the Julian year, consisting of thirty-one days; it obtained the name of October from its being the eighth month in the calendar of Romulus.

OCTOHE'DRON (*oktō*, eight; and *hedra*, a base: *Gr.*), in Geometry, one of the five regular or Platonic bodies; consisting of eight equal and equilateral triangles.

OCTOPET'ALOUS (*oktō*, eight; and *petalon*, a leaf: *Gr.*), in Botany, having eight petals or flower leaves.

OC'TOPUS (*oktō*, eight; *pous*, a foot: *Gr.*), a genus of cuttle-fishes, including the poulpe of our coasts and the polypus of ancient writers. When alarmed they vary their colours according to the nature of the ground over which they pass, in order to escape detection, and with the same object they eject a quantity of ink which discolours the water.

OCTOSPERM'OUS (*oktō*, eight; and *sperma*, a seed: *Gr.*), in Botany, containing eight seeds.

OC'TOSTYLE (*oktō*, eight; and *stulos*, a column: *Gr.*), in Ancient Architecture, the face of an edifice decorated with eight columns. These may be disposed either in a right line, as in the Pantheon; or in a circle, as in the temple of Apollo Pythius at Delphi, &c.

OC'TROI (*auctoritas*, authority: *Lat.*), an impost levied at the gates of many towns and cities in France, and applied partly to the general expenses of the state, and partly to local purposes. There were 1500 communes subject to it, forming a revenue of nearly 100,000,000 francs, of which the city of Paris alone, before the late changes, produced more than 30,000,000 francs annually.

OC'ULUS. [See EYE.]

OC'ULUS BE'LI (the eye of Belus: *Lat.*), a species of onyx; a semi-pellucid gem of a greyish-white colour variegated with yellow, and with a black central nucleus. It is of a roundish form, and its variegations represent the pupil and iris of the eye; whence the name.——**OCULUS MUNDI** (the world's eye), otherwise called *hydrophane*, a precious stone of an opaque whitish-brown colour; but becoming transparent by immersion in an aqueous fluid, and resuming its opacity when dry. It is found in Hungary, Silesia, and Iceland.——**OCULUS CATI** (cat's eye), or *Asteria*, a beautiful gem, approaching the nature of the opal, having a bright colour which seems to be lodged deep in the stone, and which shifts as it is moved in various directions. It is larger than a pea, and generally semicircular.

OD'ALISQUE (*odah*, a chamber: *Turk.*), a female slave in a Turkish harem.

ODE (*ōdē*, a song: *Gr.*), a poem belonging to that class of lyrical compositions which express the feelings of the poet with the vividness which present emotion inspires. The ancient odes had originally but one stanza, or strophe; but afterwards they were divided into three parts, the *strophe*, the *antistrophe*, and the *epode*. Unlike those of the moderns, they were usually intended to be sung and accompanied by some musical instrument. The *heroic ode* celebrates heroes or sons of gods, princes, victory, greatness of mind, &c. In course of time love and festivities were likewise thought suitable to the ode. Anacreon and Sappho excelled in this species of composition, and Horace has left us odes of various kinds, written with peculiar elegance. Among the moderns, Dryden's ode on St. Cecilia's day, and Pope's on the same subject, rank high. Coleridge and Wordsworth have also written some striking compositions of this class. Variety of numbers is essential to the ode. At first, indeed, its verse was of but one kind, but, in order to adapt it to music, the poets varied its measure to an almost boundless extent. The Pindaric ode is distinguished by its boldness and the loftiness of its flights; but Pindar, though the most daring and elevated of the lyric poets, amidst all his raptures has preserved harmony, and often uniformity, in his versification. The dithyrambic ode was a Bacchanalian song; and, on account of the attributes of the deity to which it was dedicated, it admitted of great irregularity; hence its name has been applied, in modern times, to all odes of a wild impetuous character.

ODE'ON, or **ODE'UM** (*ōdeion*, from same: *Gr.*), in Greek and Roman Architecture, a public building devoted to poetical and musical contests. The first odeon was built at Athens by Pericles, and was afterwards used for popular meetings and the holding of courts. The odeons resembled other theatres, except that they were not so large, and were covered with a roof.——The name *Odeon* has been given to one of the theatres in Paris, and in Munich to a concert-room.

ODONTAL'GIA (*odontalgia*, from *odous*, a tooth; and *algos*, pain: *Gr.*), in Medicine, the *tooth-ache*.

ODONTI'ASIS (*Gr.*, from *odontiao*, I cut my teeth), in Medicine, *teething*, or cutting the teeth.

ODONTOI'DES (*odous*, a tooth; and *eidos*, form: *Gr.*), in Anatomy, an epithet for the tooth-like process of the second vertebræ of the neck.

ODONTOL'OGY (*odous*, a tooth; *logos*, a discourse: *Gr.*), that branch of science which is concerned with the teeth of animals, their structure, mode of growth, &c.

OD'YSSEY (*Odussela*, from *Odusseus*, Ulysses: *Gr.*), a celebrated Greek epic poem, usually attributed to Homer, and containing the adventures of Ulysses in his return from the siege of Troy, and of his son Telemachus, who went in search of him. The principal adventures of Ulysses were his visit to the land of the Lotus eaters and to the land of the Cyclops, where Polyphemus lived in a cave; his arrival at Circe's island, where the enchantress turned his sailors into swine; his descent to the infernal regions, where he saw the shades of his old comrades; his dangerous voyage along the coast of the Sirens and between Scylla and Charybdis; his shipwreck, he only escaping to the island of Calypso, where he was detained seven years; his shipwreck on the coast of Phæacia, where he was hospitably entertained by King Alcinous, who possessed a beautiful garden, the description of which has been often referred to; his arrival at his own kingdom of Ithaca and his return home, when he found his wife Penelope besieged by suitors who had taken possession of his palace. He disguises himself as a beggar, the better to circumvent his enemies. Penelope at length promises to marry any one who can send an arrow from the bow of Ulysses through certain rings. The suitors all try, but fail; the beggar alone succeeds. Telemachus aids his father in slaying his enemies, and Penelope recognises him as her husband. Gods and goddesses are introduced assisting or opposing the hero and his son. The poem is written in hexameter verse and is divided into twenty-four books. It is thought to have been composed by one person, and to be of a later date than the Iliad, the author or authors of which had no hand in it. Grote thinks that both may be assigned to the period between 850 B.C. and 776 B.C.

ŒCUME'NICAL (*oikoumenikos*, from *oikoumenē gē*, the whole habitable earth: *Gr.* —*gē*, the earth, being usually omitted), *general*, or *universal;* as œcumenical council, bishop, &c.

ŒDE'MA (*oidēma*, from *oideo*, I swell: *Gr.*), in Medicine, a puffiness or swelling, arising from water having collected in the cellular membranes; it is attended with paleness and cold, retains the print of the finger when pressed with it, and is accompanied by little or no pain.

ŒNOTHE'RA (*oinothēras:* from *oinos*, wine; and *thēra*, a catching: *Gr.*—from its root, on being dried, acquiring the odour of wine), in Botany, a genus of plants, nat. ord. *Onagraceæ*, including the different species of evening primrose.

ŒSOPH'AGUS (*oisophagos: Gr.*), in Anatomy, the *Gullet*, a membranous and muscular canal, reaching from the fauces to the stomach, and conveying into it the food taken at the mouth. Its figure is somewhat like a funnel, and its upper part is called the *pharynx*.

ŒS'TRUS (*oistros: Gr.*), in Entomology, a genus of dipterous flies. [See GADFLY.]

OF'FERINGS (*offero*, I offer: *Lat.*), in a scripture sense, denote gifts presented by men at the altar, in order to express their entire dependence on and submission to the Deity. They constituted a principal part of the Israelitish worship. With regard to their meaning and object, these offerings were either *thank-offerings* and *peace-offerings*, which consisted of some animal, and were usually accompanied with offerings of vegetable food; or *trespass* and *sin-offerings*, in which only animals were used. In the last-mentioned cases, the priests were accustomed to sprinkle the parties who made the offerings with the blood of the victims, as a sign of reconciliation with Jehovah; and where the offering was an expression of the penitence and expiation of the whole people, it was usual to burn the victim; but if it concerned only private persons, the priests were allowed to eat the flesh.——OFFERINGS, in a modern sense, are church dues, payable by custom; as the Easter offerings, or the offerings at marriages, &c.

OF'FERTORY (*offertorium*, from same: *Lat.*), in the Romish church, a form of words, in the first part of the mass, by which the priest offers the elements previously to their consecration. In the English communion service, the sentences read by the officiating clergyman, while the people are making their offerings.

OF'FICE (*officium*, a business: *Lat.*), a particular charge or trust, or a dignity accompanied by a public function; as the office of a secretary of state, the office of a sheriff, of a justice of peace, &c. *Offices* are civil, judicial, ministerial, executive, legislative, political, municipal, ecclesiastical, diplomatic, military, &c.

OF'FICER (same *deriv.*), a person commissioned or authorized to fill a public situation or perform any public duty. Officers are civil, military, or ecclesiastical. The great officers of the crown, or of state, are the lord high-steward, the lord high-chancellor, the lord high-treasurer, the lord president of the council, the lord privy seal, the lord-chamberlain, the lord high-constable, and the earl-marshal.——In the army, *General officers* are those whose command is not limited to a single company, troop, or regiment, but extends to a body of forces composed of several regiments; such are the general, lieutenant-general, major-generals, and brigadiers.——*Staff officers*, those who belong to the general staff, as the quartermaster-general, adjutant-general, aides-de-camp, &c.——*Commissioned officers* are those appointed by a commission from the crown, from the general to the cornet or ensign, inclusive. ——*Brevet officers*, those who hold a rank without pay, or take rank according to the commission which they hold from the sovereign, and which is superior to the one for which they actually receive pay. ——*Subaltern officers*, all officers under the rank of captain.——*Non-commissioned officers* are sergeant-majors, quartermaster-sergeants, sergeants, corporals, and drum and fife-majors, who are appointed by the commanding officers of regiments.——In the navy, officers are distinguished into —*Commissioned officers*, who hold their commissions from the lords of the admiralty; *Flag officers*, admirals who hoist flags at the mast-head; *Petty officers*, those who are appointed by the captain; *Warrant officers*, the gunner, boatswain, and carpenter.

OFFI'CIAL (*officialis*, pertaining to office: *Lat.*), an ecclesiastical judge appointed by a bishop, chapter, archdeacon, &c., with charge of the spiritual jurisdiction of the diocese.——Also a deputy who is appointed by an archdeacon as his assistant, and who sits as judge in his court.

OFFIC'INAL (*officina*, a shop: *Lat.*), in Pharmacy, an appellation given to such medicines, whether simple or compound, as are directed by the college of physicians to be constantly kept in the apothecaries' shops.

OFF'ING, in sea language, a distance from the shore sufficient to afford deep water, and to render a pilot unnecessary. A ship in the offing is one not far from land; and when she keeps at a distance from the shore she is said to 'keep her *offing*.'

OFF'SET, in Accounts, a sum *set off* against another sum or account, as an equivalent.——In Architecture, the ledge or surface left uncovered when a wall is continued upwards with a diminished thickness.——In Gardening, the young shoots that spring from the roots of plants; which being carefully separated and planted in a proper soil, serve to propagate the species.——In Surveying, a perpendicular let fall from the stationary lines to a hedge, fence, or the extremity of an enclosure.

O'GEE (*ogive: Fr.*), in Architecture, the *Cyma reversa*, which see.

OGI'VE, in Architecture, an arch or branch of a Gothic vault; which, instead of being circular, passes diagonally from one angle to another, and forms a cross with another. The middle, where the ogives intersect, is called the *key*. The members or mouldings of the ogives are called nerves, branches, or reins; and the arches which separate the ogives, double arches. ——The pointed arch itself is termed by the French an ogive.

OIL (*öl: Ger.*; from *oleum: Lat.*), an unctuous substance, derived from various sources, both animal and vegetable. The distinctive characters of oil are inflammability, fluidity, and insolubility in water. The fat oils are little soluble in alcohol, but perfectly so in ether. From the peculiar properties of different oils, they are naturally divided into two kinds, the fixed or *fat oils*, and the *volatile* or essential oils: the former require a high temperature to raise them to a state of vapour, and indeed are decomposed before they reach their boiling point; but the latter are volatilized at or below the temperature of boiling water. The fat oils are generally bland to the taste; the volatile hot and pungent. When exposed to the action of the air, the oils by degrees lose their liquidity, thicken, and occasionally solidify. Such as become indurated take the name of *drying* oils; thus, linseed oil, poppy-seed oil, nut oil, &c. Such as do not harden in this way, but become rancid, are called *unctuous* oils; thus, olive oil, almond oil, rape-seed oil, &c. Those which burn best are a compound of carbon and hydrogen, which, changed into gas having a high temperature, by the application of heat, absorbs the oxygen of the air, emitting heat, flame, and light; but most oils contain oxygen also, and a few of the essential oils sulphur.——The fat oils are medicinally prescribed as relaxing, softening, and laxative remedies; they enter into many medical compounds, such as balsams, unguents, plasters, &c.; they are often used as food, being well adapted for that purpose, in cold countries, on account of their combustible elements, which maintain an effective combustion within the body. [See RESPIRATION.] When boiled with potash or soda, they are decomposed into glycerine, and fat acids which unite with the alkali, forming *soap*. Ammonia affords with them a milky emulsion, called *volatile liniment*; metallic oxides, and alkaline earths, insoluble soaps. Most of the fixed oils and fats are mixtures of two or more substances. Essential oils are employed as cordial, stimulant, and antispasmodic remedies. Chlorine, bromine, and strong mineral acids act energetically on the oils.

OIL GAS. [See GAS.]

OLE'FIANT GAS (*oleum*, oil; and *fio*, I make: *Lat.*), in Chemistry, a colourless elastic fluid, a compound of carbon and hydrogen, which has no taste, and scarcely any odour when pure. It extinguishes flame, does not support the respiration of animals, and is set on fire when a lighted candle is presented to it, burning slowly with an intense white light. It is obtained by the action of sulphuric acid on alcohol. When olefiant gas is mingled with chlorine in the proportion of one measure of the former to two of the latter, they form a mixture which takes fire on the approach of flame, and which burns rapidly with formation of hydrochloric acid, and a thick black smoke composed of particles of carbon; but if the gases are allowed to remain at rest after being mixed together, a very different action ensues. The chlorine, instead of decomposing the olefiant gas, enters into direct combination with it, and a yellow liquid (called Dutch liquid), which is like oil, and has an aromatic odour, not unlike that of caraways, is produced; hence the name of the gas.

OLE'IC A'CID (*oleum*, oil: *Lat.*; from *elaion*, olive oil: *Gr.*), one of the components of fats possessing a distinctly acid reaction. It has many properties that are common to margaric and stearic acids, also components of the fats.

O'LEINE (*oleum*, oil: *Lat.*), or **ELAINE** (*elaion*, oil: *Gr.*), in Chemistry, the thin oily part of fats. It may be pressed out of hog's lard and other solid fats; and may be separated from oils, by exposing them to cold, and then to pressure.

OLFAC'TORY NERVES (*oleo*, I smell of; and *facio*, I cause: *Lat.*), the pair of nerves which proceed from the brain to the nose, and cause the sense of smell. They are the first pair; and, perforating the ethmoid bone, are distributed over the mucous membrane of the nose.

OLIB'ANUM (*oleum Libani*, the oil of Libanus: *Lat.*), a gum-resin brought from the East Indies, which consists of tears or drops of a transparent yellow colour. When burned it exhales an agreeable odour, and is sometimes called *frankincense*. It was formerly used in medicine. It is produced by a tree called *Boswellia serrata*, nat. ord. *Amyridaceæ*.

OL'IGARCHY (*oligarchia*, from *oligos*, few; and *archo*, I govern: *Gr.*), a form of government, in which the administration of affairs is lodged in the hands of a few irresponsible persons.

OL'IVE (*oliva: Lat.*), in Botany, a genus of trees, nat. ord. *Oleaceæ*. The *Olea Europæa*, or common olive, the species most usually cultivated for its fruit, grows to the height of twenty or thirty feet, having an upright stem with numerous branches; the fruit is a unilocular drupe of a somewhat oval shape, containing an ovato-oblong nut with a kernel of the same form, and is almost the only example of a fruit with an oily pulp. The olive was celebrated in the mythology of the ancients; and olive wreaths were used to crown the brows of victors. It was revered by the Greeks and Romans, and was considered the emblem of peace and humility. The *athletes* anointed their bodies with olive oil when preparing for gymnastic exercises; and it was in common use after the bath. It is consumed in vast quantities, for culinary purposes, in many countries; and, as well as the pickled fruit, is the source of considerable trade. The quantity of olive oil imported into England in 1850 was nearly 21,000 tons. It is inodorous, and the taste is very mild; but if taken in large quantities it is purgative. When obtained by simple expression, without the use of boiling water, it is the best and purest; and that made in some parts of France is now the most highly esteemed. Dr. Clarke mentions an interesting fact, 'that, during a period of little more than two thousand years, Hebrews, Assyrians, Romans, Moslems, and Christians, have been successively in possession of the rocky mountains of Palestine; yet the olive still vindicates its paternal soil, and is found, at this day, upon the same spot which was called by the Hebrew writers *Mount Olivet*, and the *Mount of Olives*, eleven centuries before the Christian era.'

OL'IVINE (same *deriv.*), in Mineralogy, a gem of inferior value, being a sub-species of *prismatic chrysolite*, of a brownish or olive-coloured green, often inclining to a yellow hue, usually found in roundish grains in other stones. It frequently occurs in basaltic rocks, and is sometimes associated with meteoric iron. It contains oxide of iron.

OLIV'INITE (same *deriv.*), an ore of copper of an olive-green colour. It is a hydrated phosphate of copper, occurring, with quartz, in micaceous clay-slate.

OLYM'PIAD (*olumpias: Gr.*), a period of four years, by which the Greeks reckoned their time. This method of computation took its rise from the Olympic games, so famous in Grecian history, which were celebrated at intervals of four years. It is said that they were instituted 1354 years before the Christian era, and were revived by Iphitus, king of Elis, 844 B.C. About 100 years after was introduced the practice of designating the Olympiad by the name of the victor; and Corœbus was the first who received this honour. The Olympiad of Corœbus forms the principal era of Grecian chronology. The games in which he was victor were celebrated about the time of the summer solstice, 776 years before the era of the incarnation, in the 3938th year of the Julian period, and 23 years before the date assigned for the foundation of Rome. Subsequently to the introduction of the Metonic cycle, the Olympic year always began with the eleventh day of that moon which followed the solstice, and is usually regarded as commencing on the 1st of July. As the Olympiads began in the middle of the year, the first six months of a year of our era belong to one Olympiad, and the last six to another. Hence, to reduce the date by Olympiads to our era, multiply the number of the past Olympiad by 4, and add the odd years; subtract the sum from 777 if before Christ, or subtract 776 from the sum if after Christ; the remainder will be the year before or after Christ, if the event happened between July and January; but if it happened in the last six months of the Olympic year, that is, between January and July, the remainder must, in each case, be diminished by one. The method of computing time by Olympiads did not come into use until after the death of Alexander; it ceased at the 364th Olympiad, in the year 440 of the Christian era. History is much indebted to the Olympiads; they have served to fix the date of many important events; and, indeed, the history of Greece, before this method of computing time was observed, is almost entirely fabulous, or filled with anachronisms.

OLYM'PIC GAMES, in Antiquity, solemn games among the Greeks in honour of the Olympian Jupiter, which were celebrated once in every four years. Besides running, leaping, boxing, wrestling, and the quoit, there were horse-racing, chariot-racing, &c. Sometimes there were contests in eloquence, poetry, &c. The victor's prize was a wreath of wild olive. A material of small value was chosen, that the combatants might be stimulated by courage and the love of glory, more than by the sordid hope of gain. In fact, the glory of the conquerors (who were termed *Olympionicæ*) was inestimable and immortal. Their statues were erected at Olympia, in the sacred wood of Jove; they were conducted home in triumph on a car drawn by four horses, were complimented by poets, painters, &c.; and many privileges and immunities were thenceforth conferred on them. Not only all the states of Greece, but foreign nations also, resorted to these games, in great numbers, from the extremities of Egypt, from Libya, Sicily, and other countries. The combatants contended naked. At first they used to tie a scarf round their waist; but this having once thrown down a combatant by entangling his feet, and caused him to lose the victory, it was thenceforth laid aside. The priestesses of Ceres excepted, no females were permitted to be present; and if any woman was found to have passed the river Alpheus during the solemnity, she was to be thrown headlong from a rock.

OM'BRE DE SOLE'IL (the shadow of the sun: *Fr.*), in Heraldry, the sun borne in armoury, in such a way that the eyes, nose, and mouth, which are represented at other times, do not appear; and the colouring is so light that the field is seen through it.

O'MEGA, the name of the Greek long *o*. It is the last letter in the Greek alphabet, as *alpha* is the first; and from the expression in Revelations, 'I am Alpha and Omega, the beginning and the ending, saith the Lord, which is, and which was, and which is to come, the Almighty' (i 8), the characters of alpha and omega became with the Christians symbolical hieroglyphics.

OM'ELET (*omelette: Fr.*), a kind of pancake or fritter, made of eggs and other ingredients; much used in France and other countries.

O'MEN (*Lat.*), a casual indication, which men believe to authorize their conjectures regarding future events. Omens differ from other modes of divination, in being accidental. They constitute a superstition as ancient as the world itself; and there is a sameness regarding them, in distant times and countries, which is very remarkable. They may be divided into three classes — those derived from natural occurrences, relating to inanimate objects, as lightning, earthquakes, phosphoric appearances, &c; those derived from animals, especially birds, as the place of their appearance, their voices, actions, &c.; and those which the individual draws from sudden sensations of his own—sneezing has generally been looked upon as particularly ominous. With both Greeks and Romans the good omens came from the east, but the former stood facing the north and the latter the south; hence among the Greeks the right hand denoted good luck, and the left the contrary; among the Romans this rule was reversed, although their writers, in latter times, often adopted the Greek mode of expression. The practice of making ordinary events ominous of good or bad fortune, wherever it may have arisen, spread itself over the inhabited globe, and still prevails among the vulgar and unenlightened of all nations.

OMEN'TUM (*Lat*), in Anatomy, the *caul* or *epiploon:* a membranaceous covering of the bowels, usually furnished with a large quantity of fat; being placed under the peritoneum, and immediately above the intestines.

OM'NIBUS (for all: *Lat.*), omnibuses are of Parisian origin: having been first used in that city in 1825, and in London in 1829.

OM'NIUM (of all: *Lat*), a term relating to the public funds, and used to express the aggregate value of the stock or securities which the subscribers to a loan receive from government. As the omnium of every loan is the subject of extensive speculations, it is generally liable to considerable variations with respect to its current price, sometimes selling at a high premium, at other times at a discount.

OM'PHACITE (*omphakites*, unripe; *Gr.*—from its greenish colour), a mineral of a pale leek-green colour, massive or disseminated, and in narrow radiated concretions.

OMPHALOCE'LE (*omphalos*, the navel; and *kēlē*, a hernia: *Gr.*), in Surgery, an umbilical hernia, or rupture of the navel.

OMPHALOT'OMY (*omphalotomia:* from *omphalos*, the navel; and *temno*, I cut: *Gr.*), in Surgery, the operation of dividing the navel string

ONEIROCRIT'ICA (*Gr*: from *oneiros*, a dream; and *kritikos*, fit for judging), the art of interpreting dreams, and foretelling events from them.

ONGLE'E (*ongle*, a claw: *Fr.*), in Heraldry, an appellation given to the talons or claws of beasts or birds, when borne of a different tincture from that of the body of the animal.

ON'ION (*ognon: Fr.*), the common species is the *allium cepa* of botanists, nat. ord. *Liliaceæ*. Upwards of sixty species of this genus are known, all with bulbous roots. The leek, garlic, and shallot belong to it.

ONOMATOPŒ'IA (*onomatopoiia*, from *onoma*, a name; and *poieo*, I make: *Gr*), in Rhetoric, a figure in which words are formed so as to resemble the sounds made by the things signified; as the *buzz* of bees, the *cackling* of hens, &c.

ONTOL'OGY (*ōn*, a being; and *logos*, a discourse · *Gr.*), the doctrine of being; a name formerly given to that branch of metaphysics which treats of the essential qualities of things

O'NUS PROBAN'DI (*Lat.*), in Law, the obligation of proving what has been alleged.

O'NYX (*onux: Gr*), in Mineralogy, a species of agate, stratified with opaque and translucent lines; being a semi-pellucid gem of different colours The bluish-white kind is looked upon as the true onyx of the ancients. It is valued in proportion as the colours are distinct and opposed. Any stone exhibiting layers of two or more colours, strongly contrasted, is called an *onyx*.——ONYX, in Medicine, an abscess, or collection of pus, between the lamellæ of the cornea; so called from its resemblance to the *onyx* stone. The diagnostic signs of it are, a white spot or speck, prominent, soft, and fluctuating.

O'OLITE (*ōon*, an egg; and *lithos*, a stone: *Gr.*), in Mineralogy, a species of limestone composed of small rounded grains like the roe of a fish. Each grain has commonly a particle of sand for a nucleus about which the calcareous matter is arranged concentrically.——The *oolitic series*, in Geology, includes the great series of secondary deposits lying between the Lower Cretaceous or Neocomian beds and the Lias. In these strata are found the best materials for building which the midland and eastern counties of England produce, and the formations are systematically divided into —1. *the upper oolite*, consisting of the Purbeck beds of Dorset and Wilts, the Portland beds and the Kimmeridge clay of Dorsetshire; 2. the *middle oolite*, which includes the Coral rag and the Oxford clay; and 3. the *lower oolite*, which includes the Great or Bath oolite and the Inferior oolite. The oolitic rocks extend across England from the Yorkshire coast to the Dorsetshire coast, having an average width of nearly 30 miles. On the continent of Europe the oolitic series is well developed, and the whole mountain chain of the Jura is composed of oolitic beds, whence the term Jurassic applied to that series.

OPAC'ITY (*opacitas*, from *opacus*, dark: *Lat.*), the quality which renders anything impervious to the rays of light. It may exist in bodies of any colour.

O'PAL (*opalus*: *Lat.*), in Mineralogy, a precious stone of various colours, which comes under the class of pellucid gems. It consists of silex, with about ten per cent. water. It is found in many parts of Europe, especially in Hungary. It is brittle, and when first dug out of the earth is soft; but it hardens and diminishes in bulk by exposure to the air. The substance in which it is most commonly found is a ferruginous sandstone. It is generally dull, owing to foreign admixture; but in some specimens a lively play of light is observable, while others show different colours by reflected and transmitted light. There are many varieties or species, the chief of which are—1. *noble opal*, which exhibits brilliant and changeable reflections of green, blue, yellow, and red; 2. *fire opal*, which simply affords a red reflection; 3. *common opal*, whose colours are white, green, yellow, and red, but without the play of colours; 4. *semi-opal*, the varieties of which are more opaque than common opal; 5. *wood opal*, which appears in the shape of trunks, branches, and roots of trees; 6. *hydrophane*, which assumes a transparency only on being thrown into water; 7. *hyalite*, which occurs in small reniform and botryoidal shapes, and is transparent; and 8. *menilite*, which occurs in tuberose masses, and is opaque.

OPALES'CENCE (last), a coloured shining lustre, reflected from a single spot in a mineral. It is sometimes simple, and sometimes radiated.

OP'ERA (a work: *Ital.*), a dramatic composition, of which music makes the essential part; and in this it is distinguished from other dramas which are accompanied by music. [See MELODRAMA.] According as the serious or the comic character prevails in the opera, it is termed *opera seria* or *opera buffa*. The name of *grand opera* is given to that kind which is confined to music and song, of which the *recitativo* is a principal feature. An *operetta* is a short musical drama of a light character: to which species of composition the French *vaudeville* belongs. Italy may be considered the birthplace and cradle of the opera; but in Germany romantic operas have also, of late years, been produced with great success.

OP'ERA-GLASS, in Optics, a Galilean telescope, so called from its use in theatres. The field of view of this instrument is very limited, and therefore it cannot be used with a high magnifying power. It is generally *binocular*—that is, consists of a small telescope for each eye. These telescopes are connected together, and have their foci adjustable by turning the same screw.——The name is applied also to an instrument which causes objects to be seen in a direction different from that towards which it is pointed. The rays from the object really looked at enter at the side, are reflected to the eye-glass, and are thence transmitted to the eye. The person who uses it seems to be looking towards a very different point from that to which his attention is really directed.

OPERA'TION (*operatio*: *Lat.*), in Surgery, any methodical action of the hand, performed on the human body, with a view to heal an injured or diseased part, whether instruments are used or not.——Military or naval *operations* signify the movements of an army or fleet to effect some object of warfare.

OPER'CULUM (a lid, from *operio*, I cover: *Lat.*), in Conchology, the plate with which some species of molluscs close the aperture of their shells.——In Botany, the lid which some capsular seed-vessels possess, and which falls off when the seeds are ripe.

OPHICLEI'DE (*ophis*, a serpent: and *kleis*, a key: *Gr.*), a powerful bass wind instrument in a brass band. It is of modern introduction

OPHID'IAN (*ophis*, a serpent; *Gr.*), in Zoology, a term given to reptiles belonging to the order of SERPENTS, which see.

OPHIOL'OGY (*ophis*, a serpent; and *logos*, a discourse: *Gr.*), that part of natural history which treats of serpents.

O'PHITE (*ophitēs*, like a serpent: *Gr.*), in Mineralogy, *serpentine*, or green-speckled porphyry; a dusky green stone of different shades, sprinkled with spots or crystals of a lighter green, so as in some measure to resemble the back of a serpent.

OPHTHAL'MIA (*Gr.*, from *ophthalmos*, the eye), in Medicine, an inflammation of the mucous membrane which covers the globe of the eye, and of the correspondent surface of the eyelids. It may be induced by many different exciting causes, such as sudden transition from heat to cold, residence in damp or sandy countries in the hot season, exposure of the eyes to the vivid rays of the sun, the suppression of some habitual discharge, &c.

OPHTHALMODYN'IA (*ophthalmos*, the eye; and *odunē*, pain: *Gr.*), in Medicine, a violent pain in the eye.

OPHTHAL'MOSCOPE (*ophthalmos*, the eye; and *skopeo*, I examine: *Gr.*), an optical apparatus by which a surgeon can examine the interior of the eye in living persons. It is extremely useful in ascertaining the seat and nature of the disease.

OPIN'ION (*opinio*, from *opinor*, I think: *Lat.*), the judgment which the mind forms of any proposition, of the truth or falsehood of which there is not sufficient evidence to produce absolute certainty.

OPISTHOT'ONOS (*Gr.*: from *opisthen*, backwards; and *tonos*, a straining), in Medicine, a spasmodic action of the muscles of the back, which causes the body to arch backwards. This condition is observed in cases of tetanus. The opposite condition, or *emprosthotonos* (*emprosthen*, forwards:

Gr.), is a tetanic spasm of the anterior muscles of the trunk, by which the body is bent forwards.

O'PIUM (*opos*, juice : *Gr.*), the inspissated juice of a species of poppy, the *Papaver somniferum*, a native of Turkey and other eastern countries, but now naturalized in many parts of Europe. It is obtained by wounding the unripe seed capsules, collecting the milky juice which exudes, drying it in the sun, and kneading it into cakes. Opium is the most energetic of narcotics, and at the same time one of the most valuable of medicines. The opium of commerce is in cakes, covered with pieces of dried leaves, and the seed capsules of some species of *Rumex*. It should be of a rich brown colour, a tough consistency, and smooth uniform texture. Its peculiar narcotic smell ought to be strong and fresh ; its taste is hot, and somewhat acrid Its activity as a medicine depends on the presence of *morphia*, an alkaline base, in combination with *meconic acid*. It contains also *narcotine*, *narceine*, *codein*, gum, resin, extractive matter, and small quantities of other proximate elements. Its great consumption is in China, where, though it is contraband, 27,000 chests of it are used per annum. In 1850, the quantity imported into England was upwards of 126,000 lbs. ; the duty has been, since 1836, only 1*s*. per lb

OPOBAL'SAM (*opobalsamon*, from *opos*, juice, and *balsamon*, balsam : *Gr.*), in Medicine, the *balm of Gilead*, which see.

OPODEL'DOC, in Pharmacy, a saponaceous camphorated liniment : being a solution of soap in alcohol, with the addition of camphor and essential oils. It is considered to be a good remedy for sprains, bruises, &c.

OPOP'ANAX (*Gr.:* from *opos*, juice ; and *panakēs*, all-healing), the concrete juice of an umbelliferous plant, a native of the Levant, the *Opopanax chironum* of botanists. It is usually imported in loose granules or drops, but sometimes in larger masses, of a reddish-yellow colour, and white within. It has a strong smell and an acrid taste.

OPOS'SUM, a marsupial animal of the genus *Didelphis*, which is peculiar to the American continent. There are several species, which live in woody places, and feed on eggs, insects, and fruits. The female is remarkable for having, like the kangaroos, an external pouch in the abdomen, in which she carries her young. On the ground, the opossum's progress is awkward and clumsy, but on the branches of a tree he advances with great celerity and ease, using his tail, which is prehensile, to assist his motions. Instead of flying at the approach of danger, opossums lie close to the branch on which they are clinging. When they are discovered, the branch is shaken violently, which causes them to drop to the ground ; and if the hunter is unaccompanied by dogs, they steal slowly away, and, gathering themselves into as small a compass as possible, remain perfectly quiet as if feigning death.

OPPIL'ATIVES (*oppilo*, I stop up : *Lat.*), medicines which shut up the pores

OPPOSITIFO'LIOUS (*oppositus*, placed against ; and *folium*, a leaf : *Lat.*), in Botany, an epithet for a peduncle placed opposite to the leaf.

OPPOSI'TION (*oppositio : Lat.*), in Astronomy, that aspect or situation of two stars or planets, in which they are diametrically opposite to each other, or 180 degrees apart. ——In Logic, the disagreement between propositions which have the same subject or the same predicate, but differ in quantity, in quality, or in both.——In Politics, the name given in Great Britain to that party in parliament which is opposed to the administration for the time being, and which would, most probably, succeed to power were it displaced.

OPSIOM'ETER (*opsis*, sight; and *metron*, a measure : *Gr.*), an instrument for measuring the extent of the limits of distinct vision in different persons, for the purpose of ascertaining the focal length of the lenses necessary for correcting the imperfections of the eye.

OP'TATIVE (*optativus*, expressing a wish: *Lat.*), in Grammar, a mode or form of a Greek verb, by which is expressed the wish or desire to do a thing.

OP'TICS (*optikos*, pertaining to seeing: *Gr.*), the science which treats of the laws of vision and light, whether direct, reflected, or refracted. In a more simple application *optics* is the science of direct vision only, while the science of the laws and properties of the rays of light, when considered as reflected, is called *catoptrics*, and the science of refracted rays *dioptrics ;* but in its general sense, optics comprehends the whole of that of which catoptrics and dioptrics are two parts. For information regarding the different branches of this science, recourse must be had to the different heads. [See EYE, LIGHT, MICROSCOPE, REFLECTION, REFRACTION, TELESCOPE, &c.]——OPTIC ANGLE, that which the optic axis of the eyes make with one another, as they tend to meet at some distance before the eyes. ——OPTIC AXIS, the axis of the eye, or a line going through the middle of the pupil and centre of the eye.——OPTIC NERVES, in Anatomy, the second pair of nerves from the brain, which perforate the bulb of the eye, and serve for the sense of sight.——OPTIC PLACE of a star, in Astronomy, that point of its orbit in which to our eye it appears to be.——OPTIC PYRAMIDS, a pyramid formed by rays drawn from the several points of the perimeter to the eye.

OP'TIMISM (*optimus*, best : *Lat*), that philosophical doctrine which maintains that this world, in spite of its apparent imperfections, is the best that could have been devised.

OP'TIMUS MAX'IMUS (best greatest: *Lat.*), epithets given by the ancient Romans to Jupiter, on account of his superlative greatness and goodness.

OP'TION (*optio*, from *opto*, I choose : *Lat.*). In Ecclesiastical Law, in former times, when a bishop was consecrated by an archbishop the latter had the right of naming a clerk or chaplain to be provided for by the bishop. Instead of this the bishop now makes over to the archbishop the next presentation to a benefice in the bishop's disposal. This is called the archbishop's option; it is the private patronage of the latter, and descends to his personal representatives.

OR (gold: *Fr.*), in Heraldry, a colour, otherwise called *gold*, or *yellow*, which, in engravings, is represented by small dots all over the field or charge.

OR'ACLE (*oraculum*, from *oro*, I speak: *Lat.*), in Heathen Antiquity, a pretended revelation of future events, or the will of supernatural powers, through the medium of a priest or priestess. The most famous oracles were those of Apollo at Delphi, and of Jupiter Ammon in Egypt. [See AMMON.] In the founding of cities and colonies, the introduction of new governments, the undertaking of important enterprises, and particularly in all cases of great urgency, the oracles were consulted, and rich gifts presented to them. Darkness and ambiguity in the responses were made to cover those mistakes which would otherwise have disclosed the imposture; and thus for many centuries they obtained the veneration and homage, not only of the ignorant multitude, but of monarchs, warriors, and philosophers. They were extremely venal; the rich and powerful had no difficulty in obtaining a favourable answer. It has also been asserted that they ceased at the birth of Christ. But the edicts of the emperors Theodosius, Gratian, and Valentinian, show that they were consulted, at least occasionally, down to A D 328.

O'RANG-OU'TANG (man of the woods: *Malay*), in Zoology, the Indian or red orang (*Pithecus Satyrus*), with a flat face and distorted resemblance to the human form. These animals live in swampy forests, walk erect, feed on fruits, sleep on trees, and make a shelter against the inclemencies of the weather. They are clothed with reddish brown hair, and are remarkable for their strength, as well as their ability to use weapons with the hand. They inhabit the islands of Borneo, Sumatra, &c, and attain the height of four or five feet. They have neither tail, cheek pouches, nor ischial callosities. When full-grown they have an enormous laryngeal pouch. The African animal, corresponding to the orang-outang, is the *Chimpanzee*, which still more nearly resembles man.

OR'ANGE, the well-known fruit of the orange-tree, the *Citrus Aurantium* of botanists. The orange-tree is a low evergreen, bearing leaves resembling those of the laurel, and white flowers. It is a native of India and China, but was introduced by the Portuguese into other countries; it is very long lived. The orange-tree was not cultivated in Europe till the 14th century, nor in England till 1492. It is propagated by seeds, cuttings, layers, grafting, or inoculation. The principle varieties are the sweet or China, and the bitter or Seville orange. The orange trade is a very considerable one; in 1850, 360,000 boxes of oranges were entered for home consumption in this country, each box containing about 700 lemons and oranges. The peel, when preserved, forms an article of confectionary; and the flowers yield an essential oil, little less esteemed than *ottar of roses*. The wood is fine grained, compact, susceptible of a high polish, and is employed in the arts. The productiveness of the common orange is enormous. A single tree at St. Michael's, in the Azores, where our best oranges are obtained, has been known to afford 20,000 oranges fit for packing, exclusive of the damaged fruit and the waste, which may be calculated at one-third more.

OR'ANGEMEN, the name given by the Roman Catholics in Ireland to those who were zealous adherents of William III. Also the members of an association professing those principles on account of which that prince obtained the sovereignty.

OR'ATOR (*Lat*, from *oro*, I speak), in modern usage, signifies an eloquent public speaker, or a person who pronounces a discourse publicly on some special occasion. In ancient Rome, *orators* were advocates of a superior kind, differing from the *patrons*; the latter were allowed only to plead causes on behalf of their *clients*; whereas the former might quit the *forum* and ascend the *rostrum* or *tribunal*, to harangue the *senate* or the people. The *orators* had rarely a profound knowledge of the law, but they were eloquent, and their style was generally correct and concise.

ORATO'RIO (*Ital.*; from *oratorium*, a small chapel · *Lat.*), a musical performance of a dignified character, expressing various elevated and tender affections; dramatic, but destined only for musical execution, not for theatrical action. Properly speaking, the oratorio commenced when sacred music was distinctly separated from secular. It is probable that it originated with members of a society termed the fathers of the Oratory; who, to draw youths to church, had hymns and sacred stories written in dialogue and set to music. The people were induced to hear the sermon, that they might be present at the performance of the second part. The subjects, in early times, were the Good Samaritan, Prodigal Son, Tobit's Story, &c. The excellence of the composition, the band of instruments, and the performance, brought the oratory into great repute; and this species of musical drama obtained the general appellation of *oratorio*. Oratorios soon became great favourites in Italy, where they have been constantly performed during the carnival; and they have caused the production of the noblest and most elaborate compositions by the great masters of various countries. A character more elevated than it possessed at first was given to the oratorio by Handel, who devoted all his power to the chorus. He introduced it into England in 1720, though no oratorio was publicly performed in this country for twelve years after. Oratorios were, for a long period, performed twice a week during Lent.

OR'ATORY (*oratorius*, pertaining to an orator: *Lat.*), the art by which a speaker is enabled to persuade and convince his hearers, according to the rules of rhetoric. It properly consists of four parts, namely, invention, disposition, elocution, and pronunciation. Quintilian says, 'The faculty of speech we derive from nature; but the art of speaking from observation.' To constitute oratory, the language must be just and pertinent to the subject; it must be methodical, all parts of the discourse being disposed in due order and connection; and it must be embellished, and pronounced with eloquence. Diction, manner, gesture, modulation, a methodical arrangement of the several topics to be introduced, and a logical illustration of them, are all essential requisites in oratory; and, as Cicero has observed, 'the action of the body ought to be suited to the expressions, not in a theatrical way, mimicking the words by particular gesticulations, but in a manner expressive of the general sense, with a sedate and manly inflection.'

OR'ATORY, PRIESTS OF THE, a religious order founded by Philip Neri, in 1574, for the study of theology, and for superintending the religious exercises of the devout; its members not being bound by monastic vows. This order still exists in Italy, and there is a house in London; but the more important congregation of the *Fathers of the Oratory of Jesus*, founded at Paris in 1611, is no longer in being. The different societies which adopted this name were not necessarily connected in any way; and it has been assumed by various congregations of ecclesiastics living in community, but not bound by any special vow.

ORB (*orbis: Lat.*), in Ancient Astronomy, a hollow sphere. The heavens were supposed to consist of as many such concentric spheres as there were known planets. The sun was placed in the *orbis maximus*.

ORBICULA'RIS (of a round form: *Lat.*), in Anatomy, an appellation given to the constrictor muscle of the lips, or *osculatorius*; as also to the constrictor of the upper eyelid, which rises from the upper apophysis of the maxillary bone, near the larger canthus of the eye, and surrounds the eyelid with a series of circular fibres. This latter is called the *orbicularis palpebrarum*.

ORBIC'ULATE, or ORBIC'ULAR (*orbiculatus*, rounded: *Lat.*), in Botany, an epithet for a leaf whose margin is circular, or which has its longitudinal and transverse diameters equal.

OR'BIT (*orbita*, the track of a chariot-wheel: *Lat.*), in Astronomy, the path of a planet or comet in its course round the sun; thus the earth's orbit is the curve which it describes in its annual revolution, and which is usually called the *ecliptic*. Modern astronomers have ascertained that the orbit of every planet is an ellipse, having the sun in one of its foci; and that their motions in these ellipses are such, that a radius drawn from the centre of the sun to the centre of the planet always describes equal areas in equal times. The orbits of satellites, also, are ellipses.——In Anatomy, the two cavities under the forehead in which the eyes are situated, are termed *orbits*; and these organs are set in bony sockets.

OR'CHESTRA (*orchēstra*, from *orcheomai*, I dance: *Gr.*), the space in theatres between the stage and the seats of the spectators; appropriated by the Greeks to the chorus and the musicians, by the Romans to the magistrates and senators, and by the moderns to the musicians. The word is also used to denote any erection for the performers of a concert; or any instrumental band performing together in modern concerts, operas, or sacred music.

ORCHIDA'CEÆ (*orchis: Gr.*, one of the genera), in Botany, a natural order of herbaceous endogens, inhabiting all parts of the world, except those on the verge of the frozen zone, or which are excessively dry They are remarkable for the singular form of their flowers, many of which resemble insects. Some of them grow in the earth, others inhabit rocks and the branches of trees, and a few of them are parasites. They all belong to the Linnæan cl. *Gynandria*; they are frequently of an agreeable scent; and a few, as the *Vanilla*, produce an aromatic fleshy fruit. *Salep* is prepared from the amylaceous roots of some of the terrestrial species. Many of the epiphytal species have flowers of exquisite beauty, and these have been much sought after of late years by wealthy collectors. The very irregular structure of the floral organs has been a great puzzle to botanists, and has given rise to many theories. The latest is that of Mr. Darwin, which is probably the true one He considers that the flower consists of fifteen organs very much modified and some of them confluent, viz. three sepals, three petals (with one of which, the curiously formed labellum, two stamens are confluent), six stamens arranged in two whorls, one stamen alone being in the majority of cases fertile. However, in the genus *Cypripedium* (Lady's Slipper) two stamens of the inner whorl are fertile. Lastly, three stigmas, the two lower ones being usually confluent and the upper one modified into an organ called the rostellum. According to this view there are five simple parts, namely, three sepals and two petals; and two compound parts, namely, the labellum and the column, the latter being made up of three pistils and generally four stamens

OR'CINE, in Chemistry, the name of a colouring principle obtained from lichens. [See ARCHIL.]

ORDE'AL (*urtheil: Ger*), an ancient mode of trial, in which God was asked to manifest the truth, by leaving nature to its ordinary course, if the accused were guilty; by interposing a miracle, if innocent. It was borrowed from the pagans; it prevailed, during the middle ages, throughout almost the whole of Europe; and it is still practised in some parts of the East Indies. In England it existed from the time of the Confessor to that of Henry III., who abolished it by declaration. While it lasted, the more popular modes of resorting to it were those of *fire* and of *water*—the former, among the Saxons, for freemen and persons of rank, the latter for peasants. The method of administering the ordeal by fire, in England, was by placing nine red-hot ploughshares in a line, at certain distances from each other, and requiring the person accused to walk over them barefoot and blindfold. If his feet always alighted in the spaces between the shares, so that he passed over them unhurt, his success was considered a divine assertion of his innocence; if, on the contrary, he was burnt, the disaster was a proof of his guilt. The *ordeal by water* was of two kinds. In one, the arm was plunged into boiling water—up to the wrist if it was an *expurgatio simplex*, but up to the elbow if an *expurgatio triplex;* when the accused remained unhurt, he was deemed innocent; if he was injured, guilty. In the other, the person suspected was cast into a river or pond of cold water; and if he floated without an effort to swim, it was an evidence of innocence, but if he sank he was convicted.——*Ordeal by Combat* was when a person accused of murder was obliged to fight the next relation, &c., of the person who had been slain.—*Ordeal of the Cross* consisted in the litigants both standing upright before a cross; when he who fell, or changed his position first, lost his cause, or was condemned.——*The Trial of the Eucharist*, an ordeal which was used chiefly among the clergy, consisted in the accused taking the sacrament. It was believed that, if he were guilty, he would be immediately punished for the sacrilege. Sometimes the ordeal consisted in the choice of one out of two dice; at others, in the supposed murderer being obliged to touch the body of the slain, when, if the blood flowed, he was pronounced guilty. There is no doubt that, in the severe ordeals, the clergy took precautions to preserve those whom they desired to save, and modes of trial so liable to human collusion, and founded upon unwarranted ideas of the divine interference, have deservedly passed away. But the *fact* of their former existence remains attested by a form of words still required to be used by a person arraigned for trial. Such a one, in the days of ordeals, had it in his choice to put himself upon God and his country, or upon God alone. In the former case, he professed his readiness to abide the decision of a jury; in the latter he appealed to the ordeal, as to the immediate judgment of God. A prisoner, by pleading 'not guilty,' is now deemed, in treason and felony, to put himself upon the trial by jury; but he formerly did so expressly: being asked, 'How wilt thou be tried?' he answered, 'By God and the country'—meaning, by the latter, a jury.

ORDE'AL NUT, the seed of a tree, the *Tanghinia veneniflua*, nat. ord. *Apocynaceæ*, growing in Madagascar, where persons accused of sorcery are obliged to drink an infusion, and those who escape death by poison are declared to be innocent.

OR'DER (*ordo: Lat.*), in Zoology, a group of families, each of the latter being made up of genera; in the natural system of Botany, a group of genera; in the artificial system of Linnæus, a subdivision of a class.——**ORDER**, a term used in Astronomy, and applied to the motion of a planet. Planetary bodies are said to go *according to the order of the signs*, when their apparent motion is direct, proceeding from Aries to Taurus, thence to Gemini, &c.

OR'DERS, in Architecture, those systems of the parts of a building which are subject to uniform and established proportions. An order consists essentially of two parts, the column and entablature. The column includes the base, shaft, and capital; the entablature includes the architrave, frieze, and cornice. Though the column regulates the order, a building without columns may belong to an order, if its details are in accordance with the laws of that order. The height of a column is measured in terms of its lower diameter, supposed to be divided into sixty parts called *minutes*. The column varies from seven to ten diameters in the different orders. The entablature is generally divided into ten parts, three being given to the architrave, three to the frieze, and four to the cornice: except in the Doric, where the entablature is divided into eight parts, two being given to the architrave, three to the frieze, and three to the cornice.

OR'DERS, or HO'LY OR'DERS, the different ranks of ecclesiastical persons; or the *character* of such persons. The Roman Catholic church holds that there are seven orders:—four minor, those of janitor, exorcist, reader, and acolyte; three major or holy orders, those of sub-deacon, deacon, and priest. It does not consider the episcopacy as a separate order, but merely the perfection of the priesthood. It holds that holy orders constitute a sacrament. Previously to admission to the lowest order, the tonsure is conferred; it consists in clipping and shaving a small circular space on the crown of the head; the size of this space is increased as the cleric advances through the various orders. The reformed churches acknowledge only three orders: those of deacon, priest, and bishop.

OR'DERS, RELIG'IOUS, societies bound to observe the rules prescribed by their respective founders. An order, in fact, consists in the rules to be observed by those who enter it; thus some orders are more austere than others, and one order dresses in white, while another is habited in grey or black. There are three kinds of religious orders in the Romish church—the monastic, the military, and the mendicant. The *monastic orders* are the Basilian, instituted by Basil in the fourth century; the Augustinian, termed regular and secular canons, in the 4th; the Benedictines, by Benedict, in the 6th. The *military orders* were the knights of St. John of Jerusalem, called afterwards the knights of Rhodes, and still later the knights of Malta, founded in the 11th century; the knights-templars, in the 12th; and the Teutonic knights, also in the 12th. The latter, embracing the doctrines of the reformation, ceased to exist as an order. The *mendicant orders*, created by the papacy for its own political purposes, are the Carmelites, who pretend to derive their origin from the Jewish prophets that dwelt in Mount Carmel; the Augustinians, a revival, in the 11th century, of the order supposed to have been founded by Augustine in the 4th; the Dominicans, founded by Dominick in the 13th century; and the Franciscans, by Francis of Assisi, also in the 13th century. To these may be added the Jesuits, instituted by Ignatius Loyola in the 16th century; and a number of others of inferior note, which have been devised and established, from time to time, as the energy of those already existing diminished, their zeal cooled down, or their characters became impaired.

OR'DINARY (*ordinarius*, usual: *Lat.*), a term employed in the church of Rome, to designate the bishop of the diocese.——In English Law, it means an ecclesiastical judge—a bishop, as judge in his diocese; an archbishop, for the purpose of appeal, in his province.——ORDINARY, in the Court of Sessions in Scotland, a judge who, as the case may be, decides with or without a jury.——In the Navy, a term applied to the shipping not in actual service.——ORDINARY OF NEWGATE, a clergyman who is attendant in ordinary upon the prisoners in that gaol, preaches and reads prayers in the chapel, and attends and prays with condemned malefactors at the place of execution.——ORDINARY, in Heraldry, a portion of the escutcheon, included between straight or other lines; it should comprise the fifth of the shield. The chief ordinaries in common use are the pale, fesse, bend, bar, saltier, chevron, and cross [which see]. They are generally, but not necessarily, bounded by straight lines. If the lines are serrated, the ordinary is *indented;* other deviations from the straight line are termed *ingrailed*, *invected*, &c. When an ordinary has two sides, but is varied only on the upper, it is said to be *superingrailed*, *superinvected*, &c.; if only on the lower, *subingrailed*, *subinvected*, &c

OR'DINATE (*ordino*, I arrange: *Lat.*), in Geometry, a straight line drawn from any point in a curve, perpendicular to another straight line called the *absciss*. The absciss and ordinate together are called *co-ordinates of the point.*

ORDINA'TION (*ordinatio*, from *ordino*, I appoint to office: *Lat.*), the conferring holy orders, or initiating a person into the priesthood. In the church of England, the first thing necessary on application for holy orders is the possession of a *title*—that is, a means of support as a clergyman. The candidate is examined by the bishop, or his chaplain, respecting both his faith and his erudition; and must produce various certificates, particularly one signed by the clergyman of the parish in which he has resided during a given time; he must subscribe to the thirty-nine articles; must have attained his twenty-third year before he can be ordained a deacon, and his twenty-fourth to receive priest's orders. The ceremony of ordination is performed by the bishop, by the imposition of hands on the person to be ordained. The Roman Catholic church holds ordination to be a sacrament. It also requires a title, as a preservative against the multiplication of clergymen beyond their means of support; but this, in numerous instances, is evaded, as ordination is conferred with imaginary titles—for instance, that of *poverty* (*titulum paupertatis*). The term *ordination*, in the Presbyterian church, is applied exclusively to the solemn act by which a licensed preacher or probationer is inducted into the charge of a particular parish. Hence, in the Scottish church, a clergyman can be ordained more than once.

ORD'NANCE, a general name for artillery of every description. A large amount of inventions has been applied to the construction of ordnance, either with a view to getting a maximum of strength from a minimum of material, or of making it carry a very large ball. It requires to be very carefully cast, and the toughest quality of metal is employed. Some guns have hot rings of metal slipped upon them, in order to strengthen them. Guns are cast in a solid piece, and are afterwards bored by machinery, some being rifled; and breech-loading contrivances are frequently adopted, but they have a tendency to weaken the gun.

ORES, a general name for metals as they are dug out of the earth, where they are found in the four following states:—1. *pure*, that is, by themselves, or as alloys in combination with other metals; 2 as *sulphurets*, or in combination with sulphur; 3 as *oxides*, or in combination with oxygen; and 4. as *salts*, that is, in combination with acids. Metallic ores, after being taken from the mines, in general pass through several processes before they are in a state fit for use. They are first washed in running water, to clean them from loose earthy particles, and picked, to get rid of worthless stones, for which purpose the masses are previously reduced to a smaller size if too large. They are then crushed by hand or machinery, and sifted by contrivances of various kinds. When necessary, the ores are next roasted in heaps in the open air, between low walls, or in furnaces. Roasting in the open air is practised with iron ores, and such as are pyritous or bituminous. Roasting between walls is employed with pyritic sands, and, in general, with all ores containing arsenic, sulphur, &c., which are to be exposed several times to the action of fire. Furnaces are employed in roasting iron ores, and all others which are in the state of fine powder, or when the roasting is intended to be very perfect. The various metals are subjected to different processes for their reduction. Some are operated on without difficulty; others require much art, and the addition of proper fluxes. The substances naturally combined with metals, and which mask their metallic characters, are chiefly oxygen, chlorine, sulphur, phosphorus, selenium, arsenic, water, and carbonic acid. But some metals, as gold, silver, and platinum, often occur native—that is, in the metallic state, either alone, or forming alloys by being in combination with other metals. [See METALS, MINES, &c.]

OR'GAN (*organon*, an instrument: *Gr.*), an apparatus designed for the production of some certain action or operation; in which sense, the mechanical powers, and even the veins, arteries, nerves, muscles, and bones of the human body, may be called organs. The *organs of sense* are those parts of the body by which we receive the impressions or ideas of external objects; thus, the ears are the organs of hearing, the nerves are the organs of perception and sensation, and the tongue is the organ of speech.——The 'organic world' comprises the animal and vegetable kingdoms; minerals are not *organized* bodies. The various gradations of organized being, from man, through all the inferior animals, down to the most humble plant that grows, furnish a most curious and interesting subject of study.——**ORGAN**, in Music, a wind instrument, or rather a collection of instruments under the command of a single performer. It is a very ancient contrivance, but was little used until the 8th century. The first organ mentioned in history was a small portable instrument sent by the Emperor Constantine Copronymus to Pepin, the father of Charlemagne, in 757. St. Jerome mentions an organ with twelve pairs of bellows, which might be heard at the distance of a thousand paces, or a mile, and another at Jerusalem which might be heard at the Mount of Olives. There is an organ in the cathedral at Ulm, supplied by sixteen pairs of bellows; it is 93 feet high and 28 broad, and its largest pipe is 13 inches in diameter. The celebrated organ at Haarlem is 103 feet high and 50 broad; its great organ contains 16 stops; its upper manual, 15 stops; and the pedals, of which the largest pipe is 38 feet long and 15 inches in diameter, 15 stops. The organ in the town-hall at Birmingham contains 63 stops; it has four claviers or keyboards, and four miles and a half of trackers or wooden rods; its largest pipe, 32 feet in length, is 20½ inches in diameter; and there are two octaves and a half of bells At the Industrial Exhibition in London, in 1851, an organ was exhibited having 77 stops and 4500 pipes. The machinery of the organ is very superior to what it was in former times; it acts more easily, and as there is less leakage, the bellows do not require to be of the same power. Every part of it has been greatly improved. The size of an organ is usually expressed by the length of its longest pipe; thus, one of 32 or 16 feet. It generally consists, in reality, of two or more organs—the great organ, the choir organ, the swell organ, the pedals; each having usually its keyboard or clavier. The *stops* are contrivances for throwing one or more systems of pipes, or, as they may be very well termed, instruments, in or out of action, or combining them. And they receive their names from the kind of pipes with which they are connected, as the *flute* stop, the *trumpet* stop; or from their object, as coupling stops, &c. The word stop is applied also to the system of pipes itself; thus, the *trumpet stop* comprises all the trumpets belonging to the scale. There is, in all the stops, a different pipe for each note.

ORGAN'IC DISE'ASE (*organikos*, relating to an instrument: *Gr.*), one in which the structure of some organ of the animal body is morbidly altered. In a *functional* disease, the secretions or functions only are changed.

ORGAN'IC REMA'INS (same *deriv.*), a term given by geologists to the remains of animals and plants embedded in the strata of the earth. [See GEOLOGY, FOSSILS PALÆONTOLOGY.]

ORGANIZA'TION (*organizo*, I organize *Gr.*), the act of forming or arranging the parts of a compound or complex body in a suitable manner for use or service. Also the totality of the parts which constitute, and the laws which regulate, an organized body

ORGANOG'RAPHY (*organon*, an instrument; and *graphē*, a writing: *Gr.*), the description of the structure of plants, comprehending the various forms of their tissues, the exact organization of their parts performing vital functions, the relation which one part bears to another, and the dependence of the whole upon a common system.

ORGANOL'OGY (*organon*, an instrument; and *logos*, a discourse: *Gr.*), that branch of physiology which specially treats of the different organs of animals, but more particularly those of the human species.

OR'GANON, BACON'S The *Novum Organon Scientiarum*, or New Method of studying the Sciences, forms the second part of Lord Bacon's general work, the *Instauratio Magna*, first published in 1620. The Greek word *organon* signifies an instrument. His design was to lay before the world 'the science of a better and more perfect use of reason in the investigation of things and of the true aids of the understanding,' but, unfortunately, he completed only a small portion of the work he sketched Bacon gave his method the name of induction, and he grounded it on the uniformity of the laws of nature, so that, to borrow the words of Hallam, in certain conditions of phenomena the same effects or the same causes may be assumed. He endeavoured to establish these words on a more exact and finer process of reasoning than partial experience can effect. For the recurrence of antecedents and consequences does not prove a necessary connection between them, unless we can exclude the presence of all other conditions which may determine the event. Long and continued experience of such a recurrence, indeed, raises a probability of a necessary connection; but the aim of Bacon was to supersede experience in this sense and to find a shorter road to the result; and for this his methods of exclusion are devised. As complete and accurate a collection of facts connected with the subject of enquiry as possible is to be made out by means of that copious natural history which he contemplated or from any other good sources. These are to be selected, compared and scrutinized according to the rules of natural interpretation delivered in the second book of the *Novum Organon*, or such others as he designed to add to them; and if experiments are admissible these are to be conducted according to the same rules. Experience and observation are the guides through the Baconian philosophy, which is the handmaid and interpreter of nature.

OR'GIA (*Gr.*, probably from *erdo*, I perform sacred rites), in Antiquity, feasts and sacrifices performed in honour of Bacchus, instituted by Orpheus, and chiefly celebrated on the mountains by wild, distracted women, called *Bacchæ*. These feasts were held in the night; hence the term 'nocturnal orgies.' [See BACCHANALIA.]

OR'GUES (*orgue*, an organ: *Fr.*—from the appearance of the machine), in the Military art, a machine composed of several musket barrels united, by means of which several explosions are made at once, to defend breaches. [See INFERNAL MACHINE.] Also, long thick pieces of timber, pointed with iron, and hung over a gateway, to be let down in case of attack.

ORICHAL'CUM (*oros*, a mountain; and *chalkos*, brass: *Gr.*), in Antiquity, a metallic substance resembling gold in colour, but very inferior in value. It was known both to the Greeks and Romans; and although it has been a matter of dispute what this metal could be, it is highly probable that it was either the same kind of composition as our brass, or a mixed metal very analogous to it

O'RIEL, in Gothic Architecture, a bay window, and sometimes, with early writers, a recess. Oriel windows were usually ornamented with tracery. The fine oriel in Wolsey's Hall at Hampton Court may be cited as an example.

O'RIENT (*oriens*, rising: *Lat.*), in old Geography and Astronomy, the east, or eastern point of the horizon; thus called, because it is the point where the sun rises. ——In Surveying, *to orient* a plan is to mark its bearing with regard to the cardinal points.

ORIEN'TALS (*orientalis*, belonging to the east: *Lat.*), the natives or inhabitants of the eastern parts of the world. It is common to give this appellation to the inhabitants of Asia from the Hellespont and Mediterranean to Japan.

OR'IFLAMME (*auri flamma*, a blaze of gold: *Lat.*), the old royal standard of France, originally the church banner of the abbey of St. Denis. It was a piece of red taffeta fixed on a gilt spear, in the form of a banner, and cut into three points, each of which was adorned with a tassel of green silk.

OR'IGENISTS, in Church History, followers of Origen of Alexandria, a celebrated Christian writer, who lived in the third century, and held that the souls of men have a pre-existent state; that they are holy intelligences, and sin before they are united to the body; that the torments of the damned shall not be eternal, but that the devils themselves shall yet be happy, &c.

ORIL'LON (*Fr.*), in Fortification, a round mass of earth faced with a wall, raised on the shoulder of those bastions that have casemates, to cover the cannon of the retired flank.

O'RIOLE (*aureolus*, golden-coloured: *Lat.*), the *Oriola galbula* of ornithologists, a bird with yellow plumage, belonging to the family of thrushes which spends the summer in Europe, and the winter in more southern latitudes. There are other species well known in the United States of America for the richness of their plumage and the peculiar form of their nests

ORI'ON, in Astronomy, one of the forty-eight constellations arranged by Ptolemy. It is in the southern hemisphere, with regard to the ecliptic, but the equinoctial passes nearly across its middle. It contains seven stars, which are very conspicuous to the naked eye. Of these three are in a line and form the belt, pointing in one direction to Sirius, the Dogstar, and in the other to the cluster of the Pleiades. Immediately below the belt is Rigel in the foot of Orion Above the belt are Bellatrix on the right shoulder and Betelguez on the left shoulder. South of the belt is a cluster of stars forming the sword or the nebula of Orion. The name Orion is of great antiquity, and occurs in Job, Amos, and Isaiah.

ORLAN'DO FURIO'SO, the title of Ludovico Ariosto's great poem, published in 1516 at Ferrara There are forty-six cantos in OTTAVA RIMA, and the subject is the fabulous adventures of the Christian Knights and Moorish paladins of Charlemagne's age. The hero is Orlando (or Rolando), the champion of the Christians, who had been the hero of a poem, entitled 'Orlando Innamorato,' by Boiardo, who had represented him in love with Angelica, a Saracen princess. Ariosto took up the story, and painted Orlando driven mad by jealousy, in which state he does many absurd acts, but is at last restored to his senses by having his wits brought back to him from the moon! The war between Charlemagne and the Moors goes on throughout the poem, until the latter are driven out of France. There are besides many episodes, with abundance of giants, magicians, flying horses, enchanted palaces, and other wild creations of the fancy; so that Cardinal Ippolito, to whom the poem was dedicated, may very well have asked the author, as it is reported he did, where he had picked up so many absurdities. The poem has been translated repeatedly into English, and most European languages possess translations. The Italian reprints have been numerous, and its popularity amongst the writer's countrymen has been quite equal to that of Tasso's epic, the Jerusalem Delivered; although out of Italy the latter poem has perhaps been the greater favourite.

OR'LOP (*overloft: Teut.*), in a ship of war, a platform of planks laid over the beams in the hold, on which the cables are usually coiled. It contains also sail-rooms, carpenters' cabins, and other apartments.

ORNITH'OLITE (*ornis*, a bird; and *lithos*, a stone: *Gr.*), a *fossil bird*. The name is also applied to stones of various colours, bearing the figure of birds.

ORNITHOL'OGY (*ornis*, a bird; and *logos* a discourse: *Gr.*), that branch of natural history which treats of birds, a class in the animal sub-kingdom In the majority of birds every part of the frame is marked by lightness and buoyancy; their plumage admirably protects them from cold and moisture; their wings, although of the lightest materials, are furnished with muscles of such power as to strike the air with great force, and to impel their bodies forward with rapidity, whilst the tail acts as a rudder, by which their course can be directed at pleasure. The most characteristic part of a bird's internal structure is that connected with its power of flight. The bones of the wing are those of the fore arm modified. The muscles which set the wings in motion are attached to a widely expanded sternum or breast bone, with which is connected the fork-like elastic bone called the *furcula*, or merry-thought, which serves, with the aid of the clavicles, to keep the wings apart in the act of flying. The voice of birds is a gift of nature, by which the greater part are distinguished from all the rest of the animal creation. At the bifurcation of the windpipe is a glottis supplied with appropriate muscles, called the lower or inferior larynx; it is here that the voice is formed; the vast body of air contained in the air-cells contributes to the force, and the windpipe, by its form and movements, to the modification of the voice. The gift of song is bestowed on the male birds only, and their notes are mostly an expression of love; hence they are heard singing chiefly at the time of pairing. Almost all birds incubate or hatch their eggs, by keeping them at a uniform temperature by brooding over them; and before laying, they are directed by instinct to the operation of building a nest or habitation for their young. Birds, although the most marked of all the classes of animals, resemble each other so closely in their general characters that their subdivision is extremely difficult. Various classifications have been proposed. The following is one of the latest. 1. *Raptores* or *Accipitres*, birds of prey: as eagles, vultures, and hawks. These are a rapacious tribe, feeding on carcases, however putrid, but, unless pressed with hunger, seldom attacking living animals; they are bold, gregarious, fly slowly unless when very high in the air; and they have an exquisite sense of smell. 2. *Insessores*, or perching birds: as thrushes, nightingales, sparrows, larks, &c.; and, from including the smaller birds, they are sometimes termed *Passeres*. 3. *Scansores*, or climbers: as parrots and woodpeckers. 4. *Columbæ*, the dove and pigeon family. 5. *Gallinæ* or *Rasores*, gallinaceous or game birds, including our barn-door fowls, pheasants, partridges, grouse, curassows, &c. 6. *Struthiones*, including the ostrich, cassowary, emu, &c. In these the wings are so little developed that the birds are unable to fly. 7. *Grallæ* or *Grallatores*, the waders, including cranes, herons, snipes, plovers, rails, &c. 8. *Anseres* or *Natatores*, web-footed birds, such as the swan, duck, auk, petrel, and gull. These orders are subdivided into several families.

ORNITHORHYN'CHUS (*ornis*, a bird; and *rhunchos*, a beak: *Gr.*), an Australian four-footed animal of singular structure. Its skin is clothed with soft fur, the feet are webbed, and the mouth is furnished with a bill like a duck's. It is a mammal allied to the kangaroos, about 20 inches in length. It lives in the neighbourhood of water, and its habits are very shy.

OROG'RAPHY, or OROL'OGY (*oros*, a mountain; and *grapho*, I write, or *logos*, a discourse: *Gr.*), physical geography as it relates to mountains. Descriptions of the height and form of mountains and their branches, the trending directions of mountain chains, and their relations to the rest of the country, belong to orography. As to the measurement of heights, see **HYPSOMETRY**.

OR'PIMENT (*auripigmentum*, gold paint: *Lat.*), *yellow sulphuret of arsenic:* it is the basis of the paint called *king's yellow*.

OR'RERY (from the Earl of Orrery, for whom the first was made), a machine representing the motions, relative magnitudes, and distances of the bodies composing the solar system. It is calculated to impart a very imperfect, and even inaccurate, idea of what it is intended to represent. It differs from the *planetarium*, in giving the revolution of one or more of the satellites.

OR'RIS ROOT, the root of a white-flowering species of *Iris*, the *Iris Florentina*, a native of the south of Europe. It is exported from the Mediterranean in considerable quantities, and is used in making perfumed powders, to which it communicates an odour resembling that of violets.

OR'THODOX (*orthos*, right; and *doxa*, opinion: *Gr.*), having a right judgment in matters of religious faith. Every sect has its own notions of orthodoxy.

ORTHODROM'ICS (*orthos*, right; and *dromos*, a course: *Gr.*), in Navigation, the art of sailing on the arc of a great circle; which is the shortest distance between two points on a sphere.

ORTHO'EPY (*orthos*, right; *epos*, a word: *Gr.*), a right pronunciation of words. It refers to questions of sound, whereas orthography refers to spelling.

ORTHOG'NATHOUS (*orthos*, straight; *gnathos*, a jaw, *Gr.*), a term applied by comparative anatomists to skulls such as those of the Calmucks, which have the profile of the face almost vertical; opposed to *prognathous*.

ORTHOG'RAPHY (*orthographia:* from *orthos*, right; and *grapho*, I write: *Gr.*), in Architecture, a geometrical representation of an elevation or section of a building.——In Fortification, the profile or representation of a work in all its parts, as it would appear if perpendicularly cut from top to bottom.——In Geometry, the art of drawing a front view of an object, so as to represent the height of each part; so called from its determining things by perpendicular lines falling on the geometrical plan.——In Grammar, that division which teaches the nature and properties of letters, and the correct spelling and writing of words. — *Orthographic Projection of the Sphere*, that projection which is made upon a plane passing through the middle of the sphere, by an eye placed vertically at an infinite distance. In other words, every point of the hemisphere is referred to its diametral plane or base. In this projection only the central parts are truly represented; distortion increases as the edges of the map are approached.

ORTHOP'TERA (*orthos*, straight; *ptera*, wings, *Gr.*), in Entomology, an order of four-winged insects with incomplete metamorphoses. It includes the grasshoppers, locusts, crickets, and earwigs. The wings when present, for in some genera the females never possess any, are leathery or membranous, traversed by numerous veins. The front pair usually lap more or less over each other The hinder pair are nearly semi-circular in form, and their veins radiate from the point of attachment. When the insect is at rest they lie straight down the back, instead of being folded transversely as amongst the beetles.

OR'TIVE (*ortus*, a rising *Lat.*), in Astronomy, *rising* or *eastern*. The *ortive* amplitude of a planet is an arc of the horizon intercepted between the point where a star rises and the east point of the horizon—the point where the horizon and equator intersect.

OR'TOLAN (*Fr.*), or *Green-headed Bunting*, the *Emberiza hortulana* of ornithologists, a bird greatly esteemed for the delicacy of its flesh, when in season It belongs to the *Fringillidæ*, and is a native of northern Africa; but in summer and autumn it visits southern, and sometimes even central and northern, Europe It is about the size of a lark; and seems identical with the *miliaria* of Varro, which was sold at such enormous prices to the epicures of Rome.

ORYCTOG'NOSY, ORYCTOG'RAPHY, or ORYCTOL'OGY (*oruktos*, digged out; and *gnōsis*, knowledge; *grapho*, I write; or *logos*, a discourse: *Gr*), that branch of science which treats of fossil organic remains——Also those parts of mineralogy which have for their object the classification, description, nomenclature, and arrangement of minerals. The terms are synonymous with *mineralogy*, which is almost always employed

OS'CAN, an ancient Italian language spoken by the Samnites, who lived on the south of Rome, of which a few fragments remain It had not entirely disappeared as a spoken tongue in the time of the earlier emperors

OSCILLA'TION (*oscillatio*, from *oscillo*, I swing *Lat*), in Mechanics, the vibration, or alternate ascent and descent, of a pendulous body. In falling down the curve, it generates as much force as, but for the resistance of the air, and friction at the centre of motion, would carry it up to the height from which it descended; and, were it not for these, it would continue to descend and ascend through equal spaces. Oscillations in small circular or in cycloidal curves are performed in equal times, the length of which depends on the length of the pendulum, being proportional to its square root, thus, a pendulum four times as long as another will vibrate twice as slowly.——The *centre of oscillation* is that point in a pendulous body at which all its matter being collected, the oscillations would still be performed in the same times. The *axis of oscillation* is a straight line passing through the point of suspension, parallel to the horizon, and perpendicular to the plane in which the oscillation is made

OSCULA'TION (*osculor*, I kiss: *Lat.*), in Geometry, one curve is said to osculate another, when they are in contact in such a way that the greatest possible number of points are common to both.——OSCULATION, in Medicine, the intercommunication of blood-vessels.

OSI'RIS, I'SIS, HO'RUS, the three principal deities of the Egyptian mythology. The first was worshipped under the form of bulls, and his statues frequently had the horns of a bull A cow was sacred to Isis, who was considered the sister of Osiris, and her statues had horns. She was often represented holding a sistrum with a lotus on her head, and one of her statues bore the celebrated inscription, 'I am all that has been, that shall be; no mortal has hitherto taken off my veil' Horus was the son of Isis and Osiris, and he seems to have corresponded with the Apollo of the Greeks. He is often represented either as sitting on the lap of Isis, or as trampling on a crocodile

OS'MAZOME (*osmē*, odour; and *zōmos*, broth: *Gr*), the extractive matter of muscular fibre, which gives its peculiar smell to roast meat, and its flavour to broth and soup

OS'MIUM (*osmē*, odour *Gr.*—from the pungent smell of its volatile peroxide), a rare metal, generally found in the ores of platinum. It is, in the most compact state in which it has yet been obtained, of a bluish-white colour; and though somewhat flexible in thin plates, it is easily powdered. It cannot be fused or volatilized, for when heated to redness it combines with the oxygen of the atmosphere and forms osmic acid, which has an irritating and dangerous vapour. The specific grav. of osmium is 10, its equivalent 99·6

OS'PREY (*orfraie*: *Fr.*), or *Fishing Hawk*, the *Pandion haliætus* of ornithologists, a bird of the falcon family inhabiting Europe and North America. It is nearly two feet in length. It feeds on fish, which it takes by suddenly darting upon them when near the surface of the water

OSSIFICA'TION (*os*, a bone; and *facio*, I make: *Lat.*), the formation of bone, or the change of any soft solid of the body into bone.

OSSILE'GIUM (*Lat.*: from *ossa*, bones; and *lego*, I collect), in Antiquity, the act of collecting the bones and ashes of the dead after the funeral pile was consumed, which was performed by the friends or near relations of the deceased, who first washed their hands and unfastened their garments. When all the bones were collected, they were washed with wine, milk, perfumes, and the tears of friends; after this ceremony was over, the relics were put into an urn, and deposited in a sepulchre.

OSS'UARY (*ossuarium*: *Lat.*), a place of deposit for the bones of the dead.

OSTEOCOL'LA (*osteon*, a bone; and *kolla*, glue: *Gr.*), a term applied to the glue obtained from bones

OSTEOL'OGY (*osteon*, a bone; and *logos*, a discourse: *Gr.*), that part of anatomy which treats of the bones

OS'TRACISM (*ostrakismos*: *Gr.*), in Grecian Antiquity, a kind of popular judgment or condemnation among the Athenians, by which such persons as had power and popularity enough to attempt anything against the public liberty were banished for a term of ten years. The punishment was called by this name from the Greek word *ostrakon*, which properly signifies a tile or shell; but, when applied to this object, it is used for the billet on which the Athenians wrote the names of the citizens whom they intended to banish, and which was a tile or a shell. If 6000 of the shells deposited in the place appointed were in favour of the banishment of the accused, it took effect; otherwise he was acquitted. After the expiration of ten years, the exiled citizen was at liberty to return to his country, and resume possession of his wealth and all his civil privileges. To this sentence no disgrace was attached; for it was never inflicted upon criminals, but only upon those who had excited the jealousy or suspicion of their fellow-citizens, on account of the influence they had gained by peculiar merit, wealth, or other causes. Aristotle and Plutarch called ostracism 'the medicine of the state.'

OS'TRICH (*autruche: Fr.*), a bird distinguished by its immense size and peculiar habits, as well as by the beauty and value of its plumage. The African or true ostrich (*Struthio Camelus*) is from seven to nine feet high from the top of its head to the ground; most of this, however, is made up by the great length of its neck. Its thighs and the sides of the body are naked, and the wings are so short as to be unsuited for flying. It is different from all other birds, in having only two toes, which correspond to the two outermost in the rest of the class. It inhabits the burning and sandy deserts of Africa in large flocks; and its speed in running exceeds that of the fleetest horse, which renders the ostrich-hunter's task exceedingly laborious. In running, it dashes the stones behind it with great force. The female lays from ten to twelve eggs in a hole in the sand; and, although she does not incubate them continually, no bird has a stronger affection for its offspring, or watches its nest with more assiduity; always brooding over her eggs at night, and leaving them only during the hottest part of the day. They are said to be a great delicacy, and are prepared for the table in various ways. One of them is equal in weight to eleven hen's eggs. The digestive powers of the ostrich appear almost incredible, and its voracity is equal to its digestion. In South America there are two species of ostrich, both smaller than the African species.

OT'TAVA RI'MA (*Ital.*), the name given to the stanza in which the 'Orlando Furioso,' 'Gerusalemme Liberata,' and many other Italian poems are written. There are eight lines and three rhymes. The first, third, and fifth lines rhyme together, and the second, fourth, and sixth; the stanza then ends with a couplet. The rhyming words are trochees.

OT'TER, the *Lutra vulgaris*, a quadruped belonging to the family of *Felidæ*, remarkably sagacious in the construction of its dwelling under ground. It inhabits the banks of rivers, and feeds principally on fish. The feet are palmated, and the tail is half the length of its body, the fur of which is much esteemed. It is fierce and crafty when attacked, but may easily be tamed when young, and taught to catch fish. When the otter, in its wild state, has taken a fish, it carries it on shore, and devours the head and upper parts, rejecting the remainder. When hunted by dogs, it defends itself very obstinately, often inflicting on them the severest wounds.——The American otter (*Lataxina mollis*) is taken in great numbers in Canada, nearly 20,000 skins having been sent to England in one year by the Hudson's Bay company. Its habits are the same as those of the European species, but it is larger, and the fur much more valuable. The common mode of taking these animals is by sinking a steel trap near the mouth of their burrow.——The *sea-otter* (*Enhydra marina*), which is a much larger species than the others, is about the size of a large mastiff, and weighs 70 or 80 lbs. When in full season, the fur is a fine glossy black, and sells at very high prices in China, where the skins are usually obtained. It is exclusively found between the 49th and 60th degrees north latitude, and always frequents the coast.

OT'TO, or AT'TAR OF RO'SES, the most agreeable perfume known; being an aromatic oil obtained from the flowers of the rose, but in such small quantities that half an ounce can hardly be procured from a hundred pounds of the petals. It is brought from Turkey and the East Indies; and, when genuine, is sold at a very high price. It is frequently adulterated with some essential or fixed oil, or with spermaceti; but the adulteration may be detected by testing it in a watch-glass, with a drop of sulphuric acid, if the otto is pure, it will remain colourless; if adulterated, it will be darkened. It is chiefly manufactured at Ghazeepore, a place celebrated throughout India for the beauty and extent of its rose-gardens, which occupy many hundred acres The otto is obtained, after the rose-water is made, by setting it out during the night, until sunrise, in large open vessels, exposed to the air, and then skimming off the essential oil which floats on the top. To produce one rupee's weight of otto, 200,000 well-grown roses are required. The juice, even on the spot, is extremely dear, a rupee's weight being sold at the bazaar for 8*l.* sterling, and at the English warehouse for 10*l.*

OT'TOMAN, an appellation given to what pertains to the Turks or their government; as, the *Ottoman* power or empire. The word derived its origin from Othman, the name of a sultan who assumed the government about the year 1300.——A peculiar kind of sofa much used in Turkey, and introduced into Europe.

OUNCE (*uncia: Lat.*, in general the twelfth part of anything), in Commerce, a weight of different amounts: in avoirdupois weight, it is the sixteenth part of a pound, or 437½ grs.; in troy weight, the twelfth part of a pound, or 480 grs.; in apothecaries' weight, it is equal to eight drams.——OUNCE, in Zoology, the *Leopardus uncia*, an animal inhabiting the mountainous regions of Asia. Its tail is long and thick, the spots on the thick fur are pale and of irregular shape. It approaches the leopard in size. The jaguar of South America is sometimes called the Ounce.

OUT'LAWRY, the putting a man out of the protection of law; or the process by which a man is deprived of that protection. To kill an outlaw is murder, unless it happens in an attempt to apprehend him; any one may arrest an outlaw, on a criminal prosecution, for the purpose of bringing him to be dealt with according to law. Outlawry is a punishment inflicted for a contempt, in refusing to be amenable to the jurisdiction of a competent court. It is issued against a defendant, after he has been five times proclaimed at a county court; but, should he have previously left the kingdom, he can set it aside, by a writ of error, or on motion. In civil cases, the effect of outlawry is a forfeiture of personal goods and chattels at once; and of chattels real, and profits of lands, when found on inquisition.

OUT'RIGGER, in Nautical language, any projecting spar, or piece of timber, used for extending ropes or sails, or for any other temporary purpose.

OUT'WORKS, in Fortification, all those works of a fortress which are situated without the principal wall, within or beyond the principal ditch. They are designed not only to cover the body of the place, but also to keep the enemy at a distance, and prevent his taking advantage of the depressions and elevations usually found in the places about the counterscarp, which might serve either as lodgments, or as rideaux, to facilitate the carrying on trenches, and planting batteries against the place: such are ravelins, tenailles, horn-works, crown works, &c.

O'VAL (*ovum*, an egg: *Lat.*), an oblong curvilinear figure, resembling the longitudinal section of an egg. The mathematical oval, which is a regular figure equally broad at each end, and therefore not strictly egg-shaped, is called an *ellipsis*.

O'VATE (*ovatus*, shaped like an egg: *Lat.*), *egg-shaped*, as an *ovate* leaf.

OVA'TION (*ovatio*, from *ovis*, a sheep: *Lat.*), in Roman Antiquity, a lesser triumph allowed to commanders who had obtained a bloodless victory, or defeated an inconsiderable enemy. It derived its name from sheep being sacrificed on such occasions, instead of bullocks, which were the victims in a triumph. Ovations, but not triumphs, were permitted in civil wars.

OVERRA'KE, in sea language, a term signifying that the waves break in upon a ship lying at anchor; as, the waves *overrake* her, or she is *overraked*.

O'VERT ACT (*ouvert*, open: *Fr.*), in Law, a plain and open matter of fact, serving to prove a design; distinguished from a secret intention not carried into effect, and even from words spoken. An overt act must be alleged in every indictment for high treason.

O'VERTURE (*ouverture*: *Fr.*), in Music, a prelude or introductory symphony, chiefly used to precede great musical compositions, as oratorios and operas; and intended to prepare the hearer for the piece which is to follow, often by concentrating its chief musical ideas, so as to give a sort of outline of it in instrumental music.

O'VIDUCT (*ovum*, an egg; and *duco*, I conduct: *Lat.*), in Natural History, a passage which conveys the egg from the ovary to the uterus, or to an external outlet. In the *Mammalia*, it is termed the Fallopian tube, from Fallopius having first described that of the human subject.

OVIPOS'ITOR (*ovum*, an egg; and *pono*, I place: *Lat.*), in Entomology, the organ by which an insect conducts the eggs into the appropriate nidus. It is frequently armed at the extremity with a piercing apparatus.

OV'OLO (*Ital.*; from *ovum*, an egg: *Lat.*), in Architecture, a convex moulding, the section of which is usually the quarter of a circle, and often called the *quarter round* The Grecian ovolo resembles more the form of an egg.

OWL, the name of birds belonging to the large family *Strigidæ*. Owls are distinguished by having a large head, very large eyes encircled by a ring of fine feathers, and a harsh screeching voice. From the enormous size of the pupils of their eyes, they are enabled to see well in the night, but in the day their sense of sight is imperfect, hence during this time they keep concealed in some secure retreat. Their hearing is very acute, and their plumage soft and loose, enabling them to fly without noise, and thus to come on their prey in an unexpected manner. They breed in fissures of rocks, or in holes of trees, and feed on small birds, mice, bats, &c. There are many species, but the most common in this country is the barn owl, *Strix flammea*, which frequents barns, towers, churches, old ruins, &c., generally leaving its haunts about twilight, and exploring the neighbouring woods for its prey during the night The tawny owl, *Syrnium aluco*, is the one with the well-known hooting call, *to-woo*. The great horned owl of America, *Bubo virginianus*, with a tuft of feathers at each ear, is nearly as large as the golden eagle.

OWL'ING (so called from its being usually carried on in the night) was the offence of transporting wool or sheep out of England, contrary to the statute. It was formerly a capital crime; but the law has been repealed

OX (*ochs*: *Ger.*) The common ox, *Bos Taurus*, has a flat forehead, and round horns placed at the two extremities of a projecting line which separates the front from the occiput; the horns, however, differ so much in their form and direction in the numerous varieties, that no specific characteristic can be based upon them. There is scarcely any part of this valuable animal that is not useful to mankind. Its flesh is the principle article of animal food; the horns are converted into combs, knife-handles, &c.; the bones form a cheap substitute for ivory; the blood is employed in the manufacture of prussian blue; the hide is made into a strong leather; the hair is used by plasterers, and the fat is employed in the formation of candles and soap. Besides the differen. varieties of the common ox produced by domestication, there are several others, as the Abyssinian ox, having the horns pendulous, adhering only to the skin, and the African ox, having the body snowy, and hoofs black, &c.

OX'ALATE, in Chemistry, a salt formed by a combination of oxalic acid with a base, as the *oxalate* of *ammonia*.

OXAL'IC A'CID (*oxalis*, sorrel; from *oxus*, sour: *Gr.*), in Chemistry, an acid first obtained from sorrel, but now readily produced by the action of nitric acid on sugar. It is a compound of carbon, oxygen, and hydrogen. It is a violent poison, and has sometimes been swallowed by mistake for Epsom salts; from which, however, it is distinguishable by its intensely sour taste. The best antidote, in such cases, is a mixture of chalk and water, which may be effective if swallowed at once. Oxalic acid, as also its salts in solution, give an insoluble precipitate with solutions containing lime, or its salts; and hence oxalic acid and lime, or its salts, are employed as tests for each other.

OX'ALIS (sorrel: *Gr.*), in Botany, a genus of plants, nat. ord. *Oxalidaceæ*. The species have tuberous roots and trifoliate leaves. The common oxalis (*O. acetosella*) has been thought to be the Shamrock, as it flowers about St. Patrick's day. Some of the species have sensitive leaves, and of others the tubers are eaten as a substitute for potatoes.

OX'IDE (*oxus*, sharp; and *eidos*, form: *Gr.*), the combination of a simple or compound element with oxygen, in smaller quantity than is required to produce acidity. To designate oxides having progressively increasing quantities of oxygen, the first syllables of the Greek numerals are prefixed: thus, *protoxide, deutoxide, tritoxide*, &c. And *hyper*, or *per*, is used with the oxide containing it in the largest quantity, as *per-oxide* of iron. When the combination is equivalent to an atom of the base united with an atom and a half of oxygen, it is a *sesqui-oxide*.

OX'YGEN, or OX'YGEN GAS (*oxus*, acid; and *gennao*, I produce: *Gr.*—from being at first considered the only cause of acidity), in Chemistry, a permanently elastic fluid, invisible, inodorous, and a little heavier than atmospheric air. It is the respirable part of air, and was called *dephlogisticated air*, also *vital air*, from its being essential to animal life; but it received its present name from its property of giving acidity to compounds in which it predominates. Oxygen is the most extensively diffused of material substances. In union with azote or nitrogen, it forms atmospheric air, of which it constitutes about a fifth part. Water contains eight ninths by weight of it, and it exists in most vegetable and animal products, acid salts, and oxides. It is also a very energetic agent, and the history of its properties and combinations forms the most important subject in chemistry. Oxygen gas nowhere exists pure and uncombined; hence certain processes are required to obtain it in an insulated form; these consist, chiefly, in applying heat to some of its compounds, in which it is retained by a weak attraction. Its most striking property is that of exciting and supporting combustion. A candle or wax taper, freshly extinguished, is relighted on being immersed in a jar of this gas. A partially kindled piece of charcoal, on being introduced into it, inflames with great rapidity and brilliancy But the most interesting example of combustion in this gas is that of iron or steel wire, which only require to have their temperature elevated, by the previous ignition of a piece of sulphur and a small bit of iron turnings, attached to them at the extremity, in order to be kindled into the most vivid and intense combustion, burning with sparks and scintillations. The sulphur ignites the iron turnings, and the latter the iron or steel wire. Atmospheric air sustains life only from the oxygen it contains; the exhausted blood abstracts it from the atmosphere by means of the respiratory apparatus, giving off at the same time carbonic acid gas But *pure* oxygen proves too highly stimulating for animal existence.

OX'YGON (*oxus*, sharp; and *gonia*, an angle: *Gr.*), in Geometry, a triangle having three acute angles.

OX'YMEL (*oxus*, acid; and *meli*, honey: *Gr.*), a syrup made of honey and vinegar boiled together. It possesses aperient and expectorant qualities, and is sometimes made a vehicle of medicines.

OXYMO'RON (*Gr:* from *oxus*, clever; and *mōros*, foolish—because, though the expression is seemingly incorrect, it is really accurate), a Rhetorical figure, in which an epithet of a quite contrary signification is added to a word; as *tender cruelty*.

OXYMURIAT'IC A'CID, in Chemistry, the name by which *chlorine* was formerly known; being at first considered a compound of oxygen and muriatic acid.

OXYO'PIA (*oxuōpia*: from *oxus*, sharp; and *ōps*, the eye: *Gr.*), the faculty of seeing more acutely than usual. The proximate cause is a preternatural sensibility of the retina; and it has been sometimes known to precede the gutta serena.

O'YER AND TER'MINER (*oyer*, to hear; and *terminer*, to end: *Norm. Fr.*), a court which, by virtue of the king's commission, hears and determines certain specified offences.

O YES (corrupted from the French *oyez*, 'hear ye'), the expression used by the crier of a court, in order to enjoin silence, when any proclamation is made.

OYS'TER (*oester*: *Dutch*), a well-known edible shell-fish, belonging to the genus *Ostrea*. In many places oysters are *planted*, as it is called; that is, large artificial beds are formed in favourable situations, where they are permitted to fatten and increase. They attain a size fit for the table in about a year and a half and are in their prime at three years of age. The best British oysters are said to be those found near Purfleet, and the worst near Liverpool. They are brought from the coasts of the maritime counties, and planted on beds along the shore; they thrive best in a mixture of salt and fresh water. About 200 small vessels are employed in dredging for oysters. British oysters were highly prized by the ancient Romans, and were generally eaten at the beginning of the entertainment.

OZO'NE (*ozo*, I have a smell: *Gr.*), a substance occasionally existing in the atmosphere, and having a peculiar odour resembling that produced when repeated electric sparks, or electric discharges from a point, are transmitted through the air. It is supposed to be an allotropic form of oxygen. It is also formed in certain cases of the slow action of air upon phosphorus. The ozone existing from time to time in the atmosphere has been supposed to have an influence on the health of the community, and observations with regard to it are frequently made by means of an apparatus called an ozonometer, the essential part of which consists of strips of paper steeped in a mixture of starch and iodide of potassium. Ozone turns the paper brown, the tint varying with the quantity of ozone.

P

P, the sixteenth letter and twelfth consonant of the English alphabet, is a labial articulation, formed by expressing the breath somewhat more suddenly than in emitting the sound of *b*. When *p* stands before *t* or *s*, it is mute, as in the words *psalm*, *psychology*, *ptarmigan*, &c.; and when before *h*, the two letters thus united have the sound of *f*, as in *philosophy*. As an abbreviation, in Latin words, P. stands for *Patres:* as P. C. *Patres Conscripti* (conscript fathers). For *Publius:* P. F. *Publii Filius* (the son of Publius). For *Pontifex:* P. M. *Pontifex Maximus* (chief priest). For *Populus:* P. R. *Populus Romanus* (the Roman People); and S.P.Q.R. *Senatus Populusque Romanus* (the senate and people of Rome), &c. We use it for *post*, as P. M. *Post Meridiem* (after noon); and for *Parliament*, as M.P. *Member of Parliament*. Physicians for *partes*, as P Æ. *partes æquales* (equal parts of the ingredients); *ppt.*, for *præparatus* (prepared), &c.——In Music, *p.* stands for *piano*, or softly; *pp.* for *più piano*, or more softly; and *ppp.* for *pianissimo*, or very softly.

PAB'ULUM (*Lat.*, from *pascor*, I feed). In Medicine, such parts of our common aliments as are necessary to recruit the animal fluids.

PA'CA, the *Cœlogenys Paca* of zoologists, a small rodent animal of America, bearing some resemblance both to the capybaras and agoutis. It is sometimes called the *spotted cavy*. It is a burrowing nocturnal animal, living in damp woods and feeding on vegetables.

PACE (*pas: Fr.*), the space between the two feet of a man in walking, usually reckoned two feet and a half; but the geometrical pace, or the whole space passed over by the same foot from one step to another, is five feet. The ancient Roman *pace*, the thousandth of a mile, was five Roman feet, or about 58·1 English inches; and hence the Roman mile, or *mille passus*, was 1614 yards, or nearly 150 yards less than the English mile.

PACHA', or PASHAW' (*padi shah*, the foot of the shah: *Pers.*), the military governor of a Turkish province. The most distinguished of the pachas have three horsetails carried before them: the inferior, two. Though the pasha is appointed and removed at the will of the sultan, his power is very great, and the provincial administration is in his hands. This word is also written *bashaw*.

PACHYDER'MATA (*pachus*, thick; and *derma*, a skin: *Gr.*), in Zoology, the name given by Cuvier to an order of mammalia corresponding with the family of *Elephantidæ* of later writers. It comprehended the elephant, mastodon or North American mammoth, hippopotamus, rhinoceros, tapir, hog, &c.

PACIF'IC (*pacificus*, peaceful: *Lat.*), the appellation given to the ocean situated between America on the east, and Asia and Australia on the west; so called on account of its *supposed* exemption from violent tempests. It is the greatest expanse of water on the globe.

PA'CO, or PA'COS, the ALPACA of South America.

PAD'DOCK-PIPE (*pada*, a toad: *Sax.*), in Botany, a plant of the genus *Equisetum*.

PA'DDOCK-STOOL (same *deriv.*), a name sometimes given to various species of fungus, the *toadstools*.

PAD'ISHAH (*pad*, protector; and *shah*, prince: *Pers.*), a title assumed by the Turkish sultan. Formerly the Ottoman Porte applied that name only to the king of France, calling the other European sovereigns *koral;* but it has since been given to other princes of Europe.

PÆ'AN (*paian: Gr.*), among the ancients a song of rejoicing in honour of Apollo, chiefly used on occasions of victory and triumph. Such songs were named pæans, because the words *Io Pæan!* which alluded to Apollo's contest with the serpent, frequently occurred in them.——Also, a song to Mars before battle.

PÆ'DOBAPTISTS (*pais*, a child; and *baptizo*, I dip: *Gr.*), those who hold that baptism should be administered to infants—a term applicable to most Christians.

PÆ'ONY (*paiònia: Gr.*), the *Pæonia* of botanists, a genus of plants belonging to the natural family *Ranunculaceæ*, well known for their handsome flowers. The species are chiefly herbaceous, having perennial tuberose roots, and large leaves. The flowers are solitary, and of a crimson, purplish, or sometimes white colour. The ancients attributed many wonderful properties to this plant, but it has long since lost all such reputation.——The tree-pæony, called in China *mou-tan*, is cultivated in that country with great care; and many varieties of it are produced, of all colours.

PA'GANISM, the religion of the heathen world, in which the deity is represented under various forms, and by all kinds of images or idols; it is therefore called idolatry or image worship. The theology of the pagans was of three sorts—fabulous, natural, and political or civil. The *fabulous* treats of the genealogy, worship, and attributes of their deities, who were for the most part the offspring of the imagination of poets, painters, and statuaries. The *natural* theology of the pagans was studied and taught by the philosophers, who rejected the multiplicity of gods introduced by the poets, and brought their ideas to a more rational form. The *political* or civil theology of the pagans was instituted by legislators, statesmen, and politicians, to keep the people in subjection to the civil power. This chiefly related to their temples, altars, sacrifices, and rites of worship. The word *pagan* (*pagus*, a district: *Lat*), was originally applied to the inhabitants of the rural districts, who, on the first propagation of the Christian religion, adhered to the worship of false gods, or who refused to receive Christianity after it had been adopted by the inhabitants of the cities. In the middle ages, this name was given to all who were not Jews or Christians, they only being considered to belong to a true religion; but in more modern times, Mohammedans, who worship the one supreme God of the Jews and Christians, are not called *pagans*.

PAGE, a young person attached to the service of a royal or exalted personage. In ancient Persia it was used for a number of noble youths to attend on the sovereign; but this custom was not adopted by the Greeks or Romans. It was common among the northern nations of Europe, and until a comparatively recent period the position was one of servitude and inferiority. When, however, the young noblemen passed through the degree of page to the honours of knighthood, and the custom of bringing up the sons of noble families as pages at court became prevalent, the condition of a page was altered; and his office was continued after chivalry had disappeared. The pages in the royal household are various, and they have different offices assigned them: as pages of honour, pages of the presence-chamber, pages of the back-stairs, &c.

PAGO'DA (*poutghad*, a house of an idol: *Pers.*), a Hindoo place of worship, containing an idol. It consists of three portions: an apartment surmounted by a dome, resting on columns, and accessible to all; a chamber into which only Brahmins are allowed to enter; and, lastly, a cell containing the statue of the deity, closed by massive gates. The most remarkable pagodas are those of Benares, Siam, Pegu, and particularly that of Juggernaut, in Orissa. In the interior of these buildings, besides altars and images of the gods, there are many curiosities. The statues, which are likewise called *pagodas*, and which are often numerous, are usually rude figures of baked earth, richly gilt, but without any kind of expression.——PAGODA is also the name of a gold and a silver coin, current in different parts of Hindostan, and of a value varying from 8*s.* to 9*s.* sterling.

PA'GODITE, a name given to the mineral of which the Chinese make their statues; it is a kind of *steatite* or *serpentine*.

PAINS AND PEN'ALTIES, BILL OF, in Law, an act of parliament to inflict pains and penalties beyond or contrary to the common law, in the particular cases of great public offenders

PAINT'ING (*peinture*: *Fr*), the art of representing objects in nature, or scenes in human life, with fidelity and expression. Coeval with civilization, it was practised with success by the Greeks and Romans; obscured for many ages, it revived in Italy in the 15th century, producing the Roman, Venetian, and Tuscan schools; afterwards the German, Dutch, Flemish, French, and Spanish schools; and, finally the English school. The painting of the Egyptians, as is evident from the specimens found in their tombs, was very rude; that of the Etruscans, as seen on their vases, was extremely elegant; that of the Greeks, from the praises bestowed on some of their productions by the ancients, must have had considerable merit; and that of the Romans, as evinced by what we find in Pompeii, must have attained a high degree of excellence. The art is distinguished into *historical* painting, *portrait* painting, *landscape* painting, *animal* painting, *marine* painting, &c.; and, as regards the form and the materials, into painting in *oil*, *water colours*, *fresco*, *distemper*, *miniature*, *mosaic*, &c.——Historical painting is the noblest and most comprehensive of all branches of the art; for in that the painter vies with the poet, embodying ideas, and representing them to the spectator. He must have technical skill, a practised eye and hand, and must understand how to group his well-executed parts so as to produce a beautiful composition; and all this is insufficient without a poetic spirit which can form a striking conception of an historical event, or create imaginary scenes of beauty. The following rules of criticism in painting have been laid down:—1. The subject must be well imagined, and, if possible, improved in the painter's hands; he must think well as an historian, poet, philosopher, and more especially as a painter, in making a wise use of all the advantages of his art, and in finding expedients to supply its defects. 2. The expression must be proper to the subject and the characters of the persons; it must be strong, so that the dumb-show may be perfectly and readily understood; every part of the picture must contribute to this end—colours, animals, draperies, and especially the attitudes of the figures. 3. There must be one principal light, and this and all the subordinate ones, with the shadows and reposes, must make one entire and harmonious whole; while the several parts must be well connected and contrasted so as to render the entire as grateful to the eye as a good piece of music to the ear. 4. The drawing must be just; nothing must be out of place or ill-proportioned; and the proportions should vary according to the characters of the persons drawn. 5. The colouring, whether gay or solid, must be natural, and such as delights the eye, in shadows as well as in lights and middle tints; and the colours, whether they are laid on thick, or finely wrought, must appear to have been applied by a light and accurate hand. 6. Nature must be the obvious foundation of the piece; but nature must be raised and improved, not only from what is commonly seen to what is rarely met with, but even yet higher, from a judicious and beautiful idea in the painter's mind.

PAIR'ING, that custom in the House of Commons, by which two members of opposite political opinions agree to absent themselves from divisions of the house during a certain period.

PAL'ACE-COURT, a court erected by Charles I., and made a court of record, for administering justice in disputes between the domestic servants of the crown It was held once a week before the steward of the household and knight-marshal; its jurisdiction extending twelve miles round Whitehall. Malpractises having crept in, it was abolished in 1849

PAL'ADIN, in the romances of the middle ages, a lord, or chieftain. The name originated in that of the *palatini*, or officers of the palace, in the Byzantine court. It was appropriated by the Italian romantic poets to their heroes, the warriors of Charlemagne; and was ultimately given to the knights-errant, who travelled from place to place to exhibit proofs of their valour and gallantry; extolling their own mistresses as unrivalled in beauty, and compelling those who refused to acknowledge the truth of their panegyrics to engage with them in mortal combat. Of this kind the most famous were Amadis of Gaul and the brave Roland or Orlando, the hero of Boiardo's 'Orlando Innamorato,' and Ariosto's 'Orlando Furioso.'

PALÆOG'RAPHY (*palaios*, ancient; and *graphē*, a writing: *Gr.*), a description of ancient writings, inscriptions, characters, &c.

PALÆOL'OGY (*palaios*, ancient; and *logos*, a discourse: *Gr.*), a discourse or treatise on antiquities; or the knowledge of them.

PALÆONTOL'OGY (*palaios*, ancient: *ōn*, a being; and *logos*, a discourse: *Gr.*), that branch of the science of geology which embraces the study of fossil remains, whether of animal or vegetable origin.

PALÆOZO'IC (*palaios*, ancient; *zoe*, life: *Gr.*), a name given to the oldest groups of sedimentary strata, equivalent to the primary period of some geologists. The PERMIAN or Magnesian Limestone, the CARBONIFEROUS, the DEVONIAN or Old Red Sandstone, the SILURIAN, the CAMBRIAN, and the LAURENTIAN groups, belong to the Palæozoic series. In the Cambrian and Laurentian divisions fossils are very scanty, and the lowest members have been much altered by heat, exhibiting what is termed metamorphic action. [See GEOLOGY.]

PALÆS'TRA (*palaistra*, from *palaio*, I wrestle: *Gr.*), in Grecian Antiquity, a public building, where the youth exercise themselves in wrestling, running, playing at quoits, &c. According to some, the *palæstra* consisted of two portions, the one for exercises of the mind, the other for those of the body.

PALANQUIN', or **PALANKEE'N** (*palkee: Hind*), a sort of litter or covered carriage, used in the East Indies, and borne on the shoulders of four porters called *coolies*, eight of whom are attached to it, and who relieve each other. Fresh bearers are obtained at certain stations on the road. Palanquins are usually provided with a bed and cushions, and a curtain, which can be dropped when the occupant is disposed to sleep. The motion is easy, and the travelling, in this way, is safe and rapid.

PAL'ATE (*palatum: Lat.*), in Anatomy, the roof or upper and inner part of the mouth. The glands in this part secrete a mucous fluid, which lubricates the mouth and throat, and facilitates deglutition. The 'hard palate' is formed by the lower portions of the superior maxillary and palatal bones; the 'soft palate' by the extension of membranous and muscular substance, unsupported by bones.

PAL'ATINE (*palatinus*, belonging to the *palatium*, or emperor's court: *Lat.*), an epithet applied originally to persons holding an office or employment in the palace of the sovereign; hence it came to import possessing royal privileges, as in the cases of the counties *palatine* of Lancaster, Chester, and Durham, which have particular jurisdictions.——On the continent, a *palatine*, or *count palatine*, is a person delegated by a prince to hold courts of justice in a province, or one who has a palace and a court of justice in his own house. All the princes of the German empire were originally servants of the Imperial crown. In course of time they acquired independent authority, and secured that authority to their heirs; among these was the count-palatine, or of the palace, in the German language denominated the *pfalzgraf* This officer was a president who decided upon appeals made to the emperor himself from the judgment of provincial courts. All titles, except that of lord, which is now complimentary, and once belonged to territory, were originally official, as are those of judge, general, &c., at this day. When Charlemagne had extended the German empire, he sent persons to govern in the provinces, under the title of dukes—officers, probably, whose duty was partly military, whence their denomination, which is synonymous with that of leaders or generals. Under the dukes, justice was administered in each district of the province by a *comes*, count or earl; and from these courts lay the appeals already mentioned.

PALE (*palus*, a stake: *Lat.*), an instrument of punishment and execution among the ancient Romans, and still so among the Turks. Hence *impaling*, the passing a sharp pale or stake upwards through the body

——PALE, in Heraldry, one of the honourable ordinaries of an escutcheon; it is also the simplest, being bounded by two vertical lines, at equal distances from the sides of the escutcheon, of which it encloses one-third. The *pallet* is half the pale. A coat bisected by a vertical line, with a different field on each side of it, is said to be *party* (that is, divided) *per pale*.

PALEA'CEOUS (*palea*, chaff: *Lat.*), in Botany, an epithet for chaffy, or resembling chaff; as a paleaceous pappus.

PALIL'OGY (*palilogia*: from *palin*, again; and *lego*, I speak: *Gr.*), in Rhetoric, a repetition of a word, or portion of a sentence, for the sake of greater energy: thus, 'The living, the living shall praise thee.' When the last word of a verse or of a paragraph is repeated, the figure is that species of palilogy called *deuterologia*.

PAL'IMPSEST (*palimpsēstos*: from *palin*, again; and *psao*, I wipe away: *Gr.*), a parchment twice prepared for writing. In consequence of the scarcity of materials for writing upon, it was not unusual, particularly in the middle ages, to erase one work that another might be written in its place. The ingenuity of the monks in erasing has been exceeded by that of the moderns in reviving the original writing, and thus recovering some valuable works and fragments which had been considered as lost. Among these is the treatise of Cicero *De Republicâ*, which was found under a commentary of St. Augustine on the Psalms.

PAL'INDROME (*palin*, again; and *dromos*, a course: *Gr.*), in Composition, a verse or line which reads the same backwards and forwards: thus, what is put in the mouth of Satan—*Signa te, signa, temerè me tangis et angis* (cross thyself, cross thyself you touch and torment me in vain); or, *Roma, tibi subito motibus ibit amor* (love shall suddenly turn to thee, Rome, with deep emotion)

PALINGEN'ESY (*palingenesia*, regeneration: from *palin*, again; and *genesis*, birth: *Gr.*), a term used by entomologists to designate the transitions from one state into another, which are observed with insects, and in each of which the insect appears in a totally different form.——Also the doctrine of the destruction and reproduction of worlds and living beings; it had an oriental origin, though it seems to have been that of the stoics. In the New Testament (Tit. iii. 5), it means moral regeneration.

PAL'INODE, or PAL'INODY (*palinōdia*: from *palin*, again; and *ōdē*, a song: *Gr.*), a recantation, particularly a poetical one, of anything dishonourable or false uttered against another person.

PALISA'DES, or PALISA'DOES (*palissade*: *Fr.*; from *palus*, a stake: *Lat.*), in Fortification, an enclosure of stakes, or posts sharpened and set firmly in the ground, used to fortify the avenues of open forts, &c. They are generally nine or ten feet long, and sloped outwards from the work. Sometimes they cannot be seen by the enemy until he reaches them.

PALISSE' (*Fr.*), in Heraldry, a bearing like a range of palisades before a fortification, represented on a fesse, rising up a considerable height, and pointed at the top, with the field appearing between them.

PAL'ISSY WARE, a species of pottery originally made in France about 1555 by Bernard Palissy. The old ware is much prized by collectors, and is distinguished by the high relief of the figures and ornaments. It has been successfully imitated of late years.

PALL, in Heraldry, the *pallium*, or archiepiscopal ornament sent from Rome to the metropolitan bishops.

PAL'LA (*Lat.*), in Antiquity, a long kind of mantle or upper garment worn by the Roman females, part of which was thrown over the left shoulder, and held fast under the arm. Tragic actors also wore the *palla*.

PALLA'DIUM, a Trojan statue of the goddess Pallas, which represented her as sitting with a spear in her right hand, and in her left a distaff or spindle. On this statue the fate of the city was supposed to depend; for while this sacred image was retained, Troy was supposed to be invincible. Hence anything that affords effectual protection and security to our liberties, as the *trial by jury*, is called a palladium. ——PALLADIUM, in Mineralogy, a metal obtained in very small grains, of a steel-grey colour and fibrous structure, found associated with platina or in auriferous sand. When native, it is alloyed with a little platina and iridium. It is ductile and very malleable, superior to wrought iron in hardness; its spec. grav. is 11·8. It is oxidized and dissolved by nitric acid; its fusibility is intermediate between that of gold and platina. On exposure to a strong heat, its surface undergoes a tarnish, and becomes blue.

PAL'LET, among Gilders, a tool for taking up the gold leaf from the cushion, and applying or extending it.——In Heraldry, the diminutive of a *pale*, being one-half of its breadth.——In Horology, the pieces connected with the pendulum or balance, which receive the immediate impulse of the swing wheel or balance-wheel. They are of various forms, according to the kind of *escapement*.——Among Mariners, a partition in a hold.——Among Painters, a small oval tablet of wood or ivory, on which a painter places the several colours he has occasion to use. The middle serves for mixing the colours and making the tints required. It is held by putting the thumb through a hole made at one end of it.——Among Potters, crucible-makers, &c., a wooden instrument for forming and rounding their works

PAL'LIUM (a cloak: *Lat.*), an upper garment or mantle worn by the Greeks, as the *toga* was by the Romans. Each of these was so peculiar to the respective nations, that *Palliatus* is used to signify a Greek, and *Togatus* a Roman. The pallium or pall was also the woollen mantle which the Roman emperors were accustomed, from the 4th century, to send to the patriarchs and primates of the empire, and which was worn as a mark of ecclesiastical dignity.——The ornament sent by the pope to the archbishops of the Roman Catholic church, to the four Latin patriarchs, and sometimes to simple bishops. It consists of a collar, having a narrow flap edged with lead, covered with black silk, falling down before and behind, and decorated with small crosses. It is made of the wool of the ten white lambs blessed at Rome on the festival of St. Agnes. Formerly, archbishops were obliged to visit Rome for the purpose of being invested with it—a custom introduced by Gregory VII., when the papacy was at the height of its power; but now it is sent to them. All the Greek bishops wear the pallium.

PALL MALL, or PALLE MAILLE (*Fr.*), an ancient game, in which an iron ball was struck with a mallet through a ring or arch of iron. It was formerly practised in St. James's Park, and gave its name to the street called Pall-Mall (pronounced (Pell-Mell).

PAL'MATED (*palmatus: Lat.*), shaped like a hand with spreading fingers.

PALM'ER, a pilgrim who returned from the Holy Land, bearing branches of palm; he was distinguished from other pilgrims by his profession of poverty, and living on alms as he travelled.

PALM'ER-WORM, a name given to the larvæ of various species of coleoptera.

PAL'MIPEDES (*Lat:* from *palma*, the palm of the hand; and *pes*, a foot), in Ornithology, a name given by Cuvier to an order of web-footed birds, corresponding to the *Anseres* of Linnæus, and the *Natatores* or swimming birds of Illiger.

PALM'ISTRY (*palma*, the palm of the hand: *Lat.*), a mode of telling fortunes by the lines of the hand; a trick of imposture much practised by gipsies.

PAL'MITIN, the principal constituent of fresh palm-oil. To obtain it, the liquid portions of the oil are separated from it by pressure; the solid part is then boiled with alcohol, to remove by solution any fat acids present; and the residue, which is palmitin, is purified by repeated crystallizations with ether. It is a mass of small crystals, which, when fused and cooled, is a semi-transparent mass that may be rubbed to powder. It is nearly insoluble, except in boiling ether

PALM'-OIL TREE, an African palm, the *Elæis guineensis*, from the kernels of whose fruit is obtained a rich oil, which is brought to this country as a reddish-yellow solid, and is used in the manufacture of soap, candles, &c.

PALM-SUN'DAY, the sixth Sunday in Lent, the next before Easter. The Roman Catholic church has a festival on this day in commemoration of Christ's triumphal entry into Jerusalem, when palm branches were strewn on the way.

PALM'-WINE, a liquor obtained in the East Indies by the incision of a species of the palm. It is called *toddy* before it is fermented.

PALMS (*palma: Lat.*), an order of endogenous trees chiefly inhabiting tropical regions; Linnæus styled them the princes of the vegetable world, and Lindley avers that they are without doubt the most interesting plants in the vegetable kingdom, 'if we consider the majestic aspect of their towering stems crowned by a still more gigantic foliage; the character of grandeur which they impress upon the landscape of the countries they inhabit; their immense value to mankind as affording food and raiment and numerous objects of economical importance; or finally, the prodigious development of those organs by which their race is to be propagated.' With regard to the last point he refers to the 12,000 male flowers of the Date palm, the 600,000 flowers upon a single individual of another, and the fruits borne by every bunch of the Seje palm on the Oronoco. Their flowering parts are arranged in threes, or one of the multiples of that number. The calyx has six divisions; the stamens are six in number; and the fruit consists of a berry or drupe, composed of a substance sometimes hard and scaly, but oftener fleshy, or fibrous, surrounding a one-seeded nut. Though some species grow to a very great height, in others the stem rises only a few inches above the surface of the ground. Among the most useful of the palms may be mentioned the cocoa-nut, the sago, and the date, the last of which occasionally reaches the height of 100 feet, sometimes growing spontaneously, and sometimes cultivated with great care. The *caleu*, or palm-wine of India, is made of its juice. At certain times of the year, they ascend the trees, by means of a strap passed round the back, and a rope round the feet; and bruise the flower-bud, between two pieces of flat stick, to prevent its opening; this is done for three successive mornings; on each of the four following, a thin slice is cut from the top, to prevent the spathe from bursting; and on the eighth morning, a clear sweet liquor begins to flow. This, in its fresh state, is *toddy;* and is a favourite beverage with both natives and Europeans. It soon ferments of itself, and acquires intoxicating properties. *Sago* is obtained from the interior of the trunks of several palms, but particularly from the *Sagus farinifera*. The *Areca Catechu*, called also the betel-nut, is remarkable for its intoxicating power. The rattans of the shops are the flexible stems of a species of the genus *Calamus*. Darwin has described a palm common in Chili which has a large stem thicker at the middle than above or below. In the spring of the year many are cut down, and when the trunk is lying on the ground the crown of leaves is lopped off. The sap immediately flows from the upper end, and continues flowing for several months, it is, however, necessary that a thin slice should be shaved off from that end every morning, so as to expose a fresh surface. A good tree will give 90 gallons, and all this must have been contained in the vessels of the apparently dry trunk. The sap is concentrated by boiling, and is then called treacle, which it much resembles in taste. The handsomest palm of India is the *Caryota urens*, which derives its specific name (burning) from the sensation caused by an application of the rind of its fruit to the skin. Its pith yields an excellent sago, and a great quantity of toddy is obtained from the tree in the hot season. The Ubrissu (*Ma-*

nicaria saccifera), a Brazilian palm, has erect leaves 25 feet long and 6 feet wide, which grow round the summit of a stem only four feet high, and give to the tree the appearance of a shuttle-cock. *Fan Palms* belong to many widely scattered genera, and are so called from the resemblance of their leaves to fans. The only European species of palm, the *Chamærops humilis*, a common plant in the south of Spain and Portugal, has fan leaves. Of another species (*Mauritia flexuosa*), growing in the country of the Amazons, Mr. H. W. Bates thus writes: 'The palms which clothed nearly the entire islet had huge cylindrical smooth stems three feet in diameter and about a hundred feet high. The crowns were formed of enormous clusters of fan-shaped leaves, the stalks alone of which measured seven to ten feet in length. Nothing in the vegetable world could be more imposing than this grove of palms. There was no underwood to obstruct the view of the long perspective of towering columns. The crowns which were densely packed together at an immense height overhead shut out the rays of the sun; and the gloomy solitude beneath, through which the sound of our voices seemed to reverberate, could be compared to nothing so well as a solemn temple.' Another *Chamærops*, a native of Ceylon, Malabar, and the East Indies, attains the height of 60 or 70 feet, with a straight cylindrical trunk, crowned at the summit by a tuft of enormous leaves, which separate near the outer margin into numerous leaflets, and are usually 18 feet long, exclusive of the leaf-stalk, and 14 broad, a single one being sufficient to shelter 15 or 20 men from the rain. When this palm (sometimes called the *talipot-tree*, or the great fan-palm) has reached the age of 35 or 40 years, it flowers; producing a long, conical, scaly spadix rising to the height of 30 feet from the midst of the crown of leaves, and separating into single alternate branches, which, at the base, extend laterally sometimes 20 feet—the whole covered with whitish flowers, and presenting a most beautiful appearance. The fruit, which is very abundant, is globose, about an inch and a half in diameter, and requires 14 months to ripen, after which the tree soon perishes, flowering but once in the whole course of its existence. The Indians use the leaves for umbrellas, tents, and covering for their houses; the pith, after being pounded, is made into a kind of bread, which is of great use in times of scarcity. The *Palmetto* is a fan palm growing in the southern states of America, and attaining the height of forty or fifty feet. The summit of the stem is crowned with a tuft of large palmated leaves, varying in length and breadth from one to five feet, and supported on long foot-stalks, which give it a beautiful and majestic appearance. At their base and in the centre of the stem are three or four ounces of a white, compact, and tender substance, which is eaten with oil and vinegar.——PALM, an ancient measure, taken from the extent of the hand. The *great palm*, or length of the hand, was equal to about eight inches and a half; the *small palm*, or breadth of the hand, to about three inches. The *modern* palm is different in different places.——PALM, the broad triangular part of an anchor at the end of the arms.

PAL'SY, or PARAL'YSIS (*paralusis*, from *paraluo*, I relax: *Gr.*), in Medicine, a nervous disease, known by the loss or defect of the power of voluntary muscular motion in the whole body, or in a particular part. It appears under different forms; and may be a loss of the power of motion without a loss of sensation, or a loss of sensation without loss of motion, or a loss of both. Sometimes it attacks the whole system; at others, it affects one side of the body, when it is called *hemiplegia*; and at others only a single member. It frequently produces a distortion of the mouth, an indistinctness of speech, and an impaired intellect. A paralysis of any of the vital organs is attended with immediate death.

PA'LY, or *paleways*, in Heraldry, is when the shield is divided into four or more equal parts, by perpendicular lines from top to bottom.

PAM'PAS, vast plains in the southern parts of Buenos Ayres, which extend from the foot of the eastern ridge of the Andes to the River Plata, stretching southwards as far as Patagonia. They cannot be called deserts, since they are covered with herbage, and inhabited by vast herds of wild cattle and droves of horses.

PAMPE'ROS, violent winds so called, which come from the west or south-west; and sweeping over the Pampas, often do much injury on the coast.

PANACE'A (*panakeia*: from *pan*, every thing; and *akeomai*, I heal: *Gr.*), a remedy which professes to cure all kinds of diseases.

PANAMA' HATS; these are made of the young leaves of a palm-tree by the natives of the eastern parts of Peru. They are an article of commerce in Brazil, and the cost of the finer qualities varies from 12*s.* to 6*l.*

PANATHENÆ'A (*Panathenaia*: *Gr.*), in Grecian Antiquity, an ancient Athenian festival, in honour of Minerva, who was the protectress of Athens, and called *Athena*. There were two solemnities of this name, one of which was termed the *greater Panathenæa*, and celebrated every fourth year. It was distinguished from the *less*, which was celebrated every year, not only by its greater splendour and longer continuance, but more particularly by the solemn procession in which the *peplus* was carried from the Acropolis into the temple of the goddess. The peplus was a sacred garment with which the ivory statue of Minerva was covered; it was made of white wool, was embroidered with gold, and consecrated by young virgins. This festival was so holy, that criminals were released from the prisons on the occasion of its celebration, and men of distinguished merit were rewarded with gold crowns. The exhibitions at these festivals were races by torchlight, gymnastic exercises, musical and poetical contests, and sacrifices.

PANCRA'TIUM (*pankration*: from *pan*,

all; and *kratos*, power: *Gr.*), among the ancients, a kind of exercise, which consisted of wrestling and boxing. In these contests it was customary for the weaker party, when he found himself pressed by his adversary, to fall down, and fight rolling on the ground. In Botany, a genus of bulbous rooted plants with handsome flowers, nat. order *Amaryllidaceæ*.

PAN'CREAS (*pan*, all; and *kreas*, flesh: *Gr.*), in Anatomy, a flat glandular viscus of the abdomen; in animals it is called the *sweetbread*. It secretes a fluid resembling saliva, and pours it into the duodenum, to dilute the bile and render it more miscible with the food.

PAN'DECTS (*pandektai:* from *pan*, all; and *dektês*, a receiver: *Gr.*), the name of a volume of the civil law, digested by order of the emperor Justinian.

PANEGYR'IC (*panêgurikos*, fit for a public assembly: *Gr.*), in Oratory, an harangue or eulogy, written or spoken in praise of an individual or a body of men. Panegyrics were much used by the ancients; and in modern times they are delivered in France, where they are termed *eloges*, in certain literary and scientific institutes, on the decease of one of the members.

PAN'EL, in Law, a schedule or roll of parchment on which are written the names of the jurors returned by the sheriff. *Impanelling* a jury is returning their names in such schedule. In Scotland, the accused person in a criminal action, from the time of his appearance, is termed 'the panel.' ——PANEL, in Joinery, a square of thin wood, framed or grooved in a large piece between two upright pieces and two cross pieces; as the *panel* of a door.

PAN'IC (*panique: Fr.;* from *panikos*, groundless fear—literally belonging to Pan: *Gr.*), an ill-grounded terror inspired by the misapprehension of danger. The word is said to be derived from Pan, the name of one of the captains of Bacchus, who with a few men routed a numerous army, by a noise which his soldiers raised in a rocky valley, and which was augmented by a great number of echoes. Hence all ill-grounded fears have been called *panic* fears.

PAN'ICLE (*panicula*, the *dim.* of *panus*, a thread wound on a bobbin: *Lat.*), in Botany a sort of inflorescence, in which the primary axis developes secondary ones, and the secondary tertiary. It is therefore a branching raceme.

PAN'ICUM (*Lat.*, from *panis*, bread), in Botany, a genus of plants, nat. ord. *Graminaceæ*. The species are annuals and consist of various kinds of *panic-grass*.

PAN'NAGE (*Fr.*), in Law the feeding of swine upon *mast* in woods; also the money paid for the license to have pannage.

PANNIC'ULUS CARNO'SUS (a fleshy tunic: *Lat.*), in Comparative Anatomy, a strong fleshy substance, situated in beasts between the hide and the fat, by means of which they can move their skin in whole or in part; it is altogether wanting in the human frame.

PANORA'MA (*pan*, everything; and *orama*, a sight: *Gr.*), a picture on a very large scale, fixed around a room specially constructed for the purpose, so that from the centre a spectator may have a complete view of the objects represented. The artist must take an accurate plan of the whole surrounding country, as far as the eye can reach from a high point. Truth of representation and closeness of imitation are the great objects to be aimed at in panoramas, and the deception must be promoted by the manner in which the light is admitted. When it is well executed, the panorama produces a complete illusion. The *diorama* differs from it chiefly in being flat instead of circular, and therefore, like any other painting, presenting only a particular view, in front of, instead of all round, the spectator [See DIORAMA.]

PANSTEREORA'MA (*pan*, all; *stereos*, solid; and *orama*, a sight: *Gr.*), the model of a town or country in cork, wood, pasteboard, &c.

PAN'SY (*pensée*, a thought: *Fr.*), the garden varieties of the *Viola tricolor*, and other flowers usually termed *heartsease*.

PANTALOON' (*pianto leone*, 'I plant the lion,' the old Venetian war-cry: *Ital.*), one of the chief characters in a pantomime. His dress originally included the article known by his name. The pantaloon was introduced by the Venetians, and, with them, was a *burgher*. The name is an allusion to the boastful language indulged in by the Venetians regarding themselves.

PANTECH'NICON (*pan*, all; and *technikos*, belonging to art: *Gr.*), a repository or warehouse where every kind of manufactured article is exposed for sale.

PAN'THEISM (*pan*, every; and *Theos*, God: *Gr.*), the belief that the universe is not distinct from God; in other words, that it is both *natura naturans* and *natura naturata*.

PANTHE'ON (*pantheion*, literally common to all the gods; from last), in Roman Antiquity a temple of a circular form, dedicated to all the heathen deities. It was built on the *Campus Martius*, by Agrippa, son-in law to Augustus, and is now a church dedicated to the Virgin Mary and all the martyrs. It is called the *rotunda*, on account of its form, and is one of the finest edifices in Rome. Its hemispherical dome is 142 feet in diameter, and 144 feet in extreme height from the pavement; it has an opening in the centre, by which alone the building is lighted—the rain which falls through being conveyed away by a sewer under the marble pavement. The well-preserved portico of this edifice seems to be of a later period than the temple itself; it consists of sixteen columns of oriental granite, each of which is 15 feet in circumference. The interior was formerly adorned with vast quantities of bronze, and with the most beautiful statues of the various deities, but they were removed by Constantine to Constantinople; at present there are, in the eight niches, eight fine columns, placed there by the emperor Adrian. It is very remarkable, and shows the alteration which has taken place at Rome, that the entrance is now twelve steps below, though formerly it was twelve steps above, the surface of the ground.

PAN'THER (*panthēr:* *Gr.*), in Zoology, the *Felis Pardus*, a ferocious quadruped, of the size of a large dog, with short hair, of a yellowish colour, diversified with roundish black spots. It is a native of Africa, and has the general habits of the leopard, from which it is only to be distinguished by the larger spots which usually form rings. Naturalists now believe that both belong to the same species, *Leopardus varius*.

PAN'TOGRAPH (*pan*, all; *grapho*, I write, *Gr.*), an instrument by which drawings may be copied on a reduced or on an enlarged scale

PANTOM'ETER (*pas*, all; and *metreo*, I measure: *Gr.*), an instrument used to take all sorts of angles, distances, and elevations.

PAN'TOMIME (*pas*, all; and *mimos*, an imitator: *Gr.*), a theatrical representation consisting entirely of gestures and actions, assisted by scenery and machinery. Formerly, Harlequin, Columbine, Pantaloon, and the Clown were sufficient, but now a-days something much more elaborate is placed on the stage.——PANTOMIMES, among the ancients, were persons who could imitate all kinds of actions and characters by signs and gestures Scaliger supposes they were first introduced upon the stage to succeed the chorus and divert the audience with apish postures and antic dances. In after times their interludes became distinct entertainments, and were separately exhibited.

PA'PACY, the office of pope, or the succession of popes. The word *papa* is used in the eastern church to signify any priest; in the west it was not, at first, applied exclusively to the bishop of Rome. The earliest appearance of substantial power in the papacy is discovered in the 4th century, when Theodosius gave to the patriarch of Constantinople the *second* rank. The authority of the Roman bishop was augmented first by his see being the capital of the world, and then by the very removal of the seat of empire from it, which left him to a certain extent independent of the imperial sway. The donations, by Pepin and Charlemagne, of the territories which constitute what is called the patrimony of St. Peter, gave to the popes the position of temporal sovereigns; and they availed themselves of every opportunity of extending their dominions. But it was in the pontificate of Gregory VII. that the temporal power of the papacy received its complete development. This ambitious pontiff sought to reduce all Christendom into feudal subjection to the holy see, and claimed the prerogative of appointing the various sovereigns of Europe. This authority, though generally disputed by the emperors and other potentates, was more than once reluctantly admitted by them. The degradation to which John of England submitted is a proof of the power which the popes had succeeded in acquiring, and of the humiliations to which kings were sometimes obliged to submit. The reformation, however, in depriving the papacy of one-third of its subjects, caused a gradual decline of authority, so that in modern times it has had but little political influence.

PAPAW', the *Carica Papaya*, a tree growing in warm climates to the height of 18 or 20 feet, with a soft stem, naked nearly to the top, where there is a crown of large lobed leaves on long foot stalks; it bears a large pear-shaped succulent fruit, of little value, but its acrid milky juice is said to possess the singular property of making tough meat tender in a very short time Nat order *Papayaceæ*

PA'PER (*papier: Fr.;* from *papyrus*. *Lat*), the well known substance on which letters and figures are written or printed The ancients were obliged to have recourse to a variety of substitutes for our paper—stone, wood, lead, skins, &c, but chiefly to *papyrus* The latter was manufactured in Egypt, with great success, up to the 5th century, when its use began to decline in Europe, and it was gradually superseded by parchment and by paper, which was made from cotton at least as early as the 10th century. The Chinese and Persians were acquainted very early with the mode of manufacturing paper. It must formerly have been made by a different process from that now employed, since, in the old specimens, there are no marks of the wires through which the water is drained at present. Various materials have been latterly employed besides linen and cotton, and with great success—among others, straw; in fact, any substance will answer if it contains woody fibre, which is indispensable to a serviceable paper. The substance used is first reduced to a pulp, the quality of which is of the greatest importance; size is mixed with the pulp, except in the manufacture of writing paper, to which it is generally added when in sheets. The pulp is poured in moulds having wire bottoms, through which the fluid passes off; the marks caused by these wires are called 'water marks,' but they are now avoided in *wove paper* by the use of a wire cloth. The paper is transferred from the mould to a *felt* or woollen cloth, and when the quantity has reached a *post* or six quires, it is subjected to great pressure; this removes a large amount of the remaining moisture, after which it is placed in the drying rooms; and when dry it is, if not sized before, dipped in a mixture of size and alum. After being dried, sorted, and pressed, it is made up into quires. Paper is distinguished, as to its use, into writing paper, drawing paper, cartridge paper, copy, chancery, &c.; as to its size, into foolscap, post, crown, demy, medium, royal, imperial, &c. Some of these terms, thus *foolscap*, are due to the water marks formerly used by manufacturers as a means of distinguishing their paper from that of others. Water marks prevent frauds with regard to bank notes, &c.; and they have sometimes, in courts of law, been the means of detecting forgeries of documents pretended to be of an earlier date than what was evinced by the water mark in the paper. Paper is made either by hand or by machinery; and perhaps none of the useful arts have received more attention in order to bring them to perfection than the paper manufacture. In whiteness, fineness, and firmness, the paper made in England excels all others; the French manufacture some of a very fine quality; the Italians and Germans are noted more for the durability of their paper than for its fineness. The demand for paper is so enormous that recourse is had, of necessity, to machinery, which is of a most ingenious description. France claims, and perhaps with justice, the honour of its first invention; but almost every good automatic paper mechanism at present mounted in France, Germany, Belgium, Italy, Russia, Sweden, and the United States, has either been made in Great Britain, and exported to those countries, or has been constructed in them upon the English models. Many and various have been the improvements introduced, till at length the art has so completely triumphed over every difficulty that a continuous stream of fluid pulp is now passed round the cylinders with unerring precision, and not only made into paper, but actually dried, pressed smooth, and every separate sheet cut round the edges, in the brief space of a very few minutes.

PA'PER-MONEY, or PA'PER CUR'RENCY, bank notes or bills issued on the credit of government, and circulated as the representative of coin. In a more extensive sense, these terms may denote all kinds of notes and bills of exchange.

PA'PER-MUL'BERRY, a Japanese tree, hardy enough to grow in the open air in England. It is the *Broussonetia papyrifera* of botanists, nat. ord. *Moraceæ*. The inner bark of the young shoots is separated by maceration in water, and after having been beaten into a pulp, some of this is spread in sufficient quantity over a small tray with a slightly raised rim. Thus a sheet of paper is prepared by the Japanese, which is made ready for use by being dried in the sun.

PA'PIER LINGE (linen paper: *Fr.*), a kind of paper made to resemble damask and other linen so ingeniously, that it is impossible, without careful examination, to detect the difference. Even to the touch, articles made from the *papier linge* are very much like linen; and they can be used for every purpose to which linen is applicable, with the exception, of course, of those in which strength and durability are required, and of those in which it is necessary to subject the material to the action of water or moisture.

PA'PIER MA'CHÉ (chewed paper: *Fr.*), the composition of which superior tea-trays, snuff-boxes, and many other light and elegant articles, as well as a variety of toys, &c., are manufactured. It is made of cuttings of white or brown paper, boiled in water, and beaten until they are reduced to a pulp, and then boiled in a solution of gum-arabic, or of size, to give consistency to the pulp, which is afterwards formed into different shapes, by pressing it into oiled moulds. When dry, it is coated with a mixture of size and lamp-black, and afterwards varnished. Another article, sometimes known by this name, consists of sheets of paper glued and powerfully pressed together, so as, when dry, to possess the hardness of board, and yet, while moist, to be capable of being forced into almost any shape. Tea-trays, snuff-boxes, &c., are manufactured from it; and, after being varnished, are often exquisitely ornamented with figures, landscapes, gilding, &c. *Papier mâché* is rendered, to a great extent, waterproof by mixing sulphate of iron, lime, glue, or white of egg, with the pulp; and almost fire-proof, by borax and phosphate of soda.

PAPIL'IO (*Lat.*), in Entomology, a genus of butterflies of which there is only one representative in this country, the swallow-tailed butterfly, the *Papilio Machaon*. It is coloured yellow and black, and makes its appearance in May and June. The caterpillar feeds on fennel and carrot, and is of a green colour with black cross bands.

PAPILIONA'CEOUS (same *deriv.*), in Botany, an epithet for the corolla of plants which bear some resemblance in shape to a butterfly; such as that of the pea. The papilionaceous corolla is usually five-petalled, having an upper spreading petal called the *banner* or *standard*, two side petals called *wings* or *alæ*, and two lower petals frequently united and forming the *keel* or *carina*.

PAPIL'LÆ (*Lat.*), the nipples of the breast. Also, the terminations of the nerves in that form which constitutes the sense of feeling in the true skin, and of taste. They are prominent on the palmar surface of the fingers and plantar surface of the toes, where they are arranged along curved lines, in double rows. Also, any small nipple-like prominences.

PAPIL'LOSE (*papilla*, the nipple: *Lat.*), in Botany, covered with fleshy dots or points, or with soft tubercles.

PA'PIST (*papa*, the pope: *Lat.*), one that adheres to the doctrines and ceremonies of the church of Rome; a Roman Catholic.

PAPPOOS', the name given to a young child by the natives of New England.

PAP'PUS (*Lat.; from pappos, Gr.*), in Botany, a sort of feathery or hairy crown with which many seeds, especially those of composite plants, are furnished, and which aids in their dissemination. Structually the pappus is the limb of the calyx, elongate and divided.

PAP'ULOSE (*papula*, a pimple: *Lat*), in Botany, an epithet for a leaf, &c., covered with vesicular points or with small blisters.

PAPYROG'RAPHY (*papuros*, papyrus; and *graphē*, a writing: *Gr.*), a lately-invented art, which consists in taking impressions from a kind of pasteboard covered with a calcareous substance (called lithographic paper), in the same manner as from stones in the process of lithography.

PAPY'RUS (*Lat.; from papuros: Gr.*), a sedge-like plant, the *Papyrus antiquorum* of botanists (nat. ord. *Cyperaceæ*), famous for having furnished the ancients with a material for writing upon. In former times it grew abundantly in the marshy ground of the Nile Delta, where it is now almost extinct, and also near Syracuse, where it is still plentiful. Its roots are tortuous, and in thickness about four or five inches; its stem, which is triangular and tapering, rises to the height of ten feet, and is terminated by a number of wide spreading towering spikes, surrounded with an involucre composed of eight large sword-shaped leaves. Other species of cyperaceous plants, called by the general name of *Papyrus*, were, and are, used extensively in Egypt for other purposes. The inhabitants of the countries where they grow, even to this day, manufacture them into sail-cloth, cordage, and sometimes wearing apparel. Boats are made by weaving the stems compactly together, and covering them externally with a resinous substance, to prevent the admission of water. The papyrus was prepared for use by cutting the interior of the stalks, after the rind had been removed, into thin slices in the direction of their length; laying these, in succession, on a flat board; placing similar slices over them, at right angles; cementing their surfaces together by a glue, subjecting them to pressure, and drying. The size of the sheet was variable in length, to any desired extent. This material, in pliability, durability, and cheapness, exceeded every other employed by the ancients as we employ paper, the skins of the Ionians, the linen of the Romans, the cotton stuff and palm-leaves of the Indians, and the parchment of Mysia. Many of the papyri still existing exhibit a great difference in texture; they are fragile, and difficult to unrol till exposed to steam or the damp of a moist climate. They are chiefly found in Egypt and Herculaneum. But as yet no work of any value has been discovered in them, though their deciphering has cost much trouble and ingenuity. Papyrus was in general use until the end of the 7th century, after which it was gradually superseded by parchment and paper. We possess papyri written more than 2000 years before the Christian era.

PAR (equal: *Lat.*), in Commerce, a term applied to any two things equal in value. In money matters, it indicates the equality of one kind of money or property with another. Thus, when 100*l.* stock is worth exactly 100*l.* specie, the stock is said to be *at par;* that is, the purchaser is required to give neither more nor less of the commodity with which he parts, than the nominal equivalent of that which he acquires. Thus, too, the *par* of exchange is the value of money in one place equal to a given sum in another. In the exchange of money with foreign countries, the person to whom a bill is payable is supposed to receive exactly the same amount as was paid to the drawer by the remitter; but this is not always the case with respect to the intrinsic value of the coins of different countries, which is owing to the fluctuation in the rates of exchange among the several countries and great trading cities. In fine, bills of exchange, stocks, &c., are *at par* when they sell for their nominal value; *above par* when they sell for more; and *below par* when they sell for less.

PA'RA, a Turkish coin, very small and thin. It is of copper and silver, and is the fortieth part of a Turkish *piaster*. It is worth rather less than a halfpenny.

PAR'ABLE (*parabolē*, from *paraballo*, I set side by side—that is, compare: *Gr.*), a fable or allegorical representation of something real or apparent in life or nature, from which a moral is drawn for instruction.

PARAB'OLA (same, because its axis is parallel to the side of the cone), in Conic Sections, a curve produced by cutting a cone by a plane parallel to one of its sides. The peculiar property of the *Apollonian* parabola is, that each point in it is at the same distance from its *focus* as from a line termed the *linea directrix*, which perpendicularly intersects the axis—a line passing through the focus. There are other kinds of curve which are termed parabolas. Theoretically, projectiles describe the Apollonian parabola.

PARABOL'IC AS'YMPTOTE, a parabolic line approaching to a curve, so that they never meet; yet, by producing both indefinitely, their distance from each other becomes less than any given line.

PARABOL'IC CO'NOID, a solid generated by the revolution of a parabola about its *axis*. Its contents are equal to half those of a circumscribed cylinder, and once and a half those of a cone having the same base and altitude.

PARABOL'IC SPIN'DLE, a solid formed by the revolution of a parabola about its *base*, or double ordinate.

PARABOL'IFORM, having the form of a parabola.

PARAB'OLISM (*paraballo*, I compare one thing with another: *Gr.*), in Algebra, the division of the terms of an equation by a known quantity that is involved or multiplied in the first term.

PARAB'OLOID (*parabolē*, a parabola; and *eidos*, form: *Gr.*), in Geometry, a parabola of a higher order.——Also, another term for the *parabolic conoid*.

PARACEL'SIANS, the followers of Paracelsus, who, it is probable, was the most celebrated quack that ever existed. His system of medicine successfully opposed those of Hippocrates and Aristotle. He mingled cabalistic speculations and his peculiar notions of theology with medical and chemical knowledge. He died in 1541, but his followers exercised considerable influence over medicine, physics, and mystical science in Germany, for more than a century after.

PARACEN'TRIC MO'TION (*para*, alongside of; and *kentron*, the centre: *Gr.*), in Astronomy, denotes the rate at which a planet approaches nearer to, or recedes from, the sun or centre of attraction.

PARACH'RONISM (*para*, past; and *chronos*, time: *Gr.*), an error in Chronology, by which an event is related as having happened at a later period than its true date.

PAR'ACHUTE (*para*, against: *Gr.;* and *chute*, a fall: *Fr.*), in Aerostation, a machine in the form of a large umbrella, intended to enable a person to descend from a balloon. While attached to the lower end of the balloon, it is closed, but it expands itself immediately when beginning to descend, on being liberated from that machine. Its violent oscillations greatly endanger the safety of the aeronaut; and it was supposed that these might be prevented by using a parachute in the form of an *inverted* umbrella, with an aperture in the centre; but when the experiment was tried, the hoop broke, the parachute collapsed, and the unfortunate experimentalist was killed.

PAR'ACLETE (*paraklētos*, from *parakaleo*, I call to aid: *Gr.*), the *Comforter*, a term applied in the sacred volume to the Holy Spirit. In the early times of the church, the opinion was not uncommon, that Christ was to send the promised Paraclete corporeally; and hence several impostors, Simon Magus, Manes, Montanus, and others, pretended to be this expected Comforter.

PARACROS'TIC (*para*, alongside of; *akros*, the outermost; and *stichos*, a line: *Gr.*), a poetical composition in which it is necessary that the first verse should contain in order all the letters with which the succeeding verses commence.

PAR'ADIGM (*paradeigma*, from *paradeiknumi*, I hold up to view: *Gr.*), in Grammar, an example of a verb conjugated in the several moods, tenses, and persons.

PAR'ADISE (*paradeisos: Gr.; from pardēs: Heb.*), a region of supreme felicity; generally meaning the garden of Eden.——When Christians use the word, they mean that celestial paradise, or place of pure and refined delight, in which the souls of the blessed enjoy everlasting happiness.

PAR'ADISE, BIRDS OF, a tribe of birds belonging to the conirostral group of the *Passeres*, the same group to which the crows and finches belong. They exclusively inhabit the island of New Guinea, and some adjacent islets. About thirteen species are known, all remarkable for the great beauty of the plumage. It was at one time generally believed that they had no legs (the people who sold their skins to the traders always removing the legs), that they spent their lives on the wing, feeding upon dew, and that the females laid their eggs in a cavity on the backs of the males, where they were hatched. Even now such is the rarity of some species, and the inaccessibility of the places where all reside, that little is known of their habits. Specimens of one or two species have been brought alive to England, but they are becoming every day more rare in their native woods. That persevering traveller and naturalist, Mr. Wallace, made five voyages to different parts of the district they inhabit, each occupying in its preparation and execution the larger part of a year, and yet he only obtained specimens of five species. Nature seems, he says, to have taken every precaution that these her choicest treasures may not lose value by being too easily obtained. First we find an open, harbourless, inhospitable coast, exposed to the full swell of the Pacific Ocean; next a rugged and mountainous country covered with dense forests, offering in its swamps and precipices and serrated ridges an almost impassable barrier to the central regions; and lastly a race of the most savage and ruthless character, in the very lowest stage of civilization. In such a country, and among such a people, are found these wonderful productions of nature. In those trackless wilds do they display that exquisite beauty and that marvellous development of plumage calculated to excite admiration and astonishment among the most civilized and most intellectual races of men. A feather is itself a wonderful and beautiful thing. A bird clothed with feathers is almost necessarily a beautiful creature. How much, then, must we wonder at and admire the modification of simple feathers into the rigid polished wavy ribbons which adorn one species, the mass of airy plumes on another, the tufts and wires of a third, or the golden buds borne upon airy stems that spring from the tail of a fourth; while gems and polished metals can alone compare with the tints that adorn the breast of two others, and the immensely developed shoulder plumes of a seventh.

PAR'ADOX (*paradoxos*, contrary to opinion: *Gr.*), in Philosophy, a tenet or proposition seemingly absurd, or contrary to received opinion, yet true in fact.

PAR'AFFINE (*parum*, little; and *affinis*, connected with: *Lat.*—on account of its weak affinities), in Chemistry, one of the products obtained by the destructive distillation of coal, petroleum, &c. It is a soft white substance without taste or smell, composed of carbon and hydrogen. It has a specific gravity of about ·87, and its melting point is about 112°, is not decomposed by distillation, burns with a clear white flame without smoke or residuum, and does not stain paper. It dissolves easily in warm fat oils; also in cold essential oils, and in ether, but it resists the action of chlorine, strong acids, and caustic alkalis. This substance is manufactured into candles. Paraffine oil is the rectified product of the distillation of bituminous coal at a low temperature. It is very fluid, has a pale yellow colour, and is lighter than water. It has come into extensive use for illuminating purposes. Solid paraffine can be obtained from it by the application of cold and pressure.

PARAGO'GE (*paragōgē*, from *parago*, I move beside: *Gr.*), a figure in Grammar, by which the addition of a letter or syllable is made to the end of a word. It is used in forming the diminutives of most languages.

PAR'AGON (*para*, past; and *agōn*, a contest: *Gr.*), a model by way of distinction, implying superior excellence or perfection; as, a *paragon* of beauty or eloquence.

PAR'AGRAM (*paragramma*, from *paragrapho*, I compare by writing alongside of: *Gr.*), a play upon words. Hence *paragrammatist*, an appellation for a punster.

PAR'AGRAPH (*paragraphē*, a thing written beside: *Gr.*—on account of the mark used in referring to a paragraph), any section or portion of a writing which relates to a particular point, whether consisting of one sentence or many. Paragraphs are generally distinguished by a break in the lines; when a large quantity of matter is intended to be compressed into a small space, they may be separated by a dash, thus ——. A paragraph is also sometimes marked by a ¶.

PARALEIPOM'ENA (things to be omitted: *Gr.*), in matters of Literature, denotes a supplement of things omitted in a preceding edition of any work. The two books of the Old Testament, called by us, after St. Jerome, the Chronicles, are also termed Paraleipomena.

PARALEIP'SIS (*paraleipsis*, a passing over: *Gr.*), a figure in Rhetoric, by which the speaker pretends to pass by what at the same time he really mentions.

PAR'ALLAX (*parallaxis*, from *paralasso*, I go aside: *Gr.*), in Astronomy, a change of place or aspect.——DIURNAL PARALLAX, the difference between the places of any celestial objects as seen from the surface and from the centre of the earth at the same instant.——ANNUAL PARALLAX, a change in the apparent place of a heavenly body, caused by its being viewed from the earth in different parts of its orbit. The annual parallax of the planets is considerable, but that of the fixed stars has, till very recently, been considered as altogether imperceptible. The latter has, however, been detected in a few instances by the distance between two stars being found to vary at different periods of the year. When the parallax of a celestial body is determined, its distance can be ascertained. The distance of the star known to astronomers as *a centauri*, having a parallax of about one second, has been calculated at twenty billions of miles, through which its light will travel to us in 3¼ years. Diurnal parallax increases the zenith distance of a celestial body, by depressing it in the vertical circle. If it is on the meridian, only its declination is affected; if not on the meridian, both declination and right ascension are altered.——PARALLAX, in Levelling, denotes the angle contained between the line of the true and that of the apparent level.

PAR'ALLEL (*parallēlos*, from *para*, beside, and *allēlois*, one another: *Gr.*), in Geometry, an appellation given to lines and planes everywhere equidistant from each other.——The word *parallel* is also often used metaphorically to denote the continued comparison of two objects, particularly in history. Thus, we speak of drawing an historical *parallel* between ages, countries, or men.——PARALLEL OF ALTITUDE, in Geography, a small circle of the sphere parallel to the horizon: called also an *almacantar*.——PARALLEL CIRCLES, or *circles of latitude*, are small circles of the sphere, conceived to be drawn through all the points of the meridian, commencing from the equator, to which they are *parallel* and terminating with the poles. They are called parallels of latitude, because all places lying under the same parallel have the same latitude.——PARALLEL OF DECLINATION, in Astronomy, a small circle of the celestial sphere parallel to the equator.——PARALLEL LINES, in sieges, are those trenches which generally run parallel with the outlines of the fortress. They serve as places for concentrating the forces to be directed against the fortress, and are usually three feet deep, from nine to twelve feet wide, and of a length adapted to the circumstances of the case.——PARALLEL MOTION, a name given to various contrivances consisting of jointed combinations of linkwork, for guiding parts of machines that have a back and forward motion, such as the piston-rod of a steam-engine, with a view to get rid of the friction attending straight guides. One of the contrivances that have given celebrity to the name of James Watt was a parallel motion, which however was only approximate, not exact.—PARALLEL PASSAGES are such passages in a book as agree in import; as, for instance, certain passages in the Bible.——PARALLEL PLANES are such planes as have all the perpendiculars drawn betwixt them equal to each other.——PARALLEL RAYS, in Optics, are those which keep at an equal distance while passing from the visible object to the eye, which is supposed to be infinitely remote from the object.——PARALLEL RULER, a mathematical instrument, consisting of two equal rulers, so connected together by cross-bars and moveable joints that parallel lines may thereby be drawn at any required distance from each other, within the limits through which they can be opened.——PARALLEL SAILING, in Navigation, the sailing on or under a parallel of latitude, or parallel to the equator.——PARALLEL SPHERE, in Astronomy, the situation of the sphere when the equator coincides with the horizon, and the poles with the zenith and nadir. The sphere would have this appearance to a spectator placed at the poles; to him the stars would neither rise nor set, but would move constantly in circles parallel to the horizon, and the sun would rise and set only once a year.

PAR'ALLELISM (*parallēlismo*, a comparing of parallels: *Gr.*) OF THE EARTH'S AXIS, in Astronomy, the situation of the earth's axis in its progress through its orbit. It is such, that if this axis is parallel to a given line in any one position, it will be parallel to the same line in any other position. This parallelism is the result of the earth's double motion, viz. round the sun and round its own axis, or of its annual and diurnal motion; and we owe to it the vicissitudes of seasons and the inequality of day and night.

PARALLEL'OGRAM (*parallēlogrammos*, from *parallēlos*, parallel; and *grammē*, a line: *Gr.*), in Geometry, a plane figure bounded by four right lines, of which each opposite pair are parallel and equal to one another.——In common use, this word is applied to quadrilateral figures of a greater length than breadth.

PARALLELOPI'PED (*parallelopipède*: *Fr.*; from *parallēlos*, parallel: *Gr.*), in Geometry, a regular solid comprehended within six parallelograms, the opposite ones of which are similar, parallel, and equal to each other; or it is a prism whose base is a parallelogram.

PARAL'OGISM (*paralogismos*, from *paralogizomai*, I reckon wrong: *Gr.*), in Logic and Rhetoric, a reasoning false in point of form—that is, in which a conclusion is drawn from premises which do not logically warrant it. It is the opposite to a *syllogism*.

PARAL'YSIS (*paralusis*, from *paraluo*, I relax: *Gr.*) [See PALSY.]

PARAMAGNET'IC (*para*, beside: *Gr.*), an epithet applied to those bodies which when placed between the poles of a magnet tend to pass bodily from weaker to stronger lines of force, and if the bodies are elongated they set along the lines of force, whilst those that are diamagnetic set across them.

PARAM'ETER (*parametreo*, I measure with: *Gr.*), in Conic Sections, a constant line, otherwise called the *latus rectum*. In the parabola, it is a third proportional to the abscisa and its corresponding ordinate. In the ellipse and hyperbola, the parameter of a diameter is a third proportional to that diameter and its conjugate.——The term also denotes the constant quantity which enters into the equation of a curve.

PAR'AMOUNT (*Fr.*), in Law, the supreme lord of the fee. Lords of those manors that have other manors under them are styled lords-paramount; and the king, who in law, is chief lord of all the lands in England, is thus *the* lord-paramount.

PAR'ANYMPH (*paranumphos*, from *para*, beside; and *numphē*, the bride: *Gr.*), among the ancients, the person who waited on the bridegroom and directed the nuptial solemnities. As the *paranymph* officiated only on the part of the bridegroom, a woman called *pronuba* officiated on the part of the bride.——In Poetry, the term *paranymph* is still occasionally used for the *brideman*.

PAR'APEGM (*parapēgma*, from *parapēgnumi*, I fix beside: *Gr.*), in Classic Antiquity, signified a brazen tablet fixed to a pillar, on which laws and proclamations were engraved. Also, a tablet set in a public place, containing an account of the rising and setting of the stars, eclipses, seasons, &c.

PAR'APET (*parapetto*, a breastwork: *Ital.*), in Fortification, a wall, rampart, or elevation of earth, for screening soldiers from an enemy's shot. It means, literally, a wall breast high.

PAR'APH (*para*, alongside of; and *apto*, I touch: *Gr.*), in Diplomatics, the flourish of a pen at the conclusion of a signature. In the middle ages, it formed a rude provision against forgery, somewhat like the flourishes, &c., engraved on the bank-note. The paraph is still usual in Spain.

PARAPHERNA'LIA (*para*, beside; and *phernē*, a dower: *Gr.*), in Law, the goods which a wife brings with her at her marriage, or which she possesses beyond her dower or jointure, and which remain at her disposal after her husband's death. They consist principally of apparel, jewels, and personal ornaments suited to her degree. Nor can the husband bequeath such, though, during his life, he has power to dispose of them.

PAR'APHRASE (*paraphrasis*, from *paraphrazo*, I say the same thing in other words: *Gr.*), an explanation of some text or passage in an author, in terms more clear and ample than in the original. He who performs this is termed a *paraphrast*. A free translation is sometimes, though improperly, termed a *paraphrase*.

PARAPHRENI'TIS (*Gr.*: from *para*, beside; and *phrēn*, the midriff: *Gr.*), in Medicine, an inflammation of the *diaphragm*.

PARAPHROS'YNE (*paraphrosunē*, from *paraphrōn*, wandering from reason: *Gr.*), a term used by medical writers to express a temporary delirium or alienation of mind in fevers, or from whatever cause.

PARAPLE'GIA (a stroke on one side: *Gr.*), in Medicine, the loss of sensation and voluntary motion in the lower part of the body, in consequence of destructive disease in or injury to a part of the spinal cord.

PAR'ASANG (*parasangēs*: *Gr.*; from *pharsang*: *Pers.*), a Persian measure of length, varying in different ages and in different places, from thirty to fifty stadia or furlongs.

PARASCE'NIUM (*paraskēnia*, from *para*, beside; and *skēnē*, a scene: *Gr.*), in the Grecian and Roman theatres, the side entrances to the stage; the side scenes.

PARASCE'VE (*paraskeuē*, a getting ready: *Gr.*), a word signifying *preparation*, applied to the sixth day of the Jewish week, or Friday, because, not being allowed to prepare their food on the sabbath-day, they provided and prepared it on the day previous. It is used to express *Good Friday*, because that day was the *parasceve* of the passover.

PARASELE'NE (*para*, beside; and *selēnē*, the moon: *Gr.*), a *mock-moon* or phenomenon in the form of a luminous ring encompassing or adjacent to the moon. Sometimes it consists of one, two, or more bright spots, bearing considerable resemblance to the moon. The paraselenes are formed after the same manner as the *parhelia*, or mock-suns.

PAR'ASITES (*parasitos*, from *parasiteo*, I eat with: *Gr.*), among the Greeks, were an order of priests, or at least ministers of the gods, resembling the *Epulones* at Rome. Their business was to collect and take care of the sacred corn destined for the service of the temples and the gods; to see that sacrifices were duly performed, and that no one withheld the first fruits, &c., from the deities. In every village of the Athenians, certain *Parasiti* in honour of Hercules, were maintained at the public charge; but to ease the commonwealth of this burden, the magistrates at last obliged some of the richer citizens to take them to their own tables, and entertain them at their individual expense; hence the word *parasite*, used by the ancients in a sense very similar to that in which it is understood by ourselves. Those termed parasites were supposed to be either poor confidential friends, or guests who were expected to pay for their entertainment by the amusement they afforded, and which sometimes degenerated into buffoonery, and even the grossest flattery.——In Zoology, animals which reside in or upon other animals, deriving nourishment from their bodies.

PARASIT'ICAL PLANTS (*parasitikos*, like a parasite: *Gr.*), in Botany, such plants as grow upon other plants, and receive their nourishment from them. Of this class are the mistletoe, broom-rape, and among exotics, the gigantic *Rafflesia*. They have no proper roots. The term is often applied also to mosses, &c., growing on the bark of trees, but deriving their food from the air by means of their own roots.

PARASTREM'MA (*parastrepho*, I twist from its proper place: *Gr.*), in Medicine, a convulsive distortion of the mouth, or any part of the face.

PARATAX'IS (*Gr.*, from *paratasso*, I arrange side by side), in Grammar, the arranging of propositions, one after another, as they present themselves to the mind, without consideration of their dependence on each other; it is opposed to *syntax*.

PARATH'ESIS (a putting beside: *Gr.*), a term used by some grammarians for apposition, or the placing of two or more nouns in the same case.

PARAVA'IL (*par*, by; and *avail*, profit: *Fr.*—because it was he who was supposed to make profit from the land), in Feudal Law, the lowest tenant holding under a mediate lord, as distinguished from a tenant *in capite*, who holds immediately of the king.

PAR'BUCKLE, in Naval Language, the rolling of a cask, or any cylindrical body, by means of ropes which, having been fastened where the cask, &c., is to go, are laid along the ground, then over the ends of the cask, and back to where they start from.

PAR'CÆ (*Lat.*, from *parcus*, sparing), or the Fates, in the Heathen Mythology, three goddesses who were supposed to preside over the accidents and events, and to determine the date or period, of human life. They were called Atropos, Clotho, and Lachesis, and are variously represented—sometimes as spinning the thread of human life; in which employment Clotho held the distaff, Lachesis turned the wheel, and Atropos cut the thread. It has been supposed that, until the Augustan age, when Greek and Roman mythology became mingled, the Romans had but one *parca*, who was equivalent to the goddess *Mors*, the third of the fates.

PAR'CENER, or CO-PAR'CENER (*parsonier: Fr.*; from *persona*, a person: *Lat.*—because all of them form, as it were, *but one* individual), in Law, a *co heir*, or one who holds lands by descent from an ancestor in common with others. The holding or occupation of lands of inheritance by two or more persons, differs from *joint tenancy*, which is created by deed or devise, whereas *parcenary* is created by the descent of lands from a common ancestor. No right of survivorship exists among co-parceners; but they may agree, or any one may force the rest, to make a partition.

PARCH'MENT (*parchemin: Fr.*), the skins of sheep or goats, prepared in such a manner as to render them proper for writing upon. *Vellum* is a similar preparation from the skins of calves, kids, and lambs. The parchment used for drums is obtained from the skin of asses, calves, and wolves; that for battledores from the skin of asses, and that for sieves from the skin of goats. Parchment is made by preparing the skins as if for tanning; shaving down and pumicing them; then stretching and carefully drying them. When intended for the bookbinder, it is sometimes dyed green with verdigris. The use of parchment is very ancient; the Hebrews had books written on the skins of animals in David's time, and Herodotus relates that the Ionians, from the earliest period, wrote upon goat and sheep-skin, from which the air had been merely scraped off. It was used by Eumenes, king of Pergamus, 250 B C. He could not obtain enough papyrus for the library he was establishing, and employed it as a substitute—whence *pergamena*, its Latin name. In the beginning of the 8th century, it had entirely superseded papyrus: and all the public documents, under Charlemagne, were written upon it.——**Vegetable Parchment**, a tough and durable paper possessing many of the qualities of parchment, prepared by immersing ordinary unsized paper for a short time in strong sulphuric acid, and then washing it free of every trace of the acid.

PARD (*pardus: Lat.*), the leopard or panther. 'A soldier bearded like the pard.' —Shakspere

PAREGOR'IC (*parēgorikos*, soothing: *Gr.*), that which assuages pain.——**Paregoric Elixir**, a camphorated tincture of opium, flavoured with oil of aniseed.

PAREM'BOLE (*Gr.*, from *paremballo*, I put in between), a figure in Rhetoric, by which a paragraph is inserted in the middle of a sentence, for the purpose of explanation. It is called also *paremptosis*, and it may be considered a species of parenthesis, which see.

PARENCHY'MA (*para*, between; *cheuma*, anything effused: *Gr.*), the cellular tissue of vegetables in which the cells are not very elongate, nor very firmly adherent to each other. The pith of plant stems and the soft interior of leaves are examples of parenchyma.

PA'RENT (*parens*, from *pario*, I bring forth: *Lat.*), a term of relationship applicable to those from whom we immediately receive our being. Parents, by the law of the land, as well as by the law of nature, are bound to educate, maintain, and defend their children, over whom they have a legal as well as a natural power they likewise have interests in the profits of their children's labour, during their nonage, in case the children live with and are provided for by them; yet the parent has no interest in the real or personal estate of a child, otherwise than as his guardian. The laws relating to the mutual rights and duties of parents and children are a very important part of every code, and have a very intimate connection with the state of society and with civil institutions. In ancient times, when paternity was a great foundation of civil authority, the parental rights were much more absolute than in modern, extending, in some countries, to the power of life and death, and continuing during the life of the two parties.

PAREN'THESIS (*Gr.*), from *parentithēmi*, I put in beside), in Rhetoric, a figure, by which a few words are inserted in a sentence to explain some portion of it. All kinds of parentheses may be removed, without rendering the sentence grammatically incorrect. The ancients placed in parentheses many things which we put in explanatory notes.

PAR'GASITE, in Mineralogy, a variety of *Actinolite*, from Pargas, in Finland.

PAR'GET, in Architecture, the plaster formed of lime, hair, and cowdung, used in coating a chimney. The use of earthenware pipes in chimneys renders this unnecessary, and is a great improvement.

PARHE'LION (*para*, beside; and *hēlios*, the sun: *Gr.*), in Astronomy, a mock sun, or meteor, having the appearance of the sun itself, and seen by the side of that luminary. Parhelia are sometimes double, sometimes triple, and sometimes even more numerous; and they are always connected with one another by a white horizontal circle. They are formed by the reflection of the sun's beams on a cloud suitably situated: and are accounted for by supposing an infinity of small particles of ice floating in the air, which multiply the image of the sun by refraction or reflection. Parhelia, which appear on the same side of the circle with the true sun, and sometimes are part of the circle itself, are tinted with prismatic colours; which is never the case with those on the opposite side; hence it is supposed that the former are produced by reflection, the latter by refraction.

PA'RIAN MAR'BLE, a sort of white marble, so called from the island of Paros, where it was first found.——PARIAN CHRONICLE [See ARUNDELIAN MARBLES.]

PA'RIAHS, a degraded tribe of Hindoos, who live by themselves in the outskirts of towns, and, in the country, build their houses apart from the villages, or rather have villages of their own; they possess, strictly speaking, no caste. They dare not, in cities, pass through the streets where the Brahmins live, nor enter a temple of the superior castes. They are prohibited from all approach to anything pure, and are doomed to perform all kinds of menial work.

PARI'ETAL BONES (*parietalis*, pertaining to walls: *Lat.*), in Anatomy, two arched bones situated on each side of the superior part of the cranium. They are thicker above than below; but are somewhat thinner, and at the same time more equal and smooth, than the other bones of the cranium. In new-born infants the *ossa parietalia* are separated from the middle of the divided *os frontis* by a portion of the cranium then unossified.——PARIETAL, in Botany, a term applied to the placentas (the parts of an ovary to which the seeds are attached) when they grow from the walls of the ovary. When the placenta is unconnected with the walls, it is styled a free central placenta, but this seldom occurs.

PAR IMPAR (even, odd: *Lat.*), in Antiquity, a game of chance practised among the Greeks and Romans. It was identical with the game of 'even or odd' practised by the boys of modern times.

PAR'IS, PLASTER OF, *gypsum* or sulphate of lime, found in abundance near Paris. The moisture having been expelled by heat from gypsum or alabaster, and the resulting substance ground, it becomes *plaster of Paris*. This powder has the property, when a certain quantity of water is added to it, of becoming very rapidly solid, heat being evolved—a fact known to the ancients. If, during calcination, it be raised to a temperature which is too high, it will assume the characters of *anhydrite*, and will not set on adding water. Plaster of Paris is used for casts, stucco work, and for mixing with lime to form a plaster which will harden quickly. Hot water, or salt and water, hasten the setting of plaster of Paris; size, beer, or wine mixed with the water, retards it four or five hours

PAR'ISH (*paroisse*: *Fr.*; from *paroikia*, a neighbourhood: *Gr.*), in England a district assigned to a church either from time immemorial or by act of parliament. Some parishes are, however, so large and populous, that they contain one or more chapels of ease. At first parish and diocese seem to have been synonymous; afterwards the diocese was formed into several parishes. England was divided into parishes at least as early as 970. Their boundaries generally coincided with those of manors, for a manor seldom extended over more than one parish, though the latter might contain several manors. Besides parishes, there are other places termed *extra-parochial*, that is, not within the limits of any parish. They were formerly the site of religious houses, or of castles, whose owners would not permit any interference with their rights There are in England and Wales about 10,700 parishes, and nearly 2500 in Ireland.

PARK (*pearruc*: *Sax.*), a large quantity of ground, enclosed and privileged for beasts of the chase. To constitute a park, three things are required—a royal grant or licence; enclosure by pales, a wall, or a hedge; and beasts of chase, as deer, &c. There are parks *in reputation*, and not erected by warrant. At present, any considerable extent of pasture and woodland surrounding the country residence of a person of rank, devoted to the purposes of recreation, but chiefly to the support of a herd of deer, and sometimes of cattle and sheep, is called a *park*.——PARK also signifies a large net placed on the margin of the sea, with only one entrance, which is next the shore, and is left dry by the ebb of the tide.——PARK OF ARTILLERY, a place in the rear of an army for encamping the artillery, which is formed in lines, the guns in front, the ammunition-waggons behind the guns, and the pontoons and tumbrils constituting the third line. The phrase is also applied to denote the whole train of artillery belonging to an army or division of troops.——PARK OF PROVISIONS, the place where the sutlers pitch their tents and sell provisions, and that where the bread-waggons are stationed.

PAR'LIAMENT (*parlement*, from *parler*, to speak: *Fr.*), the grand assembly of the three estates in Great Britain, or the great council of the nation, consisting of the sovereign, lords, and commons, which forms the legislative branch of the government. The word *parliament* was introduced into England under the Norman kings. In France it was used to signify the principal judicial courts of the country, as well as deliberative assemblies. The supreme council of the nation was called by our Saxon ancestors the *wittenagemote*, or meeting of wise men or sages. A parliament is called by a writ or letter from the sovereign, directed to each lord, summoning him to appear; and by writs sent by the lord chancellor, under the great seal, commanding the sheriffs of each county to take the necessary steps for the election of members for the county and the boroughs contained in it. Parliament *must* be held at least once every three years; but as the mutiny act, land tax and malt act, are passed only for a single year, its meetings are of necessity annual. On the day appointed for the opening of parliament, the sovereign sits in the house of lords under a canopy, dressed in robes, as are all the lords in theirs, and the commons being summoned to the bar of that house, the sovereign addresses both houses on the state of public affairs. The commons are then required to choose a speaker, which officer being presented to and approved by the sovereign, the latter withdraws, the commons retire to their own house, and the business of parliament begins. In the *house of lords*, the seat of each member is prescribed according to rank, though, except in the presence of the sovereign, this formality is almost wholly dispensed with. The princes of the blood sit on each side of the throne; the two archbishops on the sovereign's right hand; the bishops of London, Durham, and Winchester, below the former; and the other bishops according to priority of consecration. On the left hand of the sovereign, above all the dukes except those of the blood-royal, sit the lord-treasurer, lord-president, and lord privy-seal; then the dukes, marquises, and earls, the individuals of each class taking precedence according to the date of their creation. Across the room are woolsacks, continued from ancient custom; and on the first of these, immediately before the throne, sits the lord-chancellor, as speaker of the house. On the other woolsacks are seated the judges and queen's counsel who are serjeants-at-law, who only give their advice on points of law. There are sixteen representative peers for Scotland, who are elected for a single parliament, and twenty-eight for Ireland, who are chosen for life. There are 2 archbishops, and 24 bishops from England and Wales, with 1 archbishop and 3 bishops from Ireland by rotation of session. Three peers constitute a house. Peers may vote by proxy, and enter on the journals of the house their dissent and reasons for it, called a *protest*. The house of peers has a jurisdiction both in civil and criminal cases; and appeals lie to it from the highest tribunals in the land. It consists of about 460 members—namely, 3 peers of the blood-royal, 2 archbishops, 20 dukes, 20 marquises, 111 earls, 22 viscounts, 24 bishops, 210 barons, 16 representative peers for Scotland, 28 representative peers for Ireland, and 4 Irish representative prelates. In the *house of commons* there are no peculiar seats for any members. The speaker only has a chair appropriated to him at the upper end of the house, and at a table before him sit the clerk and his assistant. When the parliament is thus assembled, no member is to depart without leave. Upon extraordinary occasions all the members are summoned; otherwise three hundred of the commons is reckoned a full house. Clergymen, peers, Scotch peers, the judges of England, the Scotch judges, and barons of the Scotch exchequer, are ineligible to the house of commons, also persons holding many offices supposed to cause a direct influence by the government, and pensioners during pleasure. Irish peers cannot be elected for places in Ireland, nor the eldest sons of Scotch peers for places in Scotland. The acceptance of any post of profit from the crown causes a member to vacate his seat; likewise the acceptance of the stewardship of the *Chiltern Hundreds*, or that of the manor of *East Hendred*, to which there are no profits attached; officers of the army obtaining new commissions, and persons receiving foreign appointments, such as the post of ambassador, &c., are excepted. The acceptance of the stewardship of the Chiltern Hundreds is the usual mode of vacating a seat in the house of commons. Bankruptcy prevents a member from taking his seat for a year; and if, within that time, the commission is not superseded, or the creditors are not paid, he loses his seat. In the commons, there is no house, nor committee of the whole house, if 40 members are not present. The speaker of the house of commons cannot speak in the house, but the speaker of the house of lords may. When there is a *call* of the house, a member absent without leave may be taken into custody. Every year the order for the sergeant-at-arms to take into custody strangers who are in the gallery is repeated, so that, by a kind of fiction, the house of commons is supposed to sit with closed doors. When the speaker's mace is *on* the table, it is a house; when *under* the table, a committee. When the speaker is out of the house, no business can be done. Members can speak only once, except in committee, or in explanation. All private bills affecting the peerage must begin with the lords: all others may begin in either house. A bill for a general pardon begins with neither house, but with the crown. All money bills must begin with the house of commons, and the lords can make no amendments in a bill which are likely to bring a charge on the people, nor can they insert or alter pecuniary penalties or forfeitures. The house of commons consists of 658 members—namely, 500 from England and Wales, 105 from Ireland, and 53 from Scotland. The method of making laws is much the same in both houses. In each the act of the majority binds the whole; and this majority is declared by votes openly given, not privately or by ballot. To bring a bill into the house of commons, if the relief sought by it is of a private nature, it is first necessary to prefer a petition, which must be presented by a member, and usually sets forth the grievance desired to be remedied. In public matters, the bill is brought in upon motion made to the house without any petition. A *committee of the whole house* is composed of all the members; to form it, the speaker quits the chair (another member being appointed chairman), and he may then join in the debate like any other member. In such committees, the bill is debated clause by clause, amendments made, the blanks filled up, and sometimes the bill entirely new-modelled After a bill has gone through the committee, the chairman reports it to the house, with such amendments as the committee have made; then the house reconsiders the whole bill, and the question is put upon every clause and amendment. When the house has agreed or disagreed to the amendments of the committee, and sometimes added new amendments, the bill is ordered to be engrossed. As soon as this is finished, it is read a third time, and amendments are sometimes then made to it; and if a new clause be added, it is done by tacking a separate piece of parchment on the bill, which is called a *rider*. The speaker then again opens it, and, holding it up in his hands, puts the question whether the bill shall pass. If this be agreed to, the title is then settled, and one of the members is directed to carry it to the lords for their concurrence. When both houses have done with any bill, it is always deposited in the house of peers, to await the royal assent, except in the case of a money bill, which, after receiving the concurrence of the lords, is sent back to the house of commons The answer to the question put by the speaker, or the chairman, in the house of commons, is *Ay* or *No*, and, in the house of peers, *Content* or *Not Content*. The royal assent to bills may be given, either in person (when the sovereign appears on the throne in the house of peers, regally attired), or by letters patent under the great seal, and duly signed. And when the bill has received the royal assent in either of these ways, it is then, and not before, a statute or act of parliament. Parliament is *prorogued* from one session to another by royal authority; committees are not dissolved by prorogation, but are merely adjourned to the next time of meeting It is dissolved by the sovereign's will, by the demise of the crown, or by lapse of time—at the end of the seventh year, should it not have been dissolved sooner

PARLIAMENTA'RIANS, an epithet for those who sided with the English republican parliament in opposition to king Charles I.

PAR'ODY (*parōdia*, from *parōdeo*, I sing with certain changes: *Gr.*), a kind of writing in which the words of an author or his thoughts are, by some slight alterations, adapted to a different purpose; or it may be defined, a poetical pleasantry in which the verses of some author are, by way of ridicule, applied to another object; or a serious work is turned into burlesque by affecting to observe the same rhymes, words, and cadences.

PAR'OL (*parole: Fr.*), in Law, an epithet for what is done by oral declaration, as *parol evidence*, which is testimony by the mouth of a witness in contradistinction to written evidence.

PARO'LE (*Fr.*), in Military affairs, a promise given by a prisoner of war, when suffered to be at large, that he will return at a time appointed, unless he shall have previously been discharged or exchanged. ——PAROLE also means the watchword given out every day in orders by a commanding officer, in camp or garrison by which friends may be distinguished from enemies

PAROMOL'OGY (*paromologia*, from *paromologeo*, I pretend to admit: *Gr.*), in Rhetoric, a figure of speech by which an orator concedes something to his adversary, in order to strengthen his own argument.

PARONOMA'SIA (*Gr.*, from *paronomazo*, I slightly change a word), a Rhetorical figure by which the same word is used in different senses; or words similar in sound are put in opposition to each other, so as to produce the effect of antithesis

PARONY'CHIA (*parōnuchia*, from *para*, beside; and *onux*, the nail: *Gr.*), in Medicine, a *whitlow*, or abscess formed near the nails or tips of the fingers.

PAROQUET'S, or PARRA'KEETS (*perroquet*, a parrot: *Fr.*), a tribe of parrots usually of a small size, and differing from other parrots in the form of the feet. They are natives of India and Australia.

PAROT'ID GLAND (*parōtis*, the gland beside the ear: *Gr.*), in Anatomy, a large conglomerate and salivary gland, situated under the ear, between the maxillary process of the temporal bone and the angle of the lower jaw. The excretory duct of this gland opens in the mouth, and is called, from its discoverer, the *Stenonian* duct.

PAROTI'TIS (from same), inflammation of the parotid gland; the *mumps*.

PAR'OXYSM (*paroxusmos*, from *paroxuno*, I make violent: *Gr.*), in Medicine, a fit of higher excitement or violence in a disease that has remissions or intermissions: as the *paroxysm* of a fever or the gout.

PAR'REL, among seamen, a collar of greased rope, which confines the yard to the mast while it is hoisted up.

PAR'RICIDE (*parricida*, from *patricida*: *Lat.*), strictly signifies the murder or murderer of a father, as *matricide* does of a mother; yet this word is ordinarily taken in both senses, and is also extended to the murder of any near relation. The word *parricide* is also applied to one who fatally injures any of those to whom he owes particular reverence, as his country or patron. By the Roman law parricide was punished in a severer manner than other kinds of homicide. After being scourged, the delinquent was sewed up in a leathern sack, with a live dog, a cock, a viper, and an ape, and then cast into the sea Solon made no law against parricide, supposing it impossible that any one should be guilty of so unnatural a crime; nor had the Romans any law against it originally. We treat it as any other murder; but, in some German states, the parricide is put to death with exquisite tortures.

PARRICI'DIUM (*Lat.*, from same), a name given by a decree of the Roman senate to the *Ides of March*, which was the anniversary of Cæsar's assassination. Dolabella the consul proposed a law to change its name to *Natalis Urbis*, as he looked on it as the birthday of Roman liberty.

PAR'ROTS (*perroquet*, a parrot: *Fr.*), a large family of scansorial birds, the *Psittacidæ* of ornithologists. They abound in tropical climates. There are several divisions or subfamilies, viz., the parrakeets, macaws, lories, cockatoos, owl-parrots, and true parrots. The last are the best known species, on account of their docility in captivity, and their power of articulating words in imitation of the human voice. Their hooked bill is very serviceable to them in climbing. They breed in hollow trees, subsist on fruits and seeds, and often attain a great age. The common grey parrot, a native of Africa, is the most remarkable for its loquacity, docility, and distinctness of articulation. The green parrot of South America is also remarkable in these respects. The pretty little love birds fall into this division.

PARSEE'S (*pars*, the ancient name of Persia), those who profess the religious system of ZOROASTER, the dominant religion in Persia until expelled by Mahommedanism. Those who refused to renounce their ancient faith fled from the country. The modern Parsees are chiefly resident in Bombay, where several of them are persons of great wealth.

PAR'SING (*pars*, a part: *Lat.*), in Grammar, the resolving a sentence into its elements, by showing the several parts of speech of which it is composed, and their relation to each other according to grammatical rules.

PAR'SLEY (*petra*, a rock; and *selinon*, parsley: *Gr.*), a well known umbelliferous plant, the *Petroselinum sativum* of botanists. Among the Greeks, parsley was used for decorating tombs, and consequently was regarded as a vegetable not much calculated to contribute to agreeable sensations. It was, however, the herb of which, in the Isthmian and Nemean games, the crowns of the victors were composed. Among the Romans, parsley was considered a necessary ingredient in their festive garlands, because it retains its freshness a long time, affords a grateful smell, and was supposed to absorb the inebriating fumes of wine, and by that means prevent intoxication.

PARS'NEP (*pastinaca: Lat.*), a well-known culinary vegetable, the *Pastinaca sativa* of botanists, the root of which is deemed a valuable esculent. Besides their use for the table, parsneps are often cultivated on an extensive scale as fodder for cattle. The milk of cows is improved in quality and increased in quantity by them; and they give the butter a fine saffron-yellow colour, as well as excellent flavour. Since the roots are not liable to injury from frosts, they may remain in the ground all the winter, and be taken up as required.

PAR'SON (*persona*, a person: *Lat.*), the rector or incumbent of a parish, who has the parochial charge or cure of souls; one who possesses all the rights of a parochial church; in his person (whence the name), the church he occupies is represented. He has the freehold of the parsonage, glebe, the tithes, and other dues. He must be in holy orders, presented, instituted, and inducted. A parson has a right to all the ecclesiastical dues of the parish; a *vicar* has generally an appropriator over him, who is entitled to the best part of the profits, and to whom, in fact, he is perpetual curate. In common language, any clergyman is called a parson.

PAR'SONAGE (last), ordinarily, a rectory endowed with a house, glebe, lands, tithes, &c., for the maintenance of the incumbent; but there may be a parsonage without either glebe or tithes, and with only annual payments.

PARTE'RRE (*Fr.*), in Gardening, a system of beds of various shapes and sizes, in which flowers are grown, with intervening spaces of gravel or turf for walking upon. The beds are very often bordered with dwarf box, kept low by clipping. This kind of parterre was in use among the Romans. ——PARTERRE, in France, the pit of a theatre.

PARTHE'NOGENESIS (*parthĕnos*, a virgin; *genesis*, generation: *Gr*), a term applied by naturalists to cases amongst animals and plants where a perfect embryo is alleged to be formed in the absence of male organs.

PAR'THENON (*Parthenōn*, from *parthenos*, a maiden—one of the names of Minerva: *Gr.*), the name given to the celebrated Grecian temple of Minerva, erected in the Acropolis of Athens, during the splendid era of Pericles. It was built of marble upon a spot elevated on all sides above the town and citadel; and was of the Doric order. It was a peripteral octostyle, with seventeen columns on the sides, each 6 feet 2 inches in diameter at the base, 34 feet in height; and was elevated on three steps. Its height was 65 feet; and its area was 233 by 102 feet. It was decorated with magnificent groups and statues, and its cost has been estimated at a million and a half sterling. This magnificent temple, which had been in turn converted into a Christian church and a Turkish mosque, had resisted all the ravages of time; but in the year 1687, when the Venetians besieged the citadel of Athens, under the command of General Konigsmarck, a bomb fell most unluckily upon it, setting fire to the powder which the Turks had stored up within it. This destroyed the roof, and reduced the whole building almost to ruins. It is still magnificent, though greatly dilapidated. The chief portion of its sculptures are now in the British Museum, and form, with some other remains of antiquity, the collection termed the *Elgin marbles*.

PARTHEN'OPE, one of the small planets belonging to the group between Mars and Jupiter, and the eleventh in the order of discovery.

PAR'TIAL (*pars*, a part: *Lat.*), in Botany, an epithet for *subordinate*; as, a *partial* umbel, a *partial* peduncle. A partial involucre is placed at the foot of a partial umbel.

PAR'TICEPS CRIM'INIS (a sharer in the

crime: *Lat.*), in Law, an accomplice, or one who participates in the guilt.

PAR'TICIPLE (*participium*, from *particeps*, sharing: *Lat.*), in Grammar, a word so called because, in certain languages, it participates in the nature both of a noun and a verb; being variable through the genders, numbers, and cases, like the former, and regarding time, action, &c., like the latter. Participles sometimes lose the properties of a verb, and become adjectives: as, she is a girl of *engaging* manners; that man is an *accomplished* orator.

PAR'TICLE (*particula*, the *dim.* of *pars*, a part: *Lat.*), in Physics, one of those minute portions of a body, the aggregation or collection of which constitutes the whole mass. Sometimes the word is used in the same sense as *atom*.—— PARTICLES, in Grammar, such parts of speech as are incapable of any inflection: as the preposition, conjunction, &c. The term is, however, more accurately applied to those minor words, which give clearness and precision to a sentence, but respecting whose exact use grammarians are not agreed. Thus, in Greek, *ge, ara, dē*, &c.; in German, *ja, wohl*, &c.; in English, *now, then, truly*, &c. It is also used to indicate those words which are termed *enclitics*, and which cannot be used separately, but must be joined with another word: as the *que*, in *virumque*, in Latin.

PARTI'TE (*partitus*, from *partio*, I divide: *Lat.*), in Botany, an epithet for divided; thus, a *partite* leaf is a simple leaf separated down to the base.

PART'NERS (from *part*), in a ship, strong pieces of timber bolted round the mast, at the deck, to support the latter against its pressure; also similar supports round the capstan and pump.

PART'NERSHIP, the association of two or more persons for the prosecution of any trade, manufacture, or commercial enterprise, at their joint expense. In this case the connection is formed by contract; each partner furnishing such a part of the capital stock, and being entitled to such a proportional share of profit, and subject to such a proportional share of loss as may be agreed upon; or one or more of the partners furnishing money or stock, and the others contributing their services. A partnership or association of this kind is a standing or permanent company, and is denominated a *firm* or *house*. By a recent act of parliament, persons simply lending money to a firm, and receiving in return a share of the profits instead of interest, are protected from liability for the debts of the firm. There is no particular form of contract necessary for partnership, nor even a writing. If no period has been fixed for its dissolution, any one partner may dissolve it; and if a period has been fixed, it will be dissolved, in the absence of a proviso to the contrary, by the bankruptcy, attainder, death, or, in the case of a female, the marriage of a partner; but, as far as the public is concerned, notice must be given that it has been dissolved. The partnership will be bound by the engagements of any partner, acting with reference to the joint business. By means of the act called incorporation, or by régistration as a 'limited company, the shareholders in a joint-stock company may protect themselves' from all liability beyond the amount of their shares.

PART'RIDGE (*perdrix*: *Fr.*; from *perdix*: *Gr.*), the *Perdix cineréa*, a well-known bird. The common partridge is found all over Europe. The places in which partridges most delight are corn-fields, especially whilst the corn is growing, for under cover of it they shelter and breed; and these are frequented by them when the corn is cut down, for the sake of the grain scattered over them. The *red-legged Partridge*, a bird less esteemed both by sportsmen and epicures, is the *Perdix rufa* of ornithologists.

PAR'TY (*partie*: *Fr.*), in Politics, a number of persons, united for the purpose of promoting, by their joint endeavours, their own views, according to some principles on which all of them are agreed. From the earliest times, mutual co-operation has been adopted for the execution of favourite designs. But there is a tendency, in party, to generate narrow, false and illiberal principles—a thorough follower of a party is, in some sense, a slave. Free governments are the hotbeds of party, and probably, without the existence of opposing parties in a state, civil freedom would no longer exist. *Party* differs from *faction* in implying a less dishonourable association of persons, or more justifiable designs.—— PARTY, in Heraldry, the division of a field by a line running in the direction of an ordinary: thus, *party per pale, party per fesse*, &c.—— PARTY, in Military affairs, a small detachment or number of men sent upon any particular duty, as a recruiting party, &c.—— PARTY-WALLS, when houses are built in contact the law requires that each shall have its own wall in order to prevent the spread of fire, and these walls are called party walls. —— PARTY-JURY, in Law, a jury consisting of half foreigners and half Englishmen.

PARU'LIS (*paroulis*: from *para*, beside; and *oula*, the gums: *Gr.*), in Medicine, an inflammation, boil, or abscess in the *gums*: a *gum-boil*.

PAS'CHAL CY'CLE, the cycle which serves to show when Easter occurs. It is formed by multiplying together 28, the cycle of the sun, and 19, the cycle of the moon.

PA'SHA, the name of officers in the Turkish empire who, when appointed to provinces, are at once military commanders, judges, and receivers of taxes. They are divided into three classes, viz., pashas of one, two, and three tails. The vizirs and serasker, or commander-in-chief, are pashas of three tails. The word is derived from the Persian, and signifies 'the foot of the Shah.' It had been usual from an early period to style the ministers of the Persian king his feet, hands, eyes, &c.; the governors of provinces, as the chief supporters of the empire, being called his feet.

PASIG'RAPHY (*pas*, all; and *grapho*, I write: *Gr.*), a system of universal writing, or a mode of writing what may be understood and used by all nations. Numerous attempts have been made to construct a universal language, particularly by the philosophic and persevering Germans; but hitherto all their efforts have been fruitless.

PASQUINADE' (*Fr.*), a satirical writing, directed against one or more persons. A mutilated statue, which was dug up at Rome nearly 300 years ago, and which now lies in the court of the Capitol, was named *Pasquin*, after an eccentric barber, near whose house it was at first set up. To this, and another statue near it, named *Marforio*, satirical placards, some of which were very severe, and reflected on the highest personages, were affixed at night. Sixtus V. was greatly offended when one of them demanded 'why his shirt was so soiled,' and was answered by the other that 'his washerwoman' (by whom was meant the pope's sister) 'had become a princess.' All satirical compositions in Rome have long been attributed to Pasquin, or pasted upon it. Hence the word *pasquinade* for a lampoon. The difference between a *pasquinade* and a *satire* is, that the end of the latter is to correct and reform, while that of the former is only to ridicule and expose.

PASS (*pas: Fr.*), in Military affairs, a narrow passage, which renders the entrance into a country difficult for an army.——**Pass**, among Miners, a frame of boards set sloping for the ore to slide down.——**Pass of Arms**, in Chivalry, a bridge, road, &c., which the ancient knights undertook to defend They who held a pass hung up their arms on trees, pales, columns, &c., erected for that purpose; and such as were disposed to dispute the pass touched one of the pieces of armour with his sword, a challenge which the other was obliged to accept.——**Pass parole**, in Military affairs, a command given at the head of an army, and communicated by word of mouth to the rear.——**Pass-word**, a secret word or countersign, which enables any person to pass through military stations.

PASSAD'E, or **PASSA'DO** (a push: *Ital.*), in Fencing, an advance or leap forward upon the enemy. Of these there are several kinds, as passes within, above, beneath, to the right, the left, and passes under the line, &c.——**Passade**, in the manège, a turn or course of a horse, backwards or forwards, on the same spot of ground.

PAS'SAGE (*Fr.*), in Music, a succession of sounds, forming a member or phrase in a composition.——**Birds of Passage**, those birds which at certain seasons migrate, or pass from one climate to another. [See **Migratory Birds**, &c.]——**Right of Passage**, in Commerce, an imposition or duty exacted by some princes, either by land or sea, in certain confined or narrow portions of their territories, on all vessels, and even sometimes on passengers, coming in or going out of them.

PAS'SANT (*Fr.*), in Heraldry, a term applied to a lion or other animal in a shield, appearing to walk leisurely. When walking with his head *affronté*, or looking full-faced, it is termed *passant gardant*.

PASSE-PARTOUT (*Fr.*), a master-key, or a key that answers for several locks belonging to the same house or apartment.

PAS'SERES (*Lat.*), in Ornithology, the name given to an order of birds which exhibit neither the violence of birds of prey nor the fixed regimen of the terrestrial birds, but which feed on insects, fruit or grain, and even small birds. They form the largest and least recognizable order. The females are generally smaller, and have less brilliant plumage than the males; they live in pairs, and build their nests in trees with great ingenuity. Power of flight, melody of voice, and brilliancy of plumage, are found in the highest perfection in one group or another of this extensive and varied order. As their beak varies according to the nature of their food, it has caused their classification into *Dentirostres*, having a notch and tooth-like process on each side of the margin of the upper mandible, as in the thrushes and flycatchers. *Conirostres*, having a thick, robust, conical beak, as amongst the crows and finches. *Tenuirostres*, having a long and slender bill, as amongst the humming birds and creepers; and *Fissirostres*, having a beak opening widely, as amongst the swallows and goat suckers.

PAS'SIM (*Lat.*), a word of reference in books, signifying here and there; throughout; in many different places.

PAS'SING-BELL, the bell that is tolled immediately after death. The *passing-bell* was, at first, superstitiously intended to drive away any demon that might seek to take possession of the *soul* of the dying, on which account it was sometimes called the *soul-bell*.

PAS'SION-FLOWERS, a genus of climbing plants: nat. ord. *Passifloraceæ*; containing numerous species, remarkable for the elegance and singular form of their flowers. They are all natives of warm countries, and only one of them is sufficiently hardy to succeed well here in the open air, the others requiring shelter and heat. Their stems are woody, or, more frequently, herbaceous, provided with tendrils, and bearing alternate simple or lobed leaves; the flowers are axillary, and supported on peduncles; the calyx is widely spreading, and divided into ten parts. To the base of the calyx is attached an interior crown, composed of a great number of filaments. The *Passiflora cærulea*, or blue-rayed common palmated passion-flower, has long slender stalks, ascending, upon any support by their claspers, thirty or forty feet high, with one large palmated leaf at each joint, and at the axillas large spreading flowers, with whitish-green petals, and a blue radiated nectarium—succeeded by large, oval, yellowish fruit. It flowers from July until October; the flowers are very large and conspicuous, and their composition is exceedingly curious and beautiful; but they are only of one day's duration, generally opening about 11 or 12 o'clock and gradually closing the next day, when they assume a decayed appearance, and new flowers succeed. In some Roman Catholic countries, this flower is greatly venerated, because the instruments of Christ's passion are supposed to be represented by the parts of fructification, &c.

PAS'SIVE (*passivus: Lat.*), in Grammar, a term given to a verb which expresses the effect of an action performed by some agent; as, in Latin, *doceor*, I am taught, or, in English, she *is loved.*——PASSIVE COMMERCE, trade in which the productions of a country are carried by foreigners in their own ships; opposed to *active* commerce. [See NAVIGATION LAWS.]——PASSIVE OBEDIENCE, in Civil Polity, denotes not only quiet unresisting submission to power, but implies the denial of the right of resistance, or the recognition of the duty to submit in all cases to the existing government.——PASSIVE PRAYER, among mystic divines, is a suspension of the soul or intellectual faculties, and a yielding only to the impulses of grace.

PAS'SOVER, or PAS'CHA, a solemn festival of the Jews, celebrated on the 14th day of the month following the vernal equinox; and instituted in commemoration of their providential deliverance on the night before their departure from Egypt, when the destroying angel, who put to death the first-born of the Egyptians, *passed over* those houses of the Hebrews which were sprinkled with the blood of a lamb.

PASS'PORT (*passeport: Fr.*), a written license from a king, governor, or other proper authority, granting permission to pass through his territories, or from one country to another, or to navigate a particular sea, without molestation. Also, a license for importing or exporting goods or moveables without paying the usual duties. A passport usually describes the person, objects, and destination of the bearer; it is also intended to show that his character is good, and that his design in travelling is lawful. Passports are granted by the foreign office to respectable persons, on payment of a small fee; but they may be obtained from the ambassadors, ministers, and consuls of the various states. They must have the *visé* of the ambassadors or consuls of the countries into which the traveller intends to go. Austria and Russia are very particular on this point. Passports have, until very recently, been required by the natives of nearly all European countries, when they pass even from one part of their own state to another.

PASTE (*pâte: Fr.*), a soft composition. Also, a kind of coloured glass made to imitate gems.——In Mineralogy, the mineral substance in which other substances are imbedded.

PAS'TEL (*pastillus*, a roll: *Lat.*), in Painting, a crayon formed with any colour and gum-water, and used for painting on paper or parchment. The pictures produced with pastels are not durable.

PAS'TERN (*pasturon: Fr.*), that part of a horse's foot which is under the fetlock and reaches to the heel.

PASTIC'CIO (*Ital.*, from *pasticco*, a pie), in Music, a word used to denote an opera composed of detached airs, by different composers, occasionally introduced.——In Painting, a picture painted by a master, in imitation of the style of some other painter. Teniers and Luca Giordano were very successful in this way.

PIS'TIL (*pastille: Fr.*; from *pastillus: Lat.*), in Pharmacy, a species of lozenge; also a compound of charcoal with odoriferous matters, which diffuses an agreeable odour during its slow combustion.

PAS'TORAL (*pastoralis*, pertaining to shepherds: *Lat.*), something descriptive of a shepherd's life; or a poem in which any action or passion is represented by its effects on a country life. The characteristics of this poem are simplicity, brevity, and delicacy; the two first of which render an eclogue or idyl natural, and the last delightful. As the earliest strains of poetry must have been heard in the primitive times of the human race, and as a shepherd's life is supposed to be congenial with such effusions, we naturally consider poetry as having originated in the pastoral period, but the poetic idea of pastoral life, where all is purity and simplicity, is not supported by experience, either in ancient or in modern times.——PASTORAL, in Ecclesiastical affairs, a book relating to the cure of souls, it includes the execution of the duties of a clergyman, or the practical application of his theological knowledge. The chief part of canon law is comprised in the *Pastoral* of a Roman Catholic priest, while that of the Protestant minister consists of principles addressed merely to his understanding, including certain rules which experience has shown to be important for the performance of clerical duties.

PAS'TURE, or PAS'TURE LAND (*pastura*, from *pascor*, I feed: *Lat.*), in Agriculture, ground covered with grass appropriated for the food of cattle. *Perpetual pastures* are such as are never subjected to the plough, and never manured except by the cattle which feed on them. *Artificial pastures* are sometimes mown, and sometimes receive a top dressing of dung, &c.

PATA'CHE (*Fr.*), a tender or small vessel employed in conveying men, or orders from one ship to another.

PATAVIN'ITY, a term used by classical scholars to denote a peculiarity of Livy's diction, so denominated from *Patavium* or *Padua*, the place of his nativity.

PATE, in Fortification, a kind of platform, resembling what is called a horseshoe; not always regular, but generally oval, encompassed only with a parapet, and having nothing to flank it.

PATEE', or PATTEE' (*Fr.*), in Heraldry, a cross, having the arms small in the centre and widening towards their extremities, which are broad.

PATEL'LA (*patella*, a small dish: *Lat.*), in Anatomy, a bone which covers the fore part of the joint of the knee, called also *rotula*, and popularly the *knee-pan*. The patella is composed internally of a cellular substance, covered by a thin bony plate; but its cells are so extremely minute, that its strength is upon the whole, very considerable. It defends the articulation of the joint of the knee from external injury; and likewise increases the power of the muscles which act in the extension of the leg, by removing their direction further from the centre of motion.——PATELLA, in Conchology, a genus of shell-fish, with a simple shell, of a conic or other gibbous figure, and a very wide opening at the mouth or bottom. The animal is popularly termed a limpet.

PAT'ENTS, or LET'TERS-PA'TENT (*patens*, open: *Lat.*), writings sealed with the great seal, granting a dignity, an office, or a privilege, or authorizing something which a person could not otherwise do or enjoy. They are called *patent* on account of their being open, and ready to be exhibited for the confirmation of the authority delegated by them. Peers of the realm are created, the Lord Chancellor, the Lords of the Treasury, and several other officers of state are appointed by letters patent.——LETTERS PATENT FOR INVENTIONS. Inventors can obtain letters patent from the Crown protecting such inventions as they have themselves made, or as they have derived from foreigners not domiciled in Great Britain. The invention must be new and useful. A bare principle not showing any practical application is not patentable. A provisional specification may be lodged in the first instance, and protection for the invention obtained for six months; but before the expiration of this period a complete specification must be prepared, describing fully and clearly the whole invention, and this must be lodged with the Commissioners of Patents. The invention is then secured for three years; a payment of £50 will secure an additional term of four years, and the payment of the further sum of £100 will extend the patent for an additional term of seven years, that is fourteen years altogether. The specification is an important instrument, and many patents have become invalid by reason of their not complying with the rules which the courts of law have laid down. 'Letters patent (says Johnson's Patentee's Manual) are founded upon an implied compact between an inventor and the public. The latter, through the Crown, secures to the former the monopoly of the invention with all the advantages flowing therefrom, for a given period of time; and the inventor on his part undertakes to tell the community what his invention really is, and to teach them how it may be practised and carried into effect when the monopoly shall have ceased. It is by this instrument that the public is made acquainted with the inventor's secret, and he is bound in return for the privilege granted to him to describe it clearly and fully, with the view of enabling others, when the proper time comes, to work the invention, if they desire to do so. In the mean time, the public are entitled to know what it is they are prohibited from using, that they may not unawares incur liability.' All specifications are now printed, and they may be obtained at a low charge at the office of the Commissioners, who also issue periodical lists of patents granted. The Privy Council has the power of extending the term of a patent for a further period not exceeding fourteen years, but more than seven years is seldom granted, and then only on the patentee showing that the invention is a valuable one, and that he has not been rewarded according to his deserts. In case of infringement, a patentee may proceed either by an action for damages, or file a bill in chancery for an injunction and an account. Foreign states also grant letters patent for inventions, called in France *Brêvets d'invention.* And an English patentee usually obtains patents abroad when the invention is of considerable utility.

PAT'ERA (a broad dish: *Lat.*), in Architecture, an ornament frequently seen in the Doric frieze, and in the tympans of arches. The patera was a small dish or vase in which the Romans offered consecrated food to the gods, and with which they made libations; and hence it became an ornament of the Doric order, as that was used for temples. It was also enclosed in urns with the ashes of the dead, after it had been employed in the offerings of wine and other liquors at the funeral.

PAT'ERNOSTER (our Father: *Lat.*), the Lord's prayer, so called from the two words with which it commences in Latin. The term is sometimes applied also to the *rosary*, or string of beads, used by Roman Catholics in their devotions, but more especially to every tenth large bead; for at this they repeat the Lord's prayer, and, at the intervening small ones, only an *Ave Maria.*——In Architecture, an ornament cut in the form of beads, either oval or round, for astragals, &c.——PATERNOSTER CROSS, in Heraldry, a cross represented on the escutcheon as if made with beads.

PATHET'IC NERVES (*pathētikos*, sensitive: *Gr.*), in Anatomy, a pair of very small nerves which arise in the brain, and run to the trochlear muscle of the eye. They have obtained the appellation *pathetic*, from their serving to move the eyes in the various passions.

PATHOGNOMON'IC (*pathognōmonikos*: from *pathos*, suffering; and *gnōmonikos*, fit to give judgment: *Gr.*), in Medicine, a term applied to those symptoms which are peculiar to, or exclusively characteristic of, a particular disease.

PATHOL'OGY (*pathologeo*, I treat of disease: *Gr.*), that branch of medicine which is concerned with diseases, their causes and symptoms. Its objects are to ascertain the various symptoms which characterize the disorders of each organ of the body, and especially the diagnostic and pathognomonic symptoms, which afford the means of discriminating between diseases that resemble each other; to determine the causes, both predisposing and exciting, by which diseases are induced; and to ascertain the modes of cure, and the nature and operation of the remedies adapted to the various circumstances and periods of diseases. *Physiology* teaches the nature of the functions of the body in a state of health; *pathology*, the various derangements of these functions which constitute disease.

PA'THOS (a violent feeling: *Gr.*), that quality of nature and art which excites the feelings of pity and sympathy.

PA'TIENT (*patiens*: *Lat.*), one who is under the direction of a physician, or other medical practitioner, for the cure of any disorder.——PATIENT, in Physiology, that which receives impressions from external agents; or whatever is passively affected.

PAT'INA (a broad dish: *Lat.*), in the Roman Catholic church, the cover of the chalice, used for holding particles of the consecrated wafer.——Also, in Numismatics, the fine rust with which coins become covered by lying in peculiar soils, and which not only preserves, but ornaments them.

PAT'OIS (*Fr.*), the dialect spoken by the lower classes.

PA'TRES CONSCRIP'TI [See CONSCRIPT FATHERS.]

PA'TRIARCH (*patriarchēs*: from *patria*, a race; and *archo*, I govern: *Gr.*) properly signifies the head or chief of a family. The name of patriarchs is generally confined to the progenitors of the Israelites who lived before Moses, Abraham, Isaac, Jacob, &c.; or to the heads of families before the flood, as the antediluvian *patriarchs*. The appellation has from hence been transferred to the bishops of the first churches of the East; as, the patriarchs of Antioch, Alexandria, Jerusalem, Constantinople.——**PATRIARCHAL CROSS**, in Heraldry, a cross appropriated to the dignity of a patriarch, as the triple crown was to that of the pope. The shaft of this cross is twice crossed, the lower transverse arm being longer than the upper.

PATRI'CIAN (*patricius*, from *patres*, fathers: *Lat.*), in Roman History, a title given at first to the descendants of the senators whom Romulus was said to have created, and called *patres*, 'fathers.' It was afterwards enjoyed by those who became senators by other means than hereditary right. But the dignity of the patricians was lessened by the fall of the republic, the civil wars, and the establishment of the imperial dignity. The word *patrician*, in its general and modern acceptation, signifies noble; senatorial, not plebeian.

PAT'RICK, ST., *Order of*, an Irish order of knighthood, instituted by George III. in 1783; and the only one belonging to Ireland. It consists of the sovereign, a prince of the blood-royal, a grand master, and fifteen knights. The lord-lieutenant of Ireland for the time being is grand master.

PATRIS'TIC (*pater*, a father: *Lat.*), in Theology, that which belongs to the fathers of the church: as *patristic theology, literature*, &c.

PAT'ROL, or **PATRO'LE** (*patrouille*: *Fr.*), in Military language, a detachment, which usually consists of from four to eight men, under a corporal. They are drawn from the posts of a garrison town, and march, at the hour appointed by the commandant, through the streets to repress disorder. On the continent, the patrol is generally accompanied by an officer of police.

PA'TRON (*Fr.*; from *patronus*, a protector: *Lat.*), in its most general sense, signifies one that specially countenances and supports another, or lends his aid to advance the interests of some undertaking; as, a *patron* of the fine arts; the *patrons* of a charitable institution, &c.——**PATRON**, among the Romans, any person in power, under whose protection inferiors placed themselves, on certain conditions of obedience and personal service. Those protected were called *clients*. The duty of the was to be their clients' counsellors in difficult cases, their advocates without payment in legal proceedings, their advisers in matters of doubt, &c. After the fall of the commonwealth, the term *patron* was still applied to the advocate who defended his client's cause for hire.——**PATRON** was also a title conferred on a master who had freed his slave, the relation of patron commencing when that of master expired. The patron was legal heir to his freed-men, if they died intestate, or without lawful issue born after their freedom commenced. By the Papian law, if a freed-man's fortune amounted to ten thousand sesterces, and he had three children, the patron was entitled to a child's portion.——**PATRON**, in the Canon and Common Law, a person who, having the advowson of a parsonage, vicarage, or other spiritual office, belonging to his manor, has the gift and disposition of the benefice, and may present to it whenever it becomes vacant.——**PATRON**, in the church of Rome, a guardian or saint, whose name a person bears, or under whose protection he is placed, and whom he invokes; or a saint, in whose name a church or order is founded.——**CARDINAL PATRON**, the prime minister of the pope.

PA'TRONAGE (from same), the right of presentation to livings.——*Lay patronage*, a right attached to a person either as founder or as heir of the founder, or as possessor of the fee to which the patronage is annexed. *Ecclesiastical patronage* is that which a person is entitled to by virtue of some benefice which he holds. In the church of Scotland, the right of presentation to livings has been at various times the source of serious disputes; and disregard, in one or two instances, of the expressed wish of the parishioners, was the cause of the great secession from the Scottish kirk, which took place in 1843. But, by Lord Aberdeen's act, the right of the members of the church to have, within certain limits, a voice in the nomination of their pastors, was acknowledged.——**ARMS OF PATRONAGE**, in Heraldry, those arms on the top of which are some marks of subjection and dependence.

PATRONYM'IC (*patronumikos*, from *pater*, a father; and *onoma*, a name: *Gr.*), a term applied to such names of men and women as are derived from those of their parents or ancestors; as *Tydides*, the son of Tydeus.

PAULIC'IANS, in Ecclesiastical History, a branch of the ancient Manichees, so called from their founder, Paulus, an Armenian. For several centuries they suffered great persecution, and were at length wholly exterminated.

PAUL'S, ST. This beautiful cathedral, built upon an eminence in London to the north of the Thames, was completed in thirty-five successive years, under one architect, Sir Christopher Wren; one master mason, Thomas Strong; and one bishop of London, Dr. Henry Compton. The first cathedral which occupied this site is, without much authority, supposed to have been built on the foundation of a temple of

Diana. It was burned down in 1066. The structure which succeeded was commenced immediately; and, its choir having been consumed by fire in 1135, it was consecrated in 1240, and entirely completed in 1315, having been 225 years in building. Its steeple was destroyed by lightning in 1443, but was rebuilt; and the church was, to a great extent, burned in 1631; repairs were commenced in 1663, but were interrupted by the civil wars; and it was totally consumed by the conflagration of 1666. The first stone of the present building was laid June 21st, 1675, and it was finished in 1710; having cost 736,752*l.* 2*s.* 3¼*d.* It is of Portland stone, in the form of a cross; its length is 500 feet from east to west; its width, 223 feet from north to south; and its height, 340 feet. The weight of the ball is 5600 lbs., and that of the cross 3360 lbs. The height to the cross from the centre of the floor is 404 feet, and the ascent to the cross is by 616 steps. It stands on a plot of more than two acres, and the iron balustrade round the church-yard is three furlongs and one-fifth in length. Two rows of massy piers divide the interior into a nave and side aisles. The west front towards Ludgate-street, forming the grand entrance, has an elevated portico of twelve Corinthian columns, with an upper portico of eight pillars of the Composite order, supporting a triangular pediment, having an entablature representing, in relief, the conversion of St. Paul. The dome is the most remarkable object in the view of London.

PAU'PERISM (*pauper*, a poor man: *Lat.*). See POOR LAWS.]

PAUSE (*pauo*, I make to cease: *Gr.*), in Music, a character denoting a cessation of sound. It is longer than a common rest, which is, in length, equal to some note; and lasts during the time of one, two, or more bars.

PAVAN' (*pavo*, a peacock: *Lat.*), a slow and stately dance, which was formerly practised in England, but is now confined to Spain. It derived its name from the peculiar dresses of the dancers, which produced a fancied resemblance to the tail of a peacock.

PA'VEMENT (*pavimentum*, from *pavio*, I strike; *Lat.*), a floor or covering consisting of stones, bricks, or other suitable material, laid on the earth in such a manner as to make a hard and convenient surface for horses, carriages, or foot-passengers.——Pavements of lava, with elevated side-walks, are found at Herculaneum and Pompeii; but the earliest paved streets of which any account has come down to us are those of Cordova, in Spain, which was paved with stones so early as the middle of the 9th century. London, it is said, was not paved till the 12th century, and then only very partially; nor was it until five more centuries had passed away that this kind of street accommodation was by any means general. Experiments have been tried with metal, wood, asphalte, &c., but stone pavement has yet retained its place, where macadamizing has not superseded it. If the traffic is very great, it seems superior in durability and economy to every other contrivance.

PAVIL'ION (*pavillon*: *Fr.*), in Architecture, a kind of turret or building, usually insulated and contained under a single roof, which is often in the form of a dome. Sometimes a pavilion is a projecting part in front of a building, and sometimes it flanks a corner; it is usually higher than the other portions. Summer-houses in gardens are often called by this name; but improperly. ——In Military affairs, a tent raised on poles.

PA'VO (a peacock: *Lat.*). [See PEACOCK.]

PAY'MASTER OF THE FOR'CES. The office of this functionary was formerly very lucrative, as he had the interest of large sums left in his hands for a considerable time. He was, *ex officio*, a privy councillor, and sometimes in the cabinet; but the duties were annexed, a few years ago, to another post, and the office no longer exists.

PEA (*pisa*: *Sax.*; from *pisum*: *Lat.*), in Botany, a plant and its fruit, of the genus *Pisum*; cultivation has produced many varieties. It has been cultivated from remote antiquity, and forms one of the most valuable of culinary vegetables, being nutritious, especially when green, in which state it forms an agreeable article of food. This plant has a papilionaceous flower, and the pericarp is a legume, called in popular language a *pod*. Peas are sometimes ground into flour, and mixed with that obtained from wheat, but the bread is rendered heavy and unwholesome. In the plural we write *peas* for two or more individual seeds, but *pease* for an indefinite number in quantity or bulk.

PEACE (*paix*: *Fr.*), in a political sense, freedom from war with a foreign power, or from internal commotion. Also that quiet, order, and security which is guaranteed by the laws. This latter is termed the *peace of the king*, and consists in that security, both of life and goods, which the sovereign promises to all his subjects, or others who are under his protection; such is the peace of the king's highways, which consists in freedom from all annoyance and molestation.

PEACH (*pêche*: (*Fr.*), in Botany, a tree and its fruit, of the genus *Amygdalus*. There are several species, and by cultivation a great number of varieties have been obtained. It belongs to the natural family *Rosaceæ*; the leaves are alternate, simple, lanceolate, acute, and finely serrated; the flowers appear before the leaves, are very beautiful, and diffuse an agreeable odour. The fruit is a large downy drupe, containing a stone that is deeply furrowed and rough externally, which character distinguishes it both from the almond and the apricot. It originally came from Persia, but it was not introduced into England till about the year 1560.

PE'ACOCK, a beautiful genus of gallinaceous birds, originally natives of India. It includes only the common peacock (*Pavo cristatus*), and the Javanese peacock (*Pavo Javanicus*). The name properly belongs to the male, but it is popularly applied to the species in general; though the female is, for distinction's sake, called a *peahen*. Like other domesticated birds, the common peacock exhibits several varieties. The ordinary length of this splendid bird, from the tip of the bill to that of the full-grown fan-expanded tail, is about four feet. The female is rather less; and her train is not only very short, but destitute of those brilliant hues and striking beauties which adorn the male, her crest, too, is less developed, and her whole plumage partakes of a cinereous hue. When pleased, the peacock erects his tail, unfolds his feathers, and frequently turns round, as if to catch the sunbeams in every direction, accompanying this movement with a hollow murmuring. At other times his cry is very disagreeable, and often repeated, especially before rain. Every year he sheds his plumes, and courts the most obscure retreats till the returning spring renews his lustre. The Javanese peacock resembles the common kind, but has a larger crest.

PEAR (*pera: Sax.*), the fruit of the *Pyrus domestica*, a tree growing wild in several parts of Europe, but of which many kinds are cultivated in all temperate climates.

PEARL (*perle: Fr.*), in Natural History, a hard, white, shining body, usually of a globular, but sometimes of a pyriform shape. It is formed by certain bivalve molluscs, belonging to different genera. The oriental pearls of commerce are obtained from the *Meleagrina margaritifera*, and other species of shellfish called 'pearl oysters.' Pearls consist of concentric layers of a fine compact nacre, or substance identical with that which lines the inside of the shell, the layers being alternately membrane and carbonate of lime. It is this structure which occasions the play of light called pearly iridescence. They are sometimes found free, and detached from the lobes of the mantle; but are most usually adherent to the nacrous coat of the shell, which, on that account, is termed *mother of pearl*. They are the consequence of a disease in the fish, caused by the introduction of foreign bodies within the shells. Pearls were held in the highest estimation by the ancients, with whom they were of an enormous price. In modern times their value is greatly lessened —it is probable, by the very beautiful imitations which may be obtained at a trifling cost. When pearls are very small, they are termed *seed-pearls*. The seas about the East Indies and America yield pearl-fish in great abundance; and they are found with good pearls in several parts of Europe. In the east, the coasts of the island of Ceylon and the Persian gulf are the localities most celebrated for pearl fisheries; and in the west, the coast of Terra-firma and the gulf of Mexico. The European pearls are chiefly found in rivers of Scotland and Bavaria. These are the produce of mollusca belonging to the genus *Unio*. The worth of a pearl is in proportion to its magnitude, roundness of form, polish, and clear lustre. Sometimes, but very rarely, a pearl is found as large as a nutmeg. One of the most remarkable pearls of which we have any authentic account is that mentioned by Tavernier; it was obtained at Catifa, in Arabia, a fishery famous in the days of Pliny, and cost the enormous sum of 110,400*l.* It was pear-shaped, regular, and without blemish; it was from two to three inches long, and nearly one inch in diameter. Even in antiquity, pearls were an object of luxury. One worth about 84,000*l.* of our money is said to have been dissolved by Cleopatra at a banquet, and drunk off to Antony's health. The largest known pearl now in existence is in the Hope collection. It is two inches long and four in circumference, and weighs 1800 grains.——*Artificial pearls* are small globules or pear-shaped spheroids of thin glass, perforated with two opposite holes, through which they are strung, and mounted into necklaces, &c., like real pearl ornaments. The liquor employed to imitate the pearly lustre is called *essence d'orient*, which is prepared by throwing into water of ammonia the brilliant lamellæ separated, by washing and friction, from the scales of the *bleak*, a small river fish. The ammonia renders them sufficiently soft and flexible to adhere closely to the inner surface of the glass, and passes off by the drying. The French are particularly successful in this manufacture. There are various other methods of imitating pearls, in which also the French are said to excel.

PEARL'-ASH, a fixed alkaline salt, prepared chiefly in America, Germany, Russia, and Poland, by dissolving out the salts contained in the ashes of burnt wood, evaporating the solution to dryness, and calcining the residue for a considerable time in a furnace moderately hot. Pearl-ashes are much used in the manufacture of glass, and, for that purpose, require no preparation, except when very great transparency is desired.

PEAT (*pyt: Isl.*), a congeries of decayed vegetable matter, generally including trunks of trees, leaves, fruits, stringy fibres, and the remains of aquatic mosses. In most cases, the plant which chiefly forms the peaty matter is a small moss, the *Sphagnum palustre*. It continues growing upwards from the points of the shoots, while decay is advancing in a similar manner from their lower extremities, a thick close mass of vegetable substance, which rots below as it forms above, being produced. The rotten part is peat or turf. It occurs in extensive beds, called *peat-mosses*, occupying the surface of the soil, or covered to the depth of a few feet with sand, gravel, &c. It is the common fuel of large districts of Wales and Scotland, and of some parts of England where coals are very dear. It constitutes the fuel of a large part of Ireland, where it covers thousands of acres. When powerfully compressed, it forms a dense and excellent fuel, the more valuable for many purposes since it contains no sulphur.

PEB'BLES (*pæbol: Sax.*), round nodules, particularly of siliceous minerals, such as rock-crystal, agates, &c.——The term is used by opticians to express the transparent and colourless rock-crystal or quartz, used as a substitute for glass in spectacles; its hardness makes it little likely to be scratched.

PEC'CARY, the name of two South American animals allied to the hog, but distinguished by the absence of the outer toe of the hind foot, and the presence of a peculiar gland, which exudes its secretion by an orifice situated in the back: whence Cuvier devised the name of *Dicotyles* (two navels) for the genus. The collared peccary (*Dicotyles torquatus*), and the white lipped peccary (*Dicotyles labiatus*), are the only known species.

PECH'BLEND, or **PITCH'BLEND**, in Mineralogy, ore of uranium; a metallic substance of a blackish or deep iron-grey colour, sometimes spotted with red; it is found in masses in Swedish and Saxon mines, and is generally stratified with other minerals.

PECK, a dry measure of eight quarts, being the fourth part of a bushel. The imperial peck contains 554·55 cubic inches.

PEC'TEN (a comb: *Lat.*), a large genus of *Conchifera*, bivalve mollusca, whose shells have a hinge like that of the oyster, but usually marked with ribs which radiate from the summit of each valve to the circumference, and furnished with two processes called ears. Pectens obtain their name from the ribs or ridges of their shells running in straight lines like the teeth of a comb. They are commonly called clams. The scallop (*Pecten maximus*) and quin (*P. opercularis*) are esteemed delicacies; the latter covers extensive banks, especially on the N. and W. of Ireland. The body of the scallop is bright orange or scarlet; the shell is used for 'scalloping' oysters; formerly it was used as a drinking cup, and celebrated as such in Ossian's 'Hall of Shells.' An allied species has received the name of St. James's shell (*P. Jacobæus*): it was worn by pilgrims to the Holy Land, and became the badge of several orders of knighthood.

PEC'TIN (*pēktos*, thick, as opposed to liquid: *Gr.*), the gelatinizing principle of certain vegetables, such as currants, apples, &c. It may be obtained abundantly from some esculent roots—carrots, for example, which, on this account, are so useful as ingredients in soup. Pectin, or *pectic acid*, is in the form of a jelly, which affords insoluble compounds with the earths and several other metallic oxides.

PEC'TINATED, or **PEC'TINATE** (*pectinatus*, from *pecten*, a comb: *Lat.*), in Natural History, an epithet for anything which is toothed like a comb.——A mineral is said to be *pectinated*, when it presents short filaments, crystals, or branches, nearly parallel and equidistant.

PEC'TORAL (*pectoralis*, from *pectus*, the breast: *Lat.*), an epithet for whatever relates to the breast; hence *vectoral* fins, the anterior and lateral fins, which represent, in fishes, the fore-legs or anterior members of other vertebrates.

PEC'ULATOR (*Lat.*), in Roman Law, a public officer who embezzled the public money.

PECU'LIAR (*pecularis*, special: *Lat.*), in Ecclesiastical Law, an exempt jurisdiction, which is not under the ordinary of the diocese. Peculiars are royal, of which the king is ordinary: those of archbishops, bishops, deans, chapters, &c.——COURT OF PECULIARS, a branch of the court of arches belonging to the archbishop of Canterbury, which takes cognizance of matters relating to parishes that have a peculiar jurisdiction.

PED'AGOGUE (*paidagōgos*: from *pais*, a child; and *agōgos*, a leading: *Gr.*), a slave of a superior order, to whom a child was intrusted from about the age of seven till he became a youth, by the Greeks and Romans, particularly the former. To him was committed the charge of giving instruction in the inferior branches of education, and he accompanied his pupil to the masters who taught the other branches.

PED'ALS (*pedalis*, pertaining to the foot: *Lat.*), in Music, the keys which are played by the feet, and by which the deepest bass pipes of an organ are sounded. It is worthy of notice that England, which was the first to introduce the organ into churches generally, was the last to adopt the obvious improvement of pedals. A pedal is also attached to a piano to strengthen and prolong the tones. In a harp, the pedal serves to elevate the notes half a tone; and it is used for a variety of other purposes in musical instruments, such as coupling and drawing stops, swelling, blowing a bellows, &c.

PED'ATE (*pes*, a foot: *Lat.*), in Botany, an epithet applied to a palmate leaf, having the two lateral lobes divided into smaller segments, the midribs of which do not run directly into the common central point.

PED'ESTAL (*piédestal*: *Fr.*), in Architecture, the lowest part of a wall or column, being that which serves as its stand. It consists of three parts, a trunk or *dye*, which forms the body; a *cornice*, which forms the head; and a *base*, which forms the foot.

PED'ICLE (*pediculus*, the *dim.* of *pes*, a foot: *Lat.*), in Botany, the ultimate division of a common peduncle.

PEDIC'ULUS (*Lat.*), in Entomology, a genus of parasitic apterous insects, commonly termed lice in the order *Anophera*. There are many species, some of which infest quadrupeds, some birds, and some human beings.

PED'IMENT, in Architecture, a kind of low pinnacle, which serves to complete a frontispiece, and which finishes the fronts of buildings, or is placed as an ornament over gates, doors, windows, or niches. The pediment is ordinarily angular, but sometimes it forms the arc of a circle, or some other curve. The parts of a pediment are—1. the tympanum, or central triangular part; 2. the cornice, which crowns it; and 3. the entablature, which serves as its base. The tympanum is often decorated with sculpture.

PEDOM'ETER (*pes*, a foot: *Lat.*; and *metron*, a measure: *Gr.*), an instrument by which paces are numbered, and the distance from place to place ascertained. It also marks the revolutions of carriage-wheels, This is done by means of wheels with teeth and a chain or string fastened to the foot, or to the carriage-wheel; and the wheels advance a division at every step, or at every revolution. The instrument is generally in the form of a watch.

PEDUN'CLE (a *dim.* from *pes*, a foot: *Lat.*), in Botany, the stem or stalk that supports the fructification of a plant, and of course the fruit. A *pedunculate* flower is one which grows on a peduncle.

PEER (*pair: Fr.; from par*, equal: *Lat.*), a nobleman of the realm. The lords of parliament are the peers of each other; for, whatever formality or precedence may attach to the title of duke, marquis, earl, or viscount, it is a *barony* which conveys the right to a seat in parliament, and confers every privilege annexed. It is as a baron, not as a duke, bishop, &c., that a peer sits in parliament; and the parliamentary rights are, at the present day, the essence of nobility. In compliance with an ancient practice, peers are sometimes still created by titles which convey the idea of local rights to which they have in reality no pretension; but though this is a mere form, the rank they gain is not an empty one; it is that of an hereditary legislator of the realm. A peer is not to be put upon any inquest, even though the cause have a relation to two peers; and where a peer is defendant in a court of equity, he is not to be sworn to his answer, which is to be received upon the faith of his honour; but when he is to answer to interrogatories, or to make an affidavit, or to be examined as a witness, he is to be sworn. A peer is free from arrest, in civil cases, at all times. [See PARLIAMENT.] *Trial of a Peer.* It is a maxim of the first importance, that those public men who, in a free country particularly, will always be liable to the dangers of political animosity, should be secured against possible popular injustice; and for this reason, as well as because, with the rest of his fellow-subjects, he claims to be tried by his equals, a peer must be arraigned, whether on a charge of treason or of felony, before the house of which he is a member. After the evidence for the prosecution and the answer have been heard, the lord high-steward openly demands of each lord whether the prisoner, calling him by his name, is guilty of the crime for which he is arraigned; and each lord, laying his right hand upon his left breast, separately answers, 'Guilty,' or 'Not Guilty, upon my honour.' If, by a majority of votes, the prisoner be found guilty, he is brought to the bar again; the high-steward acquaints him with the verdict of his peers, and passes sentence and judgment accordingly; or, acting as he does by commission, the high-steward may take time to advise upon the judgment, and his office continues till that is passed. The appointment of a high-steward only takes place when the parliament is not sitting; and the trial is said to be in the *court of the high-steward of England.* The peers officiate at once as jurors and judges; their speaker collects the votes: and the trial is said to be in the *high court of parliament.* In mere misdemeanors, a peer is tried, like a commoner, by a jury. There are two peculiarities attending the trial of a peer: 1st, the number of jurors is greater than ordinary, every peer having a right to sit; 2ndly, unanimity is not required, but the decision depends upon the majority, which, however, must amount to twelve.

PEER'ESS, a woman who is noble by descent, creation, or marriage. If a peeress by descent or creation marries a person under the degree of nobility, she still continues noble; but if she has obtained the dignity by marriage only, she loses it by a subsequent marriage with a commoner, though, by the courtesy of England, she always retains her title. A peeress, though she cannot sit in parliament, has the privileges of a peer; she cannot be arrested for debt or trespass, and must be tried by her peers.

PEG'ASUS (*Lat.*), in Astronomy, a constellation in the northern hemisphere. It derives its name from *Pegasus*, the winged horse, which, according to some, sprang from the blood of the Gorgon Medusa, after Perseus, a son of Jupiter, had cut off her head. The Greeks probably derived the idea of a winged horse from the Assyrians, amongst whose sculptures the figure has been found.

PEINE FORTE ET DURE (violent and severe pain: *Fr.*). [See QUESTION.]

PELA'GIANS, a Christian sect who appeared about the beginning of the 5th century. Pelagius, the founder of it, was born in Wales, and his real name was Morgan, which in the Welsh language signifies *sea born;* whence the Latin name Pelagius. Augustine gives him the character of a very pious man, and a person of superior birth. Among other peculiarities, the Pelagians denied original sin, maintaining that Adam would have died whether he had sinned or not; that we derive no corruption from his guilt; that our own powers are sufficient for our justification; that by free will we fall into sin, and by the voluntary exercise of the same will we may repent and reform, the immediate operation of the Holy Spirit not being necessary to awaken a religious feeling, or to assist us towards perfection. Augustine strongly opposed the teaching of Pelagius, and succeeded in having it rejected by the great majority of the church. But there afterwards arose another sect, the Semi-Pelagians, which spread much more widely. This was originated by Cassianus, an eastern monk, who taught that man has no need of internal preventing-grace; that the natural powers of man are sufficient to begin the renovation of his soul, and that he can have faith and a purpose of living holily, although he requires divine assistance and grace to enable him to persevere. Controversies concerning the nature and mode of divine grace necessary for salvation then commenced, and have never ceased to agitate the church.

PEL'ICAN (*pelekan: Gr.*), a web-footed bird larger than a swan, inhabiting marshy and uncultivated places, particularly islands and lakes where sedges abound. The bill is straight, except at the point, and it has a skin reaching down the neck, which forms a pouch capable of being distended so as to be very capacious. There are several species; the common pelican is an inhabitant of the eastern part of Europe and Africa.

The female pelican has a peculiar tenderness for her young, and feeds them with fish that have been macerated for some time in her pouch; hence has arisen the fabulous story of her feeding them by drawing blood from her breast. Pelicans are gregarious, very fond of fish, and, when harassed or pursued, readily reject the contents of their stomach, like the gull tribe

PELLA'GRA (*pella*, the skin; and *agra*, a catching: *Gr.*), in Medicine, the name given to a disease, or complication of diseases, common to the inhabitants of the Lombardo-Venetian plains It is a species of *elephantiasis;* it begins by an erysipelatous eruption of the skin, and is frequently accompanied by remarkable lassitude, melancholy, moroseness, and hypochondriasis, with an evident propensity to suicide It is almost confined to the agricultural population and the poorest classes

PEL'LICLE (*pellicula*, the *dim.* of *pellis*, a skin. *Lat*), any thin skin, whether animal or vegetable; also the skin which forms on the surface of some evaporating liquids

PEL'LITORY, the name of several plants of different genera Of these the root of the *Anthemis Pyrethrum*, a composite plant, termed *Pellitory of Spain*, has a pungent flavour, when chewed it promotes the flow of saliva, and is often useful in the toothache The *Pellitory of the wall* is a species of *Parietaria*, a common weed on walls

PELLS (*pellis*, a skin. *Lat* - from the parchments used), CLERK OF THE, an officer of the English exchequer, who enters every teller's bill on the parchment rolls, the roll of receipts, and the roll of disbursements.

PEL'TA (*Lat*; from *peltē*: *Gr*), in Antiquity, a small, light, and manageable buckler.-- In Botany, a term used in describing lichens, to denote a flat shield, without any elevated rim, as in the *Peltideæ*

PEL'TATE (from last), in Botany, a leaf or any other organ fixed to a stalk by the centre, or by some point distinctly within the margin.

PEL'TRY (*pelz*: *Ger*; from *pellis*, a skin: *Lat.*), the skins of different kinds of wild animals found in high northern latitudes, such as the beaver, sable, wolf, &c., before they have received any preparation. If the inner side has been tanned by an aluminous process, they are termed *furs*.

PEL'VIS (*Lat.*), the cavity formed by the hip bones. Each side of the pelvic arch is composed of three bones, which are soldered together in the adult, and form the *os innominatum* of the anatomist. The largest of these is the *ilium*, which is united to that portion of the vertebral column called the sacrum; the middle bone is the *ischium*, and the lowest the *pubis*, which joins its fellow on the opposite side, and forms as it were the crown of the arch.

PEM'ICAN, a preparation of reindeer venison used by traders and hunters in British North America. The meat is first dried, and after being pounded is mixed with fat, generally the suet of the bison. It is then sewed up in a bag of undressed hide with the hairy side outwards.

PEN (*penna*, feather: *Lat.*), an instrument used for writing, made either of the quill of some large fowl, of metal, or of any other material. In ancient times, reeds were split and shaped to a point similar to our pens; and quills are supposed not to have been employed for writing till the 6th century. Metallic pens were first made in 1803, but they were not used to any extent until about the year 1830. In manufacturing them, the steel is pressed into thin sheets, then cut into slips, annealed for fourteen hours, and again passed under the roller. By means of a peculiar cutting-machine, the pens are formed in a falchion shape. The preparation for making the slit then takes place. An extremely fine-edged chisel is brought down upon each pen separately, and is allowed to penetrate two-thirds through its substance. A piece is next cut out at the upper end of the slit, which is called *piercing*. The proper shape is given by means of a punch fitting into a corresponding concavity. The pens are then heated red-hot and dipped into oil, and afterwards polished by a peculiar apparatus, in which they are placed, and to which a motion is given resembling that required in shaking together materials in a bag. After this they are tempered in a box, and brought to a blue colour, being carefully watched, and the heat being lessened whenever a shade of yellow is observed on their surface. The slit is now completed by touching its side with a pair of pincers The process varies a little in different manufactories, but the principles on which it is conducted are very similar in all. Pens are sometimes made or tipped with other metals, to prevent rapid corrosion or wear; but the mode of manufacture remains almost the same.——FOUNTAIN PEN, a pen made of silver, or other metal, so contrived as to contain a considerable quantity of ink. This, flowing out by gentle degrees, supplies the writer a long time without his being under the necessity of taking fresh ink.

PE'NAL LAWS (*pœnalis*, belonging to punishment: *Lat.*), laws made for the punishment of criminal offences. The term is understood specially to comprehend those which were enacted to prevent the practice of the Roman Catholic religion, in consequence of its being considered incompatible with civil and religious liberty. After many of them had been from time to time relaxed or repealed, all restrictions and disabilities, except those regarding a few offices with which the safety of the established church is intimately connected, were removed by the *relief bill* passed in 1829.

PEN'ALTY (*pœna*, punishment: *Lat.*), a fine or forfeiture, by way of punishment; it includes imprisonment, whipping, &c.

PEN'ANCE (same *deriv*), in Ecclesiastical Law, the infliction of some pain or bodily suffering, as fasting, flagellation, &c.; or an exercise of repentance for some sin, either voluntary or imposed. It relates more especially to sufferings of the body, as *penitence* or *repentance* does to the regrets and sorrows of the mind. *Penance* is one of the seven sacraments of the Roman Catholic church.

PENA'TES (*Lat.*), in Roman Antiquity, tutelar deities, either of countries or of particular houses, in which last sense they were the same with the *Lares*.

PEN'CIL (*penicillum : Lat.*), a small brush used by painters for laying on their colours. Pencils are of various kinds, sizes, and materials; the larger kinds are made of swine's bristles, the thick ends of which are bound to a stick or handle, and, when very large, are called *brushes*. The finer are made of the hair of camels, badgers, and squirrels, and of the down of swans; these are tied at the upper end, and enclosed in a quill. All of the latter kind, when good, on being drawn between the lips, come to a fine point.——BLACK-LEAD PENCILS, slips of black lead (plumbago or graphite), enclosed in cylindrical or prismatic pieces of cedar, and pointed at one end. They are of different sizes and qualities, according to the purposes for which they are intended *Ever-pointed* pencils are merely very slender cylinders of black lead so placed in metallic or other cases, that they can be screwed out at pleasure: the points being protected when out of use, and never requiring to be cut.——PENCIL OF RAYS, in Optics, a number of rays diverging from some luminous point, which, after falling upon, or passing through a lens, converge again to a point.

PEN'DANT (*pendo*, I suspend : *Lat.*), in Gothic Architecture, an ornamental polygonal piece of stone or timber, hanging down from a vault or the roof of a building. Some exquisite pendants of this kind are to be seen in the chapel of Henry VII. at Westminster. The springers of arches, which rests on shafts or corbels, are also sometimes called *pendants*.—— In Heraldry, a part hanging from the label, resembling the drops in the Doric frieze.——PENDANT, in Nautical language, a long narrow flag or streamer displayed from the ship's mast-head, and usually terminating in two points. It denotes that a ship is in actual service. The *broad pendant* is a flag that serves to distinguish the chief of a squadron.——The *rudder pendant* is a rope made fast to the rudder by a chain, to prevent the loss of the rudder when unshipped.——Also, an ornament or jewel hanging at the ear.

PEN'DENTIVE (*pendens*, hanging down : *Lat.*), in Architecture, that portion of a vault which descends into an angle between the arches, when a dome springs from a straight-sided area. A circular dome may, by means of pendentives, be formed over any regular polygon.

PEN'DULUM (*pendulus*, hanging down : *Lat.*), in Dynamics, a ponderous body so suspended that it may vibrate, or swing backwards and forwards, from some fixed point, or axis of suspension. The vibrations of a pendulum are called its *oscillations*, and depend on the force of gravity. From the precision of its motions, it is employed in measuring time and space. The origin of the pendulum is traced to Galileo's observation of a hanging lamp in a church at Pisa continuing to vibrate long, and with singular uniformity, after any accidental cause of disturbance. He was induced to investigate the laws of this phenomenon, which led to results in the highest degree important. To render a pendulum perfectly isochronous, it must be made to vibrate in a cycloidal arc; but, practically, it is sufficient if the arc of vibration is small, and the pendulum heavy. A common clock is merely a pendulum, with wheel-work attached to it, to record the number of the vibrations; and with a weight or spring, having force enough to counteract the retarding effects of friction and the resistance of the air. The wheels show how many swings or beats of the pendulum have taken place, because, at every beat, a tooth of the last wheel is allowed to pass. Now, if this wheel has sixty teeth, as is common, it will just turn round once for sixty beats of the pendulum, or seconds; and a hand fixed on its axis, projecting through the dial-plate, will be the second-hand of the clock. The other wheels are so connected with this first, and the numbers of the teeth on them so proportioned, that one turns sixty times slower than the first, to fit its axis for carrying a minute hand; and another, twelve times lower still, to fit its axis for carrying an hour-hand. The pendulum has been successfully used to measure the force of gravity at different parts of the earth; the greater this is, the greater the length of a pendulum which will vibrate at a given rate. At Spitzbergen, the length of a pendulum vibrating seconds is 39·21469 English inches, at the Cape of Good Hope, 39·078. The pendulum is affected by temperature [See COMPENSATION PENDULUM.]

PEN'DULUM EXPER'IMENT. M. Foucault, of Paris, pointed out a mode of rendering the rotation of the earth *perceptible*, by means of a pendulum. A simple pendulum, if made to oscillate, may be carried in any direction round a room, without the planes in which the oscillations take place ceasing to be parallel to themselves. Hence, if a pendulum were made to vibrate at either pole, the terrestrial meridians would successively pass under it, and it would *appear* to describe an entire circle in 24 hours. When the experiment is made in any place between the pole and equator, the effect is similar, though modified; and the time of rotation will be increased, by the ratio of the cosecant of the latitude to radius. The experiment may be made in a rude, but sufficiently satisfactory manner, by suspending a ball of metal, or other heavy body, from the ceiling of a lofty room, by a cord long enough to make it almost touch the floor, and setting it in vibration, a line having been previously chalked immediately under the plane of vibration. This pendulum will soon leave the chalked line, and the line over which it vibrates will seem to revolve on its centre.

PENETRA'LE (*Lat.*), a sacred room or chapel in private houses, set apart for the worship of the household gods among the Romans. In temples also there were *penetralia*, or apartments of particular sanctity, where the images of the gods were kept, and certain solemn ceremonies performed.

PEN'GUIN (*pinguis*, fat : *Lat.*), the name of web-footed birds belonging to the Auk family. They are found only in southern latitudes, and have very remarkable peculiarities. They have very short legs, with four toes, three of which are webbed; the body is clothed with short feathers, set as compactly as the scales of a fish; the wings are small, like fins, and covered with short scale-like feathers, so that they are useless in flight. When on land, penguins stand erect, but some species when moving use their little wings as front legs, crawling on all fours so rapidly that seen from a distance they may be mistaken for a quadruped. They are tame, and may be driven like a flock of sheep; but they seldom go on shore, except in the breeding season. In water they swim with rapidity, their fin-like wings greatly assisting them. Their name is derived from their extreme fatness.

PENIN'SULA (*Lat.*; from *pene*, almost; and *insula*, an island), a portion of land, surrounded by the sea, except where it joins the mainland by a narrow neck called an *isthmus*. In Europe it is common to designate Spain and Portugal by the appellation of *the peninsula*; and when we speak of the contest maintained by the British and native troops against the French, we accordingly term it the *peninsular war*.

PENITEN'TIARY (*pœnitentia*, repentance: *Lat.*), a prison where convicts are subjected to instruction and discipline. Imprisonment for crime may be either for prevention and punishment only, or for the reformation of the offender also. An attempt to reform can scarcely have place when the period of incarceration is short. It is usual not to commence the system of reformation until the criminal has suffered in this country one, and in other countries two years' punishment. Great evils have been found to arise from prisoners feigning reformation, where no reformation has occurred, and the authorities in such cases allowing themselves too easily to be imposed upon; and from punishments being relaxed or altogether terminated, with too great facility, in cases of pretended reformation. The penitentiary at Millbank is fitted up for 800 males and 400 females.——GRAND PENITENTIARY, at the court of Rome, an officer appointed to absolve in cases reserved to the pope; also to grant secret bulls, &c., in cases of conscience. Roman Catholic bishops appoint penitentiaries in their dioceses, for the absolution of cases otherwise reserved to themselves.

PEN'ITENTS (*pœnitentes*, persons repenting: *Lat.*), an appellation given to certain fraternities in Roman Catholic countries, distinguished by their different habits; and of which there are a great variety in France, Spain, Italy, &c.

PEN'NON (*Fr.*), in Heraldry, a small pointed flag, borne in former times by a gentleman. When knighthood was conferred upon him, the point was cut off, and the square flag that remained obtained the name of *banner*.

PEN'NY (*pfennig*: *Ger.*), an ancient silver coin, which was the only one current among our Saxon ancestors; but now a copper coin, twelve of which are equal to a shilling. In Ethelred's reign the penny was the twentieth part of an ounce troy: hence the denomination *pennyweight*. Till the time of Edward I. the penny was struck with a cross so deeply sunk into it that it might, if required, be easily broken, and parted into halves and quarters; hence the terms *half-pence*, and *farthings* (fourth-things) or *quadrantes*. Edward I. required that the silver penny should weigh the twentieth part of an ounce. Queen Elizabeth reduced it to the sixty-second part.

PEN'NYWEIGHT, a troy weight, containing 24 grains, each of which is supposed to be equal in weight to a grain of wheat gathered out of the middle of the ear, and well dried. It was the weight of a silver penny in the time of Edward I.

PEN'SIONER (*pensio*, a payment: *Lat.*), one who receives an annuity from another; whether in consideration of service past or present, or merely as an act of kindness. In the university of Cambridge the *pensioners* form the great body of the students; they pay for their commons and chambers, and usually enjoy no pecuniary advantages from their colleges.——*The Band of Gentlemen Pensioners*, the former designation of the *Band of Gentlemen-at-arms*, a body of forty gentlemen who attend the sovereign at levees, drawing-rooms, and other state occasions. It was instituted by Henry VII., and their duty is to guard the royal person to and from the chapel royal, &c.; for which each receives a pension or annual allowance of 100*l*.——*Pensions of the Inns of Court*, annual payments made by each member to the society.

PENTACAP'SULAR (*pente*, five: *Gr.*; and *capsula*, a small box: *Lat.*), in Botany, an epithet for a plant having five capsules or seed vessels.

PEN'TACHORD (*pente*, five; and *chordē*, a string: *Gr.*), a musical instrument with five strings.

PENTACRI'NUS (*pente*, five; and *krinon*, a lily: *Gr.*), a genus of marine animals, allied to the star-fishes, of which only a single living species is known, viz. the *P. Caput-Medusæ*, of which a few specimens have been found in the West Indies. On the top of a long column formed of a number of calcareous plates, held together by animal matter, is a disk that has ten arms, each of which branches into three. The mouth is placed at the middle of the disk. In the lias formation several species have been found fossil, and these are called Encrinites or stone lilies. The skeleton of one of these contained 150,000 pieces.

PEN'TACOCCOUS (*pente*, five; and *kokkos*, a kernel: *Gr.*), in Botany, an epithet implying that the plant has five united cells with one seed in each.

PEN'TAGON (*pente*, five; and *gōnia*, an angle: *Gr.*), in Geometry, a plane figure having five sides and five angles. If the five sides are equal, it is called a regular pentagon. Its area is equal to five times the sine of 36° multiplied by the cosine of the same; and the square of the side of a regular pentagon is equal to the sum of the squares of the sides of the hexagon and decagon inscribed in the same circle.——In Fortification, a fort with five bastions.

PEN'TAGRAPH (*pente*, five; and *grapho*, I write: *Gr.*) [See PANTAGRAPH.]

PENTAGY'NIA (*pente*, five; and *gunē*, a female: *Gr.*), in Botany, an order of plants in the Linnæan system, comprehending such as have five pistils in an hermaphrodite flower.

PENTAHE'DRON (*pente*, five; and *hedra*, a base: *Gr.*), in Geometry, a solid having five equal sides.

PENTAHEXAHE'DRAL (*pente*, five; *hex*, six; and *hedra*, a base: *Gr.*), in Crystallography, exhibiting five ranges of faces one above another, each range containing six faces.

PENTAM'ETER (*pentametros*, consisting of five measures: *Gr.*), in Latin and Greek Poetry, a verse consisting of two parts, each composed of two feet and a long syllable, which must either be a single word or a terminating syllable. The feet may be either dactyls or spondees. A pentameter verse alternating with an hexameter constitutes what is called *elegiac verse*, a verse in which Ovid excelled.

PENTAN'DRIA (*pente*, five; and *anēr*, a male: *Gr.*), in Botany, the fifth class of the Linnæan system, containing those plants which have hermaphrodite flowers with five stamens.

PENTAN'GULAR (*pente*, five: *Gr*; and *angulus*, an angle: *Lat*), in Geometry, having five corners or angles.

PENTAPET'ALOUS (*pente*, five: and *petalon*, a leaf: *Gr*), in Botany, an epithet given to flowers that consist of five petals or flower-leaves.

PENTAPHYL'LOUS (*pente*, five; and *phullon*, a leaf: *Gr.*), in Botany, consisting of, or having five leaves.

PENTAP'OLIS (*Gr.*, from *pente*, five; and *polis*, a city), a name given by the ancient Greeks to certain countries having five very important cities, the most remarkable of these was the *Pentapolis Cyrenaica*, or that of Egypt, the cities of which were Berenice, Arsinoë, Ptolemaïs, Cyrene, and Apollonia.

PEN'TASTICH (*pentastichos*, from *pente*, five; and *stichos*, a verse; *Gr.*), in Poetry, a composition consisting of five verses.

PEN'TASTYLE (*pente*, five; and *stulos*, a column: *Gr.*), in Architecture, a building in which there are five columns in front.

PEN'TATEUCH (*pentateuchos*: from *pente*, five; and *teuchos*, a book: *Gr.*), an appellation given to the first five books of the Old Testament—Genesis, Exodus, Leviticus, Numbers, and Deuteronomy.

PENTATH'LUM (*pentathlon*, from *pentē*, five; and *athlos*, a contest: *Gr.*), an appellation given by the Greeks to the five principal bodily exercises—running, leaping, throwing the quoit or discus, hurling the javelin, and wrestling. They were termed *quinquectium* by the Romans.

PEN'TECOST (*pentēkostē*, from *pentēkostos*, the fiftieth: *Gr.*), a solemn festival of the Jews, instituted in memory of the promulgation of the law, and so named because it was observed on the *fiftieth* day after the feast of unleavened bread. It was also called the *Feast of Weeks*. It is retained in the Christian church, under the name of Whitsuntide, on account of the miraculous descent of the Holy Ghost on the apostles, which happened on one of the annual returns of its celebration.

PENT'-ROOF, a roof of any building or shed, formed like an inclined plane, the slope being all on one side.

PENTEL'ICAN MAR'BLE, a stone much employed by the ancient Greek sculptors and quarried on Mount Penteles near Athens. It was of fine grain and occasionally marked with greenish spots.

PENUL'TIMA, PENULT', or PENUL'TIMATE SYLLABLE (*penultimus*, from *pene*, almost; and *ultimus*, the last: *Lat.*), in Grammar, the last syllable but one of a word; and hence the *antepenultimate* syllable is the last but two, or that immediately before the penultima.

PENUM'BRA (*pene*, almost; and *umbra*, a shadow: *Lat*), in Astronomy, a partial shade or obscurity in an eclipse, observed between the perfect shadow, where the light is entirely intercepted, and the full light It arises from the magnitude of the sun, and is that portion of space behind the object causing the eclipse, in which the illuminated body is enlightened by only a part of the disc of the illuminating body. The nearer to the umbra the darker the penumbra, and hence it is difficult, in eclipses of the moon, to determine by observation the exact time at which the eclipse begins and ends. Penumbras must be constant attendants of all eclipses, whether of the sun or moon, or planets primary or secondary.

PEPERI'NO, the name given in Italy to a volcanic tufa quarried in the neighbourhood of Rome and employed as a building stone and for works of art.

PE'PO (*pepon*, a pumpkin: *Gr*), in Botany, the name given to the fruit of cucurbitaceous plants, such as the gourd and melon, in which under the adherent calyx there is a fleshy rind, and the placentas are parietal and at least three in number.

PEP'PER (*piper*: *Lat.*), the fruit of tropical plants belonging to the genus *Piper*, nat ord *Piperaceæ* We have three kinds of pepper—the white, the black, and the long. Black pepper is the fruit of a creeping shrub (*Piper nigrum*) growing in Java, Sumatra, Ceylon, and other Asiatic countries. The berries are produced in clusters, and change as they ripen from green to red, and afterwards to black. White pepper differs from the black only in being stripped of its corticle or covering. To effect this, the black berries are steeped in salt water, and after they have been exposed to the sun for several days the chaff is rubbed off with the hands. In this operation the pepper loses much of its original hot taste Long pepper consists of the half-ripe flower-heads of *Piper longum*. Red pepper is the ground fruit of various species of *Solanum*, which see.

PEP'PERMINT, in Botany, a plant of the genus *Mentha*. It is highly aromatic and pungent. Also, an essential oil distilled from the plant.

PEP'PERMINT-TREE, the *Eucalyptus piperita*, a native of New South Wales.

PER, a Latin preposition, signifying *by*; used in many phrases, as *per force*, *per annum*, *per cent.* &c.——In Chemistry, it is a contraction for *hyper*, and is employed as a prefix to denote *very* or *fully*, or to the *utmost extent*: as in *peroxide*, which indicates a substance oxidized in the highest degree.

PERAM'BULATOR (*perambulo*, I walk through: *Lat*), an instrument for measuring distances, otherwise called a *pedometer*, which see.

PERBISUL'PHATE, in Chemistry, a sulphate which contains two proportions of sulphuric acid, and is combined with an oxide at the maximum of oxidation

PER CEN'TUM, or **PER CENT** (by the hundred · *Lat.*), the rate of interest, or so much for every hundred; as *five per cent*, that is, five pounds for every hundred pounds, five dollars for every hundred dollars, &c.

PERCEP'TION (*perceptio* · *Lat.*), in Logic, the first act of the mind, which consists in the reception of ideas concerning external objects, through the medium of the senses It has been well observed that the first objects which strike our senses give us our first ideas; and our wants are the cause of our *attention*: the repetition of these ideas, and the development of new wants, give birth to our sentiments and thoughts The eyes convey the ideas of colour, the ears those of sound, the nostrils those of odour, and the palate those of taste These have no connection with each other—they are separate ideas of different qualities of bodies; but the sense of *touch* unites the whole in *one* object, which may happen to be at the same time coloured, sonorous, odorous, and savoury

PERCH (*perche* · *Fr.*; from *perkē* · *Gr*), in Ichthyology, a freshwater fish of the genus *Perca*, with rough scales and sharp incurvate teeth, its flesh is very delicate The *sea perch* belongs to the genus *Serranus*. Both these genera fall into the large acanthopterygian family of *Percidæ*.——PERCH, or *Pole*, a measure of five yards and a half, or sixteen feet and a half The word *rod* is much more generally used than either *pole* or *perch*, though they all signify the same thing. The Irish perch is seven yards, and the measures founded on it are in proportion.

PERCHLO'RIC A'CID, in Chemistry, chlorine converted into an acid by combination with a maximum of oxygen. A compound of this acid with a base is termed a *perchlorate*.

PERCUS'SION (*percussio*, from *percutio*, I strike: *Lat*), in Mechanics, the effect which a body produces in falling or striking upon another; or the shock of two bodies, one of which is in motion If both bodies are in motion, the shock is termed a *collision*.

PERCUS'SION LOCKS, those which, in firearms, have superseded the flint locks, which succeeded matchlocks, and remained in use for so considerable a period. Percussion locks ignite the charge by first exploding a detonating mixture contained in a copper *cap* by means of the *cock*, a kind of hammer. These caps act far more certainly than the oil *priming*, which was so liable to derangement, and which caused firearms so often to *miss fire*.

PER'DU (lost: *Fr.*), in Military affairs, a term applied to any soldier who is in a dangerous post; whence *enfants perdus*, in the plural, for the forlorn hope of an army.

PERE LA CHAISE, the name of the celebrated cemetery at Paris, laid out as such in 1804. It was formerly the chief seat of the Jesuits' establishment in France, which was presided over by Père la Chaise, confessor of Louis XIV. [See CEMETERY]

PEREN'NIAL (*perennis*, literally, that which lasts through the whole year · *Lat*), in Botany, a plant which lives or continues more than two years, whether it retains its leaves or not

PER'FECT NUM'BER (*perfectus*, complete *Lat*), in Arithmetic, one equal to the sum of all its aliquot parts or divisors. Thus 6, 28, &c. [See NUMBER]

PERFO'LIATE (*per*, through; and *foliatus*, leaved. *Lat.*), in Botany, an epithet for a leaf the base of which entirely surrounds the stem transversely, so that the stem seems to have been driven through the middle of the leaf.

PERGUN'NAH, a name given to districts in India.

PE'RI In Persian Mythology, the *peris* are the descendants of fallen spirits, excluded from paradise until their penance is accomplished

PER'IANTH (*peri*, around; and *anthos*, a flower · *Gr*), in Botany, a calyx and corolla, the limits of which are undefined, so that they cannot be distinguished from each other as in the iris and lily. The perianth is termed also *perigonium*

PERIB'OLOS (*Gr*; from *periballo*, I surround), in Architecture, an enclosure round a temple, surrounded by a wall. The great temple of Palmyra is encompassed by a wall, with two rows of interior columns, each side of which is from 700 to 800 feet long.

PERICAR'DIUM (*perikardion*, from *peri*, around; and *kardia*, the heart: *Gr*)), in Anatomy, a membrane which surrounds the whole substance of the heart It contains a fluid which prevents the surface of the heart from becoming dry by its continual motion Inflammation of this membrane is termed *pericarditis*.

PER'ICARP (*perikarpion*, from *peri*, around; and *karpos*, fruit: *Gr*), in Botany, the fruit of a plant; usually separable into three layers, the *epicarp*, the skin of a peach for example, the *mesocarp*, the fleshy part of the peach, and the *endocarp*, of which the stone of the peach is an example In some fruits, such as the filbert, these three parts are blended together.

PERICRA'NIUM (*perikranion*, from *peri*, around; and *kranion*, the skull: *Gr*), in Anatomy, the membrane that closely invests the skull.

PER'IGEE (*peri*, near; and *gē*, the earth. *Gr*), an Astronomical term. [See APOGEE]

PERIG'YNOUS (*peri*, near, and *gunē*, the female: *Gr*), in Botany, an epithet for a flower in which the stamens originate from the sides of the calyx.

PERIHE'LION (*peri*, near; and *hēlios*, the sun: *Gr.*), in Astronomy, that point of a planet's orbit in which it is nearest to the sun; opposed to *aphelion*.

PERIHEXAHE'DRAL (*peri*, around; *hex*, six; and *hedra*, a base: *Gr.*), in Crystallography, a term designating a crystal, whose primitive form is a four-sided prism, which in the secondary form is converted into a prism of six sides.

PERIM'ETER (*perimetron*, from *perimetreo*, I measure all round: *Gr.*), in Geometry, the line which bounds a figure, whether circular, rectilinear, or mixed. In circular figures instead of *perimeter* we generally use the word *circumference* or *periphery*.

PERIOCTAHE'DRAL (*peri*, around; *oktō*, eight; and *hedra*, a base: *Gr.*), in Crystallography, a term designating a crystal whose primitive form is a four-sided prism, which in its secondary form is converted into a prism of eight sides.

PE'RIOD (*periodos*, literally a going round: *Gr.*), in Arithmetic, three places or digits, separated from the rest by commas; and, in extracting roots, two places or digits for the square root, three for the cube root, &c.——In Astronomy, the time which is taken up by a planet in making its revolution round the sun; or the duration of its course till it returns to the point of its orbit where it was supposed to begin its motion.——In Chronology, the revolution of a certain number of years, as the *Julian period*.——In Grammar, a full stop at the end of any sentence.——PERIOD also means an indefinite portion of any continued state, existence, or series of events; as, the first *period* of life, the earliest *periods* of history, &c.——PERIOD of a disease, in Medicine, the time between the access of one fit, or paroxysm, and that of the next, including the entire exacerbation, decline, intermission, and remission.——In Physiology, *periods* designate the various stages in the development and decay of the animal organization, which are distinguished by a marked character, as the period of childhood, of puberty, &c.

PERIŒ'CI (*perioikoi*, from *peri*, around: and *oikeo*, I inhabit: *Gr.*), in Geography, such inhabitants of the earth as live under the same parallel of latitude, but differ in longitude by 180°. Their seasons are at the same times; but when it is noon with one, it is midnight with the other.

PERIOS'TEUM (*peri*, around; and *osteon*, a bone: *Gr.*), in Anatomy, a nervous vascular membrane, endued with acute sensibility, immediately surrounding both the internal and external surfaces of the bones; it is hence divided into the *external* and *internal periosteum*; and where it externally surrounds the bones of the skull, it is usually called the *pericranium*. The seeming sensibility of the bones is that of this membrane; and its use appears to be to distribute the vessels on their external surfaces.

PERIPATET'ICS (*peripatētikoi*, from *peripateo*, I walk about: *Gr.*), the followers of Aristotle, whose doctrines are distinguished by the name of the *Peripatetic philosophy*. He was called the *Peripatetic*, because he delivered his lectures *walking* in the Lyceum at Athens. The peripatetics were so shackled by respect for their great master, that no men of much note have appeared among them.

PERIPH'ERY (*peripheria*, from *periphero*, I carry round: *Gr.*), the circumference of a circle, ellipsis, or other regular curvilinear figure.

PERIPH'RASIS, or PER'IPHRASE (*periphrasis*, from *peri*, round about; and *phrazo*, I speak: *Gr.*), in Rhetoric, *circumlocution*, or the use of more words than are necessary to express an idea.

PER'IPLUS (*periplous*, from *peripleo*, I sail round: *Gr.*), the title of some fragments which remain of the accounts of ancient voyages.

PERIPNEU'MONY, or PNEUMO'NIA (*peripneumonia*, from *peri*, around; and *pneumōn*, the lungs: *Gr.*), in Medicine, an inflammation of the lungs, attended with acute fever, purulent expectoration, and difficult respiration.

PERIP'TEROUS (*peripteros*, from *peri*, around; and *pteron*, a wing: *Gr.*), in Architecture, an epithet for a place surrounded by a wing, aisle, or passage.

PERIS'CII, or PERIS'CIANS (*periskioi*, from *peri*, around; and *skia*, shadow: *Gr.*), in Ancient Geography, the inhabitants of either frigid zone. The sun, when in the summer signs, moves only round about them, without setting; and consequently their shadows, in the course of the day, turn to every point of the compass.

PER'ISPERM (*peri*, around; and *sperma*, the seed: *Gr.*), in Botany, a thick farinaceous, fleshy, or horny part of the seeds of plants, either entirely or only partially surrounding the embryo, and enclosed within the investing membrane; the *albumen* Also, the *testa*.

PERISTAL'TIC MO'TION (*peristaltikos*, from *peristello*, I compress: *Gr.*), in Medicine, a spiral or vermicular spontaneous motion of the intestines, performed by the contraction of the circular and longitudinal fibres composing their fleshy coats. By means of it the chyle is driven into the orifices of the lacteal veins, and the excrements are extruded.

PER'ISTYLE (*peristulos*, from *peri*, around; and *stulos*, a column: *Gr.*), in Architecture, a court, square, or cloister, with columns on *three* sides. The term is evidently incorrect. The *Rhodian* peristyle had columns on the four sides; those towards the south being frequently higher than the rest.

PERISYS'TOLE (*peri*, near; and *sustolē*, the contraction of the heart: *Gr.*), in Medicine, the pause or interval between the *systole* or contraction, and the *diastole* or dilatation of the heart.

PERITONÆ'UM (*peritonaion*, from *peri*, around; and *teino*, I stretch: *Gr.*), in Anatomy, a thin smooth, lubricous membrane, investing the whole internal surface of the abdomen, and containing, more or less completely, all the viscera comprised within the latter. Inflammation of this membrane is termed *peritonitis*.

PER'JURY (*perjurium*: *Lat.*), in Law

the crime of wilful false swearing, in any judicial proceeding. The common law takes no notice of any false swearing, except such as is committed in some court of justice having power to administer the oath, or before some officer or magistrate invested with similar authority, in some proceeding relative to a civil suit or criminal prosecution; for the law esteems all other oaths unnecessary, at least, and hence will not punish the breach of them. Voluntary oaths are now prohibited, a certain form of declaration being substituted for them, and a false declaration is a misdemeanor. The penalties of perjury have been extended to false oaths by electors, bankrupts, insolvent debtors, &c., by numerous statutes.——*Subornation of perjury* is the offence of inducing a person to commit perjury. At the common law, perjury, and the subornation of it, are punishable by fine and imprisonment. The Greeks are said to have imagined that no person could swear falsely by Styx, without some remarkable punishment; and that no one guilty of perjury could enter the cave of Palæmon at Corinth without being made a memorable example of divine justice; yet, notwithstanding the general abhorrence in which perjury was held by them, and the credit they gave to such accounts of divine inflictions, perjury was much practised by them.

PER'MIAN, a term applied by geologists to a series of strata in the earth's crust intervening between the carboniferous and the triassic systems, and forming a natural group characterized by community of organic remains in various parts of Europe. They form the uppermost number of the great Palæozoic series, and they received their designation from being largely developed in the government of Perm, Russia. In England Permian beds are found in Cumberland, some of the Midland counties, and in Somersetshire and Gloucestershire.

PER'MIT (*permettre*, to allow: *Fr.*), a note given by the officers of the excise allowing the conveyance of spirits, wine, tea, coffee, or other excisable articles, from one place to another.

PERORA'TION (*peroratio*: *Lat.*), the concluding part of an oration, in which the speaker recapitulates the principal points of his discourse or argument, and urges them with greater earnestness and force, with a view to make a deep impression on his audience. The main excellence of a peroration consists in vehemence and brevity.

PEROX'IDE, in Chemistry, a substance containing the largest quantity of oxygen, compatible with its simple oxidation.

PERPENDIC'ULAR (*perpendicularis*: *Lat.*), hanging or extending in a right line from any point towards the centre of the earth or of gravity, and therefore at right angles with the plane of the horizon.——In Geometry, a line making two equal angles, called *right* angles, with the line to which it is perpendicular.——In Gunnery, a small instrument used for finding the centre line of a piece in the operation of pointing it at any object.

PERPET'UAL MO'TION (*perpetualis*: *Lat.*). The problem of a perpetual motion consists in the invention of a machine which has the principle of its motion within itself; and the means proposed to solve this problem have been as various as the laws of mechanics, and of matter, which show its solution to be impossible. The greater number of ingenious men have at some time of their lives made the experiment; but it is rather a reproach than a merit to have tried it. In the attempt, all natural agents, such as heat, atmospheric changes, &c., must be excluded; the inertia of matter, its attractive forces, and combinations of the mechanical powers, being alone admissible. The resistance of the air and the friction of the parts which necessarily retard a machine, and finally stop it, render perpetual motion an impossibility; since no machine, however ingeniously contrived, can possibly give out a motion which it does not receive, or which is greater in total amount than what it receives. Machinery *modifies* but it cannot *produce* motion—that being the office of a *prime mover*.

PERPETU'ITY (*perpetuitas*: *Lat.*), in the doctrine of annuities, a sum which will purchase an annuity for ever. It is equal to the product of the annuity and the number of years in which the simple interest will be equal to the principal. Thus, at 5 per cent., the interest will in twenty years amount to the principal; and at this rate, the value of a perpetuity of 100*l.* is equal to 100*l.* × 20, or 2000*l.*

PERPHOS'PHATE, in Chemistry, a phosphate in which the phosphoric acid is combined with an oxide at the highest degree of oxidation.

PERQUADRISUL'PHATE, in Chemistry, a sulphate with four proportions of sulphuric acid combined with a peroxide.

PER'RY (*poiré*, from *poire*, a pear: *Fr.*), the fermented juice of pears prepared in the same way as cider from apples.

PERSECU'TION (*persecutio*, from *persequor*, I pursue hostilely: *Lat.*), the unjust infliction upon others of pain, punishment, or death; more especially when it is on account of religious creed or mode of worship. The history of the world is full of persecutions; and there is scarcely any dominant sect or party, religious or political, which has not at times disgraced humanity by inflicting unjust punishment or penalties upon their fellow-men, for adhering to principles which their conscience dictated and their judgment approved.

PER'SIAN WHEEL, in Mechanics, a contrivance for raising water above the level of a stream. It consists of a water-wheel, to the rim of which are fixed a number of strong pins supporting buckets. As the wheel revolves, the buckets, which are filled below, are carried up: and when they reach the highest point, they strike against something which empties them into a trough, whence the water is carried by a pipe to where it is wanted. It is evident that this contrivance will not raise the water to a height greater than the diameter of the wheel.

PERSIS'TENT (*persisto*, I persevere: *Lat.*), in Botany, continuing without withering:

as a *persistent calyx*, which lasts after the corolla is withered.

PER'SON (*persona: Lat.*), in Grammar, a term applied to such nouns or pronouns as, whether expressed or understood, are the nominatives in all inflections of a verb. *I*, *thou* or *you*, and *he*, *she*, or *it*, are called the first, second, and third *persons* Hence we apply the word *person* to the termination or modified form of the verb used in connection with the persons.

PER'SONAL (*personalis: Lat.*), in Law, belonging to the person; any moveable thing, whether living or dead: as *personal chattels*, goods, money, or moveables, opposed to *real* property or estates; *personal action*, an action in which a man seeks to recover goods of which he has been deprived, or in which he claims satisfaction in damages for any injury to his person or property—the specific recovery of lands, tenements, and hereditaments, only excepted.——PERSONAL IDENTITY, in Metaphysics, sameness of being, of which consciousness is the evidence.——PERSONAL VERB, in Grammar, a verb that has inflections or endings to express the three persons of each number.

PERSONIFICA'TION (*persona*, a person; and *facio*, I make: *Lat.*), the giving to an inanimate object the sentiments and language of a rational being; or the representation of an inanimate being with the affections and actions of a person The more the imagination prevails among a people, the more common are personifications; and as reflection acquires the ascendency, personifications are less used

PERSPEC'TIVE (*perspectif*: *Fr*; from *perspicio*, I look at: *Lat.*), that branch of optics which teaches the art of representing objects on a plane surface as they appear under the peculiarities incident to distance and height. Consequently, it is a science of the first importance to the painter. In a practical sense, *perspective* is the art of drawing, according to the principles of geometry, the true representations of real objects; and is divided into *lineal perspective*, which relates to the position, form, magnitude, &c, of the several lines or contours of objects, and *aërial perspective*, which has principally a reference to the colouring and shading of distant objects. Suppose we view a point situated beyond an upright transparent plane, such as a glass window, the spot where a straight line from the eye to this point will go through the window is the *perspective representation* of it; for the eye views all objects by means of rays of light, which proceed to it, from the different points of the object, in straight lines. Let us then imagine a spectator to be looking at a prospect without doors, from within, through a glass window; he will perceive not only the vast extent which so small an aperture will admit to be seen by his eye, but also the shape, size, and situation of every object upon the glass. If the objects are near the window, the spaces which they cover upon the glass will be proportionally larger than when they are at a greater distance; if they are parallel to the window, then their shapes upon the glass will be parallel also; but if they are oblique, then their shapes will be oblique, and so on. And he will always perceive, that as he alters the situation of his eye, the situation of the objects upon the window will be altered also If he raises his eye, the objects will seem to keep pace with it, and rise higher upon the window; and the contrary, if he lowers it And so, in every situation of the eye, the objects upon the window will seem to rise higher or lower; and consequently the depth of the whole prospect will be proportionally greater or less, as the eye is elevated or depressed; and the horizon will, in every situation of the eye, be upon a level with it; that is, the imaginary line which parts the earth and sky will seem to be raised as far above the ground upon which the spectator stands as his eye is Now suppose that the person at the window, keeping his head steady, draws the figure of an object seen through it upon the glass with a pencil, as if the point of the pencil touched the object; he would then have a true representation of the object in perspective, as it appears to his eye. For as vision is produced by pencils of rays coming in straight lines to the eye from every point of the visible object, it is plain that, by joining the points in the transparent plane through which all those pencils of rays respectively pass, an exact representation must be formed of the object, as it appears to the eye in that particular position and at that determined distance. And were pictures of things to be always first drawn on transparent planes, this simple operation, with the principle on which it is founded, would comprise the whole theory and practice of perspective. But what is called the *art of perspective*, which comprises certain rules deduced from optics and geometry, constitutes a study too intricate for its thorough development in a work of this kind, and forms a branch of knowledge which can be attained only from systematic works on the subject. Some idea, however, may be conveyed of the meaning of the principal terms employed.—The pane of glass just mentioned would constitute what is called the *perspective plane*, or *plane of the picture*. Planes *passing through the eye* can be seen on the perspective plane only as a line, two of these are very important—that which is horizontal, and that which is vertical—the former termed the *horizontal plane*, and the latter the *vertical plane*. The line in which the former intersects the perspective plane is called the *horizontal line*; and that in which the latter intersects it, the *vertical line* The *ground plane* is a plane on which the spectator stands, and is parallel to the *horizontal plane*; its intersection with the perspective plane is termed the *ground line*. All lines parallel to the horizontal and vertical planes converge to the *point of sight*, the point at which the horizontal and vertical lines intersect each other on the perspective plane; and that is their *vanishing point*. When objects are to be represented, whose surfaces are *oblique* to the perspective plane, every system of parallel lines issuing from them has its own vanishing point, on the horizontal line, but at some distance, at one side or the other of the vertical line. The vanishing point of any oblique system of parallel lines may be easily found, since it is that point where a line from the eye parallel to them cuts the horizontal line. And the position of this point may be determined by drawing a ground-plan of the building, &c., and marking, on the same paper, &c., the positions of the eye, of the ground line, and of the vertical line; then noting where a line from the eye, parallel to that surface of the building whence the system of lines are supposed to proceed, cuts the ground line. This will give the distance of the required vanishing point to the right or left of the vertical line. *Aërial perspective* teaches how to judge of the degree of light which objects reflect in proportion to their distance, and of the gradation of their tints in proportion to the amount of intervening air. Only the nearest objects appear in their true colours and full light; in the case of the more distant, their light and colour become blended with the colours of the vapours which fill the air, in proportion to their distance, until at last the objects become lost, in an indistinct mass of a bluish tinge, in the horizon. A painter, therefore, who would succeed in aërial perspective, ought carefully to study the effects which distance in its different degrees, or accidental lights, have on each particular colour; and in order to give any tint its proper effect in proportion to its distance, it ought to be known what the appearance of that tint would be were it close to the eye, regard being had to that degree of light which is chosen as the principal light of the picture; for if any colour is made too bright for another, or for the general colouring of the picture, the brightness of that colour, to use a technical phrase, will *kill* the rest. In short, the harmony of a picture, and that captivating charm which we find more particularly in good landscape painting, depend greatly upon a correct application of aërial perspective.

PERSPIRA'TION (*perspiro*, I breathe through: *Lat.*), a term applied to the evaporable exudations from the skin. That part which disappears without being noticed is styled insensible perspiration; the sensible perspiration or sweat collects in drops on the skin, and is commonly mingled with the sebaceous secretion and other matters deposited on the surface. Perspiration is chiefly composed of water and carbonic acid. It has been calculated that the average amount of cutaneous exhalation proceeding from an adult person in twenty-four hours is about 2½ lbs. For the due exercise of the functions of the skin it is necessary that it should be frequently washed.

PERTU'SED (*pertusus*, perforated: *Lat.*), in Botany, full of hollow dots on the surface, as a *pertused* leaf.

VIAN BARK. [See BARK, PERUVIAN.]

PESA'DE (*peser*, to weigh: *Fr.*—because he throws all his weight on his haunches), in Horsemanship, the motion of a horse when he raises his fore quarters; keeping his hind feet on the ground, without advancing.

PET'AL (*petalon*, a leaf: *Gr.*), in Botany, a leaf of a flower, as a sepal is a leaf of a calyx. When the corolla consists only of one leaf, that is, forms a tube around the stamens and pistils, it is termed monopetalous; if divided into separate leaves it is said to consist of two, three, or more petals.

PET'ALISM (*petalismos*, from *petalon*, a leaf: *Gr.*), in Antiquity, a form of proscription or banishment practised at Syracuse, by writing the person's name on a leaf; whence the name. It differed from the Athenian *ostracism* merely in being for five years instead of ten, and the name being written on leaves instead of shells or tiles.

PET'ALITE (*petalon*, a leaf; and *lithos*, a stone: *Gr.*), a Swedish mineral of a foliated texture, and a grey or reddish colour. It is a silicate of alumina and lithia.

PET'ALOID (*petalon*, a leaf; and *eidos*, form: *Gr.*), having the form of a petal.

PETARD' (*Fr.*), in Gunnery, an engine formerly used for breaking down gates, barricades, &c. It resembled a high-crowned hat, was made of gun metal, and being charged with gunpowder, it was screwed by the leaf to a thick plank, and was then suspended before the gate which was intended to be blown open. It is found that loose bags of gunpowder are just as effective.

PET'ASUS (*petasos*, from *petannumi*, I spread out: *Gr.*), in Antiquity, a covering for the head, similar to a broad-brimmed hat, and used to keep off the heat of the sun. Mercury is represented with a winged petasus.——In Architecture, the cupola of a house, in the form of a petasus.

PETE'CHIÆ (*petecchie*: *Ital.*), small red spots, caused by the effusion of drops of blood immediately under the cuticle. They resemble flea bites, and indicate an impure state of the blood. Also the purple spots which appear on the skin in malignant fevers. Hence the term *petechial* fever.

PE'TER'S PENCE, an impost, called also 'the fee of Rome,' and in Saxon 'Rome-scot;' at first a voluntary offering to the see of Rome, but afterwards levied from every house or family. It was discontinued in this country by Edward III., when the popes resided at Avignon; was afterwards revived; but was finally abolished in the reign of Henry VIII.

PE'TIOLE (*petiolus*, the *dim.* of *pes*, a foot: *Lat.*), in Botany, the *leaf-stalk*, or the stem which supports the leaf. Hence the epithet *petiolate* for a leaf growing on a petiole.

PETI'TION (*petitio*: *Lat.*), a formal supplication or request made by an inferior to a superior, especially to one having some jurisdiction. Also a paper containing a supplication or solicitation. The right of the British subject to petition parliament is founded on the *bill of rights*; but it is a misdemeanor punishable by fine and imprisonment, without the consent of three or more justices, or a majority of the grand jury at assizes or sessions, to solicit or procure the signatures of more than twenty to a petition for alterations in church or state, or for more than ten to repair with it to the sovereign or parliament.

PETI'TIO PRINCIP'II (a requesting of the principle: *Lat.*), in Logic, the taking a thing for true, and drawing conclusions from it as such; when it is either false, or at least requires to be proved before any inferences can be deduced from it. In common parlance, this is called 'begging the question.'

PETONG', the Chinese name of a species of copper, of a white colour. It differs from *tutenag*, though it is sometimes confounded with it; being an alloy of copper and nickel, while the latter is an alloy of copper, zinc, and nickel.

PET'REL, a genus of birds, the *Procellaria* of ornithologists, including the bird (*P. pelagica*) well known to seamen by the name of 'Mother Carey's chickens,' whose appearance is dreaded by them as a sure prognostic of a storm. They breed in rocks adjoining the sea, forming their nests in cavities. They seem to repose in a common breeze; but upon the approach or during the continuance of a gale, they surround a ship, and catch up the small animals which the agitated ocean brings near the surface, or any food that may be dropped from the vessel. Whisking like an arrow through the deep valleys of the abyss, and darting away over the foaming crest of some mountain wave, they attend the labouring bark in all her perilous course. When the storm subsides, they retire to rest, and are seen no more. Their name signifies 'little Peter,' and is due to their seeming to walk on the waves. Another species is the Fulmar Petrel (*P. glacialis*), which breeds at the Hebrides. This bird is in the habit of following whale ships, as it is extremely fond of the fat of the whale.

PETRIFAC'TION (*petra*, a stone; and *facio*, I make: *Lat.*), a term applied to fossil organic remains [see FOSSILS], and also to articles which having been subjected to water charged with carbonate of lime have become impregnated or coated with it.

PETRO'LEUM (*petræ oleum*, oil of the rock: *Lat.*), in Mineralogy, rock-oil, a combustible fluid which exudes from the earth in various parts of the world. Large quantities have been obtained of late years by sinking wells in Canada and Pennsylvania. Petroleum varies greatly in colour and consistence, being sometimes thin and pale, at others thick and dark coloured. The substances which mineralogists have distinguished by the names asphaltum, maltha, petroleum, and naphtha, are thought by some naturalists to be mere varieties of one species. They may be thus distinguished:—*Asphaltum* forms the connection with bituminous coal, and is found in veins and in small masses, and also sometimes on the surface of lakes. *Maltha* is softer, has a degree of tenacity, and a strong bituminous smell. *Petroleum* is semi-liquid, semi-transparent, of a reddish-brown colour and fœtid odour. *Naphtha* is of a lighter colour, more transparent, perfectly liquid, light, odoriferous, volatile, and inflammable.

PET'ROLINE, a liquid hydrocarbon now extensively consumed in lamps, obtained by distilling petroleum. It closely resembles paraffine oil, obtained by the distillation of coal, but unless carefully prepared it is apt to inflame at a temperature too low for safety.

PETROL'OGY (*petra*, a rock; *logos*, a discourse: *Gr.*), that branch of knowledge which refers to the mineral composition of rocks.

PETROMY'ZON (*petra*, a rock; and *muzo*, I suck: *Gr.*), in Ichthyology, a genus of fishes whose form and motion resemble those of the eel, and of which there are several species. The skeleton is rudimentary, the spine being simply cartilaginous not bony. The mouth is circular, and the fish can use it as a sucker and anchor itself to a stone—whence the name. There are seven gill openings at each side. The *Petromyzon marinus*, or great lamprey, is usually of a brown olive colour tinged with yellowish white. It frequently grows to the length of three feet; and is an inhabitant of the sea, but ascends rivers early in the spring for a few months. It is viviparous, and supposed to subsist almost entirely on worms and fishes. The petromyzon is very tenacious of life, and various parts of the body continue to move long after it is separated from the head. The *Petromyzon fluviatilis*, or little lamprey, is very abundant in the Thames.

PETRO'SA OSSA (rocky bones: *Lat.*), in Anatomy, the inner process of the bones of the temples; so named on account of its hardness and roughness.

PETROSI'LEX (*petra*, a rock; and *silex*, flint: *Lat.*), in Mineralogy, a genus of siliceous earths, consisting for the most part of silica, with a portion of alumina and carbonate of lime. It has no lustre, and melts before the blowpipe.

PET'TY (*petit*, small: *Fr.*), a word of very common use, particularly in Law.——PETTY TREASON, the crime of killing a person to whom duty or subjection is due. Thus the crime of murder, when a wife kills her husband, or a servant his master, has this appellation. Such crimes are now considered murder only.——PETTY LARCENY, the stealing of goods of the value of twelve pence, or under that amount. The distinction between grand and petty larceny has been abolished.——PETTY CONSTABLE, an inferior civil officer, subordinate to the high constable.——PETTY JURY, a jury of twelve freeholders who are empanelled to try causes in a court; so called in distinction from the *grand jury*, which tries the truth of indictments. [See JURY.]

PETUNS'E, or PETUN'TSE, a kind of clay used by the Chinese in the manufacture of porcelain or chinaware. It consists of quartz reduced to a fine powder.

PEW'TER (*peautre*: *Nor. Fr.*), a factitious metal, consisting of tin and lead, or of tin with a little antimony and copper, in proportions suited to the purposes for which it is intended. There are three kinds of English pewter: *plate pewter*, the finest kind, consisting of tin, antimony, bismuth, and copper; *trifle*, which should consist of tin and antimony, but generally contains a considerable quantity of lead; and *ley pewter*, consisting of tin and lead. *Britannia metal*, of which teapots are made, is composed of equal parts brass, tin, antimony, and bismuth; *queen's metal*, also used for teapots, &c., of tin, antimony, bismuth, and lead. The pewterer fashions almost all his articles by casting them in moulds of brass or bronze, which are made in various pieces nicely fitted and locked together. But a process called *spinning* is very commonly employed in Birmingham; it consists in bringing a sheet of pewter against a rapidly revolving tool, by which, with a little dexterity, it is gradually brought into the required form.

PHÆNOG'AMOUS, a botanical term. [See PHANEROGAMOUS.]

PHAGEDÆ'NIC (*phagedainikos*, from *phagedaina*, a cancer; *phago*, I eat: *Gr.*), a medicine or application that eats away proud or fungous flesh. Any wound or ulcer that corrodes or eats away the flesh is also termed phagedænic.——PHAGEDÆNIC WATER, a mixture of quick lime and corrosive sublimate.

PHALÆ'NA (*phalaina*: *Gr.*), in Entomology, Linnæus's name for a genus of moths; but so many new forms have been discovered since his time that a tribe containing many genera has been substituted for the old genus.

PHAL'ANGER, the name of some kangaroos forming the genus *Petaurus*. The skin is expanded between the fore and hind legs, and this enables them to make long leaps from tree to tree. Hence they have been called flying squirrels in New South Wales.

PHAL'ANX (*Gr.*), among the Greeks, a square, or oblong, and compact body of soldiers, having their shields joined, and pikes crossing each other. At first the phalanx consisted of 4000 men, but it was afterwards doubled and even quadrupled. The Macedonian phalanx is thus described by Polybius. It was a square (or rather a parallelogram) of pikemen, consisting of sixteen in flank and five hundred in front; the soldiers stood so close together that the pikes of the fifth rank extended three feet beyond the front; the rest, whose pikes were not serviceable owing to their distance from the front, couched them upon the shoulders of those that stood before them, and, so locking them together in file, pressed forward to support and push on the former rank; by which means the assault was rendered more violent and irresistible.——The word *phalanx* is likewise used for any combination of people distinguished for firmness or solidity of union.

PHAL'AROPUS, a genus of wading birds, allied to the snipes, and inhabiting the northern latitudes of Europe and America. They live on the sea-coasts, fly well, and swim expertly, resisting the heaviest waves; but they never dive. Their flesh is oily and unpalatable.

PHANEROG'AMOUS (*phaneros*, conspicuous; *gamos*, marriage: *Gr.*), a term applied by botanists to those plants which possess flowers, in contradistinction to cryptogamic (*kruptos*, concealed: *Gr.*) plants, or those destitute of flowers, such as ferns, mosses, sea-weeds, and lichens. Phænogamous (*phaino*, I am plainly visible: *Gr.*) is another term applied to flowering plants.

PHANTASMAGO'RIA (*phantasma*, a phantom; and *agora*, an assembly: *Gr.*), an optical exhibition very similar to the magic lantern; but the images are thrown on a transparent screen. They are magnified and diminished at pleasure, and are made to have the appearance of moving by causing the magic lantern to approach to or recede from the screen. All light is excluded, except that which passes through the figures; the rest of the slides being perfectly opaque. The focus of the lens is adjusted by the very motion of the lantern, so as to continue in focus.

PHAR'ISEES (*pharas*, separated: *Heb.*), a sect among the Jews, who distinguished themselves by their zeal for the traditions of the elders, which they derived from the same fountain with the written word itself; pretending that both were delivered to Moses on Mount Sinai, and were therefore of equal authority. From their rigorous observance of these traditions they considered themselves more holy than other Jews, and therefore separated themselves from them; on which account they obtained their name. The Pharisees numbered in their ranks the most distinguished lawyers and statesmen in Judea; and as persons of all conditions were admitted into their society, they gained a political influence which often decided the fate of the Jewish nation, under the Maccabees; and brought into their hands whatever power had been left to the great council by the Romans, in the time of Christ. They believed in a resurrection from the dead, and the existence of angels; but, according to Josephus, their belief extended to no more than a Pythagorean resurrection—that is, of the soul only, which they supposed to enter into another body and be born anew with it. From this resurrection they excluded all who were notoriously wicked, being of opinion that the souls of such persons were doomed to a state of everlasting woe.

PHARMACEU'TICS (*pharmakeutikos*, medical; from *pharmakon*, a drug: *Gr.*), *Pharmacy*, or the art of preparing and administering medicines.

PHARMA'COLITE (*pharmakon*, a medicine; and *lithos*, a stone: *Gr.*), in Mineralogy, *arseniate of lime*, which is either milk-white, or inclining to a yellowish white; and occurs in small reniform, botryoidal, and globular masses, with a silky lustre.

PHARMACOL'OGY (*pharmakon*, a medicine; and *logos*, a discourse: *Gr.*), the science or knowledge of drugs, or the art of preparing medicines. One who writes on this science is called a *pharmacologist*; and he who sells the medicines so prepared, a *pharmacopolist*, or apothecary.

PHARMACOPŒ'IA (*pharmakopoiia*, from *pharmakon*, a medicine; and *poieo*, I make:

Gr.), a *Dispensatory*, or book of directions for the composition of medicines, approved by medical practitioners, or published by authority.

PHAR'MACY (*pharmakeia*, from *pharmakon*, a medicine: *Gr.*), in its most extensive sense, signifies the art of preserving, preparing, compounding, and combining whatever substances may be necessary for medical purposes. And as these may be mineral, vegetable, or animal, to understand the theory of pharmacy requires a knowledge of chemistry, botany, zoology, and mineralogy, in order to determine the properties of the materials employed, and the laws of their composition and decomposition. In a narrower sense, *pharmacy* is merely the art of compounding and mixing drugs according to the prescription of the physician

PHA'ROS, a lighthouse, or lofty building near the sea, where a fire or light is kept burning during the night, to serve as a beacon to vessels. The lighthouse built by Ptolemy Soter, on the small island of Pharos, opposite to Alexandria, was the most celebrated structure of the kind in ancient times, and gave its name to all others. It is said that it was 500 feet high, and that its light could be seen at the distance of 42 British miles This lighthouse was considered one of the wonders of the world.

PHARYNGOT'OMY (*pharunx*, the windpipe; and *temno*, I cut: *Gr.*), in Surgery, the operation of making an incision into the *pharynx*, to remove a tumour or anything that obstructs the passage.

PHA'RYNX (*pharunx*: *Gr.*), in Anatomy, the muscular bag at the back part of the mouth. It is shaped like a funnel, adheres to the fauces behind the larynx, and terminates in the œsophagus. Its use is to receive the masticated food, and to convey it into the œsophagus.

PHASCOLARC'TOS (*phaskōlos*, a wallet; and *arktos*, a bear: *Gr.*), or KOALA, a marsupial animal, closely allied to the phalangers. Its dentition resembles that of the kangaroo rats. It has four hands with naked palms, and crooked pointed nails; but no tail.

PHASCO'LOMYS (*phaskōlos*, a wallet; and *mus*, a mouse: *Gr.*), a marsupial genus including a single species, the wombat, which is of the size of a badger. It is a vegetable feeder.

PHA'SES (*phasis*, an appearance: *Gr.*), in Astronomy, the various appearances of the moon at different ages; being first a *crescent*, then a *semicircle*, then *gibbous*, and lastly *full*. She returns by the same gradations to the state of a new moon.—— In Natural Philosophy, the state, at any particular instant, of a phenomenon which undergoes periodic change; increasing to a given point, and then diminishing regularly; thus, the phase of a *tide*, of an *eclipse*, &c.

PHASIA'NUS (relating to pheasants: from *phasis*, a pheasant: *Lat.*), in Ornithology, a genus of gallinaceous birds, including the different species of pheasant.

PHEAS'ANT (*Phasis*, a river in Asia), a beautiful bird of the genus *Phasianus*, a great favourite with both the sportsman and the epicure. The true pheasant (*Phasianus Colchicus*), which is said to have been brought into Europe from the banks of the Phasis, a river of Colchis, is distinguished by having a long tail, the feathers of which are of different lengths and overlay each other. In their wild state these birds feed, like the rest of the gallinaceous tribe, upon vegetable food. The female constructs her nest of leaves in some retired spot; and if any of her eggs are taken away, she continues, like the common hen, to lay an additional number. There are several varieties, produced by climate and domestication. The golden pheasant (*Phasianus pictus*), a native of China, is remarkable for the beauty of its plumage; the prevailing colours are red, yellow, and blue, and it is characterized by a crest upon the head, which can be raised at pleasure. The iris, bill, and legs are yellow; the tail long and richly tinted, and from above it arise a number of long straight feathers, of a varied hue of scarlet and yellow. Another fine species found in China is the silver pheasant (*Phasianus Nycthemerus*); it is of a silvery white colour, with very delicate black lines on each feather, and black under the belly. But the most splendid bird of this genus is the argus pheasant (*Phasianus Argus*) This species, which is of a large size, is found on the mountains in Sumatra and some other of the Indian isles It is distinguished by its long tail, large wing-feathers, and a profusion of ocellate spots, which give this bird an extraordinary and most beautiful appearance.

PHELLOPLAS'TICS (*phellos*, a cork tree; and *plastikos*, skilful in moulding: *Gr.*), the art of representing works of architecture, on a reduced scale, in cork. It affords very fine models, which are cheaper than those in wood, stone, gypsum, &c.

PHENAKIS'TISCOPE (*phenakismos*, illusion; and *skopeo*, I view: *Gr.*), a philosophical toy, which exhibits the *persistence* of impressions on the retina. It consists of a circular disc, from six to twelve inches in diameter, with rectilinear apertures on its margin, in the direction of its radii. A series of figures—those of a horse and his rider, for instance, leaping over a gate—is drawn on the circumference of a circle parallel to the rim of the disc. The first represents the horse standing before the gate; the second, just leaving the ground; and the others, its successive positions—the last being that he assumes when he has reached the ground, having completed the leap. The observer stands in front of a looking-glass, holding the disc by a handle in his left hand, whirling it rapidly round by a simple means provided for the purpose, and looking at the images in the glass through the apertures in the margin. The horse and his rider are seen only when the apertures pass his eye; and the impression last produced on the retina is not obliterated by that which precedes or succeeds it. All the attitudes, therefore, of the horse and his rider, are thus blended into one action —that of a leap; and the velocity with which this is accomplished depends both on the velocity with which the disc revolves, and the proportion existing between the number of figures painted upon it and the number of apertures.

PHEN'GITE (*phengos*, splendour : *Gr*.), in Mineralogy, a beautiful species of alabaster.

PHENOM'ENON (*phainomenon*, from *phainomai*, I appear : *Gr*.), in Physics, whatever is presented to the eye by observation or experiment, or whatever is discovered to exist ; as, the *phenomena* of heavenly bodies or terrestrial substances ; the *phenomena* of heat, colour, vision, &c.

PHE'ON (*pheōs*, a prickly plant : *Gr*.), in Heraldry, the barbed head of a dart, arrow, or other weapon.

PHIDI'TIA (*Gr*., from *pheidomai*, I spare), in Antiquity, the principal meals of the Lacedæmonians ; they were taken in public, and in the open air, and were remarkable for their frugality. Those who attended them made contributions of flour, wine, cheese, and figs. Rich and poor assisted alike at them, and were upon the same footing ; the design of the institution being, like that of the Roman Charistia, to reconcile differences, and to cultivate peace, friendship, and a good understanding among all the citizens, of every rank and degree.

PHIGA'LIAN MAR'BLES, part of the collection, in the British Museum, known as the *Elgin marbles*. They were discovered near the site of *Phigalia*, a town of Arcadia, and consist of a series of sculptures in alto relievo. They originally formed a frieze round the interior cella of the temple of Apollo the Deliverer, and represent the combat of the Centaurs with the Lapithæ, as also that of the Greeks with the Amazons. From their similarity to the decorations of the Parthenon, they are supposed to be the work of the same artists.

PHILADEL'PHUS (*philadelphos* : *Gr*.), in Botany, a genus of plants, nat. ord. *Philadelphaceæ*, including the deciduous shrubs known as syringas.

PHILAN'THROPY (*philanthrōpia* : from *phileo*, I love ; and *anthrōpos*, a man : *Gr*.), good will and benevolence towards the whole of mankind. It differs from *friendship*, inasmuch as it has no limits to its sphere of action, whereas friendship may be confined to an individual ; but a true *philanthropist* so loves his fellow-men, that he is continually exerting himself for their welfare.

PHILIP'PIC, a word used to denote any discourse or declamation full of acrimonious invective. It derives its name from orations made by Demosthenes against Philip of Macedon, in which the orator bitterly attacked the king as the enemy of Greece.

PHILLYR'EA (*phillurea* : *Gr*.), in Botany, a genus of plants, nat. ord. *Oleaceæ*, including the *mock privet*, a well-known evergreen shrub.

PHILOL'OGY (*philologia* : from *phileo*, I love ; and *logos*, language : *Gr*.), in its usual acceptation, is that branch of literature which comprehends a knowledge of the etymology or origin of words, and whatever relates to the history, affinity, and present state of languages. In a wider sense, it signifies an assemblage of sciences, consisting of grammar, rhetoric, poetry, antiquities, history, criticism, &c., usually understood by the French term *belles lettres*.

PHILOS'OPHER'S STONE, the object of alchemy, a long sought-for preparation, by which, as was pretended, the baser metals might be converted into gold.

PHILOS'OPHY (*philosophia* : from *phileo*, I love, and *sophia*, wisdom : *Gr*.), the love and pursuit of knowledge or wisdom. In a general sense, the term includes observation and reflection on every subject ; or an investigation of the causes of all phenomena, both of mind and of matter. The term *philosopher* originated with Pythagoras, who declined the title of *the Wise*, which had been given to his predecessors, and contented himself with the name of a 'friend or lover of wisdom.' The object of philosophy is the ascertainment of generalized truth. Philosophy, in general, was so imperfect in the earliest ages of antiquity, and even in the more polished times of Greece and Rome, that it appears, when looking down from the high pinnacle of modern improvements and of late discoveries, but little removed from solemn trifling and puerile affectation. Yet some of the ancients, it must be confessed, approached so near to the truth, in matters of high importance, that we are led to wonder how they failed of making its discovery. In ethics and in politics they have left behind them some excellent works ; but the solution of the phenomena of nature was reserved for a Bacon and a Newton. Their reasonings were hypothetical, for they never thought of arguing by induction—the only chain by which truth can be drawn from many of her deep recesses. The reader will find, under their proper heads, the several parts of philosophy, natural and experimental, separately noticed. On a subject so vast and comprehensive, it would be vain indeed for us to attempt a complete treatise, or to endeavour to write a continuous history ; but we may, not inappropriately, introduce in this place a brief sketch of the leading systems which prevailed at different periods of antiquity, and conclude by a few observations on the progress of philosophy during more recent times.——*Pythagorean philosophy*, the system taught by Pythagoras, who flourished 500 years before the Christian era. His followers were great mathematicians, and sought to explain the system of the universe by mathematical reasoning. We have no absolute certainty of the real doctrines of Pythagoras. He is said to have described the Deity as one incorruptible, invisible being ; and to have differed from some of the ancients, Epicurus, for example, in conceiving a connection between God and man—that is, in teaching the doctrine of a superintending providence. He asserted the immortality of the soul ; but in the peculiar sense which appears to have been adopted by Plato, and in which it is used, in part, at this day by the Hindoos. In the cosmogony of Pythagoras, spirit, however, diffused through all animals, was part of the Divinity himself separated only by the gross forms of matter, and ready, whenever disengaged, to unite itself with the kindred essence of God. But God was only purity; and the mind recoiled from the idea of uniting with him a portion of spirit soiled with the corruption of a sinful life; the soul, therefore, once tainted, could never return to the Deity whence it emanated, till it had again recovered its innocence After having animated a human body by which crimes had been committed, it was denied the great object of its desire, a union with its God, and forced to enter into other bodies, till at length it lived a righteous life. To this theory was added another, by means of which punishments, proportioned to offences, were awarded; the soul of a negro-driver must pass into the body of an infant negro; and that which in one existence plied the whip, in the other would receive the lash; the soul of the wicked would occupy the body of some animal exposed to suffering; and that of a being of few foibles undergo a sentence proportionably mild.—Such is the doctrine of the metempsychosis or transmigration of souls, a leading feature in the Pythagorean system. But it is by no means certain that the genuine Pythagoreans held it in the literal sense.——*Socratic philosophy*, or the doctrines of Socrates, who flourished at Athens about 400 years B.C., and died a martyr in the cause of natural religion against paganism He is believed to have been the founder of moral philosophy in Greece, where he preceded Plato, from whose writings his philosophy is chiefly known, as he wrote nothing himself. While other philosophers boasted of their knowledge, he is said to have laid the greatest stress upon his ignorance, asserting that he knew nothing but this, that *he knew nothing* Socrates led men from the contemplation of universal nature to that of themselves—a branch of philosophy which was inculcated in that famous inscription, *Know thyself!* The Socratic method of argument was that of leading an antagonist to acknowledge a proposition by dint of repeated questions, in preference to that of laying it down authoritatively. In a more general sense, Socratic philosophy includes all the sects from Socrates down to the Neo-Platonists, since they all affected to teach his doctrines.——*Platonic philosophy*, a system of theology and morals, delivered by Plato about 350 years before Christ. Plato, it is said, laboured to re-establish natural religion by opposing paganism. The existence of one God was zealously inculcated by him; and also the immortality of the soul, the resurrection of the dead, the everlasting reward of righteousness, and punishment of sin. It was Plato, too, who taught that the world was created by the *Logos* or *Word;* and that through knowledge of the *Word* men live happily on earth, and obtain eternal felicity hereafter. From him, also, came the inducements to monastic life; for he pressed upon his disciples that the world is filled with corruption; that it is the duty of the righteous to fly from it and to seek a union with God, who alone is life and health; that in the world the soul is continually surrounded with enemies; and that, in the unceasing combat through which it has to struggle, it can conquer only with the assistance of God or of his holy angels. 'A happy immortality,' said Plato, 'is a great prize set before us, and a great object of hope, which should engage us to labour in the acquirement of wisdom and virtue all the time of our life.' In morals, he taught that there is nothing solid and substantial but piety, which is the source of all virtues and the gift of God; that the love of our neighbour, which proceeds from the love of God as its principle, produces that sacred union which makes families and nations happy; that self-love causes the discord and division which reign among mankind, and is the chief source of our sins; that it is better to suffer wrong than to do it; that it is wicked to hurt an enemy or to revenge an injury received, that it is better to die than to sin; and that man ought continually to learn to die, and yet to endure life with all patience and submission to the will of God. ——The *Aristotelian philosophy*, which succeeded the Platonic, is characterized by a systematic striving to embrace all the objects of philosophy by cool and patient reflection ——The *Epicurean philosophy*, or the system of Epicurus, an Athenian This teacher laid down, as the basis of his doctrine, that the supreme good consists in pleasure—a proposition that soon suffered a twofold abuse. On the one hand, by misconstruction, it was regarded as a barefaced inculcation of sensuality; on the other, it was adopted by the luxurious, the indolent, and the licentious, as a cloak and authority for their conduct; and hence it has happened that the name Epicurean is now used in an absolute sense to designate one anxiously and luxuriously attentive to his food. Epicurus is reported to have written a great number of works, but of these none are extant; and the particulars of his philosophy, which have come down to us, are chiefly found in the writings of Lucretius, Diogenes Laertius, and Cicero His system, for which he is said to have been almost wholly indebted to Democritus, consisted of three parts: *canonical*, *physical*, and *etherial*. Soundness and simplicity of sense, assisted with some natural reflection, constituted all the method of Epicurus. His search after truth proceeded only by the senses, to the evidence of which he ascribed so great a certainty that he considered them as the first natural light of mankind. It is in the meanings allowed to the words pleasure and pain that everything which is important in the morals, and doubtful in the history, of the Epicurean system is contained. According to Gassendi, the *pleasure* of Epicurus consisted in the highest tranquillity of mind, united with the most perfect health of body—blessings enjoyed only through habits of rectitude, benevolence, and temperance; but Cicero, Horace, Plutarch, and several of the fathers of the Christian church represent his system from a very different point of view. The disagreement, however, is easily reconciled, if we believe one side to speak of what Epicurus *taught*, and the other of what many of his followers, and still more of those who took shelter under his name, were accustomed to *practise*.——To the foregoing we must add the *Stoic philosophy*, or the doctrines of Zenŏ, whose morality was of a magnanimous and unyielding kind, formed to resist temptation to evil, and to render men callous to adversity. Thus the Stoics maintained, among other things, that a man might be happy in the midst of the severest tortures;—the *Cynic philosophy*, the followers of which affected a great contempt of riches and of all sciences except morality;—and the *Sceptical philosophy*, under Pyrrho, who pretended to doubt everything.——In glancing at the *history of philosophy*, the student has abundant opportunities of observing its gradual development as a science, and tracing the progress and aberrations of the human mind—in themselves subjects most important and instructive. Departing from, or only partially retaining, the conflicting dogmas of the Greek and Roman philosophers, we find the scholastics of the middle ages engaged in a struggle for the attainment of intellectual excellence, under the influence of principles derived from the Christian faith and doctrine; yet the progress of philosophic truths was for a long time feeble, irregular, and vacillating. During the 15th century there arose a freer and more independent spirit of inquiry, penetrating deeper into ultimate causes; till, at length, the cool and searching energy of Bacon enabled him to produce his *Novum Organon*, and to give a more substantial basis to the efforts of the intellect, by making observation and experience the foundations of philosophy. Some there were, however, who disputed his laws, and hence new theories occasionally obtained a temporary distinction; but his doctrines, in a great measure, ultimately prevailed; and at no distant period, the calm reasoning of Locke introduced into the study of the human mind the method of investigation which his great predecessor had pointed out.

PHLEBOT'OMY (*phlebotomia*: from *phleps*, a vein; and *temno*, I cut: *Gr*.), in the Medical art, the opening of a vein for the purpose of letting blood.

PHLEGM (*phlegma*, literally inflammation; from *phlego*, I burn: *Gr*), bronchial mucus, a thick tenacious matter secreted in the throat.

PHLOGIS'TON (*phlego*, I burn: *Gr*.), a word formerly used to denote the principle of inflammability; or pure fire fixed in combustible bodies, in distinction from fire in action, or in a state of liberty. But the theory having proved to be false, the term is abandoned

PHŒNI'CIAN LAN'GUAGE, a Semitic dialect allied to the Hebrew, and spoken by the people inhabiting the seacoast of Syria, the cities of Tyre, Sidon, &c., and the colonies they founded, Carthage, &c. The remains of this language are very scanty, and consist chiefly of inscriptions on coins, vessels, stones, pillars, and tablets; especially an altar of the fourth century B.C., recently discovered at Marseilles, and a royal sarcophagus, which has still more recently come to light at Sidon. There are also a few words of this language quoted by old writers, such as the names of persons and places.

PHŒ'NIX (*phoinix*, literally belonging to Phœnicia: *Gr*.), in Fabulous History, a wonderful bird which the ancients describe as of the size of an eagle; its head finely crested with a beautiful plumage, its neck covered with feathers of a gold colour, its tail white, and its body purple. By some authors he was said to come from Arabia to Egypt every five hundred years at the death of his parent, bringing the body with him, embalmed in myrrh, to the temple of the sun, where he buried it. According to others, when he found himself near his end, he prepared a nest of myrrh, and precious herbs, in which he burned himself, but he revived from his ashes in the freshness of youth. The several eras when the phœnix has been seen are fixed by tradition. The first was said to have been in the reign of Sesostris; the second in that of Amasis; and in the period when Ptolemy, the third of the Macedonian race, was seated on the throne of Egypt, another Phœnix directed its flight towards Heliopolis. It is conjectured that the phœnix is a symbol of a period of 500 years, of which the conclusion was celebrated by a solemn sacrifice, in which the figure of a bird was burnt.——PHŒNIX, in Astronomy, one of the new southern constellations

PHONET'IC WRIT'ING (*phōnētikos*, belonging to sound: *Gr*.), that in which sounds are represented, in opposition to *ideographic*, in which objects are represented according to their appearance, and abstract ideas symbolically—as in the figurative part of the Egyptian hieroglyphics.

PHON'ICS (*phōnē*, sound: *Gr*.), the doctrine or science of sounds; otherwise called *acoustics*.

PHONOL'OGY (*phōnē*, a sound; and *logos*, a discourse: *Gr*), that branch of science concerned with the elementary sounds uttered by the human voice, including its various degrees of intonation.

PHOS'GENE GAS (*phōs*, light; and *gennao*, I produce: *Gr*.), in Chemistry, a compound of chlorine and carbonic oxide, which will unite under the influence of light, but not in the dark.

PHOS'PHATE. [See PHOSPHORIC ACID.]

PHOSPHORES'CENCE (*phōs*, light; and *phero*, I bear: *Gr*.), the emission of light by substances at common temperatures or below a red heat. Phosphorescence can be artificially produced in inorganic matter which contains not a particle of phosphorus. What is called the *Bolognian stone* is a native sulphate of barytes which has been calcined, and afterwards exposed to the sun's rays. When cold it will shine in the dark. In the vegetable world, it is well known that certain fungi exhibit this phenomenon, but it is doubtful whether living flowers ever emit luminosity notwithstanding the statements to that effect. Wood in a state of decay is frequently phosphorescent. This is thought to be a vital phenomenon, and due to the mycelium (spawn) of a fungus. Decaying fish is luminous in the dark, possibly from the same cause. In warm latitudes the sea at night often presents a brilliant spectacle in the neighbourhood of a vessel in motion, from the innumerable sparklings of the agitated water, caused, it is generally thought, by the presence of minute animals of low organization, many such being known to emit light when irritated. Several molluscs are phosphorescent under such circumstances, as well as some small crustaceans (*Entomostraca*). Some medusæ give out vivid luminosity, and certain Sertularian zoophytes. Amongst insects there are the wellknown cases of the GLOW WORM and the FIRE-FLY. Other insects also are known to give out light.

PHOSPHOR'IC A'CID, in Chemistry, an acid formed by a saturated combination of phosphorus and oxygen. When phosphorus undergoes combustion in oxygen gas, a great quantity of white fumes are produced and deposited in white flakes, and to this substance the name of *phosphoric acid* is given. It is generally manufactured from *bones*, which consist of phosphate of lime; but there are also other processes for obtaining it. Its component parts are one atom phosphorus, and five atoms oxygen. It unites with alkalis, earths, and metallic oxides, forming with them salts denominated *phosphates*. Phosphate of lime constituent of bone, to which it gives rigidity. The value of guano and coprolites as manure depends in a great measure on the phosphates they contain. *Phosphorous acid*, which contains a smaller proportion of oxygen than phosphoric, consists of one atom phosphorus, and three atoms oxygen. It forms compounds with alkalis, earths, and metallic oxides, which are known under the name of *phosphites*

PHOS'PHORITE, in Mineralogy, a native phosphate of lime.

PHOS'PHORUS (*phōs*, light; *phoreo*, I bring: *Gr.*), in Chemistry, a yellowish semi-transparent substance of the consistence of wax, but brittle in frosty weather. It is obtained by calcining bones, so as to destroy the animal matter; powdering, mixing them with water, and then adding half their weight of strong sulphuric acid. The resulting superphosphate of lime, which remains in solution, is poured off, and then evaporated to dryness; the residue is mixed with about half its weight of charcoal; and, being raised to a high temperature, in a well-luted retort, the beak of which is immersed in water, the phosphorus distils over, and is condensed in the liquid. It is purified by remelting under water and straining through chamois leather. This substance is luminous in atmospheric air, at common temperatures, without producing any perceptible heat, but emitting the odour of garlic. It is sparingly soluble in the fixed and volatile oils, and in ether and alcohol, but is insoluble in water. Its spec. grav. is 1 77; it melts at 108°, takes fire in pure oxygen at 80°—but in the atmosphere at 148°—and boils at 550°. Its slow combustion in common air is prevented by olefiant gas, the vapour of ether, or oil of turpentine. Placed on blotting-paper with soot, it takes fire spontaneously, the oxygen of the air being condensed by the soot. It may be inflamed under water by a current of chlorine, or, if the water is warm, by a current of oxygen. Its solution in ether, on exposure to the air, is luminous, as also the hands, &c., if rubbed with it. When some of the ethereal solution is dropped on a piece of loaf sugar, and the latter is thrown into hot water, the ether and phosphorus will ascend and inflame on the surface of the liquid. A great quantity of phosphorus is now consumed in the lucifer match manufacture. An *allotropic* state of phosphorus exists. It is then amorphous, opaque, and reddish; it is non-luminous in the dark, and is not ignited by friction or percussion at a less temperature than about 482° Fahr. Combined with chlorate of potash, &c., it is highly inflammable. If used in the manufacture of lucifer matches [see LUCIFERS], unlike the ordinary phosphorus, it is not injurious to the workmen; matches made with it are not poisonous, nor do they emit a disagreeable smell; they are not hygrometric, nor liable to be inflamed by accident. The amorphous state is produced by keeping ordinary phosphorus for some time at a temperature of from 450° to 460°. A higher heat would cause explosion, or reduction to ordinary phosphorus

PHOS'PHURET, in Chemistry, a combination of phosphorus with a metal, or other elementary substance, as phosphuret of iron, &c.——PHOSPHURETTED HYDROGEN, a compound of one atom phosphorus, and three atoms hydrogen. It is obtained by filling a retort containing a small quantity of phosphorus, with a solution of caustic potash—no vacant space being left for atmospheric air, which would cause explosion; placing the retort in a solution of common salt, to secure a proper temperature, and prevent danger if it should break; and applying heat. Phosphuretted hydrogen is evolved, and spontaneously inflames on issuing from the water in which the beak of the retort has been immersed. As each bubble of the gas takes fire, a ring of smoke ascends from it, revolving rapidly on axes the planes of which are perpendicular to that of the ring. When the gas is transmitted into oxygen, the effect is very brilliant, but the experiment is dangerous.

PHO'TOGEN (*phōs*, *phōtos*, light; *gennao*, I produce: *Gr.*), one of the liquid hydrocarbons used in lamps, and obtained by the distillation of bituminous shale, lignite, &c.

PHOTOGRAPH'IC ENGRAVING. Experiments on this subject were tried in 1827, and others at various times since that period. The most effective of all the processes proposed is probably that of Fox Talbot. Steel, copper, or zinc plates, such as are used by engravers, are cleaned extremely well; then covered with a gelatinous substance, sensitive to light; and, when this is become dry, the lace, or other object which is to be engraved, is placed upon it, and it is exposed to sunlight for a certain time. On removing the object, a faint image of it will be perceived on the plate, which is to be slightly covered with a little finely powdered gum copal, very carefully scattered over it; and is then to be heated just long enough to melt the copal. When the plate is cold, the etching liquid, which is of various kinds, is poured upon it. This penetrates the gelatine, where the light has not acted upon it; and the details of the picture appear with great rapidity. As soon as it is perceived that the etching will no longer improve, the fluid is wiped off with cotton wool; the plate is well washed with a stream of cold water; and, having been cleaned with soft whiting and water to remove the gelatine, the etching is complete.

PHOTOG'RAPHY, or **PHOTOGEN'IC DRAW'ING** (*phōs*, light; and *grapho*, I write, or *gennao*, I produce: *Gr.*), processes for the production of pictures by means of light. There is reason to believe, however, that the effect is due to other than the luminous rays of the spectrum. We have already given an account of the Daguerreotype process [which see]. The principles of the photographic process, properly so called, may be understood by experimenting with a piece of paper which has been dipped in a solution of nitrate of silver and cautiously dried; if the light is carefully excluded, it remains white; but if it is exposed to light, it gradually darkens, until it at last becomes black. If, while it is white, any opaque or translucent object is laid upon it, so as wholly or partially to intercept the rays, a representation of the object is obtained on the paper. Where the rays have been totally intercepted, it remains white; where none of them have been intercepted, it is dark; and where they have been partially intercepted, it is darkened to an extent dependent on the amount of light to which it has been exposed. To *fix* this picture, it must be washed in the solution of a hyposulphite, to remove the unaltered salt of silver, and prevent further darkening. Instead of paper containing only nitrate of silver, one which, after having been impregnated with that substance, has been dipped in a solution of common salt—to change the nitrate of silver into chloride—is employed; having been found more sensitive to the action of light. Photographic papers have been prepared also with other substances, which improve their delicacy, colour, &c. If some of the prepared paper is put into the camera obscura, a *negative picture* will be produced; and if this is *printed from*—that is, if it is placed between another portion of the prepared paper and the light—a *positive picture* will result. Collodion [which see], carefully spread on glass, and rendered sensitive by some of the salts usually employed for the purpose, is found, in many cases, more convenient than paper. And, by varying the process a little, either a positive or negative picture can be had at pleasure. Albumen may be used instead of collodion, also *waxed paper*, &c. There are other methods, termed the *catalysotype*, the *ferrotype*, &c.; but they vary chiefly in the materials adopted to produce sensitiveness, colour, &c. The advantage of a negative picture is that a number of copies may be made from it without repeating the original process, whereas good copies cannot be obtained from a positive picture.

PHOTOM'ETER (*phōs*, light; and *metron*, a measure: *Gr.*), an apparatus for measuring the intensity of light; or an instrument intended to indicate the different quantities of light on cloudy and bright days, or received by bodies illuminated in different degrees. Instruments for this purpose have been invented by Rumford, De Saussure, Leslie, and others. In Leslie's photometer, the essential part is a glass tube, like a reversed siphon, whose two branches are equal in height, and terminated by balls of equal diameter; one of the balls is of black enamel, and the other of common glass, into which is put some liquid. When the instrument is exposed to the solar rays, those which are absorbed by the dark colour heat the interior air, which causes the liquid to descend with rapidity in the corresponding branch, thus marking the intensity of the light; while no effect is produced by the light upon the transparent ball. Various contrivances have been devised for comparing the lights of two heavenly bodies; but one that is both simple and accurate is yet to be discovered.

PHOTOZINCOG'RAPHY, a method of copying ancient documents, &c., recently invented. Paper, after having been washed over with a solution of the bichromate of potash and gum, and then dried, is placed under a collodion negative, which is a reduced picture of the document, obtained by the photographic process. After it has been exposed to light, its whole surface is coated over with lithographic ink; and a stream of hot water is then poured upon it. As that portion of the coating which was exposed to light is insoluble, while the other portions are easily washed off, a picture of the document, &c., is obtained on the paper, and is ready for transference either to stone, zinc, or a copper plate.

PHRASE (*phrasis*, from *phrazo*, I speak: *Gr.*), a short sentence or expression, said to be *complete* when it conveys complete sense, as 'to err is human,' and *incomplete* when it consists of several words without affirming anything. Any peculiar sentence or short idiomatic expression is also denominated a *phrase*.——In Music, any regular symmetrical course of notes which begin and complete the intended expression.

PHRENI'TIS (*Gr.*, from *phrēn*, the mind), in Medicine, inflammation of the brain, attended with acute fever and delirium.

PHRENOL'OGY (*phrēn*, the mind; and *logos*, a description: *Gr.*), a modern science, which professes to teach, from the conformation of the human skull, the particular characters and propensities of men, presuming that the powers of the mind and the sensations are dependent on peculiar parts of the brain; the front portions governing the intellectual, the middle portions the sentimental, and the hinder portions the animal propensities; the degree of which is dependent on the projection or bulk of the parts. It was long ago observed by physiologists, that the characters of animals were determined by the formation of the forehead, and that their intelligence, in most cases, rose or fell in proportion to the elevation or depression of the skull. But it was reserved to Drs. Gall and Spurzheim to expand this germ of doctrine into a minute system, and to map out the whole cranium into small sections, each being the dwelling-place of a certain faculty, propensity, or sentiment; all these sections amounting to thirty-five, and having certain names given to them to mark their specific qualities, their uses and abuses. Were phrenology an established science, and were it possible to draw unerring deductions from the data which it lays down, its discovery would be the greatest step ever made in mental philosophy, and its application the most beneficial means ever used for the amelioration of the human race. By revealing individual character, it would give security to social intercourse, and make communication prompt and easy. It would disclose real merit and expose unworthiness. The truly wise and good would at last attain their proper station in society, while the ignorant and vicious would be known and shunned. But neither is phrenology an established science, nor, if it were, can it ever be applied with certainty to the illustration of individual character. Many of the organs are so heterogeneous in their nature, that they may indicate faculties or dispositions diametrically opposite, while others are furnished with compensating organs which balance their good or evil tendencies, and so render both ineffective. Thus you may have the organ of *destructiveness* developed largely, and yet be a peaceable and good man. How is this accounted for? Your organs of *cautiousness* and *benevolence* are brought to bear upon it, so that it becomes harmless. It is tolerably certain, that the division of the brain, generally, into *intellectual*, *sentimental*, and *animal* portions, is well founded; perhaps also the existence of some *very marked* organs—destructiveness, for example—can scarcely be denied; and, were it divided internally into thirty-five cells, phrenologists might be justified in marking out its exterior divisions. But it consists of one mass; there is no kind of inward separation or distinction of structure corresponding to the outward boundaries of the phrenological organs; and the interior hollows of the skull do not always correspond with the prominences on the exterior. The science, however, if not carried too far, is not unreasonable, since we generally find a peculiar form of skull to accompany peculiarities of disposition; and the ancient sculptors, though, as a science, phrenology was unknown to them, do not appear to have been regardless of its principles.

PHRYGA'NEA (*phruganon*, a dry stick: *Gr.*—on account of the case, formed of bits of wood, in which the larva encloses itself), a genus of trichopterous insects. [See CADDICE WORM.]

PHTHI'SIS (*Gr.*, from *phthio*, I decay), in Medicine, a consumption occasioned by ulcerated lungs. [See CONSUMPTION.]

PHYLAC'TERY (*phulaktērion*, an amulet; from *phulasso*, I defend: *Gr.*), among the Ancients, a general name given to all kinds of spells, charms, or amulets, which they wore about them, to preserve them from disease or danger. It is more particularly used to signify a slip of parchment, on which was written some text of scripture, especially of the Decalogue, which the more devout Jews wore on the forehead, breast, or neck, as a badge of their religion.——Among the primitive Christians, a *phylactery* was a case in which they enclosed the relics of the dead.

PHYLLO'DIUM (*phullon*, a leaf; *eidos*, form: *Gr.*), a flattened and dilated leafstalk. In several species of Australian acacias the true pinnate leaves are only seen when the plants are young. Afterwards they cease to be developed, and their phyllodia are then frequently mistaken for true leaves.

PHYS'ALITE (*phusalis*, a bubble: *Gr.*—sometimes called *pyrophysalite*, because it intumesces with heat), a mineral of a greenish-white colour, a sub-species of *prismatic topaz*.

PHYSE'TER (*phusētēr*, from *phusao*, I blow: *Gr.*), a genus of *Mammalia* of the cetaceous order. The *Physeter macrocephalus*, or cachalot, the spermaceti whale, grows to the length of sixty feet, and the head is nearly one-third of the whole bulk of the animal. Of all the whales it is one of the most difficult to be taken, and it survives for several days the deepest wounds given it by the harpoon. Its skin, oil, and tendons are all converted by the Greenlanders to some valuable purpose; spermaceti is found in its head, and ambergris in its intestines.

PHYS'ICAL (*phusikos*, belonging to nature: *Gr.*), an epithet denoting that which relates to nature and natural productions, as opposed to things moral or imaginary. We speak of *physical force* or power, with reference to material things; whereas knowledge, skill, &c., constitute *moral force*.——A *physical body* or substance is a material body or substance, in distinction from a spirit or metaphysical substance.——PHYSICAL EDUCATION, a course of training which has for its object the imparting of health and vigour to the bodily organs and powers.

PHYSICIAN (same *deriv.*), one whose profession is to prescribe remedies for diseases, and who is consequently relied on as being skilled in the art of healing. Physicians were held in high estimation in Greece, and the name of Hippocrates is an honour to the profession. The study of physic, indeed, being looked upon as a branch of philosophy, it was sure to command respect in a land where philosophy was in such high repute. It was not exactly so in Rome. As long as the Romans led a hardy and laborious life, physicians were dispensed with, and even totally unknown amongst them, without any bad consequence ensuing. But the luxury of the table, and the excesses with which it was attended, introduced diseases; and diseases introduced physic, to which there had been before so much repugnance. In the 535th year of Rome, some physicians came from Greece to that city, but they had no fixed establishment there till A.U.C. 600. Physic at that time included pharmacy and surgery; for physicians not only compounded medicines, but performed all surgical operations themselves, though they had then but a very imperfect knowledge of anatomy. During the commonwealth there were no physicians or surgeons in the army, but the older citizens, who had almost all served in it, administered medicines, and the soldiers dressed each other's wounds with some well-known remedies used in the city. The emperors, however, having a particular regard for their own health, took physicians with them upon every expedition. The art of healing was not held in high estimation at Rome, and was sometimes professed by slaves. Cæsar granted physicians, as a singular favour, the freedom of the city; and their reputation increased with the luxury of the people.

PHYS'ICO-THEOL'OGY, theology or divinity illustrated or enforced by physics or natural philosophy.

PHYS'ICS (*phusikos*, belonging to nature: *Gr.*), or NATURAL PHILOSOPHY, a term applied to the study of the phenomena of material attraction and those terrestrial phenomena which are studied in the separate sciences of mechanics, acoustics, optics, thermotics, electricity, and meteorology, but not chemistry or physiology.

PHYSIOGNOM'ICS (*phusis*, constitution; and *gnōmonikos*, fit to give judgment: *Gr.*), among Physicians, signs in the countenance which serve to indicate the state, disposition, &c., both of the body and mind; and hence the art of reducing these signs to practice is termed *physiognomy*.

PHYSIOGN'OMY (*phusis*, disposition; and *gnōmē*, a means of knowing: *Gr.*), the art of discovering the predominant temper or other characteristic qualities of the mind, by the features of the face or external signs of the countenance.

PHYSIOL'OGY (*phusiologia*: from *phusis*, nature; and *logos*, a discourse: *Gr.*), that branch of science which treats of the peculiar functions and properties of living bodies, that is, of bodies which grow and reproduce their kind—a definition which includes both vegetables and animals. It is distinct from physics in general, inasmuch as it regards organised bodies alone; and from metaphysics, inasmuch as it does not treat of mind. It is divided into *animal physiology* and *vegetable physiology*. The functions of animal life are not only more complicated in the same individual than those of vegetation, but also more diversified in the different classes into which animals are divided; so that the physiology of each class of animals has its peculiar laws, which is not the case with regard to vegetables.

PI'A MA'TER (the sacred mother: *Lat.*), in Anatomy, the third tunic or membrane of the brain, which not only extends over its whole surface, but insinuates itself into all its cavities. [See MATER.]

PIAN'OFORTE (*piano*, and *forte*: *Ital.*), a well-known musical stringed instrument, the strings of which are extended over bridges rising on the sounding-board, and are made to vibrate by means of small covered hammers, which are put in motion by keys. It has been gradually improved, till it has become one of the most important instruments in all domestic musical entertainments.

PIASSA'VA, fibres largely imported into this country, and employed in the manufacture of brooms. They are obtained from the stem of a Brazilian palm, a species of *Leopoldinia*. 'It grows in moist places, and is about 20 or 30 feet high, with the leaves large, pinnate, shining, and very smooth and regular. The whole stem is covered with a thick coating of the fibres hanging down like coarse hair, and growing from the bases of the leaves which remain attached to the stem. Large parties of men, women, and children go into the forests to cut this fibre. It is extensively used for cables and small ropes for all the canoes and larger vessels on the Amazon.' (A. R. Wallace.)

PIAZ'ZA, an Italian name for a portico or covered walk. The word literally signifies a broad open place or square; whence it came to be applied to the walks or porticoes which surround it.

PIC'ARESQUE (*Fr.*, from *picaresco*, roguish: *Span.*), a term applied to a class of novels once very popular in Spain, in which the adventures of rogues and thieves are related. The amusing story of Lazarillo de Tormes (first printed in 1586) is the earliest specimen of this style, and is mentioned in 'Don Quixote,' by a rank *picaro* or rogue, who is made to say that he had written his own history, wherein he related truths so ingenious and entertaining that no fictions could come up to them.

PI'CIDÆ, in Ornithology, a family of birds in the order of Scansores, including the woodpeckers.

PICK'ET or **PIC'QUET** (*Fr.*), in Military affairs, a certain number of men, horse or foot, who do duty as an outguard to prevent surprises.——PICKETS, in Fortification, sharp stakes, sometimes shod with iron, used in laying out ground, or for pinning the fascines of a battery. In the artillery, *pickets* five or six feet long are used to pin the park lines; in the camp, *pickets* about six or eight inches long are used to fix the tent cords, or five feet long in the cavalry camp to fasten the horses.

PIC'ROLITE (*pikros*, bitter; and *lithos*, a stone: *Gr.*), fibrous serpentine, a green coloured mineral, composed chiefly of carbonate of magnesia.

PIC'ROMEL (*pikros*, bitter; and *meli*, honey: *Gr.*), the characteristic principle of *bile*. The name contains allusion to its sharp, bitter, and sweet taste.

PICROTOX'INE or **PICROTOX'IA** (*pikros*, bitter; and *toxikon*, poison: *Gr.*), in Chemistry, the bitter and poisonous principle of the *Cocculus Indicus*. It crystallizes in small white needles or columns.

PICTS' WALL, an ancient wall begun by the emperor Adrian, A.D. 123, on the northern boundary of England, from Carlisle to Newcastle, to prevent the incursions of the Picts and Scots. It was first made only of turf, strengthened with palisades, till the emperor Severus, coming in person into Britain, caused it to be built with stone; and Actius, the Roman general, rebuilt it with brick, A.D. 430. Some remains of this wall are still visible in parts of Northumberland and Cumberland.

PICTURES'QUE (*pittoresque: Fr.*), a term usually applied to such beautiful objects as are suitable for the artist. In the theory of the fine arts, the word *picturesque* is used as contradistinguished from *poetic* and *plastic*. The *poetical* has reference to the fundamental idea to be represented—to the painter's conception of his subject; whilst the *picturesque* relates to the mode of expressing the conception, the grouping, and the distribution of objects, persons, and lights. The poetical part of a picture, as well as its mechanical execution, may be without fault, and yet the picture be a total failure as regards the picturesque.

PI'CUL, a Chinese and Japanese weight equivalent to about 133 lbs. avoirdupois.

PIECE (*Fr.*), in the Military art, any kind of cannon or mortar. Large guns are called battering-pieces, smaller guns are called field-pieces. We also say a fowling-piece. ——In Heraldry, the honourable *pieces* of the shield are the chief, fesse, bend, pale, bar, cross, saltier, chevron; and, in general, all those which may take up one-third of the field.

PIE'POUDRE (*pied poudreux*, dusty-footed: *Old Fr.*), an ancient court of record, incident to every fair or market, and of which the steward of the person who had the toll of the market was the judge. According to the derivation, the term implies that the court was that of petty dealers or chapmen who assembled on those occasions. It was instituted to administer justice for all commercial injuries committed in that very fair or market, and not in any preceding one; so that it was necessary that the injury should be done, complained of, heard, and determined within the compass of one and the same day, unless the fair continued longer. This court has now fallen into disuse.

PIER (*pierre*, stone: *Fr.*), a very strong stone wall, or mass of solid stone-work, running into the water, to resist the force of the sea, and to withstand the dashing of waves. The term is also applied to the constructions used to support the arches of a bridge or the quay of a wharf, and to that part of the wall of a house which is between windows.

PIE'RIAN, an epithet given to the Muses, from *Pieros*, a mountain of Thessaly which was sacred to them; or from their victory over the nine daughters of *Pieros*, the Macedonian king.

PIETA (*Ital.*), a name given by Italian painters to the subject of the dead Christ with weeping women or attendant angels.

PI'ETISTS (*piétiste: Fr.;* from *pietas*, piety: *Lat.*), a sect of Protestants which sprang up in Germany in the latter part of the 17th century. They professed great strictness and purity of life; affecting to despise learning and ecclesiastical polity, as also forms and ceremonies in religion, and giving themselves up to mystic theology.

PIEZOM'ETER (*piezo*, I squeeze; and *metron*, a measure: *Gr.*), an instrument for ascertaining the compressibility of water, and the degree of such compressibility under any given weight.

PIG'EONS (*Fr.*), birds of the order *Columbidæ*. There are many domesticated varieties, *powters*, *shakers*, *tumblers*, *croppers*, *runts*, &c., names which are indicative of their respective peculiarities. In the wild state the pigeon tribe live on high trees, generally in flocks. Pigeons feed principally on seed, retaining their food in the crop for some time. The greater proportion of the species build on elevated situations; forming a loose nest of small twigs, and wide enough to contain both the parent birds; the female lays two eggs, several times a year. They pair for life; assemble in flocks; and have no song, their note being a simple cooing. They walk well, and fly with great swiftness, continuing on the wing for a long time. Of all the varieties of the pigeon, the most remarkable for its attachment to its native place is the *carrier*, which is distinguished from the others by a broad circle of naked white skin round the eyes. This species has for ages been used for carrying messages of importance where expedition and secresy were required. When a letter is tied under the *carrier's* wing, and the bird is set at liberty, from some inconceivable instinct, it directs its flight, in a straight line, to the very spot from whence it has been taken. In America there is a species of pigeon called the *passenger* or *wild pigeon*, which is extremely prolific, and is of a bluish slate-colour with a white belly. These birds visit the different states in vast multitudes, but are beyond measure abundant in the western states; where, according to Wilson, the ornithologist, some of their 'breeding-places,' as they are termed, extend over a distance of thirty or forty miles. They are taken by means of clap-nets, managed by a person concealed in a hut composed of brushwood, who in this way will sometimes take from ten to forty or fifty dozens at a sweep. Audubon, in speaking of these immense flocks of pigeons, and their extraordinary powers of flight, remarks, that they have been killed in the neighbourhood of New York, with their crops still filled with rice, collected by them in the fields of Georgia and Carolina, the nearest point at which this supply could possibly have been obtained; and as it is well ascertained that, owing to their great power of digestion, they will decompose food entirely in twelve hours, they must have travelled between 300 and 400 miles in six hours, making their speed at an average about one mile in a minute; and this would enable one of these birds, if so inclined, to visit the European continent, as swallows undoubtedly are able to do, in a couple of days. Such, indeed, are their numbers, that the air is described as 'literally filled with pigeons; the light of the noon-day becoming dim, as during an eclipse.' Only four species of pigeon are found wild in Europe; from one of which are descended all the varieties which are domesticated. The great-crowned pigeon, or *gouza*, bears the greatest resemblance to the *Gallinæ* in size; it is a native of New Guinea, and various isles of the Eastern Archipelago. The *Nicobar pigeon* is distinguished for its brilliant plumage; it runs along the ground and builds its nest like that of a partridge; it inhabits Sumatra, Nicobar, and other islands in the east. [See DOVE.]

PIG'MENTS (*pigmentum*, paint: *Lat.*), preparations of various kinds, used in painting and dyeing, to impart the colours required. They are obtained from animal, vegetable, and mineral substances.

PIKE (*pic: Sax.*), the name of a malacopterygious fish of the family of the *Esocidæ*, distinguished by having only one dorsal fin, a long slender body compressed laterally, and the lower jaw projecting beyond the upper. The common pike (*Esox Lucius*) abounds in most of the lakes of Europe. It is remarkable for its voracity, and also for its longevity.——PIKE, in Military Affairs, a long slender staff with a kind of spearhead at the end. Its use among soldiers has been superseded by that of the bayonet.

PILAS'TER (*pilastro: Ital.*), in Architecture, a square column, sometimes insulated, but more frequently placed against a wall, and projecting only one quarter of its depth. The pilaster is different in different orders; it borrows the name of each, and has the same proportions, and the same capitals, members, and ornaments, as the columns themselves.

PIL'CHARD, the *Clupea Pilcardus*, a fish resembling the herring, but rounder and thicker Pilchards appear on the Cornish coast about the middle of July, in immense numbers, and constitute a considerable article of commerce.

PILE (*pil: Sax.*), a large stake or beam, pointed and driven into the earth, as at the bottom of a river, or in a harbour, for the support of a bridge or other superstructure.——PILE (*Fr.*, in Artillery, a heap of shot or shells, either triangular or otherwise.——PILE (*pilum*, a rammer: *Lat.*), in Coinage, a kind of punch, which, in the old way of coining with the hammer, contained the arms, or other figure and inscription, to be struck on the coin. The arms side of a piece of money is yet sometimes called the *pile;* and the head the *cross*, because, in ancient coins, a cross usually took the place of the head.——In Heraldry, one of the minor ordinaries, resembling the pile first described.——PILE (*pilus*, hair: *Lat.*), the fine hairy substance on the surface of cloth, velvet, &c.——PILE-DRIVER, or *Monkey*, a machine for driving pointed beams of wood into beds of rivers or soft foundations, on which to raise bridges and buildings.——*To pile arms*, in Military tactics, is to place three muskets, with or without fixed bayonets, in such a relative position that the butts shall remain firm upon the ground, and the muzzles be close together in an oblique direction.

PILES (*pilulæ*, little balls: *Lat.*), or HÆMORRHOIDS, in Medicine, a diseased condition of the hæmorrhoidal veins. Two forms are commonly recognised; the external or blind, and the internal. The latter is the more serious, as hæmorrhage frequently takes place from the diseased veins. Anything which retards the portal circulation favours the development of piles.

PIL'EUS (*Lat.*, from *pilus*, hair—literally, made of hair or wool), in Antiquity, a hat or cap worn by the Romans, during any indisposition which prevented them from appearing safely with their heads uncovered, as was the general custom. The *pileus* was also worn by such as had lately received their freedom, because, on having their liberty granted, they were shaved; the *pileus*, therefore, being necessary on this account, was also esteemed a badge of liberty; hence *pileo donari* signifies to be made free.——PILEUS, in Botany, the cap of a mushroom or toadstool, expanding horizontally, and covering the fructification.

PIL'GRIM (*Ger.*; from *peregrinus*, a stranger: *Lat.*), one that travels to a distance from his own country to visit a holy place for devotional purposes. In the middle ages, kings, princes, bishops, and others made *pilgrimages* to visit the holy sepulchre at Jerusalem. This was permitted while Palestine was held by the Saracens; but when the Turks obtained possession of that country, the Christian pilgrims were visited with the greatest indignities, and their repeated complaints occasioned the excitement which led to the *crusades*. In subsequent times pilgrimages to Rome, Compostella, Loretto, Tours, and other places where the relics, either real or fictitious, of martyrs and saints attracted the notice of devotees, have been common. To this day pilgrims who travel to Rome are provided for in establishments founded especially for their reception and entertainment. The Mahommedans make an annual pilgrimage to Mecca, the place of their prophet's tomb. The Hindoos also have their holy places, which are visited by pilgrims.

PIL'LAR (*pilar: Span.*), a kind of *column*, either too massive or too slender for regular architecture; the parts and proportions of which, not being restricted to any rules, are arbitrary. The following are the heights and the dates of erection of some of the most remarkable of those erected as monuments:—

Date.	Column.	Place.	Height of Capital.
118	Trajan's	Rome	115 ft.
162	Antonine's	Rome	123
1672	The Monument	London	172
1806	Napoleon's	Paris	115
1832	Duke of York's	London	109
18	Nelson's	London	162

Any kind of column is sometimes, though improperly, termed a *pillar*.

PIL'LORY (*pilori*, from *pilier*, a pillar: *Fr.*), an instrument of punishment, consisting of a frame of wood erected on posts, made to confine the head and hands of a criminal, in order to expose him to view, and to render him publicly infamous. According to Sir Henry Spelman, it was at first specially intended for the punishment of bakers who should be found faulty in the weight or fineness of their bread. In 1816, this mode of punishment was restricted to cases of perjury, and it has since been abolished altogether. The French punishment of a similar description is termed *carcan*, from the iron collar by which the neck of the criminal is attached to the post.

PI'LOSE (*pilosus*, from *pilus*, hair: *Lat.*), in Botany, hairy; a *pilose leaf* is one covered with long distinct hairs. A *pilose receptacle* has hairs between the florets.

PI'LOT (*pilote: Fr.*), one who has the care of a ship and superintends the navigation, either along the seacoast or upon the main ocean. In a stricter sense, a pilot is one whose profession it is to direct a ship's course, when near the coast, into and out of the harbours, bays, roads, rivers, &c., within his peculiar district. The captain neglects or opposes the directions of the pilot at his own risk.

PI'LOTAGE, the compensation made or allowed to a pilot.

PI'LOT-FISH, the *Naucrates Ductor*, a Mediterranean fish, belonging to the *Scomberidæ*, about a foot long. It is of an oblong shape, and the body is marked by six dark cross bands. It derives its name from sailors, who suppose that it acts as a guide to sharks. One or two of them will accompany vessels for many days. The ancients regarded it as sacred, believing that it indicated the true direction to voyagers doubtful of their course.

PI'LUM (*Lat.*), a missile weapon used by the Roman infantry when charging the enemy. It was thick and strong; its shaft, often made of cornel, was four and a half feet long, and the barbed iron, which extended half-way down the shaft, was of the same length. It was used either to throw or thrust with.

PIM'ELITE (*pimelē*, fatness: *Gr.*), in Mineralogy, an earthy substance of an apple-green colour, unctuous, soft, and not fusible by the blowpipe. It is a variety of *steatite*, and is a silico-aluminous mineral, containing oxide of nickel.

PIMEN'TA or **PIMEN'TO**, *Jamaica pepper*, popularly called *all-spice*. The tree producing it (*Myrtus Pimento*) grows spontaneously in Jamaica in great abundance; its flower consists of five petals, and its fruit is a roundish berry, containing a pulpy matter about the seeds. The fruit is gathered when green, and exposed to the sun for many days on cloths; being frequently shaken, and turned until thoroughly dry. Pimenta abounds with a fragrant essential oil, which is separated in great quantity by distillation, and is so heavy that it sinks in water.

PIM'PERNEL, the name of several plants of different genera. The principal are the water pimpernel, of the genus *Veronica*; the scarlet pimpernel, of the genus *Anagallis*; and the yellow pimpernel, of the genus *Lysimachia*.

PIN (*pinn: Sax.*), a well-known small pointed instrument made of brass wire and headed; used chiefly by females for fastening and adjusting their dress. The perfection of pins consists in the stiffness of the wire and its whiteness, in the heads being well turned, and in the fineness of the points. In making this little article, there are no fewer than fourteen distinct operations: 1. *straightening the wire*; 2. *pointing*, which is executed on two iron or steel grindstones, by two workmen, one of whom roughens down, and the other finishes; 3. *cutting into pin lengths*; 4. *twisting of the wire for the pin heads*; 5. *cutting the heads*, 12,000 of which may be cut by a skilful workman in an hour; 6. *annealing the heads*, by putting them into an iron ladle, making them red-hot over an open fire, and then throwing them into cold water; 7. *shaping and fixing on the heads*, which operations are performed by the same workman, who can complete 1500 an hour; 8. *yellowing or cleaning the pins*, by boiling them for half an hour in wine lees, sour beer, or solution of tartar; 9. *whitening or tinning*, which is effected by laying alternate strata of grain-tin and pins in a copper pan, and heating them all together for about an hour; 10. *washing the pins*, in pure water; 11. *drying and polishing* them, in a leathern sack filled with coarse bran, which is agitated to and fro by two men; 12. *winnowing*, or separating them from the bran; 13. *pricking the papers* for receiving the pins; and 14 *papering* them, which is done by children, each of whom by practice is able to put up 36,000 a day. Well indeed may it be said, that the pin manufacture is one of the greatest prodigies of the division of labour. It furnishes 12,000 articles for the sum of three shillings, which have required the united diligence of fourteen skilful operatives. The above is a brief outline of the hand manufacture; but it must not be forgotten that several inventions have been employed to make pins, in part at least, by machinery. The head is now made solid, from a portion of the extremity of the pin—a great improvement. The quantity required for home sale and export amounts to 15,000,000 of pins daily, for this country alone!——The name of *pin* is given to any piece of metal or wood sharpened or pointed in the shape of a pin, which serves to fasten anything: as, the *linch pin*, which locks the wheel to the axle. In shipbuilding, the larger pins of metal are usually called *bolts*, and the wooden pins, *treenails*. A very small wooden pin is called a *peg*.

PINA'CIA (*pinakion*, the *dim.* of *pinax*, a tablet: *Gr.*), among the Athenians, were tablets of brass inscribed with the names of all the citizens in each tribe, who were duly qualified and willing to be judges of the court of Areopagus. These tablets were cast into one vessel provided for the purpose, and the same number of beans a hundred being white and all the rest black, were thrown into another. The names of the candidates and the beans were then drawn out one by one; and they whose names were drawn together with white beans were elected judges or senators.——Also, the tablets on which the judges wrote their verdict of *guilty* or *not guilty*.

PINAC'OTHEK (*pinax*, a painting; *thēkē*, a repository: *Gr.*), a name sometimes given to a picture gallery—e.g., the Pinacothek at Munich, designed by Von Klenze, and opened in 1836.

PIN'CERS (*pincette: (Fr.*), a very useful implement, employed by carpenters, smiths, and other artisans: being a double lever, the fulcrum of which is in the joint.

PINCH'BECK, in Metallurgy, an alloy, containing four parts of copper and one of zinc.

PINDAR'IC, an ode in imitation of the odes of Pindar, the prince of Greek lyric poets [See ODE.]

PINE (*pinus: Lat*), the name of many coniferous trees belonging to several genera. Those belonging to the genus *Pinus* are natives of northern climates. Canada produces the red pine (*Pinus resinosa*) which attains the height of 80 feet with a straight trunk two feet in diameter. It affords a strong and durable wood, which is much used in architecture; also the yellow pine (*P. mitis*), which grows to the height of 60 feet with a straight trunk two feet in diameter The timber is much used in ship-building and all kinds of architecture. The white pine (*Pinus Strobus*) is the loftiest tree in Canada, and its timber, though not without defects, is used in much greater quantities, and for a far greater variety of purposes, than any other. It attains the height of 150 feet, or more, with a trunk five feet in diameter. Trees 220 feet high, with trunks 22 feet in circumference and 120 to the first limb, are sometimes found. It is imported into Britain under the name of Weymouth Pine. The *Pinus Lambertiana* is a species which attains a gigantic size; the trunk rises from 150 to upwards of 200 feet in height, and is from seven to nearly twenty feet in diameter The timber is white, soft, and light, and produces an abundance of a pure amber-coloured resin, which, when the trees are partly burned, acquires a sweet taste, and in this state is used by the natives as a substitute for sugar. The seeds are eaten either roasted, or pounded into coarse cakes for use during the winter season. The *Scotch fir* (*Pinus sylvestris*) is another very important species. The trunk is often eighty feet in height, and four or five in diameter; the timber is applied to a great variety of uses, and is especially suited for masts. These, together with the timber in other forms, are exported from Riga, Memel, Dantzic, and other parts of the north to the various maritime states of Europe, and particularly to Great Britain. Large vessels have been constructed of this pine; and though they last a shorter time than those built of oak, they come next to it in durability. In those districts where it abounds, houses as well as furniture are generally constructed of it, and its lightness and rigidity render it superior to any other material for beams, girders, joists, rafters, &c. It also furnishes excellent charcoal for forges; but a more important product is the resinous matter, consisting of tar, pitch, and turpentine, of which articles it supplies four-fifths of what is consumed in the European dockyards. The Norfolk Island Pine, the *Araucaria excelsa* of botanists, has a peculiar aspect when young, and forms when old a noble tree. The Brazilian Pine belongs to the same genus.

PIN'EAL GLAND (*pinea*, a pine cone: *Lat.*), in Anatomy, a small heart-shaped substance, about the size of a pea, situated at the base of the brain. It was anciently supposed to be the seat of the soul.

PI'NE APPLE, the fruit of species of *Ananassa*, herbaceous plants of South America with leaves somewhat resembling those of the aloe. Many varieties are in cultivation. The fruit resembles, in shape, the cone of the pine-tree, whence it has derived its name.——The place where pine-apples are specially raised is called a *pinery*

PINE'TUM, in Gardening, the place where pines and other coniferous trees are grown

PIN'ION (*pignon: Fr*), in Mechanics, a *spindle*, in the body of which are several notches, which catch the teeth of a wheel with which it is in connection. Also, a small wheel which drives or is driven by a larger.——That joint of a bird's wing which is most remote from the body.

PIN'ITE, a mineral found in prismatic crystals of a greenish white colour, brown, or deep red; it holds a middle place between *steatite* and *mica*, and consists of alumina, silex, and oxide of iron.

PINK (*pince: Fr*), a well-known flower belonging to the genus *Dianthus*, nat. ord. *Caryophyllaceæ*.

PIN'NA (*Gr.*), a genus of conchiferous molluscs, usually called *wing-shells*. The shells of some species occasionally grow to the length of two feet. They are remarkable for the size of the byssus, by which they adhere to rocks, and which is manufactured into gloves, &c., by the natives of Sicily.——PINNA (*Lat.*), in Botany, though it signifies literally a wing, is applied to plants to denote the leaflet of some compound leaves.

PIN'NACE (*pinnasse: Fr.*), a small vessel navigated with oars and sails, and having generally two masts, which are rigged like those of a schooner. Also one of the boats belonging to a man of war, having generally eight oars, and used to carry the officers to and from shore.

PIN'NACLE (*pinnaculum: Lat.*), in Architecture, the top or roof of a building terminating in a point. Among the ancients the pinnacle was appropriated to temples, their ordinary roofs being all flat. It was from the pinnacle that the *pediment* originated

PIN'NATE or PIN'NATED (*pinnatus*, winged: *Lat.*), in Botany, a term applied to compound leaves formed of leaflets on each side of a leafstalk. Accordingly, as there are one, two, or many pairs of leaflets, the terms unijugate, bijugate, or multijugate are employed. If the leaf ends with an odd leaflet it is said to be imparipinnate; but if the leaf ends with a pair of leaflets it is paripinnate. If the leaflets are attached to stalks which branch from the primary stalk the leaf is termed bipinnate; and if the leaflets are attached to a tertiary division of the stalk it is a tripinnate or decomposed leaf. An alternately pinnate leaf is one in which the leaflets are not opposite; and when the leaflets are of different sizes it is said to be interruptedly pinnate.

PINNAT'IFID (*pinna*, a wing; and *findo*, I divide: *Lat.*), in Botany, an epithet for a kind of simple leaf, divided transversely by oblong horizontal segments or jags, not extending to the middle rib.

PINNAT'IPED (*pinna*, a fin; and *pes*, a foot: *Lat.*), in Ornithology, an epithet for birds whose toes are bordered by membranes

PIN'NULATE (*pinnula*, a small wing: *Lat.*), in Botany, an epithet for a leaf in which each pinna is subdivided

PI'NUS (*Lat.*), in Botany, a genus of gymnospermous exogenous plants, nat ord. *Coniferæ.* They are distinguished from the *firs* by their leaves, always evergreen and needle-shaped, growing in pairs, threes, fours, or fives, surrounded by a membranous sheath at their base. [See PINES.]

PIONEE'R (*pionier: Fr*), a military labourer, or one whose business is to attend an army in its march to clear the way, by cutting down trees and levelling roads; as also to work at entrenchments or form mines for destroying an enemy's works.

PIP (*pippe: Belg*), a disease in young birds, particularly in those of the domestic kind. It consists in a white skin or film near the tip of the tongue, and which if not removed proves fatal, as it hinders their feeding.

PIPE (*Fr.*), a long tube or hollow body, used as a conductor of water or other fluids. The pipes used underground were formerly of wood, but are now almost always, in these countries, of metal. They are, when large, of cast iron, with a socket at one extremity, into which the end of the next pipe is inserted The joints thus formed are rendered tight, either by filling the interstices with lead, or by driving in a small quantity of hemp, and filling the remainder of the space with iron cement, made of sulphur, muriate of ammonia, and chippings of iron. *Copper pipes* are extremely durable, and are formed of sheet copper, with the edge turned up and soldered. *Lead pipes* are much employed on account of the facility with which they can be soldered and bent in any direction; but they ought not to be used for conveying water or other liquids intended to be drunk. *Stone pipes* preserve the water contained in them in a very pure state, but are generally very expensive on account of the labour of working them *Earthen pipes* made of common pottery ware, and glazed on the inside, are more liable to be broken than most other kinds, and cannot therefore be relied on.——PIPE, in Music, a wind instrument, smaller than a *flute.* The word is not now the proper technical name of any particular instrument.——PIPE, a wine measure, usually containing 105 imperial, or 126 wine gallons. But, in commerce, the size of the pipe varies according to the description of wine it contains. Thus, a pipe of port is about 128 wine gallons; of sherry, 130; Lisbon and Bucellas, 140; Madeira, 110; and Vidonia, 120.——PIPE, in Law, a roll in the exchequer, otherwise called the *great roll.*——In Mining, the ore when it runs forward endwise in a hole, and does not sink downward or in a vein. ——PIPE-OFFICE, in Law, an office in which a person, called the *clerk of the pipe*, made out leases of crown lands by warrant from the lord-treasurer, the commissioners of the treasury, or the chancellor of the exchequer. He also made out all accounts of the sheriffs, &c. The pipe-office has been abolished ——PAN-PIPES, a rude musical instrument, formed of a range of short pipes bound together side by side, and diminishing in length from one end to the other.

PI'PE-CLAY, a white argillaceous earth, found in great quantities at the isle of Purbeck in Dorsetshire, and at Teignmouth in Devonshire, in lumps, which are purified by diffusion in water. It is a silicate of alumina. The clay, when prepared, is spread on a board and beaten with an iron bar to temper and mix it; it is then divided into pieces of a proper size to form a tobacco pipe, which, being shaped in a mould and baked in a moderately heated furnace, is ready for use. In Germany there are many kinds of *smoking pipes*, with bowls of wood, meerschaum, porcelain, &c A German pipe generally consists of four chief parts—the mouth piece, the tube, the bowl, and a part which connects the two latter, and also serves to collect the juice descending from the tobacco, so as to prevent it from getting into the tube. The Eastern *hookah* is a very curious instrument, the essential feature of which is that the smoke passes through water, loses the particles which give it a disagreeable flavour, and becomes cool before it reaches the mouth.

PIPE FISHES, curious fishes of which several species have been taken on our coasts. The jaws are united and form a long tube. The bodies are slender, and are covered with hard plates instead of scales They belong to the genus *Syngnathus*, which is placed among the *Lophobranchii*, on account of the gills being separated into small rounded tufts.

PI'PER (*Lat.*), in Botany, a genus of plants, nat. ord. *Piperaceæ*, including the Peppers [which see].

PIP'ERINE, a crystallizable principle extracted from black pepper by means of alcohol. It is colourless, has scarcely any taste, fuses at 212°, is insoluble in water, but is soluble in acetic acid, ether, and particularly in alcohol. The pungency of pepper resides in a peculiar fixed oil.

PIPIS'TREL, the common bat or *flitter mouse.*

PIP'PIN (*puppynghe: Dut.*), the name given to several kinds of apples; as the *golden pippin*, the *lemon pippin*, the *Kentish pippin*, &c. *Pippins* take their names from the small spots or pips that usually appear on their sides.

PI'PUL, the sacred Fig-tree of India, known by its rootless branches and its evergreen heart shaped leaves with long narrow points. It is the *Ficus religiosa* of botanists.

PIQUET' (*Fr.*), a game at cards played by two persons, with only thirty two cards; all the deuces, threes, fours, fives, and sixes being set aside.

PI'RACY (*peiratês*, from *peirao*, I attempt: *Gr.*), the crime of robbery or taking of property from others by open violence on the high seas. It includes all acts of plunder and depredation committed at sea, which, if occurring on land, would amount to felony. The word pirate signifies literally an adventurer. Formerly the offence of piracy was only cognizable by the admiralty courts; but as it is inconsistent with the liberties of the nation that any man's life should be taken away, unless by the judgment of his peers, an act was passed in the reign of Henry VIII., establishing a new jurisdiction for this purpose which proceeds according to the course of common law. During the anarchy of the middle ages, when every baron considered himself a sort of independent prince, entitled to make war on others, piracy was universally practised; nor was the nuisance finally abated in Europe till the feudal system had been subverted, and the ascendency of the law everywhere secured. In more modern times, some of the smaller West India islands have been the great resort of pirates; latterly, however, they have been almost all driven from their haunts in that quarter. ——PIRACY is also a word very generally used to express an infringement of the law of *copyright*.

PIROUETTE' (*Fr.*), in Dancing, a rapid circumvolution upon one foot, which, on the stage, is repeated by the dancers many times in succession.——In Riding, a short turn of a horse, which brings his head suddenly in an opposite direction.

PIS'CARY (*piscarius*, pertaining to fish: *Lat.*), in our ancient statutes, the right or liberty of fishing in another man's waters. ——*Piscatory* and *piscine*, whatever relates to fishes or fishing; *piscivorous*, feeding or subsisting on fishes; *piscation*, the act or practice of fishing.

PIS'CES (*Lat.*), in Natural History, the lowest class of the subkingdom vertebrata. [See ICHTHYOLOGY.]——PISCES, in Astronomy, the twelfth sign or constellation in the zodiac. It is represented by two fishes; which are fabled by the Greeks to have been those into which Venus and Cupid were changed, in order to escape the giant Typhon. According to the Egyptian mythology, the *Pisces* were emblematical of the spring season when the season commences.

PIS'CIS VO'LANS (the flying fish: *Lat.*), in Astronomy, a small constellation of the southern hemisphere.

PIS'IFORM (*pisum*, a pea; and *forma*, a form: *Lat.*), granular iron ore, called *pisiform* iron-ore, from its containing small rounded masses resembling peas in size.

PIS'OLITE (*pison*, a pea; and *lithos*, a stone: *Gr.*), a carbonate of lime, slightly coloured by the oxide of iron. It occurs in small globular concretions of the size of a pea or larger, containing each a grain of sand as a nucleus

PISSASPHAL'TUM (*pissa*, pitch; and *asphaltos*, bitumen: *Gr.*), *Earth pitch*, a fluid opaque mineral substance, of a thick consistence, a strong smell, readily inflammable, but leaving a residuum of greyish ashes after burning.

PISSELÆ'UM IN'DICUM (*pisselaion*, from *pissa*, pitch; and *elaion*, oil: *Gr.*), *Barbadoes Tar*, a mineral fluid resembling the thicker bitumens, and approaching nearer than any other, in appearance, colour, and consistence, to the true *pissasphaltum*, though differing from it in other respects. It is very abundant in many parts of America, where it is found trickling down the sides of mountains in large quantities, and sometimes floating on the surface of the water [See PETROLEUM.]

PISTA'CHIA (*pistacia*: *Lat.*; from *pistakia*: *Gr.*), in Botany, a genus of plants belonging to the nat. ord *Anacardiaceæ*. The *Pistachia Terebinthus*, or *Turpentine-tree*, affords the pistachio nut, a kernel of a pale green colour, flavoured like an almond, and yielding a pleasant oil. It is wholesome and nutritive. It grows in Syria, Arabia, and Persia.

PIS'TIL (*pistillum*, a pestle: *Lat.*), in Botany, the female organ of flowers, which in due time is changed into the fruit. It is in the centre of the flower; and, when perfect, consists of the germ or *ovary*, at the base; the *style* and the *stigma*, at or near the summit From the stigma exudes a viscous fluid, which retains the grains of pollen that fall upon it.

PISTILLA'CEOUS, growing on the germ or seed-bud of a flower.

PISTILLIF'EROUS, having a pistil, usually applied to unisexual flowers that have a pistil but no stamens.

PIS'TOL (*pistolet*: *Fr.*), the smallest kind of firearms, and consequently the most portable Pistols are of various lengths, and borne by horsemen in cases at the saddle bow; their management forms a part of the manual exercise of the cavalry.

PIS'TOLE, a Spanish gold coin, but current also in the neighbouring countries. It is worth nearly 16*s.* sterling.——Also a gold coin, current in many parts of Germany, and worth about 8*s.* 6*d.*

PIS'TON (*piston*: *Fr.*), a short cylinder of metal or other solid substance, fitted exactly to the cavity of the barrel of the pump, or other machine to which it is applied. There are two kinds of pistons used in pumps, the one with a valve, and the other without one, called a *plunger*.——The piston of the steam-engine is a circular disc, which moves up and down the cylinder; being connected by a piston rod, which works steam-tight through a stuffing-box, with the external machinery. Great care is taken to render and keep it steam-tight, as any leakage would be both a waste of steam and a loss of power. This is effected very ingeniously by what is called a *metallic packing*, which is so constructed that the more it works the more perfect it becomes. In the early days of the steam-engine, hemp packing was used, which required readjustment or renewal very frequently.

PITA FLAX, a fibre obtained from the leaves of the American aloe, *Agave Americana*. It is not so strong as hemp or flax, but it is employed in the manufacture of various articles in the countries where the plant grows.

PITCH (*pech: Ger.*; from *pissa: Gr.*), a thick, tenacious, oily substance, the residuum of inspissated tar, obtained by incision from pines and firs, and used to preserve wood from the effects of water, and for other purposes. It consists chiefly of carbon and hydrogen, and is, therefore, very combustible. The smoke of pitch condensed forms lamp-black.——*Pitched shirts* were made use of by the Romans to punish incendiaries. They were wrapped up in a garment daubed over with pitch and other combustibles, and then set on fire.——PITCH, in Architecture, the angle at which the roof of a building is set. It is usually designated by the ratio of its height to its width.——PITCH, in Music, the degree of elevation of the key-note of a tune. The instruments used for determining this are called a *pitch-pipe*, &c.——In wheel-work, the distance between the centres of two contiguous teeth. *Pitch-line*, a circle, concentric with the curve which passes through the centres of all the teeth.

PITCH'BLENDE. [See PECHBLENDE.]

PIT'CHER PLANTS, curious climbing herbs, which grow in swamps in China and the East Indies. The midrib of the leaf is prolonged and enlarged into a capacious vessel furnished with a lid. These vegetable pitchers contain water. They form the genus *Nepenthe* of botanists.

PITCH'ING, in Sea language, the movement by which a ship plunges her head and afterpart alternately into the hollow of the sea. This motion may proceed from two causes: the waves which agitate the vessel, and the wind which acts upon the sails, so as to make her bend to every blast.

PITCH'STONE, in Mineralogy, a sub-species of quartz, which, in lustre and texture, resembles pitch. It occurs in large beds, and sometimes forms whole mountains. Its colours are green and black; or brown tinged with red, green, or yellow. It is also called *obsidian* and *resinite*.

PITH (*Sax.*), the soft spongy substance in the centre of the stems of plants. It consists of minute cells closely packed together, sometimes of a rounded or oval shape, but usually angular. The young pith abounds with fluid, which serves to nourish the plant. Afterwards it becomes dry, and often disappears altogether.

PITU'ITARY GLAND (*pituita*, a clammy moisture, as that from the nostrils, &c.: *Lat.*), in Anatomy, a small oval body on the lower side of the brain, supposed by the ancients to secrete the mucus of the nostrils.——PITUITARY MEMBRANE, the mucous membrane that lines the nostrils and sinuses communicating with the nose.

PITYRI'ASIS (from *pitura*, bran: *Gr.*), in Medicine, scurvy of the head and adjacent parts.

PIU, in Music, an Italian word, signifying *a little more*. It is used to increase the force of other words; as *più allegro*, a little brisker; *più piano*, a little softer, &c.

PIV'OT (*pivot: Fr.*), in Mechanics, a pin on which anything turns.——In the Military art, the officer, sergeant, corporal, or private, upon whom the different wheelings are made in military evolutions.

PIZZICA'TO (*Ital.*, from *pizzicare*, to pinch), a Musical term, signifying that the notes are to be produced by pinching the string of the violin with the fingers.

PLAC'ARD (*Fr.*), a printed or written paper, posted in a public place, intended to notify some public measure. It was originally the name of a proclamation issued by authority.

PLACE (*Fr.*), in Physics, that part of space which a body occupies. It is either *absolute* or *relative*—the latter signifying position with relation to other objects. 'Place is to space or expansion,' says Locke, 'as time is to duration. Our idea of place is nothing but the relative position of anything with reference to its distance from some fixed and certain points; whence we say, that a thing has or has not changed place, when its distance either is or is not altered with respect to those bodies with which we have occasion to compare it.'——In Astronomy, the word *place* has various significations: the *physical place* is that in which the centre of a celestial body lies; the *optical place* is that point on the surface of the sphere to which the spectator refers the centre of the star, &c. The *heliocentric place* of a planet is that point of its orbit in which it would appear if seen from the sun. The *geocentric place* is that point of the ellipse to which a planet viewed from the earth is referred.

PLACEN'TA (a cake: *Lat.*), the *After-birth*, an organ through which the blood of the mother passes during circulation before it reaches the fœtus. It is variously modified in the different orders of animals in which it is found. Amongst the mammalia the *Macropidæ* (the kangaroo family) are the only animals destitute of a placenta.——In Botany, that part of the ovary to which the seeds are attached.

PLA'COID (*plax*, a plate: *Gr.*), in Ichthyology, a term applied to the outward coat of fishes when it consists of hard, bony plates. Such plates never overlap, and they frequently bear a spinous projection at the middle. Sharks afford examples of placoid scales, and many fossil fishes were furnished with them.

PLAGUE (*plaga*, a blow: *Lat.*), a malignant and contagious disease, that often prevails in Egypt, Syria, and Turkey. It generally proves fatal; and is due to a want of cleanliness, or exposure to the effluvia of putrid fermentations, of which especially it seems to be a result. Dr. Madden, who paid great attention to the nature, causes, and effects of the plague, observes, in his Travels in Turkey, Egypt, &c., 'I am thoroughly persuaded that the plague is both contagious and infectious; at one period epidemical, at another endemical—in plain English, that the miasma may be communicated by the touch or by the breath; that at one period it is confined to a particular district, and at another is disseminated among the people; but if plague have one form more decided than another, it is the endemic.' He adds, 'I have given the plague the name of *typhus gravissimus*. The symptoms, from the first, are general debility, congestion about the heart, not depending on inflammation, but on the putrescent state of the circulation. It differs little from putrid typhus, except in its duration and eruptions. In every stage of plague nature appears to lie prostrate under the influence of the poisonous miasma; and when the patient sinks at last, it is from the want of force in the constitution to drive out the eruptions on the surface.'

PLAICE (*platessa: Lat.*), a flat-fish, the *Pleuronectes Platessa* of ichthyologists, constituting an article of wholesome food. It rarely exceeds seven or eight pounds in weight; but some twice as heavy have been taken occasionally on our coasts. In ordinary circumstances, it swims slowly and horizontally; but if suddenly frightened it darts upwards with great velocity.

PLAIN'TIFF (*plaintif*, from *plaindre*, to complain: *Fr.*), in Law, the person who commences a suit before a judicial tribunal; opposed to *defendant*.

PLAN (*Fr.*; from *planus*, flat: *Lat.*), the representation of something drawn on a *plane*; as a map, chart, or ichnography. It is, however, more particularly used for the draft of a building, as it appears, or is intended to appear, on the ground; showing the extent, division, and distribution of the area which it occupies into apartments, rooms, passages, &c.——A *geometrical plan* is one in which the solid and vacant parts are represented in their natural proportions. The *raised plan* of a building is otherwise called an *elevation* or *orthography*. A *perspective plan* is that which is exhibited according to the rules of perspective. [See PERSPECTIVE.]

PLANE (*planus: Lat.*), in Geometry, a surface without curvature, one that lies evenly between its boundary lines; and as a right line is the shortest extension from one point to another, so a plane surface is the shortest extension from one line to another.——In Astronomy, the term *plane* is used for an imaginary surface, supposed to pass through any of the curves described on the celestial sphere; as, the *plane* of the ecliptic, the *plane* of a planet's orbit, &c.——In Joinery, &c., a *plane* is an instrument consisting of a smooth piece of wood, with an aperture, through which passes obliquely a sharp-edged tool. It is used in paring and smoothing wood, and is of various forms and sizes adapted to the nature of the work.

PLANE SAIL'ING, in Navigation, the art of determining a ship's place, on the supposition that she is moving on a plane instead of a spherical surface. For short distances this leads to no great error, and it has great conveniences. The ship's place is found by merely calculating a plane triangle, of which the part of the meridian between the ship and the parallel of latitude of the place whence she departed forms the perpendicular; the distance on the parallel between the place of departure and the foot of the perpendicular is the base—technically termed the *departure*; and the distance sailed is the hypothenuse. The angle at the ship is the *course*, and the other acute angle the *complement* of the course. Any two of these four things being given, the triangle can be laid down on the chart, and the others found.

PLAN'ET (*planētēs*, from *planao*, I wander: *Gr.*), a celestial body revolving round the sun as a centre, and continually changing its position with respect to the fixed stars; whence the name. The planets are distinguished into primary and secondary. The *primary* planets are those which revolve round the sun as a centre; and the *secondary*, more usually called satellites or moons, those which revolve about a primary planet as a centre, and constantly attend it round the sun. The primary planets are Mercury, Venus, the Earth, Mars, Jupiter, Saturn, Herschel or Uranus, Neptune, and the smaller planets, or *asteroids*, which have been discovered between the orbits of Mars and Jupiter. [See ASTEROIDS.] Saturn, Jupiter, Mars, and Uranus, being without the earth's orbit, are sometimes called the *superior* planets; Venus and Mercury, being within the earth's orbit, the *inferior* planets. These bodies are opaque, and receive their light from the sun; and they are distinguished from the *fixed* stars, not only by their motion or revolution, but by their not twinkling.——*Motion of the planets.* The primary planets all revolve about the sun, and are accelerated in their motions as they approach to him, but retarded as they recede from him, in such a manner that a ray, drawn from any one of them to the sun, always describes equal spaces or areas in equal times: from which it follows, that the power which bends their course into a curve line must be directed to the sun. This power is no other than that of gravitation, which increases according as the square of the planet's distance from the sun decreases, and *vice versâ*. The universality of this law still further appears by comparing the motions of the different planets; for the power which acts on a planet near the sun is manifestly greater than that which acts on a planet more remote, both because it moves with greater velocity and because it moves in a less orbit, which has more curvature, and separates further from its tangent in arcs of the same length than in a greater orbit. To convey some idea of the space occupied by the planetary system—if, indeed, the idea of space so vast be capable of comprehension sufficiently clear to have its due effect on the mind—it must be observed that the sun, which occupies so small a portion of that space, is 1,400,000 times larger than the earth. Huygens, one of the most expert astronomers of the last century, calculated the time in which a cannon-ball would traverse the space between the earth and the sun, and between the sun and the upper planets, and thence to the fixed stars He deduced from experiments, that it passes through the first hundred fathoms in a second; continuing to move with the same velocity, it will traverse three leagues in a minute, 180 in an hour, and 4320 in a day; and therefore, judging upon astronomical principles of the several distances required, and dividing them by the space so run over in a given time, this philosopher concluded that the ball must take up twenty-five years in passing from the earth to the sun, 125 in passing from the sun to Jupiter, and 250 in reaching Saturn. But how astonishing soever these distances may be, they are trivial compared with that of the fixed stars. Those bodies, which appear only as points in the firmament, and of which millions escape our sight, are considered the centres of systems—suns round which planets revolve. What then must be their distance, since all this multitude of suns shed so small a portion of light on the planet to which we belong! Sometimes the motion of the planets is the same as the apparent motion of the sun, from east to west; their course is then said to be *direct:* when they move in the opposite direction, it is *retrograde:* between each change, they remain for a few days *stationary*. The ancient astronomers found it extremely difficult to explain these phenomena, as they supposed the planets to revolve about the earth; but they are easily understood, on the supposition that they revolve about the sun; in which case they must necessarily present these appearances to a spectator on the earth. Mercury and Venus, and Mars to a certain extent, exhibit *phases*, like the moon, and for a similar reason [see MOON and PHASES]; and all the planets would do so, but for their distance from the sun being very great, compared with the distance of the earth from that luminary. The periodic times of the principal planets, and their mean distances from the sun, are as follows—Ceres being given as a type of the group between Mars and Jupiter:—

Planet.	period.	Distance from the sun.
	Days.	Miles.
Mercury .	87·969258	37,000,000
Venus . .	224·700787	68,000,000
The Earth	365·256361	95,000,000
Mars . .	686·979646	142,000,000
Ceres . .	1681·393100	362,000,000
Jupiter .	4332·584821	485,000,000
Saturn . .	10759·219817	890,000,000
Uranus .		1,800,000,000
Neptune .	60126·710000	2,800,000,000

The following are the excentricities of their orbits, and their inclination to the ecliptic:—

Planet.	tricity.	Inclination.		
Mercury .	0·205515	7	0	9·1
Venus . .	0·006861	3	23	28·5
The Earth	0·016784	0	0	0·0
Mars . .	0·093307	1	51	6·2
Ceres . .	0·078439	10	37	26·2
Jupiter .	0·048162	1	18	51·3
Saturn .	0·056151	2	29	35·7
Uranus .	0·046679	0	46	28·4
Neptune .	0·008720	1	46	59·0

The following are the diameters and volumes of the planets in terms of those of the earth:—

Mercury .	0·398	0·063
Venus . .	0·975	0·927
The Earth .	1·000	1·000
Mars . . .	0·517	0·139
Ceres. . .	—	—
Jupiter . .	10·860	1280 900
Saturn . .	9·982	995 000
Uranus . .	4·332	80·490
Neptune . .	5·236	143·500

The planets and satellites move in the same direction, that is, from west to east (with the very curious exception of the satellites of Uranus, which move in their orbits from east to west); and, as far as known, they all revolve about their axis, from west to east also.

PLA'NE-TABLE, an instrument used in land surveying, by means of which a plan is made on the spot, without protraction or measurement of angles.

PLANETA'RIUM (*planeta*, a planet: *Lat.*), an astronomical machine for showing the relative motions of the planets, and their positions with regard to the sun.

PLA'NE-TREES (*plane: Fr.;* from *platanos: Gr.*), a species of the genus [illegible]*nus*, nat. ord. *Platanaceæ*. The oriental plane-tree (*P. orientalis*), a native of Asia, rises with a straight, smooth branching stem, to a great height, with palmated leaves and long pendulous peduncles sustaining several heads of small flowers. The seeds are downy, and collected into round, rough, hard balls. There is also a downy pubescence which coats the young leaves and branches of plane-trees. The occidental plane-tree (*P. occidentalis*), which grows to a great height, is a native of North America, where it is also called *button-wood.*

PLANIFO'LIOUS (*planus*, flat; and *folium*, a leaf: *Lat.*), in Botany, an epithet for a flower made up of plain leaves or petals, set together in circular rows round the centre. The word *planipetalous* is also used for the same.

PLANIM'ETRY (*planus*, a flat surface: *Lat.*; and *metron*, a measure: *Gr.*), the mensuration of plane surfaces, or that part of geometry which regards lines and plane figures, without considering their height or depth.

PLAN'ISPHERE (*planus*, a plane surface; and *sphæra*, a sphere: *Lat.*), a sphere and its various circles projected on a plane, as in maps, &c.; but more particularly, a projection of the celestial sphere upon a plane, representing the stars, constellations, &c.

PLA'NO (*planus*, flat: *Lat.*), a prefix to several words: as *plano-conical*, plane or flat on one side, and conical on the other; *plano-convex*, flat on one side and convex on the other; *plano horizontal*, having a level horizontal surface or position; *plano-subulate*, smooth and awl-shaped.

PLANT (*plante: Fr.*; from *planta*: *Lat.*). [See BOTANY.]——*Plants used in food and medicine.* Notwithstanding accident first directed attention to the cultivation of culinary vegetables, very few of these are now found in a natural state, and they are then so modified as to escape the notice of any except expert botanists. And it may almost be taken as a general rule, that, in proportion as the nutritive qualities of the plant are improved by cultivation, its medicinal properties are deteriorated. It is also remarkable that a very large proportion of plants employed as food are not now known in a wild state, particularly the different varieties of corn which have followed man in his migrations, and are only met with under the hands of the cultivator. ——*Spontaneous plants.* Few things are more extraordinary than the unusual appearance and development of certain plants in certain circumstances. Thus, after the great fire of London in 1666, the entire surface of the destroyed city was covered with a vast profusion of a species of cruciferous plant, the *Sisymbrium Irio* of Linnæus. When a lake happens to dry up, the surface is immediately usurped by a vegetation which is quite different from that which flourished on its former banks.

PLAN'TAIN-TREE, the *Musa paradisiaca*, a tropical plant congeneric with the Banana tree. In external appearance the two closely resemble each other, but the plantain-fruit requires cooking before being eaten, whereas the banana is eaten as it comes from the tree. It has a soft false stem about 15 feet high, composed of the stalks of the great leaves which spread from the top.

PLANTA'TION (*plantatio: Lat.*), in the West Indies, and also in the United States of America, an estate or tract of land occupied and tilled, either for the culture of the sugar cane, or for tobacco, rice, indigo, or cotton.——In Politics, a colony or settlement of people in a foreign country.

PLANT'-CANE, in the West Indies, sugar canes of the first growth, in distinction from the ratoons, or sprouts from the roots of canes which have been cut.

PLASH (from *plisser*, to plait: *Fr.*), the branch of a tree partly cut and bound to other branches.——PLASHING, bending the boughs of hedges, and interweaving them, so as to thicken them.

PLAS'MA (an image, from *plasso*, I mould: *Gr.*), in Mineralogy, a translucent chalcedony, of a greenish colour and a glittering lustre. It was formerly used for ornamental purposes, but is now in little esteem.——Also the fluid of the blood in which the red particles are suspended. It consists of serum holding fibrine in solution.

PLAS'TER (*plâtre: Fr.*; from *emplastron*, *emplasso*, I daub over: *Gr.*), in Medicine, an external application to the body, spread on linen or leather.——PLASTER, in Masonry, a composition of lime, water, and sand, well mixed into a kind of paste, and used for coating walls of houses, &c.; when dry it becomes hard, but still retains the name.——PLASTER OF PARIS, a preparation of gypsum. [See PARIS, PLASTER OF.]

PLAS'TIC ART (*plastikos*, fit for moulding: *Gr.*), a branch of sculpture, being the art of forming figures of men and animals in plaster, clay, &c.

PLAT'BAND (*plate bande*, a border: *Fr.*), in Architecture, a square moulding having a projection less than its height.——Also, though improperly, the fillets between the flutes of a column. The lintel of a door.

PLATE (*plata*, silver: *Span.*), vessels or utensils of gold or silver. Strictly speaking, the expression gold plate is erroneous, and that of silver plate pleonastic.——PLATE (*platte: Fr.*), in Architecture, a piece of timber, lying horizontally on a wall, to receive the ends of girders, rafters, &c.——PLATE ARMOUR, that which is composed of broad pieces, and thus distinguished from *mail* armour.

PLAT'FORM (*plateforme: Fr.*), in Architecture, a plane level surface, used for the reception of a foundation, building, &c. ——Also, any erection consisting of boards raised above the ground for an exhibition or any other temporary purpose.——PLATFORM, in the Military art, an elevation of earth on which cannon are mounted for the purpose of being fired on an enemy.——PLATFORM, in a ship of war, a place on the lower deck; the orlop.

PLA'TING, the art or operation of covering baser metals with a thin plate of silver, so as to form what is termed *plated goods.* It is said to have been invented by a spurmaker, not for show, but a purpose of real utility. The more elegant spurs were made of solid silver, and, from the flexibility of that metal, were liable to be bent by the slightest accident. To remedy this defect, the workman alluded to, who resided at Birmingham, contrived to make a pair of spurs hollow, and to fill the space with a slender rod of steel or iron. Finding this a great improvement, and being desirous to add cheapness to utility, he made the hollow larger, and of course the iron thicker, till at length he discovered the means of coating an iron spur with silver, in such a manner as to render it equally elegant with those which were made wholly of that metal. The invention was quickly applied to other purposes; and numberless vessels have now the strength and cheapness of copper or iron, with the appearance of silver. With the old method, *plating* was effected by dissolving silver in nitric acid, dipping the copper in the solution, and depending on the affinity of the metals, by which a very slight coating was produced But at Sheffield and Birmingham, plate is now manufactured by rolling ingots of copper and silver together. About the eighth of an inch in thickness of silver is united by heat to copper an inch thick, and about the size of a brick. It is then flattened by steel rollers worked by a steam engine. The malleability of the silver causes it to spread equally with the copper into a sheet of any required thickness, according to the nature of the article for which it is wanted. The plated metal is thus greatly extended in surface, and the plating would still be perfect, though the rolling had reduced it to the thinness of silver paper. This process secures to modern plate a durability notpossessed by any that is silvered by immersion. Hence plated goods are now in general use, and, if fairly used, are nearly as lasting as silver itself; particularly since the introduction of silver edges instead of plated ones, which must be considered the greatest improvement that has taken place in this branch of industry. Manufacturers now avail themselves also of the electrotype process for the purpose of plating. And nothing would be more perfect, but that the purity, and therefore the softness, of the silver deposited on the article, renders it less durable than silver put on in the older way.

PLA'TINUM or PLA'TINA (*plata*, silver: *Span.*—on account of its resemblance to that metal), a white metal, extremely ductile and malleable. Its spec. grav. is 21·5; it is therefore the heaviest substance known. It is not affected by air, moisture, or any of the pure acids, but is dissolved by aqua regia, and is thrown down from the resulting solution by sal ammoniac. It is oxidized at high temperatures by pure potassa and lithia. Platinum is found in South America, Ceylon, and the Uralian mountains—generally in small grains, combined with palladium, rhodium, iridium, and osmium. The flame of the oxyhydrogen blowpipe easily melts thick platinum; otherwise the metal is scarcely fusible, but welds like iron, and can be drawn into an extremely fine wire. Vessels made of it are very valuable to the chemist; but they must be heated with great caution, and scarcely in an open fire, as various substances eat it into holes. In a state of minute division, when it is termed spongy platinum, it has a curious effect upon some gases. If placed in a mixture of hydrogen and oxygen the gases combine, and the metal immediately becomes red hot. In the state of further division called platinum black it possesses strongly the power of condensing gases into its pores; alcohol dropped upon it is at once converted into acetic acid, with an elevation of temperature; formic acid in contact with it is converted into carbonic acid with effervescence.

PLATON'IC, pertaining to Plato, his school, philosophy, opinions, &c. [See PHILOSOPHY.] *Platonic love* signifies a pure spiritual affection, subsisting between persons of opposite sex, and regarding no object but the mind and its excellences. It is also sometimes understood as a sincere disinterested friendship between persons of the same sex, abstracted from any selfish views, and regarding no other object than the individual so esteemed.——PLATONIC SOLIDS, five regular geometrical bodies, described by Plato. They are the tetrahedron, hexahedron, octahedron, dodecahedron, and icosahedron. Except these, no solids can be bounded by like, equal, and regular plane figures, whose solid angles are all equal ——PLATONIC or GREAT YEAR, a period of time determined by the revolution of the equinoxes, or the space of time in which the stars and constellations return to their former places with respect to the equinoxes. This revolution, which is calculated by the precession of the equinoxes, is accomplished in about 25,800 years.

PLA'TONIST, one who adheres to the philosophy of Plato.

PLATOO'N (*peloton*: *Fr.*), in the Military art, a small square body of forty or fifty musketeers, drawn out of a battalion of foot, and placed between the squadrons of horse to sustain them Or a small body acting together, but separate from the main body; hence the expression, to fire by *platoons*.

PLATS, flat ropes belonging to a ship, made of rope yarn. They are used to preserve the cable from galling in the hawse, and are wound about the flukes of the anchors to keep the pennant of the fore-sheet from rubbing against them.

PLAT'YPUS (*platus*, flat; and *pous*, a foot: *Gr.*), a name of the *Ornithorhynchus* [which see].

PLAY (*plegan*, to play: *Sax.*). [See DRAMA.]

PLEA, in Law, that which is alleged by a party in court, in a cause there depending; but in a more limited sense, the defendant's answer to the plaintiff's declaration in a common law court. That which the plaintiff alleges in his declaration is answered, and repelled or justified, by the defendant's *plea*. The word plea anciently meant also a suit or action. *Pleas of the crown*, all suits in the king's name, or in the name of the attorney-general on his behalf. *Common pleas*, those carried on between subjects in civil cases. This is the name of one of the superior courts of common law, also called the court of common bench.

PLEAD'ING (*plaider*, to plead: *Fr.*), in Law, a preparatory allegation, in writing, which intervenes between the commencement of a cause and its trial. The first thing to be done, in deciding a dispute, is to ascertain what it is about. The plaintiff, having brought the defendant into court, makes his first statement, termed a *declaration*. The defendant's answer may be that there is a defect *in substance*, or a defect *in form*, in the plaintiff's proceeding he may controvert his facts, or allege new ones. In the former case he *demurs* to the declaration; in the latter he answers by one or more *pleas*. A demurrer may be made either by plaintiff or defendant, any time during the proceedings; and it is either *general* to substance, or *special* to form. The defendant may answer, or *traverse*, by the *general issue:* a form which originally implied an absolute denial of the plaintiff's facts, but which at present allows the defendant to bring forward other facts—though these more properly form the subject of *special pleas*. When the defendant admits all or part of the plaintiff's facts, but relies on other facts to exonerate him, these latter are to be stated. This is termed a plea *by way of confession and avoidance*. The plaintiff may reply in a second statement, called a *replication*, either by denying the defendant's facts, that is, *by way of traverse*, or alleging fresh ones. The defendant may deny these, or allege fresh ones, in his *rejoinder;* and a *surrejoinder*, a *rebutter*, and a *surrebutter* may be added; and, by the gradual exclusion of superfluous facts, one or more issues in law or fact are gradually produced, the decision of which settles the dispute. Many defences, which might formerly have been given under the *general issue*, must now be pleaded *specially*. The attorneys for the parties give in their respective pleadings, on paper, to the officers of the court. When issue is joined, the pleadings are entered on a parchment roll, and also the issue—in the form of appointing a day for the hearing of the demurrer, if the issue be *in law;* or in the form of a precept to the sheriff of the county named in the pleadings, to summon twelve men for the trial of the issue, if it be *in fact*. This roll is termed the record, and is preserved as a memorial of the proceedings, the verdict and judgment being entered on it.——*Pleading*, amongst the Greeks and Romans, was limited as to its duration by a *clepsydra* or hour-glass of water; and an officer was appointed to see that the orators had justice done them in this respect, and to distribute the proper quantity of water to each.

PLEBE'IAN (*plebeius*, pertaining to the common people: *Lat.*), a person in the lower ranks of society. Amongst the Romans, a free citizen, belonging to that class which was distinguished from the senatorian and equestrian orders. The plebeians at first were employed in cultivating the lands, and in the exercise of trades and mechanical professions; but in time they broke through this illiberal restraint, and claimed a participation with the other orders in places of trust, dignity, and emolument. Their power, from the first appointment of tribunes, in the year of the city 260, gradually increased, till it became an overmatch for that of the senate.

PLEBIS'CITUM (*plebis-scitum*, a decree of the people: *Lat.*), in Roman History, an enactment made by the plebs, comitia, or assembly of the tribes, on the rogation of a tribune. In course of time *plebiscita* obtained the force of laws.

PLEDGE (*pleige: Fr.*), something left in pawn; that which is deposited with another as security for the repayment of money borrowed, or for the performance of some agreement or obligation.——In Law, bail; surety given for the prosecution of a suit, for the appearance of a defendant, or for restoring goods taken in distress and replevied.——To *pledge*, in drinking, is to undertake that a person shall receive no harm while drinking, or from the draught—a practice which originated with our ancestors in their rude state, and which was intended to assure him that he would not be stabbed while drinking, or poisoned by the draught.

PLEDG'ET (*plegghe: Belg.*), in Surgery, a small tent of lint, applied to a wound to absorb the matter discharged from it, and keep it clean.

PLEI'ADS, or PLEI'ADES (*Gr.*), in Astronomy, a cluster of 60 or 70 stars in the constellation Taurus, of which six or seven may be seen by the naked eye. They were supposed by the ancients to be the seven daughters of Atlas and Pleione, changed into stars. Only six are visible in ordinary circumstances; and it was thought that the seventh concealed herself, from shame at having loved a mere mortal. They were called by the Latins *Vergiliæ* (from *ver*, spring), because of their rising about the vernal equinox.

PLEIST'OCENE (*pleistos*, most; *kainos*, recent: *Gr.*), in Geology, the later of the two divisions of the pliocene series of tertiary strata.

PLENIPOTEN'TIARY (*plenus*, full; and *potentia*, power: *Lat.*), a person having full power to transact any business; generally an ambassador from a prince, invested with full authority to negotiate a treaty or conclude peace with another prince or state

PLE'NUM (*Lat.*), in Physics, an old term, denoting that every part of space or extension is full of matter, as maintained by the Cartesians. Those philosophers who do not admit the idea of a vacuum are called *plenists*.

PLE'ONASM (*pleonasmos*, from *pleonazo*, I abound: *Gr.*), in Rhetoric, a redundancy of words, used, though improperly, to express a thought with greater energy or perspicuity; such as, 'I saw it with my own eyes.'

PLEONAS'TE (*pleonastikos*, redundant: *Gr.*), in Mineralogy, a variety of the *spinelle ruby:* so called from its having sometimes four facets on each solid angle of the octahedron.

PLESIOMOR'PHISM (*plēsios*, near; and *morphē*, shape: *Gr.*), the state of crystallized bodies in which the forms are nearly identical.

PLE'SIOSAURUS (*plēsios*, near; and *sauros*, a lizard: *Gr.*), the name of an extinct genus of marine *Saurians*, remarkable principally for their length of neck. Cuvier, says Dr. Buckland, asserts the structure of the plesiosaurus to have been the most heteroclite, and its characters altogether the most monstrous, that have been yet found amid the ruins of a former world. To the head of a lizard it united the teeth of a crocodile, a neck of enormous length resembling the body of a serpent; a trunk and tail having the proportions of an ordinary quadruped, the ribs of a chameleon, and the paddles of a whale. The remains of several species have been found in the lias.

PLETHO'RA (*plēthōrē*, from *plēthuo*, I become full: *Gr.*), in Medicine, excess of blood, or an overloaded state of the blood-vessels of the human body.

PLEU'RA (*Gr.;* literally a rib), in Anatomy, a membrane which covers all the inner surface of the thorax and its viscera. It forms two portions or bags, which are placed beside each other, and form the partition called the *mediastinum.*

PLEURI'TIS, or PLEU'RISY (*pleuritis: Gr.*), in Medicine, an inflammation of the *pleura* or membrane that covers the inside of the thorax. It is accompanied with fever, pain, difficult respiration, and cough.

PLEURONEC'TES (*pleura*, a side; and *nektēs*, a swimmer: *Gr.*), in Ichthyology, a genus of flat fishes, including the plaice, dab (*P. limanda*), flounder (*P. flesus*), and many other species. The genus gives its name to the family *Pleuronectidæ*, which includes all the flat fishes distributed amongst several genera.

PLI'CA POLON'ICA (the Polish plait: *Lat.*), a disease of the hair, peculiar to Poland and the neighbouring countries. In this disease the hair is matted or clotted by means of an acrid humour which exudes from it.

PLINTH (*plinthos*, a brick: *Gr.*), in Architecture, a flat square member. It is used as the foundation of columns, being the flat square table under the moulding of the base and pedestal at the bottom of the order. The abacus of a Tuscan capital is sometimes called its plinth.——PLINTH of a wall, two or three rows of bricks projecting from the wall in form of a platband; and, in general, any flat broad moulding that serves in a front wall to mark the floors, &c.

PLI'OCENE (*pleion*, more; and *kainos*, recent: *Gr.*), in Geology, the name given to the most modern of the divisions of the tertiary epoch. From 90 to 95 per cent. of the fossil shells discovered in the newer pliocene or pleistocene division belong to existing species; whilst only from 30 to 35 per cent. of those found in the older pliocene strata appertain to species still living. The glacial drift or boulder formation of Great Britain, the ochreous gravel of the valley of the Thames, the Norwich crag, and the cave deposits with their bones, belong to the newer division; whilst the Red Crag and Coralline Crag of Suffolk represent the older pliocene. [See GEOLOGY.]

PLOT (*plat: Sax.*), any stratagem or plan of a complicated nature, adapted to the accomplishment of some mischievous purpose; as a *plot* against the government, or against the life of a sovereign.——PLOT, in dramatic writings, the tissue of events in a tragedy or comedy, but more particularly the knot or intrigue, comprising a complication of incidents which is ultimately unfolded.——PLOT, in Surveying, the plan or draft of any field, farm, &c., made by means of instruments, and laid down in the proper figure and proportions.

PLOUGH (*plog: Sax.*), in Agriculture, an important implement for turning over the exhausted soil and bringing up the fresh and fertile parts; so contrived as to save the labour of digging. Ploughs are of different forms, according to the nature of the soil, &c., and are generally worked by horses, though in some places by oxen, and even, in some few instances, by steam. Ploughs without wheels are termed *swing ploughs;* with them, *wheel ploughs.* Each kind has a beam, by which it is drawn; stilts or handles, by which it is guided; a coulter, by which the furrow slice is cut; a *share*, by which the slice is turned up; and a *mould-board*, by which it is turned over. The *subsoil* plough is a strong swing plough, without coulter or mould-board: its use is to follow the common plough and loosen the subsoil. It is one of the greatest improvements of modern times. *Draining* ploughs are of various kinds; the mole plough merely leaves in its track an opening, formed by a small iron cylinder attached to the lower extremity of the coulter; other kinds of draining ploughs cut the soil. The application of steam to the working of ploughs and other agricultural implements is rapidly extending amongst agriculturists.

PLO'VER (*pluvier: Fr.*), in Ornithology, the name of several species of birds of the genus *Charadrius:* as the green plover, which is about the size of the common lapwing; and the grey plover, which has a black beak and green legs, and is a very beautiful bird. Plovers are allied to the waders, but, generally partaking of the nature of land birds, are classed with them.

PLUM (*Sax.*), the fruit of trees belonging to the genus *Prunus*, of which many varieties are in cultivation.

PLUMB, PLUMB'-LINE, or PLUM'MET (*plumbum*, lead: *Lat.*), a leaden weight attached to a string, by which depths are sounded perpendicularly, and perpendiculars are taken by carpenters, masons, &c. Sometimes the string descends along a wooden ruler, &c., raised perpendicularly on another; in which case it becomes a level. The plumb-line was formerly much used in arranging astronomical instruments; but it has been almost entirely superseded by the *spirit level.*

PLUMBA'GO (*Lat.*), GRAPHITE (*grapho*, I write: *Gr.*). [See BLACK LEAD.]

PLUM'BUM (*Lat.*), lead; whence *Plumber*, a worker in lead. [See LEAD.]

PLUME-AL'UM (*pluma*, a feather: *Lat.*), in Mineralogy, a kind of *Asbestos.*

PLU'MIPED (*pluma*, a feather; and *pes*, a foot: *Lat.*), in Ornithology, a bird that has feathers on its feet.

PLUM'MING, among miners, the operation of finding by means of a mine-dial the place where to sink an air-shaft, or to bring an adit to the work, or to find which way the lode inclines.

PLU'MOSE (*plumosus*, covered with feathers: *Lat.*), a term applied to anything formed in the manner of feathers, with a stem and fibres issuing from it on each side; as the antennæ of certain moths, butterflies, &c.——In Botany, a *plumose bristle* is one that has hairs growing on the sides of the main bristle. A *plumose pappus*, or down, is a flying crown attached to some seeds, composed of feathery hairs.

PLU'MULA, or PLU'MULE (*plumula*, a small feather: *Lat.*), in Botany, the growing point of the *embryo:* placed at the apex of the radicle, and the base of the cotyledons which protect it while young. It is the rudiment of the future stem.

PLU'RAL (*pluralis*, belonging to more than one: *Lat.*), in Grammar, an epithet applied to that number of nouns and verbs which is used when we speak of more than one, or that which expresses a number of things.

PLURAL'ITY (*pluralitas: Lat.*), a number consisting of two or more of the same kind; as a *plurality* of worlds, &c.——*Plurality of benefices* or *livings*, is where the same clergyman holds two or more spiritual preferments, with cure of souls. In a plurality of livings, the first, *ipso facto*, becomes void; on which account, the patron may present to it, provided the clerk be not qualified by dispensation, &c., to hold move livings than one. The law strictly enjoining residence, no spiritual person can take and hold together two benefices unless their churches are within three miles of one another by the nearest road, and the annual value of one of them does not exceed 100*l*. If the population belonging to one exceed 3000, he cannot take another having a population of more than 500, nor can any one having more than one benefice with cure of souls take any cathedral preferment. In certain cases, however, the archbishop of Canterbury can dispense with regard to population and yearly value.

PLUS (more: *Lat.*), in Algebra, a character formed thus +, used as the sign of addition, or to mark some distinctive quality, then termed positive.

PLUSH (*peluche: Fr.;* from *pilosus*, hairy: *Lat.*), a kind of shaggy cloth, with a velvet nap on one side, usually composed of a woof of a single woollen thread, and a double warp—the one, wool of two threads twisted; the other of goats' or camels' hair. There are also some plushes made entirely of worsted, and others wholly of hair.

PLUTON'IC ROCKS (*Pluto*, the god of the infernal regions), in Geology, crystalline rocks, destitute of organic remains, supposed to be of igneous origin, and to have been formed at great depths in the earth. Such are GRANITE, SYENITE, and some of the porphyries, which belong to the unstratified division of the hypogene formations. The other division contains rocks which exhibit stratification, such as GNEISS and MICA SLATE. These have been styled METAMORPHIC ROCKS.

PLUVIOM'ETER (*pluvia*, rain: *Lat.;* and *metron*, a measure: *Gr.*), an instrument for ascertaining the quantity of water that falls, as rain and snow, in any particular place. [See RAIN-GAUGE.]

PNEUMAT'ICS (*pneumatikos*, belonging to the air: *Gr.*), the science which treats of the mechanical properties of elastic or aeriform fluids; such as their weight, density, compressibility, and elasticity. The air, being a heavy body, presses like other fluids, in every direction, upon whatever is immersed in it, and in proportion to the depths. This pressure may be thus shown:—Cover a wine-glass, quite full of water, with a piece of writing-paper; then place the palm of the hand over the paper, so as to hold it close to the edge of the glass. The latter may then be turned upside down, and the hand removed, without the water running out. The pressure of the air upon the paper sustains the weight of the water. Air can also be compressed into a much less space than it naturally occupies. Take a glass tube open only at one end—it is of course full of air; plunge the open end into a bowl of water, and the water will rise an inch or so in the tube; the air, therefore, which before filled the whole length of the tube, is compressed into a smaller space. The pressure of the atmosphere is capable of supporting about 33 feet of water or about 29 or 30 inches of mercury. If a glass tube upwards of 31 inches long, and hermetically sealed at one end, be filled with mercury, and, while the mercury is retained in it by the thumb, have its open end immersed in a cup of the same fluid, the altitude of the mercury which remains within it on account of the pressure of the air on the surface of what is in the cup, will be found to vary both at different times and in different places. Hence it appears that the pressure of the atmosphere is variable; and the above-mentioned tube, filled with mercury, has, from its showing this pressure, been called a *barometer* [which see]. By removing the pressure from air, it always expands; nor is it known to what degree this expansion will reach. By increasing the pressure, it may be condensed into any given space, however small, nor has this condensation any known limits. The density of the air is in proportion to the force that compresses it. Gravity acts on aeriform fluids as it does on liquids and solids; but molecular force acts upon them very differently—with liquids and solids it is strongly attractive, with gases repulsive. The volumes of gases are inversely as the pressures they sustain: this is called the *law of Mariotte*, although previously discovered by Boyle. Thus, if air sustaining a pressure of 30 lbs. to the square inch occupies the space of one cubic foot, it will occupy the space of two cubic feet if the pressure is diminished to 15 lbs. The elasticity of gaseous fluids is greatly increased by increase of temperature. In consequence of numerous investigations regarding the mechanical properties of the air, which were made by experimental philosophers in England, France, and Germany, after Torricelli had clearly demonstrated its pressure, the barometer was invented in 1643, and subsequently also a variety of pneumatic machines, such as the air-pump, air-balloon, thermometer, &c. [For further information on this subject, the reader is referred to the articles ATMOSPHERE, AIR, AIR-PUMP, BAROMETER, FLUIDS, GRAVITY, &c.]

PNEUMAT'IC RAIL'WAY. [See RAILWAY.]

PNEUMATO'SIS (*Gr.*, from *pneumatoo*, I inflate), in Medicine, *Emphysema*, a collection of air in the cellular membrane, rendering the part swollen, elastic and crepitating when pressed. It generally arises from some wound in the lungs by which the air escapes into the cellular membrane; and it is sometimes the effect of poison.

PNEUMO'NIA (*pneumonia*, from *pneumōn*, the lungs: *Gr.*), in Medicine, inflammation of the lungs, a disease which generally attacks robust persons, on account of exposure to cold or wet, and suppressed perspiration, and is sometimes produced by over-exertion of the lungs in any way. Fever, cough, difficult breathing, a strong, hard, and quick pulse, are the symptoms at its commencement; and if it is neglected, it may end in suffocation, or in suppuration and gangrene.

PNEUMON'ICS (*pneumonikos*, belonging to the lungs: *Gr.*), medicines proper in diseases of the lungs, in which respiration is affected.

PO'A (grass: *Gr.*), in Botany, a genus of grasses, very abundant in the pasturages of Europe. The *Poa annua* is the most common of all weeds; the *Poa trivialis* and *pratensis* are used extensively in artificial pastures and lawns. Most of the species are agreeable and nutritious to cattle.

POD (*bode*, a little house: *Dut.*), the capsule or seed-vessel of certain plants. It is a word in popular use, but is never applied scientifically.

PODA'GRA (*Gr.*: from *pous*, a foot; and *agra*, a catching—literally a *trap* for the feet), in Medicine, that species of gout which recurs at regular intervals, attacking the joints of the foot, particularly the great toe, the pain of which is described as resembling that produced by laying a burning coal upon it. When the disease is violent the whole foot is so sensitive that the lightest touch causes excruciating pain. The attacks usually recur once a year, in spring or autumn; sometimes twice, and even oftener. [See GOUT.]

PODES'TA (*potestas*, power: *Lat.*), one of the chief magistrates of Genoa and Venice in former times.

PO'DIUM (*Lat.*), in Architecture, the part of the amphitheatre projecting over the arena, above which it was raised between ten and fifteen feet. It was set apart for persons of distinction.

PŒ'CILE (*poikilē*, from *poikilos*, many-coloured: *Gr.*—on account of its fresco paintings), a celebrated portico, or gallery, at Athens, adorned with statues and pictures.

PŒCILIT'IC (*poikilos*, many-coloured: *Gr.*), a geological term applied to the Trias, or upper new red sandstone series, from the variety of colours the strata exhibit.

POET'ICAL JUS'TICE, a term often used in speaking of dramatic writings, to denote a distribution of rewards and punishments to the several characters, according to their deserts, at the catastrophe or close of a piece.

PO'ET-LAU'REATESHIP (*laureatus*: *Lat.*, crowned with laurel), an office in the royal household, bestowed as a mark of court favour upon some eminent poet, with a small annual salary. Formerly it was the duty of this official to produce a set of verses on the sovereign's birth-day, and on the occasion of any other court event of importance, but this is now forborne. The first mention of a poet-laureate was in the reign of Henry III., under the name of *court-poet*. Chaucer, a contemporary of Petrarch, who was crowned with laurel in the Capitol at Rome, assumed the title of *poet-laureate*, and, in the reign of Richard II., obtained a grant as such. We afterwards find poets-laureate noticed in the reigns of Edward IV., Henry VII., &c. Ben Jonson was court-poet to James I., and received a pension, but does not appear to have had the title of *laureate* formally granted to him. Dryden was appointed laureate to Charles II., and afterwards to James II., by regular patent under privy seal. Nahum Tate, Rowe, Eusden, Cibber, Whitehead, T. Warton, Pye, Southey, Wordsworth, and Tennyson, have been Dryden's successors.——POETA LAUREATUS was also an academical title in England, conferred by the universities when the candidate received the degrees in grammar (which included rhetoric and versification). The last instance of a laureated degree at Oxford occurred in 1512.

PO'ETRY (*poiēsis*: *Gr.*), in its ordinary acceptation, is the art of expressing elevated sentiments in measured language according to certain rules, in accordance with harmony and taste; and also the expression of those sentiments in that language. In the latter meaning it is divided into *blank verse* and *rhyme*, and is denominated according to its subject—as *pastoral* for rural objects; *elegiac* for plaintive pieces; *lyrical* for music; *didactic*, or instructive; *satirical*; *humorous*; and *dramatic*, or conversational. But, agreeably with the extensive signification of its Greek origin, poetry, in more extended meaning, includes every effusion, every creation of the mind, whether expressed by the pen, the pencil, or musical sounds. Some languages, as the Greek and the Italian, are admirably adapted for poetry; and they impart to it a charm which is independent of the genius or the taste of the poet. In all cases, poetry has the same general character—that of an appeal to the passions or the affections. The *rules* of poetry and versifying are taught by art, and acquired by study; but the force and elevation of thought, which Horace calls something divine, and which alone makes the poetry of any value, must be derived from nature.

POINT (*Fr.*), among artists, an iron or steel instrument used for tracing designs on copper, wood, stone, &c.——POINT, in Astronomy, a term applied to a certain place marked in the heavens, or distinguished for its importance in astronomical calculations. The four principal points or divisions of the horizon, viz. the east, west, north, and south, are called the *cardinal points*. The zenith and nadir are the *vertical points*; the points where the orbits of the planets cut the plane of the ecliptic, are called the *nodes;* the points where the equator and ecliptic intersect are called the *equinoctial points*—that whence the sun ascends towards the north pole, being called the *vernal point;* and that by which he descends to the south pole, the *autumnal point.* The points of the ecliptic, where the sun's ascent above the equator, and descent below it, terminate, are called the *solstitial points.*——POINT, in Geography, a small cape or headland, jutting out into the sea; thus seamen say, two points of land are *in one another,* when they are so completely in a right line against each other that the innermost is hidden by the outermost.——POINT, in Geometry, as defined by Euclid, is a quantity which has no parts, or which is indivisible. Points are the ends or extremities of lines. If a point be supposed to be moved any way, it will, by its motion, describe a line.——POINT, in Grammar, a character used to mark a division of writing, or the pause to be observed in reading or speaking; as the comma (,) semicolon (;) colon (:) and period (.), also the points of interrogation (?) and admiration (!).——POINTING, the art of dividing a discourse, by points, into periods and members of periods, in order to show the proper pauses to be made in reading.——POINT, in Heraldry, a part of the escutcheon denoting the local position of a figure.——POINT, in modern Music, a dot placed after a note to raise its value or prolong its time one-half, so as to make a semibreve equal to three minims, a minim equal to three crotchets, &c. A note of this kind is usually called a *dotted* note. When a point is placed over a note, it is called *staccato* [which see.]——POINT, in Optics, a term variously applied with reference to the rays of light: thus, the *point of dispersion* is that in which the rays begin to diverge; the *point of incidence,* that point upon the surface of a glass, or any body, on which a ray of light falls; *point of reflection,* the point from which a ray is reflected; *point of refraction,* that point in the refracting surface where the refraction is effected.——POINT, in Literature, a lively turn or expression that strikes with agreeable surprise, such as is usually found or expected at the close of an epigram.——POINT-BLANK, in Gunnery, denotes the shot of a gun levelled horizontally. *Point-blank range* is the extent of the apparent right line described by a ball discharged horizontally. In shooting point-blank, the ball is supposed to move directly to the object without a curve.——POINT OF SIGHT, in Perspective, that point in the perspective plane, at which the horizontal and vertical lines intersect each other. [See PERSPECTIVE.]

POINTS, small pieces of cordage, put through the sail in rows, for the purpose of reefing.——POINTS OF SUPPORT, in Architecture, the collected areas, *on the plan,* of the piers, walls, &c., by which an edifice is supported. The smaller the number of these required by an architect, the greater his skill and economy. The following are the ratio of the area to the points of support, the total area, and the area of the points of support, in some of the most celebrated buildings:—

Building.	Ratio of area to points of support.	Total area in feet.	Area of points of support.
Church of St. Paul, Rome	0·118	106,513	12,655
Church of Notre Dame, Paris . .	0·140	67,343	8,784
Pantheon, Paris .	0·154	60,287	9,269
Cathedral, Milan .	0·169	125,853	21,365
St. Paul's, London	0·170	84,025	14,311
Cathedral, Florence	0·201	84,802	17,030
St. Sophia, Constantinople . .	0·217	103,200	22,567
Pantheon, Rome .	0·232	34,238	7,954
St. Peter's, Rome	0·261	227,069	59,308
Invalides, Paris .	0·268	29,003	7,790

POINT'ER, a variety of the *Canis familiaris,* and the dog used by sportsmen for finding partridges, pheasants, and other feathered game. Though the pointer is not a native of England, it has been long naturalized in it. Pointers differ from setters, as, on approaching sufficiently near to the game, they stand erect, whereas the true-bred setter either sits upon his haunches or lies close to the ground, generally the latter. Pointers are very susceptible of education, and their speed, strength, and persevering nature, enable them to continue the chase for an almost incredible length of time.

POINT'ERS, THE, in Astronomy, are the two outer stars of the quadrangles in the Great Bear so called, because they point to the Pole Star.

POI'SON (*Fr.*), any substance which, by its chemical action, when taken into the stomach, mixed with the blood, or applied to the flesh, disturbs or suspends the circulations and functions necessary to life. Poisons have been divided into irritants, narcotics, and narcotico-acrids. *Irritants* act chiefly on the alimentary canal, causing inflammation and sometimes ulceration of the throat and parts leading to the stomach, &c., nausea, vomiting, the vomited matter being often streaked with blood, and other most painful symptoms connected with the stomach and intestines. *Narcotics* produce totally different effects—headache, vertigo, confused vision, stupor, convulsions, paralysis, and coma. *Narcotico-acrid* poisons produce symptoms which usually consist of those of the other two classes. In large doses, narcotism predominates; in smaller, irritation; and both seldom co-exist. No general rule can be given for the treatment of cases of poisoning. In nearly every instance vomiting should be caused as soon as possible by tickling the throat, and by the use of emetics, such as sulphate of zinc, &c. The stomach-pump should be employed also, but with great caution when there is disorganization on account of the presence of irritants. The stomach should be washed out with bland albuminous or mucilaginous fluids, such as milk, barley-water, flour and water, &c., and sometimes sugar and water. The following are antidotes for the most usual poisons:—For *mineral acids*, *acetic*, or *oxalic* acid—chalk or whiting and water, magnesia and water, soap and water, albuminous diluents. For *alkalis*—vinegar, or any mild acid and water, including even very dilute mineral acids, olive oil, almond oil. For *arsenic*—emetics, thin milk gruel, and other diluents, in large quantities. For *corrosive sublimate*—white of eggs, and water, milk, cream. For *cupreous* poisons—sugar and water, white of eggs and water. For *antimonial* poisons—warm milk, gruel, or barley water, infusion of galls. For *nitrate of silver*, abundance of warm salt and water. For *sulphate of zinc*—solution of carbonate of soda in water, milk, mucilaginous and farinaceous liquids. For *acetate of lead*—emetics, solution of sulphate of soda in water, milk, white of eggs and water. For *opium* and its preparations—emetics, strong coffee; torpor to be prevented by dashing cold water on the face, and forced exercise.

POLA'RIS, or the POLE STAR, so called because it is situate very near the north pole of the axis round which the earth performs its diurnal motion, is a star of the second magnitude, and the principal star in the constellation of the Little Bear. It is the α *Ursæ Minoris* of astronomers. It is easily found, because the two outer stars of the quadrangle, in the Great Bear, point to it.

POLAR'ISCOPE (*polarity*; and *skopeo*, I examine: *Gr.*), an instrument contrived for the exact and convenient observation of the phenomena of polarized light. It consists of two parts, that by which the polarization of the light is effected, and that by which the polarized light is examined. When fitted to a microscope the first is formed of a prism of Iceland spar, so arranged that only one of the rays into which the original pencil of light is divided shall be transmitted; and the second part is a similar prism placed next the eye. By revolving one of these prisms whilst the eye is looking along the tube, the effect of polarization upon an object placed between the two prisms is made apparent.

POLAR'ITY (*polus*, a pole: *Lat.*), that property of bodies which is manifested by the exhibition of opposite and equal effects always tending to neutralize each other. Magnetism and electricity afford instances of polarity.

POLARIZA'TION OF LIGHT (same *deriv.*), in Physics, a change produced upon light by the action of certain media, which cause it to exhibit the appearance of having *polarity*, or sides possessing different qualities. The knowledge of this singular fact with regard to light has afforded an explanation of several intricate phenomena in optics. [See OPTICS.] Light, in ordinary cases, can be decomposed not only into rays of *different colours*, but into *two white rays* of very different properties. This is effected by either refraction or reflection. The most simple example of polarization by refraction is afforded by Iceland spar. If a dot is made on certain surfaces of a piece of this substance, and it is looked at from the opposite side, *two* dots will be seen. If a ray of light be transmitted in the same direction through this spar, it will appear double, and each of these rays will be incapable of reflection, in certain positions of a mirror: that is, when the mirror will not reflect *one* of the rays, on being turned round 90°, without changing its angle of inclination, it will not reflect the *other*. The most brilliant colours may be produced by polarization. The subject is one of the highest interest in philosophy: it has thrown the greatest light, not only on optics, but on other branches of science. ——POLARIZING ANGLE, that angle at which light must fall on a reflecting surface, that it may be polarized; for glass, it is about 33°. A very important law has been discovered, namely, that 'the tangent of the polarizing angle, for any medium, is the index of refraction for that medium.' All reflecting substances are capable of polarizing, if the light is incident at a proper angle. When the angle is not the proper one, the light is polarized to an extent dependent on its approximation to accuracy, and the polarization may be completed by successive reflections.

POLE (*po os*, from *poleo*, I turn round: *Gr.*), in Astronomy, the extremity of the axis of the earth, an imaginary point on the earth's surface, of which there are two, namely, the *Arctic* or North Pole, and the *Antarctic* or South Pole.——POLE OF THE ECLIPTIC, a point on the surface of the sphere, 23° 30′ distant from either pole of the world.——POLE, in Spherics, a point equally distant from every part of the circumference of a great circle of the sphere: it is 90° from the plane of a circle, and in a line called the *axis*, passing perpendicularly through the centre. Thus, the zenith and nadir are the *poles* of the horizon.——MAGNETIC POLES, two points, or rather *positions*, on any magnet, where the opposite magnetic influences chiefly reside. It was long expected that two points would be found on the earth at which the opposite magnetic powers would respectively be found concentrated. Philosophers, however, discovered apparently several; and at last, reasoning from the well-known properties of ordinary magnets, perceived that its magnetic poles, supposing the earth to be, as it is, a great magnet, could not be mere points, but must occupy a considerable space, though its magnetic effects would naturally be most powerful at some particular part of each. It is probable that the earth is an *electro*-magnet, the magnetism of which is caused by electric currents. These are developed by a change of temperature produced by rotation—which brings the different parts *successively* under solar influence. The magnetic poles must, therefore, be in the neighbourhood of the terrestrial.

PO'LE-AXE, a kind of hatchet with

short handle, and a point or claw bending downward from the back of its head. It is principally used at sea, to cut away the rigging of an enemy attempting to board; sometimes it is driven into the side of an enemy's ship to assist in boarding it, and is then called a *boarding-axe*.

PO'LECAT (*Pole* or *Polish-cat*, because of their abundance in Poland), the *Putorius fœtidus* of zoologists, an animal allied to the weazel, which emits a most fœtid stench when pursued. It inhabits Europe and Asiatic Russia. It is a nocturnal animal, and of a bloodthirsty disposition, making great havoc in hen roosts and dovecots.

POLEM'ICS (*polemikos*, belonging to war: *Gr.*), controversial writings particularly on matters of divinity.

POLEM'OSCOPE (*polemos*, war; and *skopeo*, I examine: *Gr.*), in Optics, an oblique perspective glass, or *diagonal opera-glass*, contrived for seeing objects that do not lie directly before the eye. It received its name from its inventor supposing it might be useful in war. It consists of a mirror placed obliquely in a tube having an opening in the side opposite to the mirror, so that rays from any object, falling on the mirror, are reflected to the eye. Opera-glasses [which see] are sometimes constructed on this principle.

PO'LE-STAR, or **PO'LAR STAR**. [See POLARIS.]

POLI'CE (*Fr.*), the internal regulation of a kingdom, city, or town. In its most popular acceptation, the *police* signifies the administration of the municipal laws and regulations of a city, incorporated town, or borough; as the *police* of London, of Birmingham, &c. The *police*, in this sense, differ from the military, in being under the command of civil officers, but they are drilled and armed in a half military manner. Their object is both to prevent and detect crime; and they are either the ordinary *police*, dressed in uniform, or *secret* and *detective police*, who are not intended by their dress and manners to be distinguished from ordinary citizens: that the guilty may neither feel themselves safe from detection, nor be so. Such a secret force requires very careful regulation, or it might lead to great abuses. The metropolitan police of London amounts to upwards of 5000 men. The constabulary force of Ireland has more of a military character than city police; and amounted in 1850 to 12,000 men, at a cost of 560,000*l.* per annum.

POL'ICY, in Commerce, a written instrument containing the terms or conditions on which a person or company undertakes to indemnify another person against losses of property exposed to peculiar hazards, as fire, casualties at sea, &c. [See INSURANCE.]

POLIT'ICAL ARITH'METIC (*politikos*, belonging to the state: *Gr.*), the art of making arithmetical calculations on matters relating to a nation, its revenues, value of lands and effects, produce of lands or manufactures, population, and the general statistics of a country.

POLIT'ICAL ECON'OMY (same *deriv.*), the science which treats of the administration of the revenues of a nation; or the management and regulation of its resources, and productive property and labour. It is a term of very comprehensive meaning, and includes all the measures by which property and labour are directed in the best manner to the success of individual industry and enterprise, and to the public prosperity. Political economy considers the production and distribution not of those things which are merely useful, but of those which are of *value*. The air is very useful, but it commands no price; bread is useful, but its utility and its value are two different things. The wealth of a country, which forms the subject of political economy, consists in what is *capable of appropriation*. A thing may be very useful, but it may be attainable by every one—thus, the light of day. *Labour* is the only source of wealth, since it is the only source of value; it does not create matter, but it makes it suitable to our wants; and is required generally in a variety of ways—to appropriate the material, to convey it from place to place, and most usually to give it some peculiar form. As wealth depends on labour, everything that facilitates labour adds to the wealth of a country. But this is effected by a proper division of employments, and a judicious application of capital. *Division of employment* produces greater dexterity in the workmen; saves the time lost in passing from one occupation to another; and tends to facilitate the invention of useful machinery and advantageous processes of manufacture. But division of labour supposes a certain demand for the article manufactured. Ten or more men are employed to make one pin; but if all the pins which these ten men can manufacture are not required, the division of labour in this case is disadvantageous. Division of labour is useful, not only among individuals, but among provinces and countries; for one province or country may have greater facilities for producing one article, and another province or country for producing another. This leads to the conclusion, that facilities for intercourse between different countries, or parts of a country, are of deep importance. *Capital* consists of what is necessary for the support of human beings, or to facilitate production. Food, clothes, &c., which are required continually, constitute *circulating capital*; the tools, machines, &c., which are more slowly consumed, constitute *fixed capital*. The co-operation of both kinds of capital is required for the successful production of wealth. It has been said that the employment of machinery lessens the demand for labour. This may be true in a particular department, and temporarily; but the total employment of labour is increased by it. The introduction of locomotives threw the drivers of stage-coaches out of employment; but what an incalculably greater number of men do they cause to be employed in the preparation of materials, construction of machinery, and even in the staff of officials required by the rail ways!

POL'ITICS (*politeia*, civil polity: *Gr.*), in the most extensive sense, are the theory and practice of obtaining the ends of civil society; or the regulation and government of a nation or state, for the preservation of its safety, peace, and prosperity. Politics are necessarily divided into two branches; the one regarding a state in all its relations with other states, and the other its internal arrangements or *polity*. The latter includes what is frequently called its *domestic economy*, viz. the augmentation of its strength and resources, and the protection of its citizens in their rights, with the preservation and improvement of their morals.

POLL (*pol*, the head: *Sax.*—a register of heads), in elections, the register of those who give their vote, containing their name, place of residence, &c. Also the place where the votes are registered.

POL'LEN (fine flour: *Lat.*), in Botany, a fine powder contained in the anthers of flowers, and which being shed on the pistil, fructifies the ovary and causes it to produce fertile seeds. Each pollen grain is a cell which contains a granular semifluid matter called *fovilla*. Sometimes the exterior of the cell is prettily marked, but to see the markings requires a good microscope. In the tribe of orchids the pollen grains are joined together by viscid matter into masses called *pollinia*.

POL'LUX, in Astronomy, a fixed star of the second magnitude in the constellation Gemini, or the Twins.

POL'VERINE (*pulver*, dust: *Lat.*), in Chemistry, the calcined ashes of a plant brought from the Levant and Syria. In the manufacture of glass it is preferred to other ashes, as the glass made with it is perfectly colourless.

POL'Y (*polus: Gr.*), a prefix in a number of our words, signifying *many*; as in *polygon*, a figure of many angles.

POLYACOUS'TIC (*polus*, many; and *akoustikos*, belonging to hearing: *Gr.*), an epithet applied to that which multiplies or intensifies sound.

POLYADEL'PHIA (*polus*, many; and *adelphos*, a brother: *Gr.*), in Botany, the 18th class of the Linnæan system of plants, consisting of plants which have the stamens united into three or more bundles by the filaments.

POLYAN'DRIA (*polus*, many; and *anēr*, a male: *Gr.*), in Botany, the thirteenth class of the Linnæan system of plants, consisting of those whose hermaphrodite flowers have twenty or more separate stamens inserted on the receptacle, not on the calyx, as in *Icosandria*.

POLYAN'THUS (*polus*, many; and *anthos*, a flower: *Gr.*), a garden variety of the wild primrose.

POL'YCHROITE (*polus*, many; and *chroia*, colour: *Gr.*), in Chemistry, the colouring matter of saffron. It has received this name on account of the various colours it exhibits when acted on by reagents.

POLYCYSTI'NA (*polus*, many; *kustis*, a bag: *Gr.*), a tribe of minute marine animals of very low organization, allied to the *Foraminifera*, but inhabiting siliceous shells. These shells are of elegant and varied shape, and have large orifices through which the animal can protrude, at will, parts of its body, to collect food or to assist its movements.

POLYGA'MIA (*polus*, many; and *gamos*, marriage: *Gr.*), the 23rd class of the Linnæan system of plants, containing those with perfect flowers, accompanied by one or both sorts of imperfect flowers.

POLYG'AMY (*polugamia*, from same), a plurality of wives or husbands at the same time; the latter, however, is hardly included under the term, as it has scarcely ever been considered lawful. In some countries, Turkey for instance, polygamy is allowed; but, by the laws of England, polygamy is made felony, except in the case of absence beyond the seas for seven years. Polygamy prevailed among the Jewish patriarchs, both before and under the Mosaic law; but the state of manners had probably become reformed in this respect before the time of Christ, for in the New Testament we meet no trace of its practice. Polygamy has been allowed under all the religions which have prevailed in Asia. By the laws of Mohammed, every Mussulman is permitted to have a plurality of wives; the Arabs, however, seldom avail themselves of this privilege. The ancient Romans never practised it, though it was not forbidden among them; and Mark Antony is mentioned as the first who used the privilege of having two wives. From that time it became frequent in the Roman empire, till the reigns of Theodosius, Honorius, and Arcadius, who prohibited it, A.D. 393

POLYG'ENOUS (*polugenēs*, of many families: *Gr.*), consisting of many kinds, an epithet used in Mineralogy; as a *polygenous* mountain, one composed of strata of different species of stone.

POLYG'LOTT (*polus*, many and *glōtta*, a tongue: *Gr.*), a book containing many languages; as the *Polyglott Bible*, a bible printed in several languages

POL'YGON (*polus*, many; and *gōnia*, an angle: *Gr.*), in Geometry, a figure having many angles or whose perimeter consists of more than four sides. Every polygon may be divided into as many triangles as the figure has sides, and its area may therefore be easily measured.——POLYGONAL NUMBERS are so called because the units of which they consist may be disposed in such a manner as to represent several regular polygons. They are numbers forming arithmetical progressions. When their common difference is 1, the sums of the terms give triangular numbers—that is, numbers representing the points or angles in a series of triangles having a common vertex. When the common difference is 2, the sums of the terms give square numbers, which will represent the points or angles in a series of squares having a common angle. When the common difference is 3, the sums of the terms give a similar series of pentagons; and so on.

POL'YGON OF FOR'CES, in Mechanics, the theorem, 'If any number of forces acting at one angle of a polygon are repre-

sented by all the sides of the polygon taken in succession except one, that remaining side taken in the opposite direction will represent their *resultant*.'

POLYG'ONUM (*polugonos*, producing much: *Gr.*), in Botany, a genus of plants, nat. ord. *Polygonaceæ*. It includes the knot-grasses, bistorts, buckwheats, &c.

POL'YGRAM (*polus*, many; and *grammē*, a line: *Gr.*), a figure consisting of many lines.

POL'YGRAPH (*polus*, many; and *grapho*, I write: *Gr.*), an instrument for multiplying copies of a writing with ease and expedition.

POLYG'RAPHY (same *deriv*), the art of writing in, and deciphering, various ciphers.

POLYGYN'IA (*polus*, many; and *gunē*, a female: *Gr.*), in Botany, one of the Linnæan orders, containing plants the flowers of which have twenty or more styles.

POLYHAL'ITE (*polus*, much; and *hals*, sea-salt: *Gr.*), a mineral occurring in masses of a fibrous structure, a brick-red colour, and tinged with iron. It contains sulphates of lime, magnesia, and potash, with chloride of sodium or common salt.

POLYHE'DRON (*polus*, many; and *hedra*, a base: *Gr.*), in Geometry, a body or solid comprehended under many sides or planes. ——In Optics, a multiplying glass or lens, consisting of several plane surfaces disposed in a convex form.

POLYMIG'NITE (*polus*, much; and *mignumi*, I mix: *Gr.*), the name of a mineral found in Norway. It consists of titanic acid, zirconia, lime, yttria, oxides of iron, cerium, manganese, magnesia, potash, silica, and oxide of tin.

POL'YNOME (*polus*, many: *Gr.*; and *nomen*, a name: *Lat.*), in Algebra, a quantity consisting of many terms.

POLYOP'TRUM (*polus*, many; and *opteuo*, I see: *Gr.*), in Optics, a glass through which objects appear multiplied.

POLYPET'ALOUS (*polus*, many; and *petalon*, a leaf: *Gr.*), in Botany, having many petals.

POLYPH'ONY, or POLYPH'ONISM (*poluphōnia*: from *polus*, many; and *phōnē*, a voice: *Gr.*), multiplicity of sounds, as in the reverberations of an echo.

POLYPHYL'LOUS (*poluphullos*: from *polus*, many; and *phullon*, a leaf: *Gr.*), in Botany, many-leaved; as, a *polyphyllous* calyx or perianth.

POL'YPI (*polus*, many; and *pous*, a foot: *Gr.*), in Natural History, a term used synonymously with ZOOPHYTES [which see].

POLYP'ODY (*polupodion*: from *polus*, many; and *pous*, a foot: *Gr.*—from the roots having many tubercles like the feelers of a *polypus*), a fern belonging to the genus *Polypodium*. The common polypody is one of our most abundant ferns.

POL'YPUS, in Surgery, a fleshy tumour, commonly met with in the nose. It abounds in ramifications, from which it derives its name.

POL'YSCOPE (*polus*, many; and *skopeo*, I behold: *Gr.*), an optical instrument, consisting of a plano-convex lens, the convex surface of which is subdivided into several *facets*. Each of these will give a distinct image, and thus the object will appear in different places at the same time.

POLYSPERM'OUS (*poluspermos*, abounding in seed: *Gr.*), in Botany, an epithet for such plants as have several seeds.

POL'YSTYLE (*polustulos*: from *polus*, many; and *stulos*, a column: *Gr.*), a building surrounded by numerous columns, so that they cannot be readily counted at first view.

POLYSYL'LABLE (*polusullabos*: from *polus*, many; and *sullabē*, a syllable: *Gr.*), in Grammar, a word consisting of more syllables than three; for when a word consists of one, two, or three, it is called, respectively, a monosyllable, dissyllable, and trisyllable.

POLYSYN'DETON (*polusundetos*: from *polus*, much; and *sundetos*, bound together: *Gr.*), in Grammar and Rhetoric, a figure in which a redundancy of conjunctions, especially copulative ones, is used; as, 'We have armies and fleets, and gold and stores—all the sinews of war.'

POLYTECH'NIC (*polus*, many; and *technē*, an art: *Gr.*), an epithet denoting or comprehending many arts; as, a polytechnic school, a polytechnic gallery, &c.——The *Polytechnic School* of France was established by a decree of the National Convention of March 11, 1794, which was passed by the influence of Monge, Carnot, Fourcroy, &c., the committee of public safety having seen the necessity of providing for the education of engineers. Lagrange, Laplace, Berthollet, Fourcroy, and many other distinguished individuals, were its professors. Napoleon did much for it, and under him it received considerable modifications. The pupils were obliged to live in the building, and wear a uniform. Its object is to diffuse a knowledge of the mathematical, physical, and chemical sciences, and to prepare pupils for the artillery service and the various departments of engineering, military, naval, and civil. The inmates of this establishment fought bravely against the allies, March 30, 1814. In April, 1816, it was abolished, but re-established in September of the same year.

POL'YTHEISM (*polus*, many; and *theos*, a god: *Gr.*), the doctrine and worship of a plurality of gods; opposed to *monotheism*, or the belief in one Supreme Being.

POMA'CEÆ (*pomum*, fruit, but particularly an apple: *Lat.*), a nat. ord. of plants, including the apple, pear, medlar, and quince.

POMA'TUM (*Lat.*, from *pomum*, fruit—sometimes used in making it), a compound of jessamine, orange, &c., with lard and rose-water; an unguent used in dressing the hair.

POM'EGRANATE (*pomum granatum*, fruit having many seeds: *Lat.*), in Botany, the fruit of a tree belonging to the genus *Punica*, nat. ord. *Myrtaceæ*, a native of the south of Europe. It is as large as an orange, is of a reddish colour, and has a hard rind filled with a soft pulp and numerous seeds.

POMIF'EROUS (*pomum*, fruit; and *fero*, I bear: *Lat.*), fruit-bearing; an epithet applied to plants which bear pomes, that is fruits like the apple, pear, and quince.

POMOL'OGY (*pomum*, fruit: *Lat.*; and *logos*, a discourse: *Gr.*), that branch of gardening which is directed principally to the cultivation of fruit-trees, shrubs, &c. In Germany and France there exist many pomological societies, upon a similar principle to our horticultural, though the former, as the name implies, direct their attention chiefly to the cultivation of fruits.

POM'PA CIRCEN'SIS (the Circensian procession: *Lat.*), in Antiquity, a solemn march of the persons who were to engage in the exercises of the circus, attended by the magistrates and ladies of quality; the statues of the gods and illustrious men were carried along in state, on wagons called *thensæ*, from the shrines to the *pulvinaria*, and, when the games were over, back again.

PO'MUM A'DAMI (Adam's apple: *Lat.*), in Anatomy, the name of a protuberance in the anterior part of the neck, so named from the whimsical supposition that a part of the forbidden fruit of which Adam ate stuck in his throat, and thus caused it.

PONTEE', in glass works, an iron instrument used for taking the hot glass out of the pot.

PON'TIFEX (*Lat.*: from *pons*, a bridge; and *facio*, I make—probably because originally the construction and preservation of bridges were a part of his duties), among the Romans, one of those priests who had the superintendence and direction of divine worship in general. The pontifices, at first, were only four in number, but were made fifteen by Sulla, and sixteen by Julius Cæsar—including the pontifex maximus. The latter was always chosen from those who had borne the highest dignities in the state; and the office was conferred for life. There were other pontiffs who were termed *minores* (lesser): they were probably the secretaries of the higher order. The Roman emperors assumed the right of appointing as many pontifices as they pleased, which diminished the splendour of the pontifical college; and they retained for themselves the office of pontifex maximus (supreme pontiff), which was one of great dignity and power, as it gave the supreme, direct control over religious matters, and great indirect influence in all others.

PON'TIFF (from last), in the Roman Catholic and Greek churches, a bishop. The pope is termed *sovereign pontiff*. The Jews had their pontiffs or *chief priests*. *Pontificate* is used for the state or dignity of a pontiff, or high priest; but more particularly for the reign of a pope.

PONTIFICA'LIA (pertaining to a pontiff: *Lat.*), the robes in which a bishop performs divine service.

PONTOO'N BRIDGE (*ponton*: *Fr.*), a floating bridge, formed of flat-bottomed boats or pontoons, anchored or made fast in two lines, and used in forming bridges over rivers for the passage of armies.——PONTOON CARRIAGE, a vehicle formed of two wheels only, and two long side pieces, whose fore-ends are supported by timbers.

PONT-VOLANT' (a flying bridge: *Fr.*), in Military affairs, a kind of bridge used in sieges for surprising a post or outwork that has but a narrow moat. It is composed of [illegible] and so contrived that, by the aid of ropes and pulleys, the upper may be pushed forward till it reaches the destined point.

POOR and POOR LAWS (*pauvre*: *Fr.*). [See PAUPERISM.]

POPE (*papa*, a father: *Lat.*), the head of the Roman Catholic church. The appellation of *pope* was anciently given to all Christian bishops; but about the latter end of the 11th century, in the pontificate of Gregory VII., it was claimed as the exclusive title of the bishop of Rome, whose peculiar title it has ever since continued. The spiritual monarchy of Rome sprang up soon after the declension of the Roman empire. The bishops of Rome affect to owe their origin to the appointment of St. Peter, who was considered as transferring the keys of heaven (figuratively consigned to his keeping) to them as his successors; hence they assumed a supremacy which was admitted by all the western Christians, but resisted by the eastern, who, in Greece, Turkey, and Russia, constitute a separate church, termed *Greek*, in distinction from that of the west, termed *Latin*. The vices of the clergy led, however, in the 14th and 15th centuries, to schisms; and a personal quarrel between the pope and Henry VIII. of England induced the latter to assume the title of the head of the Anglican church. The *Reformation* took place at that period, and its principles were adopted by many German princes, and by the northern sovereigns. The pope retains his spiritual ascendency throughout Italy, France, Belgium, Austria, Spain, and Portugal; and four-fifths of the Irish are Roman Catholics. He is a temporal prince, but his dominions are now reduced to the sovereignty of Rome, and a few provinces around that city. On the death of a pope his successor is appointed from amongst the cardinals by the cardinals assembled in conclave. There are four modes of election:—1. By *inspiration*, when a number of cardinals call out a name as if on the impulse of the moment and under the direction of God. 2. By *compromise*, when after long deliberation without result the cardinals agree to leave the nomination to one of their number. 3. By *scrutiny* or *ballot*, when each cardinal writes the name of his nominee on a ticket which is deposited in a consecrated chalice. If, on an inspection of these tickets, it is found that any cardinal has obtained two-thirds of the votes, he is considered to be elected. If no one has received the requisite number of votes, there remains another mode of proceeding: 4. By *access*, when any cardinal accedes to the vote of another, and alters his ticket accordingly so as to give the nominee the number of votes required.——Priests in the Greek church are termed *Popes*.

POP'LAR (*peuplier*: *Fr.*; from *populus*: *Lat.*), the name of trees belonging to the genus *Populus*, nat. ord. *Amentaceæ*. The commonest species in Britain are the black poplar (*P. nigra*), the white poplar or Abele

(*P. alba*), and the Lombardy poplar (*P. fastigiata*). The aspen (*P. tremula*) belongs to the genus.

POP'LIN, in Commerce, a kind of fine-woven stuff made of silk and worsted.

POP'PY (*popig: Sax.*), the name of plants belonging to the genus *Papaver*. From one species, *P. somniferum*, or white poppy, opium is collected. [See OPIUM.]

POPULA'RES (*Lat.*, from *populus*, the people), the name of a party at Rome, who struggled to ingratiate themselves with the people, and sought, by extending the influence and power of the latter, to increase their own. The *Populares* were opposed to the *Optimates*. [See OPTIMATES.]

POPULA'TION (*populatio*, from same), the aggregate number of people in any country. Owing to the progressive increase of births over deaths, the population is continually augmenting in most parts of the habitable world. 'Countries,' says Adam Smith, in his 'Wealth of Nations,' 'are populous, not in proportion to the number of people whom their produce can clothe and lodge, but in proportion to that of those whom they can feed.' A notion formerly existed that an increase of population was necessarily an advantage to a country; but it is now admitted that the increase is beneficial only when accompanied by an increase in the means of subsistence.

Population of England and Wales, from the year 1700 *to* 1861.

Year.	No. of Persons.	Year.	No. of Persons.
1700 . .	5,475,000	1790 . .	8,675,000
1710 . .	5,240,000	1801 . .	9,168,000
1720 . .	5,650,000	1811 . .	10,502,500
1730 . .	5,769,000	1821 . .	12,218,500
1740 . .	6,064,000	1831 . .	14,594,500
1750 . .	6,467,000	1841 . .	15,914,000
1760 . .	6,736,000	1851 . .	18,000,000
1770 . .	7,428,000	1861 . .	20,228,497
1780 . .	7,953,000		

Scotland.

1801 . .	1,652,400	1841 . .	2,365,114
1811 . .	1,865,900	1851 . .	2,870,784
1821 . .	2,135,300	1861 . .	3,096,808
1831 . .	2,365,807		

Ireland.

1821 . .	6,846,949	1851 . .	6,515,794
1831 . .	7,767,401	1861 . .	5,850,309
1841 . .	8,175,238		

Total population of the United Kingdom in 1861 . . 29,321,288

Dividing the population into 100 parts, England and Wales have 69 parts, Scotland 10½ parts, and Ireland nearly 20, and the islands in the British seas have half such a part.

Increase per cent. of the population of Great Britain at periods between 1700 *and* 1851.

Between	1801	and	1811 . . .	14	per cent.
"	1811	"	1821 . . .	17¾	"
"	1821	"	1831 . . .	14	"
"	1700	"	1851 . . .	175	"
"	1851	"	1861 . . .	12	"

During the interval between 1851 and 1861 more than 2,050,000 British subjects emigrated to distant places. The population of 1801 doubled its numbers in 1852, but at the rate of increase during the last decennial period the population would double itself in 52 years. The boys born in England are in the proportion of 104,811 boys to 100,000 girls, but from various causes the males become reduced in number, and the census of 1861 gave 10,289,965 females to 9,770,259 males. The number of families in 1861 was 4,491,524, and the average number of persons in two families was about nine. It was found that there were on the average 344 persons to each square mile.——POPULATION OF THE WORLD. The human race is thought to comprise about 1000 millions of living persons, speaking 3064 languages and professing 1100 forms of religion. The average duration of human life is estimated at 33⅓ years. One-fourth of the children born die before their seventh year, and one half before their seventeenth. About 330 millions of persons die every year, or one every second.

POR'CELAIN (*porcelaine: Fr.*), a fine sort of earthenware, originally manufactured in China, and thence called *china-ware*. It is supposed to have been invented before our era. A combination of silex and alumina is the basis of porcelain; and with the addition of various proportions of other earths, and even of some metallic oxides, it forms the different varieties of pottery, from the finest porcelain to the coarsest earthenware. Though siliceous earth is the ingredient which is present in large proportion in these compounds, it is the argillaceous which more particularly gives them their character; for this communicates plasticity to the mixture when soft, so that it may be moulded in any way, or even turned into any shape on the lathe, and renders it capable of being baked. *Porcelains* differ much in their fineness and beauty. They are either of the *pâte dur* or *pâte tendre*, the hard quality being the oldest. *Egg-shell porcelain* is so called from its extreme thinness. *Cracklin porcelain* has a curious appearance, due to a cracking of the glaze in all directions, and a filling-up of the cracks with a dark pigment. [See CHINA-WARE, EARTHENWARE, &c.]

PORCEL'LANITE, a species of jasper, a siliceous mineral of various colours. It is sometimes marked with vegetable impressions of a brick-red colour, and seems to be formed accidentally in coal-mines which have indurated and semi-vitrified beds of coal-shale or slate-clay.

PORCH (*porche: Fr.*; from *porticus: Lat.*), in Architecture, a kind of vestibule supported by columns, at the entrance of temples, halls, churches, or other buildings.——A public portico in Athens, where Zeno the philosopher taught his disciples, was called, by way of distinction, the *porch* (*Stoa*). Hence, *the porch*, in classical literature, is equivalent to the *school of the Stoics*.

POR'CUPINE (*porc*, a hog; and *épine*, a thorn: *Fr.*), the name of some rodent quadrupeds belonging to the genus *Hystrix*. The common porcupine (*H. cristata*) is a native of Asia and Africa. Its foreteeth are obliquely truncated, and it has no canine teeth; its ears are of a roundish form, and the body is covered with prickles or spines, and also with bristles like those of a hog. The spines, or quills, as they are also called, are of two kinds; some being short, thick, strong, and sharp-pointed; others longer, weaker, more flexible, and compressed at the point. The porcupine is capable of erecting them if attacked or in danger; but not of projecting them, as is sometimes stated. It is a burrowing animal, and its habits are nocturnal. It feeds on vegetables.

PORE (*Fr.; from poros*, literally a passage: *Gr.*), a small aperture in the skin for perspiration; so fine as to be invisible except by microscopes of great power, and so numerous that thousands of them exist within a very small space.——Also, a small opening in other organic bodies; as the *pores* in plants.

PO'RISM (*porisma*, from *porizo*, I deduce: *Gr.*), a corollary; a name given by ancient geometers to certain propositions, which partake of the nature of both problems and theorems. The *porism* asserts that a certain problem may become indeterminate, and so far it partakes of the nature of a theorem; in seeking to discover the conditions by which it may be effected, it partakes of the nature of a problem.

POR'PHYRY (*porphurites*, literally purple-coloured: *Gr.*), in Mineralogy, a rock composed of an earthy or compact base through which distinct crystals are disseminated. It is of igneous origin, usually very hard, and susceptible of a fine polish. The term was originally applied to the extremely hard stone found in Egypt, of various shades, from a violet to a claret colour, variegated with white, the well-known *Rosso antico*. The extensive quarries from which the Romans obtained the porphyry they caused to be worked up into baths, columns, tazze, and architectural ornaments, were situate in a mountain now called Gebel Dokhan, which rises in the eastern desert of Upper Egypt between the Nile and the Gulf of Suez. It is probable that the greater part of a year was consumed in transporting an object from the quarries to Rome. They are now entirely deserted.

POR'POISE (*porc*, a hog; and *poisson*, a fish: *Fr.*), the name of cetaceous mammals, belonging to the genus *Phocæna*, and allied to the dolphins. The common porpoise is known to every voyager, being frequently seen in packs, rolling over and over as they swim after shoals of herring and mackarel, which they drive before them. It also seeks food by rooting with its snout like a hog in the sand and mud. Its tough skin is of a bluish black colour, and this can be tanned and usefully applied. The blubber yields a pure oil.

PORT (*Fr.; from portus: Lat.*), a haven, cove, inlet, or recess of the sea; in short, any commodious place situated on the sea-coast, or at the mouth of a river, screened from the wind, with depth of water sufficient for ships of burden, and where vessels may safely unload their cargoes. The word *port* is generally applied to spacious harbours much resorted to by ships, as the *ports* of London and Liverpool; and they may be either natural or greatly improved by art.——PORT, a kind of wine made in Portugal: so called from *Oporto*.

PORT'AGE (*Fr.*, from *porter*, to carry), a place on the rivers in Canada, where rapids or cataracts prevent the passage of boats, and where, therefore, travellers are obliged to carry their goods over land until the stream becomes again navigable.

PORTCUL'LIS (*portecoulisse: Fr*), in Fortification, a machine like a harrow, hung over the gateway of a fortified town. It is let down, in case of surprise, to prevent the entrance of an enemy.

POR'TER, a kind of malt liquor made of high-dried malt, and characterized by its dark brown colour, its peculiar aromatic flavour, and its tonic and intoxicating qualities. Before the year 1730, the malt liquors in general use in London were ale, beer, and twopenny; and it was customary for the drinkers of malt liquor to call for a pint, or tankard, of half and half, that is, a half of ale and a half of beer, a half of ale and half of twopenny, or half of beer and half of twopenny. In course of time, it also became the practice to call for a pint, or tankard, of *three threads*, meaning a third of ale, of beer, and of twopenny; and thus the publican had the trouble to go to three casks and turn three cocks for a pint of liquor. To avoid this inconvenience and waste, about 1722 a liquor was made which should partake of the united flavours of ale, beer, and twopenny, which was called *entire* or entire-butt; and as it was a very exhilarating and nourishing liquor, it was very suitable for *porters* and other working people: hence it obtained its present name. Some brewers colour their porter with burnt sugar; but in general they concentrate a quantity of their first and best wort to an extract in an iron pan, and burn this into a *colouring stuff;* by which they can lay claim to the merit of using nothing in their porter but malt and hops.

PORT'-FIRE, in Gunnery, a paper tube, about ten inches in length, filled with a composition consisting of meal-powder, sulphur, and nitre, rammed moderately hard. It is used with guns and mortars instead of a match.

PORT'GLAIVE (*porte-glaive*, a sword-bearer: *Fr.*), one who formerly carried the sword before a prince or governor.

PORT'GREVE, or PORT'REEVE (*port*, a harbour; and *gerefa*, a governor: *Sax.*), in former times, the chief magistrate of a port or maritime town. This officer is now styled either mayor or bailiff. According to Camden, the chief magistrate of London was anciently called *portgreve*, but that officer was changed by Richard I. for two bailiffs; and these gave place in the reign of John to a mayor.

PORT'HOLES, the openings or embrasures in the sides of ships of war, through which guns are run out.

POR'TICO (*Ital.; from porticus: Lat.*), in

Architecture, a range of columns supporting a roof, and affording a space where people may walk under cover. Though this word is ultimately derived from *porta*, a gate or door, it is used for any arrangement of columns which forms a gallery.——The Athenians were magnificent in their porticos. Poets and philosophers recited their works and held their disputations in them. Their most famous portico was that called *Pœcile*, which was, in fact, a picture gallery, adorned with the works of the greatest masters.——The word *portico* is sometimes applied to any place for walking under shelter, though constructed with arches; but it is more accurately confined to a projection in front of a building, supported on columns.

PORT'LAND STONE, a granular limestone, belonging to the upper portion of the *oolite* formation, obtained in the isle of Portland, on the coast of Dorsetshire.

PORT'LAND VASE, a celebrated cinerary urn, found in the tomb of the emperor Alexander Severus, and his mother Mammæa. It was first in the possession of the Barberini family at Rome; whence it came into that of the Portland family, who, in 1810, deposited it in the British Museum. It is said to be of glass, is of a deep blue colour, and the figures are white. Wedgwood made a number of copies of it closely resembling the original.

POSE' (placed: *Fr.*), in Heraldry, a lion, horse, or other beast, standing still, with all his four feet on the ground.

POSI'DEUM, or POSI'DEON (*Poseideōn*: *Gr.*), in Ancient Chronology, the sixth month of the Athenian year, which consisted of thirty days, and answered to the latter part of December and beginning of January. The name was due to a festival in honour of Neptune Posidonius, which was celebrated during that month.

POSI'TION (*positio*, a placing: *Lat.*), in Arithmetic, called also the *rule of false*, a rule which, by the use of one or more assumed but false numbers, enables us to find the number sought.——POSITION, in Geometry, is a term sometimes used in contradistinction from *magnitude*; thus, a line is said to be given in position when its situation, bearing, or direction, with regard to some other line, is defined; on the contrary, a line is given in magnitude when its length is stated but not its situation.——POSITION, in Logic, the groundwork or proposition on which an argument is raised.

POS'ITIVE (*positus*, placed: *Lat.*), a term of relation sometimes opposed to *negative*; hence, a positive quantity, in Algebra, is a quantity opposed to that which is negative. Thus, if the latter represent a *debt*, a positive quantity will represent money in *possession*, or to which one has a *claim*; if it represent motion towards the *south*, a positive quantity will represent motion towards the *north*. Negative quantities are just as real as positive, and it is absurd to suppose that in any case they can be *less* than nothing. If I owe money beyond what I am able to pay, my condition is *negative*, and I am worse off than if I simply possessed nothing—the debt is a *reality*. If I intend to go *westward*, and by mistake go *eastward*, my position with regard to my destination has become *negative*, but the distance traversed by mistake is a *reality*. *Positive quantities* are designated by the character + prefixed or supposed to be prefixed to them.——POSITIVE DEGREE, in Grammar, the adjective in its simple signification, without comparison or relation to increase or diminution: as, *good*, *bad*, &c. ——POSITIVE ELECTRICITY, a term applied to the electricity of bodies supposed to contain more than their natural quantity. *Positive* electricity, being that produced by rubbing glass, is called also *vitreous*; *negative* electricity, produced by rubbing amber or resin, being called *resinous*.

POSOL'OGY (*posos*, how much? and *logos*, a statement: *Gr.*), in Medicine, the science or doctrine of preparing and administering doses.

POS'SE COMITA'TUS (*posse*, to be able; and *comitatûs*, belonging to the county: *Mod. Lat.*—the *power of the county*), in Law, the armed power of the county, or the attendance of all persons charged by the sheriff to assist him in the suppression of riots, &c. It includes all males above fifteen years of age within the county, except ecclesiastical persons, peers, and such as labour under any infirmity.

POSSES'SION (*possessio*: *Lat.*), in Law, the holding or occupying of anything, either *de jure* or *de facto*. Possession *de jure* is the title a man has to enjoy a thing, though it is in the actual possession of another; or the title which a person has when lands are descended to him and he has not yet entered into them. Possession *de facto*, or actual possession, is where there is an actual and effectual enjoyment of a thing. Long undisturbed possession is presumptive proof of right or property in the possessor.

POSSES'SIVE CASE (*possessivus*, relating to possession: *Lat.*), in English Grammar, the *genitive case*, or case of nouns and pronouns, which either denotes ownership, as *John's* book (a book belonging to John); or some relation of one thing to another, as *Byron's* admirers (those who admire the writings of Byron).

POST (*after*), a Latin preposition used in composition with several English words, and generally implying a relation of posteriority.

POST (*poste*: *Fr.*), a messenger or carrier of letters; one that goes at stated times to convey the mail and despatches.——A military station.——A public office or employment.——The name of a sort of writing-paper much used for letters.——*To ride post* is to be employed to carry despatches and papers, and consequently to ride with speed. Hence, *to travel post* is to travel expeditiously by the aid of fresh horses taken at certain stations.——*To post*, in Book-keeping, is to carry accounts from the waste-book or journal to the ledger.

POST'AGE (same *deriv.*), the duty or charge imposed on letters or parcels conveyed by post. This charge is at present only *one penny* for each letter not exceed ing half an ounce in weight, from any part of Great Britain and Ireland to any other part, and in proportion for other weights. Great facilities are now afforded, at very moderate rates, for the transmission of books, and also of money.

PO'ST-DATE, to date after the real time; as to *post-date* a bill or a contract, that is, to date it after the true time of drawing the one or making the other. There is a penalty of 100*l.* for post-dating bills, &c., on stamps which do not cover the real term. Bankers' cheques must not be post-dated unless on a bill stamp, under the same penalty.

POST-DISSE'ISIN, in Law, a writ which was formerly issued for the purpose of putting in possession a person who had been disseised after a judgment to recover the same lands of the same person, under the statute of Merton.

POS'TEA (afterwards: *Lat.*), in Law, the return of a record of the proceedings in a cause, after a trial and verdict by writ of *nisi prius*, into the court after a verdict. The entry of the result of the trial upon the record commences with this word

POS'TERN (*posterne: Fr.*), in Fortification, a small gate, usually in the angle of the flank of a bastion, or in that of the curtain descending into the ditch.

POST'HUMOUS (*posthumus:* from *post*, after; and *humus*, the earth: *Lat.*—after interment), born after the death of a father. Also, published after the death of the author; as *posthumous works.*

POS'TIL (*postilla*, afterwards: *Lat.*), a marginal note; originally, a note in the margin of the Bible; so called because written after the text.

POSTLIMIN'IUM (*Lat.:* from *post*, after; and *limen*, the threshold), among the Romans, the return to his own country of a person who had gone to sojourn in a foreign country, or who had been banished or taken by an enemy.——In the modern law of nations, the right of *postliminy* is that by virtue of which persons and things taken by an enemy in war are restored to their former state, when coming again under the power of the nation to which they belonged. But this cannot extend in all cases to personal effects, on account of the difficulty of ascertaining their identity.

POST'MASTER, the officer who has the superintendence and direction of a post-office.——The *postmaster-general* is the chief officer of the post-office department, whose duty is to make contracts for the conveyance of the public mails and see that they are executed; and who receives and is accountable for the moneys arising from the postage of letters, pays the expenses, and superintends the whole. It is usual to appoint a peer to this office, and he retires with the ministry. The chief secretary is the person by whom the duties are principally performed.

POST MOR'TEM (after death: *Lat.*), an epithet applied to an inspection and examination of the body of a deceased person, for the purpose of ascertaining the cause of death.

POST'-NOTE, in Commerce, a bank-note intended to be transmitted to a distant place by the public mail, and made payable to *order;* differing in this from a common bank-note, which is payable to the *bearer.*

POST'-OFFICE, an establishment for the reception, conveyance, and delivery of letters, &c. Posts were established for the first time in modern Europe by Louis XI. of France, in 1479; and were originally intended to serve merely for the conveyance of public despatches, and of persons travelling by authority of government. But the great convenience afforded to individuals, particularly as commercial transactions multiplied and extended, by a safe, regular, and speedy communication between distant parts of the country, induced the government to convert it into a source of public revenue. In 1635, Charles I. erected a letter-office for England and Scotland; it extended to only a few of the principal roads, the times of carriage were uncertain, and the postmasters on each road were required to furnish horses for the conveyance of the letters at 2½*d.* a mile. The plan did not eventually succeed; but it led to an establishment for the conveyance of letters to all parts of the kingdom, weekly, in 1649, under the commonwealth. In 1657, the post-office was established very nearly as it was before the recent changes; and the rates of postage that were then fixed were continued till the reign of queen Anne. But instead of improving, the post gradually became less expeditious; and in 1784, when a journey from London to Bath was made by the diligences in 17 hours, the post took 40 hours! and on other roads the rate of travelling bore about the same proportion. Under these circumstances, it occurred to Mr. John Palmer, of Bath, comptroller general of the post-office, that a very great improvement might be made in the conveyance of letters, in respect of economy, as well as of speed and safety, by contracting with the proprietors of the coaches for the carriage of the mail: the latter being bound to perform the journey in a specified time, and take a guard with the mail for its protection. Railways have increased in an extraordinary degree the speed with which letters are transmitted. The journey from London to Liverpool, by the mail coach, took about *twenty-two* hours: it is now accomplished in *eight* or less. The Post-office Act (1839), which recognizes the expediency of one uniform postage, is now in operation; the rate being one penny for all inland letters not exceeding half an ounce in weight; twopence for those not exceeding one ounce; fourpence for those not exceeding two ounces; and so on, if not exceeding sixteen ounces, except in certain specified cases. Newspapers require only a penny stamp for transmission from one part of Great Britain to another; they must be open at each end; any writing or enclosure subjects them to a treble postage. They require only the same stamp when sent to the British colonies, if put into a post-office within fifteen days of publication; or if sent to countries with which there is a postal arrangement

Books and deeds may now also be sent to all parts of the empire and the colonies, if enclosed in envelopes open at each end, at very moderate rates; and probably the *penny postage* scheme will soon be extended to all parts of the civilized world. The heavy postage was to a great extent evaded [see FRANKING]; nevertheless the revenue has not yet been benefited by the change. In 1838 the net receipt from the post-office was 1,659,510*l*., in 1865 it was only 1,500,000*l*.

POST'SCRIPT (*postscribo*, I write after: *Lat.*), an addition made to a letter after it is concluded and signed by the writer.——Also, any addition made to a literary performance after it has been supposed to be finished, containing something omitted or something which subsequently occurs to the writer.

POST'ULATES (*postulatum*, a demand: *Lat.*), fundamental principles in any art or science, which are too simple and obvious to need demonstration, and are therefore assumed or taken for granted.

POTAR'GO, a kind of pickle imported from the West Indies.

POT'ASH (*potasse: Fr.*), in Chemistry, the name of a vegetable fixed alkali. It is procured, in an unrefined state, from the ashes of certain plants, by lixivation and evaporation; the residue after evaporation is purified in a crucible or furnace, and the extractive substance burnt off or dissipated. Refined potash is called *pearlash*; it is an impure carbonate of *potassa*. [See next.]

POTAS'SIUM, in Chemistry, a substance procured by passing a galvanic current through potash, of which it is the metallic basis, and still more conveniently by other means. It is remarkable for its low spec. grav., which is only 0·865; it is therefore lighter than water, and, when thrown into that fluid, it takes fire spontaneously on account of its extraordinary affinity for oxygen, and floats about in a state of ignition. At the ordinary temperature of the atmosphere it is solid; at 80° it becomes soft; and at 150° liquid, in which state it resembles mercury in appearance. In the atmosphere it rapidly absorbs oxygen, and becomes protoxide or *potassa*: heated in oxygen, it becomes *peroxide*, which is at once changed by water into the protoxide. The latter is as a *hydrate* in what is called *caustic potash*; which may be obtained by removing the carbonic acid from the carbonate with caustic lime and water, evaporating the solution, and fusing the residue. Potassium burns with great splendour in chlorine. It must be kept immersed in naphtha, or some other fluid containing no oxygen, or it will speedily lose its metallic state. As potassium has the most powerful affinity for oxygen of all substances known, it takes it from every other compound, and hence is a most important agent in chemical analysis.

POTA'TO, the wholesome and nutritive root of the *Solanum tuberosum*, a native of America. It was introduced into the British dominions by Sir Walter Raleigh in the 16th century.

POTEN'TIAL MOOD, in Grammar, that form of the verb which is used to express the possibility of an action, as, I *may* go, he *can* sing.

POT'STONE, in Mineralogy, a tough variety of steatite, the *Lapis ollaris* of Pliny. It is sometimes made into culinary vessels.

POT'TERN ORE, in Mineralogy, a species of ore which has been so called by the miners on account of its tendency to vitrefy like the glazing of potter's ware.

POT'TERY, the manufacture of earthen pots, or earthenware in general, but particularly of the coarser species. The better kinds of pottery, called in this country *Staffordshire ware*, are made of an artificial mixture of alumina and silica; the former obtained in the form of a fine clay, chiefly from Devonshire; and the latter consisting of chert or flint, which has been heated red-hot, and quenched in water. Each material, carefully powdered and sifted, is diffused through water, mixed by measure, and brought to a due consistency by evaporation, it is then highly plastic, and is formed upon the potter's wheel or lathe into various circular vessels, or moulded into other forms, which, after having been dried in a warm room, are enclosed in baked clay vessels, resembling band-boxes, and called *seggars*; these are ranged in the kiln so as nearly to fill it, leaving only space enough for the fuel; the ware is kept red-hot for a considerable time, and is thus brought to the state of *biscuit*. This is afterwards *glazed*; which is done by dipping it into a mixture of about 60 parts of litharge, 10 of clay, and 20 of ground flint, diffused in water to a creamy consistence; when taken out, enough adheres to the piece to give a uniform glazing, when it is again heated. The pieces are then again packed up in the seggars, with small bits of pottery interposed between them, and fired in a kiln as before. The glazing mixture fuses at a very moderate heat, and gives a uniform glossy coating, which finishes the process when ordinary white ware is to be made. [See EARTHENWARE.] The blue patterns, so common on account of the facility with which cobalt is applied, are generally first printed on paper, which is attached to the article while it is in the state of biscuit, and the colour transfers itself when heat is applied; other mineral substances are sometimes put on in the same way. The work of the porcelain manufacturer is one which requires great skill, and is highly interesting; his art owes more to chemistry than perhaps any other.

POUL'PE. [See OCTOPUS.]

POUNCE (*ponzone: Ital.*), gum-sandarach pulverized; a fine powder used to prevent ink from spreading on paper. There is also a kind of *pounce*, used by embroiderers and lace-makers, which consists of coloured powders enclosed in muslin, &c. It is passed over holes pricked in the work, to mark the lines or designs on a paper underneath.——POUNCES, in Falconry, the talons or claws of a bird of prey.

POUND (*pund: Sax.; from pondus*, a

weight: *Lat.*), a weight containing 12 ounces troy, and 16 avoirdupois. It also denotes a money of account; so called because the ancient pound of silver weighed a pound troy.——Pound (*pynan*, to confine: *Sax.*), any enclosed place, erected by authority, in which cattle are confined when taken trespassing, or going at large, in violation of law. A common pound is kept in every township, lordship, or village; and it is said there ought to be one in every parish, the want of which is punishable in a court-leet. The pound-keeper is bound to receive any animal brought to him, and is not answerable if it is illegally impounded.

POURPRES'TURE (*pourpris*, an enclosure: *Fr.*), in Law, the appropriation of anything which ought not to be appropriated; but specially any encroachment on a highway, by the erection of a shed, or the making of a projecting window, &c.

POW'ER (*pouvoir: Fr.*), in Mechanics, signifies those simple mechanical contrivances intended to render power more effective. Also, any force which, applied to a machine, sets it in motion. The use in mechanics of the word *power* in two senses is productive of some inconvenience. In the former sense there are six mechanical powers, reducible to two: the lever, pulley, and wheel and axle, reducible to the *lever*; the inclined plane, wedge, and screw, reducible to the *inclined plane*. In the latter, there are many powers: gravity, acting in the form of weights; elasticity, in springs; the strength of animals; wind, water, heat—particularly in the application of steam. A power is rarely suited precisely to the production of the effect intended. The action of gravity is modified by the pendulum; the varying force of a spring, by the fusee; the reciprocating motion imparted by steam is changed by the crank into rotary; and the irregularities of the crank itself are corrected by the fly-wheel.——Power, in Arithmetic and Algebra, the product of any quantity multiplied by itself some number of times. Thus, the second power or square of 5 is 25, or 5 multiplied by 5; the third power or cube of *a* is the product of three *a*'s multiplied together, briefly expressed by a^3, &c.

POW'ER OF ATTOR'NEY, in Law, an instrument by which one party empowers another to perform certain acts for him, either generally or for a particular purpose.

POW'ERS, GREAT, of Europe, in Diplomacy, England, France, Austria, Russia, and Prussia.

POW'TER, an appellation given to a certain kind of pigeon which has a habit of swelling up its neck when it is displeased.

POY'NING'S LAW. Several laws were called by this name; but the most important was an act of parliament made under Henry VII., by which the law of England became in force in Ireland. It derived its name from Sir Edward Poyning, then lord-lieutenant of Ireland.

PRAC'TICE, in Arithmetic, a rule which abridges the operations in proportion, by facilitating the multiplication of quantities containing different denominations: as pounds, shillings, pence, &c.; yards, feet, inches, &c.——Practice of the Courts, in Law, the form and manner of conducting or carrying on suits at law or in equity.

PRÆ-AD'AMITES, those who are supposed, by some writers, to have inhabited the earth before Adam.

PRÆ'CIPE IN CAP'ITE, in Law, a writ issuing out of the court of chancery, for a tenant who held of the king in chief, as of his crown, and not as of any honour, castle, or manor.

PRÆCIPITA'TIO de Robore (*Lat.*), in Antiquity, a capital punishment among the Romans, which consisted in throwing the criminal headlong from that part of the prison which was called the *robur*.

PRÆCOG'NITA (*Lat.*), things which are to be previously known in order to understand something else. Thus, a knowledge of the structure of the human body is one of the *præcognita* of medical science and skill.

PRÆ'FECTURE (*præfectura: Lat.*), in Antiquity, an appellation given to certain towns in Italy, whose inhabitants had the name of Roman citizens, but were not allowed to enjoy either their own laws or magistrates, being governed by annual prefects sent from Rome. These were generally such places as were suspected, or had in some way or other incurred the displeasure of the state. The title of prefect (*præfectus*) was given to many officers in ancient Rome.

PRÆMUNI'RE (for *præmoneri*, to be forewarned: *Lat.*), in Law, a species of offence, consisting of a contempt of the king and his government. It derives its name from the words at the beginning of the writ issued preparatory to prosecution, *promoneri* or *præmoneri facias* (you will cause to be warned). The first statute of this nature was passed in the reign of Edward I., to restrain the encroachments of the Roman Catholic clergy; and others were subsequently enacted, previous to the reformation, relating to the assumption of authority in England by virtue of papal and other foreign provisions. But later statutes under this name affect very miscellaneous acts; and among them, the refusing to take the oaths of allegiance and supremacy, &c.

PRÆNO'MEN (*præ*, before; and *nomen*: *Lat.*), that name among the ancient Romans which, like our Christian name, stood before the *gentile* or family name, and served to distinguish brothers, &c., from each other; as Caius, Lucius, Marcus, Julius, &c. Care was generally taken, in conferring the *prænomen*, to give that of the father to the eldest son, that of the grandfather to the second, and so on. The *prænomen* was not brought into use till long after the *nomen*, or family name. The word was also used to indicate a *title* prefixed to a name.

PRÆTEX'TA, or Toga Prætexta (*Lat.*, from *prætexo*, I border), a long white robe, with a broad purple border, originally appropriated to the Roman magistrates and some of the priests, but afterwards worn by children of quality—by boys till the age of seventeen, when they assumed the *toga virilis*; and by girls till they were married.

PRÆ'TOR (*Lat.*, for *præitor*, from *præeo*, I precede), a chief magistrate among the Romans, instituted for the administration of justice in the city in the absence of the consuls. The office of *prætor* was established in the year of the city 388, the consuls being at that time wholly engaged in foreign wars. The institution was intended also to compensate the nobility for the loss of their exclusive right to the consulship, to which honour the commons had now put in their claim, and succeeded. But this office also was thrown open to the plebeians, A.U. 418. Only one prætor was appointed until A.U. 519, from which time there were two—one, the *prætor urbanus*, for administering justice to the citizens of Rome; the other, the *prætor peregrinus*, for administering justice in places at a distance. When Sicily and Sardinia were formed into provinces, two more were created to govern them; and two more when hither and farther Spain were subjugated. Like the consuls, the prætors obtained their provinces by lot. Under the emperors, their privileges were greatly diminished. The prætor decreed and proclaimed public feasts; had the power to make and repeal laws, with the approbation of the senate and the people; and kept a register of all the freed men who were enfranchised at Rome. In the absence of the consuls, he had a right to lead the armies; he also commanded the *quæstors*, who served him as lieutenants, and were charged with part of the business of his office. He was entitled to the *prætexta*, the curule chair, and two lictors to walk before him in Rome, and six when out of the city.

PRÆTORIA'NI, PRÆTORIÆ COHORTES (from last), or *Prætorian Guards*, the emperor's guards, who in time were increased to ten thousand. The Prætorian bands owed their first institution to Scipio Africanus, who chose for his guards a company of the bravest men in his army; but in time they became very inimical to the liberties of their country. They were reorganized by Severus, and altogether disbanded by Diocletian. Their commander was called the *prætorian prefect;* and as the government gradually changed into a military despotism, he became the head of the army, the provinces, and even superior to the law.

PRÆTO'RIUM (same *deriv.*), among the Romans, the hall or court where the prætor administered justice. It was also the name of his palace.

PRAGMAT'IC SANC'TION, in the Civil Law, a rescript or answer of the sovereign, delivered by advice of his council to some college, order, or body of people who consult him in relation to the affairs of their community. A similar answer given to an individual is called simply a rescript.——The term *pragmatic sanction* was applied to the ordinance of Charles VII. of France, in 1438, which formed the foundation of the liberties of the Gallican church; also to the arrangement made by Charles VI., emperor of Germany, when, having no sons, in 1722 he settled his hereditary dominions on his eldest daughter, the Archduchess Maria Theresa.

PRA'IRIE (a meadow: *Fr.*), a word used to designate the remarkable natural meadows, or plains, which are principally found in the Mississippi valley, North America. They are classed as follows:—1. The *heathy* or *bushy*, which have springs, and are covered with small shrubs, bushes, grape vines, &c., very common in Indiana, Illinois, and Missouri. 2. The *dry* or *rolling*, generally destitute of water, and almost all vegetation but grass. These are the most common and extensive: the traveller may wander for days in these vast and nearly level plains, without wood or water, and see no object rising above the horizon. In this kind of prairies roam immense herds of bisons. 3. The *alluvial*, or wet prairies, form the third and smallest division; they are covered with a rich vegetation, and have a black, deep, and friable soil, of inexhaustible fertility; in a state of nature they are covered with tall rank grass, and in the rainy season are frequently overflowed, or contain numerous pools, the waters of which pass off solely by evaporation.

PRAM, or **PRAAM**, a flat-bottomed boat or lighter, used in Holland for conveying goods to or from a ship in loading or unloading. Also a kind of floating battery mounting several cannon, used in covering the disembarkation of troops.

PRATI'QUE (*Fr.*), in Commerce, a license or permission to hold intercourse and trade with the inhabitants of a place, after having performed quarantine, or upon a certificate that the ship has not come from an infected place.

PRE'AMBLE (*préambule: Fr.;* from *præambulo*, I walk before: *Lat.*), in Law, the introductory matter to a statute, which contains the reasons for making the enactment.

PREB'END (*prébende: Fr.*), the stipend or maintenance a prebendary receives out of the estate of a cathedral or collegiate church. There are several prebendaries attached to such churches, who reside and officiate in rotation. Prebends are *simple* or *dignitary:* a simple prebend has merely the revenue destined for its support; but a prebend with dignity has always a jurisdiction annexed to it.

PREB'ENDARY (from last), an ecclesiastic who enjoys a prebend. The difference between a prebendary and a canon is, that the latter obtains his prebend in consideration of his officiating in the church; but the former merely in consequence of his being admitted among the clergy of the cathedral, and without his enjoying, necessarily, any stipend from it.

PRECE'DENCE (*præcedo*, I go before: *Lat.*), by custom and courtesy, the right to taking place before another; which is determined by authority, and followed exactly on all public occasions of processions and the like.

PREC'EDENT (*præcedens*, going before *Lat.*), in Law, a judicial decision, which serves as a rule for future determinations in similar or analogous cases.——PRECEDENT also frequently denotes an original authentic instrument or writing, which serves as an exemplar from which to draw others.

PRECEN'TOR (*præcentor : Lat.*), the chanter or master of the choir in a cathedral.

PRE'CEPT (*præceptum : Lat.*), in Law, a command in writing sent by a justice of the peace, &c., for the purpose of bringing a person, record, or other matter before him. In a general sense, a *precept* signifies anything laid down as an authoritative rule of action; but it is applied particularly to commands respecting moral conduct.

PRECES'SION OF THE EQ'UINOXES (*præcedo*, I go before: *Lat.*), in Astronomy, a motion of the axis of the earth, by which the equinoctial points, or nodes, recede, with reference to the stars. The pole, the solstices, the equinoxes, and all the other points of the ecliptic, have a *retrograde motion*, and are constantly moving from east to west, or from Aries towards Pisces, &c.; by means of which the equinoctial points are carried further and further back among the preceding signs or stars, at the rate of about 50·1″ each year. This retrograde motion is called the *precession*, *recession*, or *retrocession* of the equinoxes It is caused by the combined action of the sun and moon on the mass of matter accumulated about the earth's equator, and forming the excess of the terrestrial spheroid above its prescribed sphere; and the motion which produces it may be compared to that of a top made to rotate rapidly with its axis inclined to the horizon. The axis, in such a case, slowly revolves about a vertical line, describing a cone Any section of the top perpendicular to its axis will, if produced to meet the horizon, at every instant intersect it in a new line, and the line of intersection will revolve with a motion corresponding to that of the axis of the top, but in a direction opposite to that of rotation. The precession of the equinoxes was discovered by Hipparchus, a century and a half before the Christian era; though it is alleged that the astronomers of India had discovered it long before. [See EQUINOXES.]

PRECIP'ITATE, anything thrown out of a combination of which it is a constituent, on the addition of a substance capable of producing a new combination with the other constituents. Thus if lime be added to a solution of sulphate of magnesia, magnesia is precipitated, being displaced by the lime which enters into combination with the acid. One metal may also be precipitated by another. At the Mint plates of copper are immersed in solutions of sulphate of silver, and metallic silver is thrown down, the acid combining with the copper to form a sulphate. At the mines of Freyburg metallic silver is obtained by agitating chloride of silver with scrap-iron. The iron enters into combination with the chlorine and turns out the silver. When sulphate of antimony is fused with scrap-iron the iron unites with the sulphur, and turns out the antimony. The metals aluminium and magnesium are obtained by fusing the chlorides with metallic sodium, when the latter combines with the chlorine and turns out the aluminium or magnesium.

PREDESTINA'TION (*prædestinatio*, a determining beforehand: *Lat.*), in Theology, a term used to denote the pre-ordination of men by the Supreme Being to everlasting happiness or misery. One who believes in this doctrine is called a *predestinarian*. [See CALVINISM]

PRE'DICABLE (*prædico*, I declare: *Lat.*), in Logic, a term which can be predicated of several others. There are said to be five predicables: genus, species, difference, property, and accident. Notions expressed by such terms are formed by the faculty termed *abstraction*

PREDIC'AMENT (same *deriv.*), in Logic, a *category*. Scholastic philosophers distribute all the objects of our thoughts and ideas into genera or classes, which the Greeks call *categories*, and the Latins *predicaments*

PRED'ICATE (same *deriv*), in Logic, that part of a proposition which affirms or denies something of the subject: thus, in 'snow is white, ink is not white,' whiteness is the *predicate* affirmed of snow and denied of ink.

PRE-EMP'TION (*præemptio: Lat*), the right of purchasing before others.

PREEN, to clean, arrange, and dress the feathers, as is done by birds, to enable them to glide more easily through the air or water. For this purpose they are furnished with two glands on the rump, which secrete an oily substance in a bag, from which they draw it with the bill, and spread it over the feathers.

PRE'FIX (*præfixus*, set up in front: *Lat*), or AFFIX, in Grammar, a particle put to the beginning of a word, either to vary its form or alter its signification.

PREHEN'SILE (*prehensus*, grasped: *Lat.*), adapted to seize or grasp. Thus, we say, the tails of some monkeys are *prehensile*.

PREHN'ITE, a mineral of a greenish colour, allied to the *Zeolites*, and originally discovered at the Cape of Good Hope by Prehn. It has been called shorl, emerald, chrysoprase, folspath, chrysolite, and zeolite. It is massive or crystallized, but the form of its crystals cannot be determined in consequence of their aggregation.

PREJ'UDICE (*Fr.*; from *præjudico*, I decide beforehand: *Lat.*), a judgment neither founded upon, no consistent with, reason; the error of ignorance, weakness, or idleness. It is the enemy of all truth, knowledge, and improvement, and is the blindness of the mind, rendering its powers not only useless but mischievous. Innumerable are the prejudices we imbibe in our youth; we are accustomed to believe without reflection, and to receive opinions from others without examining the grounds by which they are supported.

PREL'ATE (*prælatus*, carried in front: *Lat.*—distinguished), an ecclesiastic raised to some eminent dignity in the church, as a bishop or archbishop. The office or dignity of a prelate is called a *prelacy*.

PRELIM'INARY (*præ*, before; and *limen*, the threshold: *Lat.*—before the commencement), in general, denotes something to be examined and determined before an affair can be treated effectually. The *preliminaries of peace* consist chiefly in settling the powers of ambassadors, and points which may be in dispute must be determined previous to the treaty itself.

PREM'IER (the first: *Fr.*), the name usually given to the prime minister of England.

PREM'ISES (*præmissus*, sent in advance: *Lat.*), in Logic, the first two propositions of a syllogism, from which the inference or conclusion is drawn. Also, propositions antecedently proposed or proved.——PREMISES, in Law, lands, tenements, &c., before mentioned in a lease or deed.

PRE'MIUM (*præmium: Lat.*), properly, a reward or recompense; but it is chiefly used in a mercantile sense for the sum of money given to an insurer, whether of ships, houses, lives, &c. Also, the money paid by a purchaser in excess of the prime cost of an article, a share in a public company, &c. Also, the recompense or prize offered for a specific discovery, or for success in an enterprise.

PREMON'STRANTS, the order of regular canons or monks of Prémontré, in the isle of France; instituted in 1120.

PREMOR'SE(*præmorsus*, bitten off: *Lat.*), in Botany, an epithet which, when applied to *roots*, means such as are not tapering, but blunt at the end; and when applied to *leaves*, such as end very obtusely with unequal notches.

PREPEN'SE (*præpensus*, weighed beforehand: *Lat.*), in Law, an epithet applied to actions attended with premeditation and forethought; whence the term *malice prepense.*

PREPOSI'TION (*præpositio*, from *præpono*, I put before: *Lat.*), in Grammar, a part of speech which denotes the relations between the things signified by various words in a sentence.

PREROG'ATIVE (*prérogatif: Fr.*; from *prærogo*, I ask before: *Lat.*), an exclusive or peculiar privilege.——The *royal prerogative* is that special pre-eminence which a sovereign has, not only over all his subjects, but over the ordinary course of the common law, in virtue of the regal dignity. Among his prerogatives are the right of appointing ambassadors, and of making peace and war. It is the *prerogative* of the house of lords in Great Britain to decide legal questions in appeals against decisions of the courts of law. It is the *prerogative* of the house of commons to determine the validity of all elections of their own members.

PREROG'ATIVE COURT, an ecclesiastical court, which formerly existed for the trial of all testamentary causes, where the deceased had left *bona notabilia* (5*l.*) within two different dioceses. Its powers have been transferred to the court of probate.

PRESBYO'PIA (*presbus*, an old man; and *ôps*, an eye: *Gr.*), in Medicine, that defect of vision by which objects that are near are seen confusedly, but those at a distance more distinctly. It proceeds from various causes, but generally from too great flatness in the crystalline humour [see EYE]; and is common amongst aged persons.

PRES'BYTER (*presbuteros*, the comparative of *presbus*, old: *Gr.*—an *elder*), in the primitive Christian church, an *elder;* one who had authority in the church, and whose duty was to watch over the flock. The word is borrowed from the Greek translation of the Old Testament, where it usually signifies a ruler or governor. It was a title of office and dignity—not of age; and, in this sense, bishops are sometimes called presbyters in the New Testament.

PRESBYTE'RIANS (same *deriv.*), a sect of Protestants so called from their maintaining that ecclesiastical authority, in the New Testament, is vested in *presbyteries* that is, in ministers and ruling elders. The *kirk*, or church of Scotland, is governed by presbyteries, synods, and general assemblies, which constitution was introduced from Geneva, together with the doctrines of Calvin, the reformer of that country, by the celebrated John Knox. The *kirk-session* is the lowest court, and consists of the parochial minister and lay elders, generally to the number of twelve, the minister being moderator *ex officio.* The *presbytery* is composed of the ministers of several neighbouring parishes, with a lay elder from each. A moderator is chosen by it for half a year: he must be a clergyman. The *synod* is formed of the lay and clerical members of two or more presbyteries. The *general assembly* is the highest ecclesiastical court. Its decisions are final. It consists of representatives chosen by the various presbyteries, royal burghs, and universities. The total number of members is 386, of which 218 are ministers. The assembly chooses a moderator annually; he is a clergyman. A nobleman is present at its meetings as representative of the sovereign, under the title of *lord high commissioner;* but he merely opens, closes, or dissolves its sittings. There are 82 presbyteries and 16 synods in Scotland, about 150 presbyterian congregations in England, 450 in Ireland, and upwards of 100 in our North American colonies. The presbyterians stand opposed to the *episcopalians*, the latter preferring the hierarchy of bishops, and to *congregationalists* or *independents*, who hold every *pastor* to be as a bishop or overseer of his own congregation, *independent* of any person or body of men.

PRESCRIP'TION (*præscriptio*, from *præscribo*, I write before: *Lat.*), in Law, a right and title to a thing grounded upon a continued possession. Prescription is *negative*, when it relates to realty or corporeal hereditaments; *positive*, when to incorporeal hereditaments. It is *personal* when it is in a man and his ancestors; if it is in right of a particular estate, it is termed prescription in *que* estate. Prescription supposes a grant, and therefore can exist with regard to those things only which can pass by grant. Uninterrupted possession for thirty, and, in many cases, for twenty years, gives this title; and unless the title have arisen from some agreement, it becomes absolute in sixty years. Prescription differs from *custom*, which is a local usage.——

Prescription, in Medicine, the formula of a remedy for a disease, and the manner of using it, as given by a physician.

PRESENTA'TION (*præsentatio*, a placing before: *Lat.*), in Ecclesiastical Law, the act of a patron offering his clerk to the bishop, to be instituted in a benefice of his gift. An advowson is the right of presentation. A patron may revoke his presentation before institution, but not afterwards.

PRESENT'MENT (*præsento*, I place before: *Lat.*), in Law, an information made by the jury in a court, before a judge who has jurisdiction in the matter. Properly speaking, it is the notice taken by the grand jury, of their own knowledge, without any bill of indictment at the suit of the king, of any offence, nuisance, libel, &c.

PRES'ENTS (*præsentes* literas, the writing under observation: *Lat.*), in the *plural*, is used, in Law, for the thing then actually made or spoken of—a deed of conveyance, a lease, or other written instrument; as in the phrase, 'Know all men by these *presents*;' that is, by the writing itself (*per præsentes*).

PRES'ENT TENSE (*præsens*: *Lat.*), in Grammar, the tense or form of a verb which expresses an action or being in the present time, as 'I am reading;' or something that exists at all times, as 'temperance is to be preferred to excess;' or which expresses habits or general truths, as plants *grow*, birds *fly*, dogs *bark*, &c.

PRESER'VE (*préserver*, to preserve: *Fr.*), a small enclosed place where game is kept

PRES'IDENT (*præsideo*, I sit foremost: *Lat.*), an officer appointed to preside over a corporation, company, or assembly of men; to keep order, manage their concerns, or regulate their proceedings. Also an officer appointed or elected to govern a province or territory, or to administer the government of a nation. A *vice-president* is one who is second in authority to the president, and performs the duties of president when the latter is disabled or absent.

PRESS (*presso*, I press: *Lat.*), a machine by which things are compressed. It acts by means of the screw, the pressure of fluids [see **Hydrostatic Press**], &c.; and is of various kinds, as a wine-press, a cheese-press, a printing-press, &c.

PRESS'-GANG, a detachment of seamen, under the command of an officer, empowered to impress men into the naval service.

PRESS'MAN, in Printing, a workman who manages the press and impresses the sheets.

PRESS'URE (*pressura*, a pressing: *Lat.*), the force of one body acting on another by weight or by the continued application of power. Pressure is occasioned by weight or gravity, by the motion of bodies, by the expansion of fluids, by elasticity, &c. The degree of pressure is in proportion to the weight of the pressing body, to the power applied, or to the elastic force of resisting bodies.

PRESTA'TION MONEY (*præstatio*, a payment: *Lat.*), a sum of money paid yearly by archdeacons and other dignitaries to their bishop; also purveyance.

PREST-MONEY,* called *earnest-money*, the sum given to a soldier at the time he enlists; so called because it binds the receiver to be ready for service at all times appointed.

PRESUMP'TIVE EV'IDENCE (*præsumo*, I take for granted: *Lat.*), in Law, that which is derived from circumstances that necessarily or usually attend a fact, as distinct from direct evidence or positive proof.

PRETERIMPER'FECT (*præteritus*, past; and *imperfectus*, unfinished: *Lat.*), in Grammar, the tense which expresses action as being carried on at a past time: as *legebam*, I was reading. It is called also the *imperfect* tense.

PRE'TERITE (*præteritus*, past: *Lat.*), in Grammar, the tense which expresses an action perfectly past or finished, but without a specification of time: as *scripsi*, I have written. It is called also the *perfect* tense.

PRETERI'TION (*præteritio*, a passing over: *Lat.*), in Rhetoric, a figure by which, while pretending to pass over anything, we make a summary mention of it; as, 'I will not say the prince is noble, or that he is as learned as he is accomplished,' &c. The most artful praises are those bestowed by way of *preterition*.

PRETERNAT'URAL (*præter*, more than; and *naturalis*, natural: *Lat.*), an epithet for those events in the physical world which are deemed extraordinary, but not miraculous; in distinction from events which are *supernatural*, which cannot be produced by physical laws or powers, and must therefore be due to the direct intervention of a superior Being.

PRETERPER'FECT (*præter*, beyond; and *perfectus*, complete: *Lat.*), in Grammar, an epithet equivalent to *preterite*; applied to the tense of verbs which expresses action or being absolutely past; as, *scripsi*, I wrote.

PRETERPLU'PERFECT (*præter*, beyond; *plus*, more; and *perfectus*, complete: *Lat.*), an epithet in Grammar, designating the tense of verbs which expresses action or being past, prior to another past event or time; as, *scripseram*, I had written.

PREVARICA'TION (*prævaricatio*, from *prævaricor*, I walk crookedly: *Lat.*), a deviation from the plain path of truth and fair dealing; a shuffling or quibbling to evade the truth or the disclosure of truth.

PREVEN'TIVE SER'VICE, an appellation for the duty performed by the armed police officers engaged to watch the coasts, for the purpose of preventing smuggling and other illegal acts. The men thus employed are termed the *coast guard*.

PRICE-CUR'RENT, in Commerce, a published list or enumeration of the various articles of merchandise, with their prices, the duties (if any) payable on them when imported or exported, and the drawbacks occasionally allowed upon their exportation.

PRIEST (*priester*: *Ger.*; from *presbuteros*, an elder: *Gr.*), according to the modern acceptation of the word, a person who is set apart or consecrated to the ministry of the

Gospel. In its most general sense, the word includes all orders of the clergy duly licensed according to the forms and rules of each respective denomination of Christians; but Protestants are accustomed to apply the word more especially to clergymen of the Roman Catholic persuasion.——In primitive ages, the fathers of families, princes, and kings, were priests. In the days of Moses, the office of priest was restricted to the tribe of Levi. The priesthood consisted of three orders, the high-priest, the priests, and the Levites; and the office was made hereditary in the family of Aaron.——Among pagans, priests were persons whose appropriate business was to offer sacrifices and perform other sacred rites.

PRI'MACY (*primatus*, from *primus*, first: *Lat.*), the chief ecclesiastical station or dignity. The Archbishop of Canterbury is *primate* of all England. The Archbishop of York is primate of England; words without meaning, as the provinces of the two are quite distinct.

PRI'MÆ VI'Æ (the first passages: *Lat.*), the Medical term for the whole alimentary duct, including the œsophagus, stomach, and intestines, with their appendages.

PRI'MAGE, in Commerce, a small duty payable to the master and mariners of a ship.

PRIMA'TES (*primatus*, the chief place: *Lat.*), in Zoology, the highest order of Mammals. It is divisible into six families:—1. *Anthropini*, containing man alone; 2. *Catarhini* or *Simiidæ*, containing the apes of the old world; 3. *Platyrhini* or *Cebidæ*, containing all the apes of the old world, except the Marmosets; 4. *Arctopithecini*, containing the Marmosets; 5. *Lemurini*, containing the Lemurs; 6. *Galeopithecini*, containing the flying Lemur alone, a form which almost touches the bats, which some naturalists also place amongst the Primates. There is here an extraordinary series of gradations, leading from the kings of the animal world down to a point which must be placed low amongst the vertebrates.

PRIME MOV'ERS, the sources whence power is obtained; as steam, electro-magnetism, &c.

PRIME NUM'BERS, in Arithmetic, those which cannot be divided by any whole number greater than unity, or less than themselves; thus, 5, 7, &c. They are termed *prime* because they may be conceived to exist before those formed from them by multiplication, and which are said to be *composite*. Numbers are said to be prime to each other when they have no common measure except 1.

PRIME VER'TICAL, in Astronomy, the vertical circle of the sphere which intersects the meridian at right angles, and passes through the east and west points of the horizon.

PRI'MING, the spray with which wet steam is charged in the boilers and cylinders of steam engines.——PRIMING, among Painters, the first colour laid on canvas, or on a building, &c.

PRIM'ITIVE (*primitivus*, the earliest: *Lat.*), in Grammar, a root or original word in a language, in contradistinction from *derivative*; thus, *God* is a primitive, *godly* a derivative.

PRIMOGEN'ITURE (*primogenitus*, first-born: *Lat.*), in Law, the right of the first-born, which with us is restricted to the inheritance of descendable honours, and of the whole of the real estate, in the absence of a testamentary disposition. The justice of the latter arrangement has been often contested. By the ancient custom of gavelkind, still preserved in Kent, primogeniture is disregarded, the paternal estate being equally divided among the sons. [See FEUDAL SYSTEM.]

PRIM'ROSE, a well-known plant, the *Primula veris* of botanists.

PRINCE (*Fr.*; from *princeps*: *Lat.*), a general title for sovereigns. Also, a title of honour, which with us is limited to the blood royal.

PRIN'CIPAL (*principalis*, original: *Lat.*), in Commerce, the sum due or lent, so called in opposition to *interest*.——In Law, the absolute perpetrator of a crime is called a *principal* in the first degree; a *principal* in the second degree is one who is present aiding and abetting; distinguished from *accessory*.

PRINCIP'IA, NEWTON'S, a work by Sir Isaac Newton, published in 1687, the full title of which is *Philosophiæ Naturalis Principia Mathematica*, that is, the mathematical principles of Natural Philosophy. The manuscript was presented to the Royal Society, in whose keeping it remains. It was ordered by that body to be printed, but the expense was borne by Halley the astronomer. This work, the greatest in the history of science, is divided into three books. The first deals with the laws of unresisted motion and attraction. The second treats of the laws of resisted motion, hydrostatics, and the motions of fluids. In the third book Newton showed the application of the results arrived at in the two preceding books to the system of the world. He here treats of gravitation, the motions of the planets and their satellites round their respective centres of gravity, the nature of their orbits, the lunar phenomena, the tides, the motions of comets, &c.

PRIN'CIPLE (*principium*: *Lat.*), in a general sense, the origin, source, or primordial substance of anything.——In Ethics, that which is believed, and serves as a rule of action or the basis of a system; as, the *principles* of morality, the *principles* of the Stoics, &c.——In Science, a truth admitted either without proof, or considered as having been before proved.

PRINT'ING (*empreinte*, an impression: *Fr.*), the art of taking impressions from wooden blocks, types, or plates, upon paper, silk, calico, or any other substance. It is that very important art, by means of which copies of books are multiplied, and consequently knowledge and science diffused among mankind. It is understood to have been practised at least fifty years before the Christian era, in China; but Chinese printing differs essentially from European, and the merit of rendering the art truly valuable to the human race belongs to him who first introduced *moveable* types. In their earliest essays Guttenburg, Faust, and Mentz all used wooden blocks, on which the letters were cut in the Chinese manner: and from the specimens that remain, it appears that they impressed only one side of the paper, and then pasted the blank faces of every two leaves together, to form but one, with print on either side. About the year 1450, they used single letters of wood; and at length, letters of metal. This last great invention is generally attributed to Schoeffer, first the servant, and afterwards the partner and son-in-law, of Faust. At the invention of the art, the character employed was the old Gothic or German, and the earliest printing was such a complete facsimile of the manuscripts which it copied, that, at the present day, it often requires the aid of chemistry to determine whether a given volume is a manuscript or a production of the press; particularly as the ornamental letters and the borders were filled in by hand, after the book was printed. The Roman type was first introduced by Sweynheim and Pannartz, at Rome; and the *Italic* by Aldus. The earliest complete Greek work was a grammar of that language, printed at Milan in 1476. The Pentateuch, which appeared in 1482, was the first work printed in the Hebrew character: and the earliest known Polyglott Bible—Hebrew, Arabic, Chaldaic, Greek, Latin—issued from the press of Genoa in 1516. The art of printing was first introduced into England by William Caxton, a native of Kent, who established a press in Westminster Abbey, some time between 1471 and 1474. Before the middle of the 16th century, printing had reached a flourishing condition in this country; for it is recorded that, in the reigns of Henry VIII. and his successors, English printers had become 'so skilful as to print books as well as any beyond the seas.' The art is not known to have existed in Scotland earlier than the year 1500; and we find that about fifty years subsequent to that time, it was introduced into Ireland. But it was not long before Scotland distinguished itself by the extent and beauty of its typographical productions; while Ireland can hardly be said to have advanced a step in the art of printing *books* till the beginning of the 18th century. The workmen by whom the art of printing is performed are of two kinds:—1. *Compositors*, who range and dispose the letters into words, lines, pages, and sheets; and, 2. *Pressmen*, who apply the ink and take off the impressions. Until a comparatively recent period, the printing press was formed chiefly of wood; and for the first essential modification of it the world is indebted to Earl Stanhope. The *Stanhope press* is composed entirely of iron; the table on which the types rest, and the platten (or surface which produces the impression) are made perfectly level; a beautiful combination of levers is added to give motion to the screw, causing the platten to descend with increasing force, till it reaches the type, when a very great power is obtained. Various other iron presses, more or less upon the principle of the 'Stanhope,' with such improvements as time and further experience suggested, were subsequently made; among which the ingenious inventions of Clymer, Ruthven, Cogger, and Cope deserve to be mentioned. They were all, however, constructed on the principle of a reciprocating, not a continuous motion: and it is a remarkable fact that from the invention of printing to the year 1798, a period of nearly 300 years, no important improvement was introduced into this art. A new era had, however, arrived, when the demands for prompt circulation of political intelligence required powers of printing newspapers beyond the reach of the most expeditious hand presswork; and at length the automatic printing machine struggled into existence. A mere outline of the improvements which have taken place since the commencement of the present century would occupy many pages. The great triumph in the art has, however, been the introduction of cylindrical machinery. The *suggestion* of this important change belongs to Mr. W. Nicholson, the able editor of the 'Philosophical Journal;' but the first *working* machines were erected by König, a Saxon, who was engaged for several years in this country in bringing his contrivances to perfection; and, at length, the reader of the *Times* was told, on Nov. 28th, 1814, that he held in his hand a newspaper printed by machinery, and by the power of steam. In these machines the type was made to pass under the cylinder, on which was wrapped the sheet of paper, the latter being held firmly in its place by means of tapes; the ink was placed in a cylindrical box, from which it was forced by means of a powerful screw depressing a tightly-fitted piston; thence it fell between two iron rollers; below these were placed a number of other rollers, two of which had, in addition to their rotary motion, an end motion—that is, a motion in the direction of their length—for the purpose of distributing the ink more uniformly; and the whole system of rollers terminated in two, which applied the ink to the types. This machine produced 1100 impressions per hour, and subsequent improvements raised the number to 1800. The next machine, also by König, was one that printed *both* sides of the sheet, by conveying it from one cylinder to another. This was made in 1815, and printed 1000 sheets on both sides per hour. In the same year Cowper obtained a patent for curving stereotype plates, for the purpose of fixing them on a cylinder. These machines, though only adapted for stereotype printing, first showed the best method of furnishing, distributing, and applying the ink by rollers. Applegarth and Cowper, by their conjoint ingenuity, superseded König's inventions; and constructed a number of machines, modified in twenty-five different ways, for printing books, bank-notes, newspapers, &c.; their greatest success has been in printing newspapers. In the *Times* machine constructed by them, the form passes under four printing cylinders, which are fed with sheets of paper by four boys, and after the sheets are printed they pass into the hands of four others; by this contrivance from 4600 to 5000 sheets per hour are printed on one side. But the machine used at present in that establishment for ordinary purposes is still more powerful. It consists of eight *vertical* cylinders, each carrying and printing its sheet of paper; and all of them printed on one side, by a single revolution of a central drum, which carries the type. One of these machines prints 11,000 and another 12,000 per hour; and 70,000 copies of the newspaper have been issued in one day. We shall conclude with a short description of Mitchel's composing and distributing machines, which are used in the printing works of Messrs. Spottiswoode & Co., and have been found highly effective: they complete the subservience of mechanism to printing, in all its details. Attempts have been made for some years past, in various parts of Europe, with different degrees of success, to construct such machines. It is clear that no composing machine can ever supersede the necessity of intelligence in connection with mechanism; for the combinations of the type in printing being practically infinite [see PERMUTATIONS and COMBINATIONS], they can never be provided for even in the most perfect. The composing machine very much resembles a grand pianoforte; the workman occupies the position of the player; each of the keys is marked with the letter with which it is in connection, and of which a sufficient number is contained in one of a set of nearly vertical grooves which have been filled with the respective letters by the distributing machine. When the workman touches a key, the required letter drops from its slide, and, falling on one of a system of travelling tapes which correspond in position to the strings of a piano, is carried to another travelling tape which runs along the sloping side of the machine, and which brings it to the end of the longest side, whence it is tilted into a long brass slide. The latter, when full, is removed for the purpose of adjusting the lines to the lengths required by the width of the intended page of the book. The *parallel* tapes just mentioned carry the types away from the workman, and when they arrive at the *oblique* tape, this carries them in a direction from his right towards his left hand. All the types, therefore, except that released by the key at his extreme left, are carried successively in two directions, that they may ultimately reach the same point, and be tilted from it. They must come to that point exactly in the order in which the workman touches the keys, so that in fact, were all the keys touched at once, all the letters thus liberated from the slides would arrive together at the tilting-point, however different the distances to be travelled over by them respectively. Effecting this constitutes the real ingenuity of the contrivance. It is done, first by diminishing the lengths of the parallel tapes, as the distance to be travelled over on the oblique tape increases. But as no modification of this kind can exactly equalize the sums of the distances to be travelled by the types liberated by the different keys, the excess, which gradually increases from left to right of the workman, is compensated by an increased velocity imparted to the motion of the oblique tape: so that types from all parts of the machine take exactly the same time to reach the tilting-point, and there will be exactly the same interval between the arrival of the different types successively liberated by the keys as between the points of time at which they are touched by the workman. The latter requires a little practice to become used to the machine, but it soon enables him greatly to exceed the hand-compositor in the amount of work which he does, so as soon to do without difficulty twice as much. Another advantage is, that one workman can 'justify'—that is, arrange the composed type in lines—while another works the keys. There are but forty keys, including all the types, &c., except those which are rarely used, and which, being in a case near the workman, can, when it is required, be easily conveyed by him to one of the parallel tapes. The distributing machine may be worked by a child. It consists of a round table, with slides radiating from the centre; the letters are carried round on the revolving frustum of a cone, being poised on notches which are placed variously in the different letters, and which allow them to assume such positions as will cause them, when during revolution they come into contact with the proper one of a series of offsets on an inclined plane beneath, to be tilted off into the radiating grooves which are intended to receive them respectively. Only one of the letters can be tilted off by any one of the offsets, which are passed by those letters with which they do not correspond; and thus all the letters are distributed successively into their proper grooves, whence they are removed with great facility to the respective vertical grooves of the composing machine. This machine distributes about 8000 types per hour: a workman in the ordinary way can distribute only about 5000 types per hour. The subordinate details of these machines are highly ingenious and effective, but would not be understood without illustrations; the general principles on which they act will, however, be sufficiently evident from what has been said.

PRI'OR (*Lat.*), the superior of a convent of monks; or the next in dignity to an abbot when there is one.

PRI'SAGE (*prise*, a taking: *Fr.*), an ancient right belonging to the crown of England, of taking two tuns of wine from every ship importing twenty tuns or more. This, by charter of Edward I., was changed into a duty of two shillings for every tun imported by foreign merchants; and called *butlerage*, because paid to the king's butler.

PRISCIL'LIANISTS, in Church History, a Christian sect, so called from their leader, Priscillian, a Spaniard by birth, and bishop of Avila. He was put to death A.D. 382, for heresy, on the accusation of a brother bishop, whose character is stated to have been disreputable, and with whom, there is reason to believe, it was enough to lead a life of purity and austerity to fall under the accusation of Priscillianism, which was considered to be identical with *Manichæism*. But the accusation of Manichæism was not unfrequently made at a later period, against those who merely denounced abuses and demanded a reformation of morals. His peculiar tenet was stated by his enemies to have been, that it is lawful to make false oaths in the support of one's cause and interest.

PRISM (*prisma*, from *prizo*, I saw: *Gr.*), in Geometry, a solid whose upper and lower bases are equal and similar figures, and whose lateral surfaces are plane parallelograms. If the bases are triangular, it is called a *triangular prism;* if square, a *quadrangular*, &c.——PRISM, in Dioptrics, a triangular glass body used in experiments regarding the nature of light and colours. The phenomena and uses of the prism arise from its separating the rays of light in their passage through its substance; and the doctrine it demonstrates is, that colours are original properties, inherent in light itself. The sun's rays transmitted through a prism to an opposite wall project an image tinted like a rainbow. Its colours are red, yellow, green, blue, and violet; and the whole phenomenon is explained upon the principle that the coloured rays, which were before mixed and blended together, are now, in virtue of their different refrangibilities, separated by refraction, in passing through the prism, so that each colour is placed by itself.

PRIVATEE'R (*privatus*, pertaining to an individual: *Lat.*), a ship of war owned and equipped by private persons at their own expense, but authorized by the government to seize or plunder the vessels of an enemy. The owners of privateers must bind themselves not to violate the stipulations of treaties made by their government, and not to misuse their prisoners. A ship fitted out and acting as a privateer without being licensed or commissioned by government, is a *pirate*. It is manifestly proper that the severest restrictions on privateering should be enforced. The wish to amass plunder is the only principle by which men in such circumstances are actuated; and hence it would be idle to suppose that they will be very scrupulous about abstaining from excesses.

PRIV'ATIVE (*privativus*, denoting privation: *Lat.*), in Grammar, a prefix to a word which changes its signification, and gives it a contrary sense. Thus *un* and *in*, as *unwise*, *inhuman*.

PRIV'ET, in Botany, a well-known shrub of the genus *Ligustrum*, nat. ord. *Oleaceæ*. The *evergreen privet* is of the genus *Rhamnus*, nat. ord. *Rhamnaceæ*.

PRIV'ILEGE (*privilegium:* from *privus*, separate; and *lex*, a law: *Lat.*), in Law, some peculiar benefit granted to certain persons or places, contrary to the usual course of the law, or beyond the advantages enjoyed by other citizens. Thus the nobles of Great Britain have the *privilege* of being tried by their peers only; and members of parliament have the *privilege* of exemption from arrest in certain cases.

PRIV'Y-COUN'CIL (*privé*, private: *Fr.*), in British Polity an executive body, with whose assistance the crown issues proclamations, which, if not contrary to law, are binding on the subject. It is summoned on a warning of forty-four hours, and is never held without the presence of a secretary of state. The members of the privy-council are styled *right honourable*. Anciently, the *privy-council* was a high court of justice; but it does not in modern times interfere with judicial matters, confining itself to the executive branch of government. It has, however, an appellate jurisdiction from all parts of the British dominions, except Great Britain and Ireland; and appeals from certain courts are intrusted to a judicial committee of the privy-council.

PRIV'Y-SEAL (same *deriv.*), a seal affixed, by the lord-keeper of the privy seal, to instruments which afterwards pass the great seal.——The word *privy-seal* is also used elliptically for the person intrusted with the privy-seal: he is the fifth great officer of state in England, and a member of the cabinet.

PRO AND CON, i.e. *pro* and *contra* (*Lat.*), for and against; a phrase frequently occurring in common parlance.

PRO CONFES'SO (as a thing admitted: *Lat.*), in Law, a term applied to a defendant in chancery who appears and is afterwards in contempt for not answering; in which case the matter contained in the bill is taken *pro confesso*, that is, as though it had been confessed.

PRO'A, a vessel used in the South Seas, with the head and stern exactly alike, but with the sides differently formed; that intended for the lee side being flat, the other rounded. To prevent oversetting, the proa is furnished with what is called an outrigger, from the windward side.

PROBABIL'ITY (*probabilitas*, from *probabilis*, capable of proof: *Lat.*), that state of a question which falls short of moral certainty, but inclines the mind to receive it as the truth. Demonstration produces certain knowledge, and *probability* opinion. If the chance that a thing may happen is less than the chance that it may not happen, it is said to be probable; and the methods of obtaining the numbers which express these variable chances constitute what is termed the *science of probabilities.*——In mathematical language, probability has a definite signification. Suppose that seven balls, four black and three white, are placed in an urn: the probability of drawing any particular ball is $\frac{1}{7}$, and the probability of drawing a black is four times as great, that is, $\frac{4}{7}$. The probability will remain the same as long as the ratio between the colours is unchanged; for, if there are seventy balls, forty black and thirty white, the chance of drawing a black will be $\frac{40}{70}$ which is the same as $\frac{4}{7}$. If the probability relates to *simultaneous events*, it is also easily calculated: thus the chance of throwing two aces with two dice. The chance of throwing an ace with one of them by itself is $\frac{1}{6}$, and with the other by itself, $\frac{1}{6}$; therefore, with both together, it is $\frac{1}{6}$ of $\frac{1}{6}$, that is, $\frac{1}{36}$. The same reasoning would hold with three or more events. If the probability relates to *successive events*, the calculation is similar: thus, the probability of throwing an ace twice successively. The probability of throwing it the first time is $\frac{1}{6}$, and the second time also $\frac{1}{6}$; but, at both times, it is $\frac{1}{6}$ of $\frac{1}{6}$, that is, $\frac{1}{36}$. Of course, the probability of throwing it neither time is $\frac{5}{6}$ of $\frac{5}{6}$, that is, $\frac{25}{36}$.——PROBABILITY, as applied to human life, is founded on tables of mortality, and serves as the foundation of societies which, for certain annual premiums, varied according to age, &c., undertake to pay certain sums to the executors of the party whose life is insured.

PRO'BATE (*probo*, I prove: *Lat.*), in Law, the official proof of the genuineness and validity of a will; or the exhibition of the will to the proper officer, and such other proceedings as the law prescribes as preliminary to its being carried into effect by the executor. *Probate* of a will is now obtained in the court of probate; the will which has been proved is deposited in that court, and a copy on parchment is made out under its seal and delivered to the executors.

PROB'LEM (*problēma*, from *proballo*, I put forward: *Gr.*), in Algebra, a question or proposition which requires something unknown to be investigated, and the truth of the result demonstrated.——In Geometry, a proposition in which some operation or construction is required; as to bisect a line or an angle, &c.——In Logic, a proposition that appears neither absolutely true nor false, and consequently may be asserted either in the affirmative or negative.——In a general sense, a *problem* may be defined, any question involving doubt or uncertainty, and requiring some operation or further evidence for its solution.

PROBOS'CIS, the trunk or snout of an elephant, being a prolongation of the nose.——The oral instrument of the *Diptera*.——The oral apparatus of certain gasteropods, which is so long as to be capable of being protruded to some distance from the body. The mouth is at the end.

PROCATARX'IS (*prokatarxis*, from *prokatarcho*, I begin first: *Gr.*), in Medicine, the predisposing cause of a disease; the *procatarctic* cause.

PRO'CEEDS (*procedo*, I am derived from: *Lat.*), in Commerce, the money raised by the sale of goods.

PROCELLA'RIA (*procella*, a violent storm: *Lat.*), in Ornithology, a genus of oceanic birds. [See PETREL.]

PROC'ESS (*procès*: *Fr.*; from *processus*, a going forwards: *Lat.*), in Law, the whole course of proceedings in any cause, civil or criminal, from the original writ to the end of the suit. In a more limited sense, *process* denotes that by which a man is first called into any temporal court. *Original process* is the means taken to compel the defendant to appear in court. *Mesne process* is, strictly speaking, that which issues, at the commencement of a suit or during its progress, upon some collateral or interlocutory matter. It is usually applied only to writs under which parties are arrested. *Final process* is the process of execution.——PROCESS, in Anatomy, any protuberance, eminence, or projecting part of a bone.——PROCESS, in Chemistry, the whole course of an experiment or series of operations, tending to produce something new.

PRO'CHRONISM (*pro*, before; and *chronos*, the time: *Gr.*), an error in chronology, when events are dated anterior to the time at which they happened.

PROCLAMA'TION (*proclamatio*: *Lat.*), a public notice or declaration of anything in the name of the prince or supreme magistrate. To issue a proclamation is a prerogative of the sovereign; and it is binding on the subject, so far as it is grounded on, and enforces, the laws of the land. It is of two kinds: one enforcing an actually existing law, the other exercising an extraordinary but dormant power in the king. It is held that the sovereign may, by a proclamation, suspend or dispense with existing laws, in particular circumstances.——PROCLAMATION, a solemn declaration of war and peace; and the act of notifying the accession of a prince to the throne. Also, the public declaration used at the calling of a court, and for various other objects.

PROCON'SUL (*Lat.*: from *pro*, instead of; and *consul*, a consul), a Roman magistrate sent at the close of his consulship (though sometimes without his having been consul) to govern a province, with consular authority. The proconsuls were appointed from the body of the senate, and their authority expired at the end of a year; but it might be prolonged, as was done in the case of Cæsar. In the time of the republic, the proconsul held both the military command and the civil jurisdiction of his province. Before the proconsul quitted Rome, he went up to the Capitol, offered sacrifice, put on the robe of war called *paludamentum*, and then departed from the city in pomp, preceded by lictors with rods and axes, and attended by his friends to some distance from Rome. His equipage, consisting of pavilions, horses, mules, clerks, secretaries, &c., was called his *viaticum*, and was provided at the public expense.

PROC'TOR (contracted from *procurator*, a manager: *Lat.*), a person employed to manage another's cause in a court of civil or ecclesiastical law; as in the court of admiralty, or in a spiritual court. His duty is similar to that of a solicitor or attorney in other courts.——Also an officer in the universities of Oxford and Cambridge.

PROCUM'BENT (*procumbens*, bending down: *Lat.*), in Botany, trailing; an epithet applied to a stem which is unable to support itself, and therefore lies on the ground, but without putting forth roots.

PROCURA'TION (*procuratio*, literally the averting by a sacrifice: *Lat.*), in Law, a composition paid by an incumbent to the bishop or archdeacon, to commute for the entertainment which was to have been given him at his visitation.——Also, the instrument by which a person is empowered to transact the affairs of another.

PROCURATO'RES (managers: *Lat.*), under the Roman emperors, officers sent into the provinces to regulate the public revenue, receive it, and dispose of it as the emperor directed. Such an officer was Pontius Pilate in Judæa; but, since the Jews were looked upon as a rebellious people, besides his authority over the revenue, he was invested with all the power of a proconsul, even that of life and death.——**PROCURATORES**, in the Roman courts of judicature, were properly such lawyers as assisted the plaintiff in proving, or the defendant in clearing himself from, the matter of fact alleged. They are often confounded with the *advocates*, but were equivalent to our *attorneys*.

PRO'CYON, a star of the first magnitude in the constellation of the Lesser Dog; it is the α *Canis Minoris* of astronomers.

PROD'UCE (*produco*, I make: *Lat.*), in an enlarged sense, is what any country yields from labour and national growth; which may serve either for the use of the inhabitants, or be exported to foreign countries. In a more limited sense, we speak of the *produce* of a farm, of a mine, of a tax, &c; but, when we allude to a work either of nature or art, we use the word *production*.

PRO'DUCT (*productus*, formed by prolongation: *Lat.*), in Arithmetic and Algebra, the number or quantity produced by multiplying two or more quantities together, as $5\times4=20$, $a\times b=ab$: 20 and ab are the products required.

PRODUC'TIVE LA'BOUR, that which increases the number or amount of consumable products; opposed to *unproductive labour*. The labour of the farmer and mechanic is productive; the labour of officers and professional men is unproductive to the state

PROEMPTO'SIS (*pro*, before; and *empipto*, I fall in: *Gr.*), in Astronomy, the addition of a day every 330 years, and another every 2400, to prevent the new moon happening too soon. The opposite is *metemptosis*, which see.

PROFES'SION (*professio*: *Lat.*), a word which, when applied to a person's vocation or employment, designates an occupation not merely mechanical. We say, the learned *professions*; the *profession* of a clergyman, a lawyer, a physician, a surgeon, a lecturer, or a teacher. In like manner, we use the word *professional* when speaking of literary and scientific studies, pursuits, or duties.

PROFES'SOR (*Lat.*), one who publicly teaches any science or branch of learning in a university or college, as a professor of natural history, of mathematics, of theology, &c. In a university, some professors are denominated from the arts they profess, others from the founders of the professorships, or those who assigned a revenue for the support of the professors.

PRO'FILE (*profil*: *Fr.*), in general, the view of an object from one of its sides.——**PROFILE**, in Architecture, the outline of a figure, building, or member; also the draft of a building, representing it as if cut down perpendicularly from the roof to the foundation.——**PROFILE**, in Sculpture and Painting, a head, portrait, &c., represented sideways, or in a side view. On almost all medals, faces are represented in profile.

PROF'IT AND LOSS, in Commerce, the gain or loss arising from goods bought and sold; the former of which, in book-keeping, is placed on the creditor's side, the latter on the debtor's. *Net profit* is the gain made by selling goods at a price beyond what they cost the seller, and beyond all costs and charges.

PROFLU'VIA, in Medicine, morbid excretions of mucus from the nostrils, and parts connected with them.——Also, dysentery, with a morbid excretion of mucus from the bowels.

PROG'NATHOUS (*pro*, before; *gnathos*, a jaw: *Gr*), a term applied to skulls, such as those of negroes, which have the profile of the face inclined by reason of the front part of the jaws projecting much beyond the forehead; opposed to *orthognathous*. 'Draw a line on a globe,' says Prof. Huxley, 'from the Gold Coast in Western Africa to the steppes of Tartary. At the southern and western end of that line there live the most dolicocephalic, prognathous, curly-haired, dark-skinned of men, the true negroes. At the northern and eastern end of the same line there live the most brachycephalic, orthognathous, straight-haired, yellow-skinned of men, the Tartars and Calmucks. The two ends of this line are ethnological antipodes.'

PROGNO'SIS (*prognōsis*, a perceiving beforehand: *Gr.*), in Medicine, the method of foretelling the event of a disease by particular symptoms. Hence the word *prognostic*, a sign or symptom indicating the way in which a disease will progress or terminate

PRO'GRAMME (*programma*: *Gr.*), a detailed account or advertisement of some public performance. In a university, a billet or notice to invite persons to an oration.——In Classical Antiquity, an edict posted in some public place.

PROGRES'SION (*progressio*, a going forwards: *Lat.*), in Arithmetic, a series of numbers increasing or decreasing by a certain law In an *arithmetical* progression, they increase or decrease by a *common difference*; thus, 3, 5, 7, 9, &c., where the common difference is 2. In a *geometrical* progression they increase by a *common ratio* or multiplier, or decrease by a common divisor: thus, 3, 9, 27, 81, &c., where the common ratio is 3. In any three consecutive terms of an *harmonical* progression, the first is to the third as the difference between the first and second is to the difference between the second and third.

PROJEC'TILE FORCE (*projectus*, thrown to a distance: *Lat.*), the force with which a cannon-ball or missile is thrown: being modified by the action of gravity, it occasions the body to describe a curve line. The velocity of a musket-ball is, on an average, 1600 feet per second, and its range half a mile. In velocities exceeding 1600 feet per second, the resistance of the air is greatly increased; hence the absurdity of giving balls too great an initial velocity. To give a bullet the velocity of 2000 feet per second, requires half as much more powder as to give it the velocity of 1600 feet; yet, after both have moved 400 feet, the difference between the velocity of each is reduced to 8 feet per second. A 24-pound ball moving at the rate of 2000 feet per second, meets with a resistance of 800 pounds.

PROJEC'TILES (same *deriv.*), in Mechanics, that branch which treats of the motion of bodies thrown or driven from the surface of the earth by an impelling force, and affected by gravity and the resistance of the air. Not taking the latter into account, the path of a projectile can be shown to be a parabola; but, when a body moves with considerable velocity, the resistance of the air becomes very serious. Some anomalous circumstances occur in experiments with artillery; thus, balls are frequently driven to the right or left, as if acted on by a lateral force; and sometimes, without any apparent cause, the range is much shorter than at others, &c.

PROJEC'TION (*projectio: Lat.*), in Architecture, the prominency of columns, &c., beyond the level of the wall.——PROJECTION OF THE SPHERE, a representation of the circles on the surface of the sphere, upon a plane surface. There are three principal kinds of projection: the *stereographic*, the *orthographic*, and the *gnomonic*; and to these may be added the *globular*, on which is founded the construction of the *globular chart*. [See these terms.]

PROLEGOM'ENA (things to be said previously: *Gr.*), introductory or preliminary remarks or dissertations, prefixed to a book or treatise.

PROLEP'SIS (*prolēpsis*, from *prolambano*, I take beforehand: *Gr.*), a figure in Rhetoric, by which the speaker anticipates or prevents objections, by alluding to or answering them himself.

PROLEP'TIC (*prolēptikos*, anticipating: *Gr.*), in Medicine, an epithet applied to a periodical disease, whose paroxysm returns at an earlier hour every time, as is frequently the case in agues.

PROLIF'EROUS (*proles*, offspring; and *fero*, I bear: *Lat.*), in Botany, prolific. A *proliferous stem* is one which puts forth branches only from the centre of the top, or which shoots out new branches from the summits of the former ones, as the pine and fir. A *proliferous umbel* is a compound one which has the smaller umbels divided.

PROLIFICA'TION (*proles*, offspring; and *facio*, I make: *Lat.*), in Botany, the production of a second flower from the substance of the first, either from the centre of a simple flower, or from the side of an aggregate one.

PRO'LOGUE (*prologos*, from *prolego*, I say beforehand: *Gr.*), in Dramatic Poetry, an address to the audience previous to the commencement of the play, delivered by one of the performers. It may be in either prose or verse, but is generally in the latter; and it usually consists of apologetic remarks on the merits of the piece about to be represented. Sometimes it relates to the situation in which the author or the actors stand to the public.

PROLU'SION (*prolusio*, from *proludo*, I play beforehand: *Lat.*), in Literature, a term formerly applied to certain pieces or compositions made previously to others, by way of prelude or exercise.

PROM'ISSORY NOTE (*promissum*, a promise: *Lat.*), a writing or note of hand, promising the payment of a certain sum at a certain time, in consideration of value received by the promiser.

PROM'ONTORY (*promontorium:* from *pro*, in front of; and *mons*, a mountain: *Lat.*), in Geography, a high point of land or rock, projecting into the sea; the extremity of which is called a *headland*.

PRONA'TION (*pronus*, inclined downwards: *Lat.*), in Anatomy, that motion of the radius by which the palm of the hand is turned downwards; opposed to *supination*.

PRO'NOUN (*pro-nomen*, instead of a noun: *Lat.*), in Grammar, a declinable part of speech which, being used instead of a noun, prevents the repetition of it. Pronouns are *personal* when they simply denote the person, as *I*, *thou*, *he*, &c.; *possessive*, when they also denote possession, as *my*, *thine*, *his*, &c.; *relative*, when they express a relation to something going before, as *who*, *which*; *interrogative*, when they serve to ask a question; *demonstrative*, when they point out things precisely, as *this*, *that*. They are also, and more accurately, divided into *substantive*, or personal; and *adjective*, which include all the others.

PROOF (*prouver*, to prove: *Fr.*; from *probo*: *Lat.*), in Logic, that evidence which convinces the mind of the certainty of a proposition, and produces belief. *Proof* differs from *demonstration*, being derived from personal knowledge or conclusive reasoning; whereas the term demonstration is applicable only to those truths of which the contrary is inconceivable.——In Printing and Engraving, a *proof* is a rough impression taken for correction.

PROOF SPIRIT, a mixture of equal weights of absolute alcohol and water. The spec. gravity of such a mixture is 0·917, but the density of commercial proof spirit is 0·930.

PROPAGANDA (*propago*, I propagate: *Lat.*), a term applied during the French revolution to secret societies, whose object was the propagation of democratical principles; and it has since come to signify any kind of institution for making proselytes for political objects. The name was originally given to those institutions which were erected by the papal court for the extension of its own power and the Roman Catholic religion among those who were not within its pale. It was called the *Congregatio de Propaganda Fide* (Society for Propagating the Faith), and was founded by Gregory XV. in 1622.

PROP'ER (*propre*: *Fr.*; from *proprius*, peculiar: *Lat.*), in Heraldry, an epithet for any charge which is to be represented in coat-armour in its own tincture or natural colours.

PROP'ERTY (*proprietas: Lat.*), a particular virtue or quality which nature has bestowed on some things exclusive of all others. Thus, colour is a *property* of light; extension, figure, divisibility, and impenetrability are properties of bodies, &c.——LITERARY PROPERTY can be secured only for a limited time; and many consider it unreasonable that the productions of manual labour should rank higher in the scale of rights than the nobler productions of the intellect.

PROPH'ET (*prophētēs*, from *prophēmi*, I say beforehand: *Gr.*), in general, one who foretells events. Among the canonical books of the Old Testament are the writings of sixteen prophets, four of whom are denominated the 'greater prophets,' viz. Isaiah, Jeremiah, Ezekiel, and Daniel, who were so called from the length or extent of their writings, which exceed those of the others. The 'lesser prophets' are Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zechariah, and Malachi. Jonah, the earliest of the prophets, lived about 800 years B.C.; and Malachi, the latest, about 400 B C.

PROPHYLAC'TIC (*prophulaktikos*, precautionary: *Gr.*), in Medicine, an epithet for whatever preserves or defends against disease.

PROPITIA'TION (*propitiatio*, from *propitio*, I appease: *Lat.*), in Theology, an atonement or sacrifice offered to God to assuage his wrath, and render him propitious. Among the Jews there were both ordinary and public sacrifices, offered by way of thanksgiving; and extraordinary ones, offered by particular persons guilty of any crime, by way of *propitiation.*——PROPITIATION, a feast among the Jews, celebrated on the 10th of the month Tisri, in commemoration of the divine pardon proclaimed to their forefathers through Moses, who, as God's agent, remitted the punishment due to the crime of their worshipping the golden calf.

PROPI'TIATORY (*propitiatorium*, a means of atonement: *Lat.*), or MERCY-SEAT, the cover or lid of the ark of the covenant, lined within and without with plates of gold. It is said to have been a type of Christ.

PRO'POLIS (*Gr.: from pro*, in front of; and *polis*, a city), a thick odorous substance having some resemblance to wax, and used by bees for stopping the holes and crevices in their hives, to prevent the entrance of cold air, &c.

PROPOR'TION (*proportio: Lat.*), in a general sense, the relation of any one thing to another.——PROPORTION, in Mathematics, an equality of ratios; but the term is sometimes improperly used for *ratio.* The *arithmetical* ratio between two quantities consists in their difference: thus, the arithmetical ratio between 6 and 4 is 6 − 4, or 2. And four quantities constitute an *arithmetical proportion* when they form two ratios having equal differences: thus, 8 is to 6 as 4 is to 2, or more briefly 8 : 6 : : 4 : 2; because 8 − 6 = 4 − 2. The *geometrical* ratio between two quantities consists in their quotient; thus, the geometrical ratio between 4 and 7 is $\frac{4}{7}$. And four quantities constitute a *geometrical proportion*, when they form equal ratios, that is, two fractions having equal quotients: thus, 8 : 4 : : 6 : 3, because $\frac{8}{4} = \frac{6}{3}$. Quantities form an harmonic proportion when, of three numbers, the first is to the third as the difference of the first and second is to the difference of the second and third. Thus, 2, 3, 6, are in harmonical proportion; for 2 is to 6 as 1 is to 3. The *rule of proportion* enables us, when three terms of a geometrical proportion are given, to find the fourth. If more gives more, the proportion is said to be *direct;* if more gives less, and *vice versâ*, it is said to be *inverse*—but improperly, as only the mode of *stating* is affected by these circumstances. 'If 5 men build 20 yards of a wall in a week, how many yards would 7 men build?' is an example of the *direct* rule; for, the more men, the more yards of the wall they will build. But 'If 5 men build a wall in a week, how many days would 9 men require?' is an example of the *indirect:* since, the greater the number of men, the less time they require to perform a certain work.

PROPOSIT'ION (*propositio*, from *propono*, I point out: *Lat.*), in Logic, the part of an argument in which some quality, negative or positive, is attributed to a subject; as, 'man is mortal,' 'war is dreadful.'——In Mathematics, a statement in terms of either a truth to be demonstrated, or an operation to be performed. It is called a *problem* when something is to be done; and a *theorem* when something is to be proved.

PROPRÆ'TOR (*proprætor*, a vice-prætor: *Lat.*), a Roman magistrate, who, having discharged the office of prætor at home, was sent into a province to command there with his former prætorial authority. [See PROCONSUL.]

PRO RA'TA (*pro rata parte*, in a fixed part: *Lat.*—proportionally), in Commerce, a term sometimes used by merchants, for *in proportion*; as, each person must reap the profit or sustain the loss *pro rata* to his interest, that is, in proportion to his stock.

PRO RE NA'TA (*Lat.*), according to exigencies or circumstances: a phrase commonly used in medical prescriptions.

PROROGA'TION (*prorogatio*, from *prorogo*, I prolong: *Lat.*), a term used at the conclusion of a session of parliament, denoting its continuance from one session to another; as an *adjournment* is a continuation of the session from day to day.

PROSCE'NIUM (*Lat: from proskēnion: pro*, in front of; and *skēnē*, the scene: *Gr.*), in the Grecian and Roman theatres, the stage or place before the scene, containing the *pulpitum*, into which the actors came from behind the scenes to perform. In the modern theatre, it is the frontispiece, or part where the drop-scene separates the stage from the audience, and beyond the orchestra.

PROSCRIP'TION (*proscriptio*, from *pro-*

scribo, I publish in writing: *Lat.*), a punishment in use among the Romans, which had some analogy to our outlawry. The names of the *proscripti*, or persons proscribed, were posted up in tablets at the forum, that they might be brought to justice, a reward being promised to those who took them, and a punishment denounced against those who concealed them. Under the triumvirate many of the best Roman citizens fell by it. Cicero was slain in the proscription agreed upon by Octavius, Antony, and Lepidus.

PROSECU'TION (*prosecutus*, pursued: *Lat.*), in Law, the commencement and carrying on of a suit in a court of law or equity; or the process of exhibiting formal charges against an offender before a legal tribunal, and pursuing them to final judgment.——The person who institutes and carries on a criminal suit is called the *prosecutor*.

PROS'ELYTE (*prosēlutos*, literally one who has arrived at a place: *Gr.*), a new convert to some religion, system, or party. Thus a pagan converted to Christianity is a *proselyte;* and, although the word primarily refers to converts to some religious creed, we speak familiarly of *proselytes* to philosophical theories, &c.

PROSENNEAHE'DRAL (*pros*, beside; *ennea*, nine; and *hedra*, a base: *Gr.*), in Crystallography, having nine faces, on two adjacent parts of a crystal.

PROS'ODY (*prosōdia: Gr.*), that part of Grammar which treats of quantity, accent, and the laws of versification.

PROSONOMA'SIA (*Gr.*, from *prosonomazo*, I call by name), a figure in Rhetoric, in which allusion is made to the similarity of sound in several names or words.

PROSOPOLEP'SY (*prosōpolēpsia:* from *prosōpon*, a person; and *lēpsis*, a seizing: *Gr.*), a word used by some writers on ethics to express a premature opinion or prejudice against a person, formed in consequence of his external appearance.

PROSOPOPŒ'IA (*prosōpopoïïa:* from *prosōpon*, a person; and *poieo*, I make: *Gr.*), a figure in Rhetoric, in which qualities or things inanimate are personified and addressed, as if endowed with human form and sentiments.

PROSPEC'TUS (a view: *Lat.*), the outline or plan of a literary work, containing the general subject or design, with the necessary particulars as to the mode of publication. The word *prospectus* has recently been adopted in announcing many undertakings and schemes not literary.

PRO'STYLE (*prostulos:* from *pro*, in front of; and *stulos*, a column: *Gr.*), in Architecture, a range of columns in the front of a temple.

PROTA'SIS (*Gr.*, from *proteino*, I stretch out in front), in the ancient Drama, the first part of a comic or tragic piece, in which the several members of the *dramatis personæ* were shown, and the subject or plot entered on. It is opposed to the *epitasis*, or part where the plot thickens.

PROTEA'CEÆ (*Proteus*, in Mythology, remarkable for his power of assuming different shapes), in Botany, a natural order of exogenous shrubs and trees, natives chiefly of the Cape of Good Hope and Australia. The flowers are apetalous. The great diversity of appearance presented by the genera suggested the name of the order. The principal genera are *Leucadendron* (to which the Silver tree of the Cape of Good Hope belongs), *Protea*, *Grevillea*, *Hakea*, *Banksia*, and *Dryandra*. The order affords little that is useful to man.

PROTEC'TOR (*protego*, I defend: *Lat.*), in English History, a title assumed at various times by those who seized the regal power, without adopting its name: first by Richard, Duke of York, in 1453: next by the Duke of Somerset, in 1548; and then by Cromwell, in 1653. The last was nominally, but not really, succeeded by his son.

PROT'EST (*protestor*, I declare in public: *Lat.*), a formal and solemn declaration of opinion, given in writing, commonly against some act: as, the *protest* of lords in parliament; or the formal and recorded dissent of a minority against the majority of any public body.——PROTEST, in Commerce, a formal declaration made by a notary public at the request of the holder of a bill of exchange, on account of the non-payment of it, against the drawer and others concerned; and a demand of the exchange, charges, damages, and interest. It is written on a copy of the bill, and notice of it is given to the indorser, by which he becomes liable for the amount with charges and interest. There is also another kind of *protest*, which is a writing attested by a justice of the peace or consul, drawn by the master of a vessel, stating the circumstances through which his ship has suffered, and showing that the damage was not occasioned by his misconduct or neglect.

PROT'ESTANT (same *deriv.*), a name first given in Germany to those who adhered to the doctrine of Luther, because, in 1529, they protested against a decree of the emperor Charles V. and the diet of Spires, declaring that they appealed to a general council. This name was afterwards extended to the Calvinists, and is now common to all who belong to the reformed churches. The great principles upon which all protestants, however they may differ in other respects, agree, are the right of private judgment, and the rejection of any infallible head of the church or ultimate authority in pope or council. Protestants differ among themselves as to whether the Bible alone is to be taken both as a rule of faith and its own interpreter, or the opinions of the fathers of the first three centuries also are to be appealed to. [See REFORMATION.]

PRO'TEUS, in Mythology, a marine deity, whose distinguishing characteristic was the faculty of assuming different shapes. Hence we denominate one who easily changes his form or principles a *Proteus*.——In Zoology, a genus of amphibia, including the *Proteus anguinus*, an aquatic animal which possesses both lungs and permanent gills. Sir Humphry Davy, who saw one of them in a lake in the beautiful grotto of Maddalena, at Adelsburg, in Illyria, thus describes it: 'At first you might suppose it to be a lizard, but it has the motions of a fish. Its head, and the lower part of its body, and its tail, bear a strong resemblance to those of the eel; but it has no fins; and its curious branchial organs are not like the gills of fishes; they form a singular vascular (net-like) structure, almost like a crest, round the throat, which may be removed without occasioning the death of the animal, which is likewise furnished with lungs. With this double apparatus for supplying air to the blood, it can live either below or above the surface of the water. Its fore feet resemble hands, but they have only three claws or fingers, and are too feeble to be of use in grasping or supporting the weight; the hinder feet have only two claws or toes, and in the larger specimens are found so imperfect as to be almost obliterated. It has small points in place of eyes, as if to preserve the analogy of nature. It is of a fleshy whiteness and transparency in its natural state; but when exposed to light, its skin gradually becomes darker, and at last gains an olive tint. Its nasal organs appear large; and it is abundantly furnished with teeth, from which it may be concluded that it is an animal of prey; yet, in its confined state, it has never been known to eat, and it has been kept alive for many years, by occasionally changing the water in which it was placed.'

PROTHON'OTARY (*proto-notarius*, first notary: *Lat.*: from *prōtos*: *Gr.*, and *notarius*: *Lat.*), a title which had its origin in the Byzantine empire.——An officer in the court of king's bench, and also in that of common pleas, until changes were made in these courts.——*Apostolical prothonotaries*, in the church of Rome, are twelve persons constituting a college, who receive the last wills of cardinals, are employed in the proceedings necessary for the canonization of saints, &c.

PROT'OCOL (*prōtos*, first; and *kolla*, glue: *Gr.*), the first draft of a deed, contract, or instrument. The word is generally applied to such writings as are of a diplomatic character.

PRO'TOMARTYR (*proto-martūr*: *Gr.*), a designation given to Stephen, the first Christian martyr; and used also for the first sufferer in any cause, religious or political.

PRO'TOPOPE, the imperial confessor, an officer of the holy directing synod, the supreme spiritual court of the Greek church in Russia. [See POPE.]

PROTOSUL'PHATE, in Chemistry, the combination of sulphuric acid with a protoxide.

PRO'TOTYPE (*prōto-tupos*: *Gr.*), an original or model after which anything is formed.

PROTOX'IDE, in Chemistry, a substance combined with oxygen in the first degree.

PRO'TOZOA (*prōtos*, first; *zōon*, animal: *Gr.*), a sub-kingdom of animals comprising the lowest forms of the kingdom. They are all aquatic, and the majority are of minute size. They may be divided into six groups, viz.:—1. *Rhizopoda*, including FORAMINIFERA. 2. POLYCYSTINA. 3. *Spongiadæ* [see SPONGES]. 4. *Thalassicollidæ*. 5. *Gregarinidæ*. 6. INFUSORIA. All except the last group are destitute of distinct organs; and, as the *Infusoria* possess a mouth and digestive apparatus, and have power to move rapidly, it is not improbable that hereafter they may cease to be classed with the *Protozoa*, of which many of the forms are of such low organization that they have frequently been placed in the vegetable kingdom.

PROVEDO'RE (*proveditore*: *Ital.*), a purveyor, or one employed to procure supplies for an army.

PROVEN'ÇAL, a corrupted form of Latin employed in France during the middle ages, and much used for poetical purposes. There were two dialects, both corruptions of the Latin: the Langue d'Oil, ancient northern French, of which the lately discovered song of Eulalia, written before the tenth century, is a specimen; and the Langue d'Oc, employed in the south of France, of which the song of Boethius, usually attributed to the tenth century, is the earliest example. The river Loire was the boundary between these two dialects. It was the latter, or Langue d'Oc, which was called Provençal, and this was the dialect employed by the Troubadours, whilst the Trouvères used the Langue d'Oil.

PROV'ENCE or PROV'INCE ROSE, a gardener's name for a tribe of cultivated roses, known also as cabbage roses, of which the *Rosa centifolia*, which has been found wild in the Caucasus, is the parent. The moss rose is one of the numerous varieties.

PROV'ERB (*proverbium*: *Lat.*), a pithy sentence in common use, embodying or applying a truth of practical value. A proverb has been styled the wisdom of many, and the wit of one. Every country has its proverbs, and amongst the quaintest are those of Spain, of which Sancho Panza made abundant use.——In Dramatic Literature, chiefly French, a short piece, in which some proverb or popular saying is made the foundation of the plot.——BOOK OF PROVERBS, a canonical book of the Old Testament, containing a great variety of wise maxims, practical truths, and excellent rules for the conduct of all classes of men. The first twenty-four chapters are attributed to king Solomon; the five succeeding chapters are a collection of several of his proverbs, made by order of king Hezekiah; and the last two bear the names of different authors.

PROV'INCE (*provincia*: *Lat.*), among the Romans, a country of considerable extent, which, being reduced under their dominion, was new modelled according to the pleasure of the conquerors, subjected to the command of annual governors sent from Rome, and obliged to pay such taxes and contributions as the senate thought fit to demand. Provinces had the appellation of *consular* or *prætorian*, according as they were governed by consuls or prætors.——Among the moderns, a country belonging to a kingdom or state, either by conquest or colonization, usually situated at a distance from the kingdom or state, but more or less dependent on and subject to it. Such are Canada, Novia Scotia, &c., in reference to Great Britain.——PROVINCE, in Geography, a division of a kingdom or state, comprising several cities, towns, &c., all under the same government, and usually distinguished by the extent either of the civil or ecclesiastical jurisdiction.——In the ecclesiastical division of England, there are two *provinces*, viz. those of Canterbury and York, under the jurisdiction of their respective archbishops.

PROVIN'CIALISM (*provincialis*, pertaining to a province: *Lat.*), a mode of speech peculiar to a province or district remote from the mother country or from the metropolis.

PROVIS'IONAL, intended for present need or for a temporary occasion; as, a *provisional* government, a *provisional* treaty, &c.

PROVI'SO (it being provided: *Lat.*), or CONDITION, in Law, an article or clause in a statute, deed, or writing, limiting something that has gone before, or introducing a condition. It usually begins, 'Provided that.'

PROV'OST (contracted from *præpositus*, placed first: *Lat.*), in a general sense, a person who is appointed to preside over or superintend; as, the *provost* of a college. ——PROVOST, in Scotland, is equivalent to our mayor; and the chief magistrates of Edinburgh and Glasgow are termed *Lord Provost*. [See UNIVERSITY.]

PROVOST-MARSHAL of an army, an officer appointed to arrest and secure deserters and other criminals, to execute the sentences of courts-martial, to hinder the soldiers from pilfering, to regulate weights and measures, &c. There is a similar officer in the royal navy, who has the charge of prisoners taken at sea.

PROW (*prōra: Gr.*), in Nautical language, the beak or pointed cutwater of a galley, &c. The upper part is usually furnished with a grated platform. Also, the fore-part of a ship.

PROX'IMATE CAUSE (*proximus*, the nearest: *Lat.*), that which immediately precedes and produces the effect, as distinguished from the *remote* or *predisposing* cause.

PROX'Y (contracted from *procuracy*—from *procuratio*, a taking charge of: *Lat.*), one who acts as a substitute for another. ——In England, any member of the house of lords may commission another peer to vote for him as his *proxy* in his absence. Proxies cannot be used when the house is in committee, nor can a proxy sign a protest. No peer can hold more than two proxies.

PRUD'HO'MME (*Fr.; from prudens homo*, a prudent man: *Lat.*). Tribunals in France during the middle ages, composed of citizens acting as arbiters of disputes, inspectors of police, &c., were termed *councils of prud'hommes*. A court of this kind was reestablished at Lyons in 1806.

PRU'NING, in Horticulture, the lopping off the superfluous branches of trees, either to improve their appearance, or to cause them to bear better fruit.

PRU'NUS (*Lat.*), in Botany, a genus of plants belonging to the natural order *Rosaceæ*, including the plum (*Prunus domestica*), the sloe (*P. spinosa*), the cherry-laurel (*P. Laurocerasus*), and other species.

PRURI'GO (*Lat.*), in Medicine, a cutaneous disease, in which there is itching, and an eruption of small pimples. The term is applied to irritation caused in various parts of the body from vermin, worms, &c.

PRUS'SIAN BLUE, a pigment of a beautiful blue colour, a combination of iron and cyanogen. Good Prussian blue is known by the following tests: it feels light in the hand, adheres to the tongue, has a dark, lively, blue colour, and gives a smooth deep trace; it should not effervesce with acids, which it will do, if adulterated with chalk, nor become pasty with boiling water, which will be the case when adulterated with starch. It is obtained from organic matters abounding in nitrogen, and is used in calico-printing.

PRUS'SIATE, in Chemistry, a salt formed by the union of prussic or hydrocyanic acid with different bases. Thus, the *prussiate* of potash, which is much used as a test for various metals, particularly iron.

PRUS'SIC A'CID, in Chemistry, one of the deadliest poisons known. It is a compound of cyanogen and hydrogen, hence also called *hydrocyanic acid*. When even moderately strong, its fatal effects are so rapid, that it is impossible to prevent them by any antidote. The smallest quantity of the pure acid applied to the eye of a cat, &c., causes instantaneous death. If there is the least hope of saving one who has swallowed it, a solution of chlorine, which decomposes it, should be administered; also ammonia, which both combines with it and acts as a stimulant. It is a narcotic; and, given with great caution, it may be used as a powerful sedative and anti-irritant, especially in whooping-cough. It is this acid that gives a peculiar flavour to the kernels of peaches and bitter almonds and the leaves of the cherry laurel.

PRYTANE'UM (*prutaneion*, from *prutanis*, a president: *Gr.*), in Grecian Antiquity, the senate-house in Athens, where the council of the *prytaneis*, or committee of fifty, assembled, and where those who had rendered any signal service to the commonwealth were maintained at the public expense.

PSALM (*psalma*, from *psallo*, I play a stringed instrument: *Gr.*), a divine song or hymn. The term is chiefly appropriated to the hundred and fifty *Psalms of scripture*, a canonical book of the Old Testament. The Psalms were called by the Jews *Thehillim* (praises), and were divided by them into five books, ending respectively with the 40th, 71st, 88th, 105th, and last. Most of them have a particular title, signifying either the name of the author, the person who was to set it to music or sing it, the instrument that was to be used, or the subject and occasion of it. Some have imagined that David was the sole author of the Book of Psalms; but the titles of many of them prove the contrary. Some of the psalms were apparently written by Solomon ; a few belong to the reigns of the kings immediately succeeding him ; and several to the mournful days of the Babylonish captivity, and of the return, especially those headed 'For the sons of Korah,' most of which are probably by the same author. Finally, a few belong to the age of the Maccabees.

PSAL'TERY (*psaltērion*, a stringed instrument: *Gr.*), a musical instrument used by the Hebrews, the form of which is not known. It is supposed to have resembled both the harp and the lyre.

PSAM'MITE (*psammos*, sand: *Gr.*), in Mineralogy, a species of micaceous sandstone.

PSEUDEPIG'RAPHY (*pseudēs*, false ; and *epigraphē*, an inscription : *Gr.*), the assigning to an author works which he did not write, to secure for them a wide circulation and an undeserved authority. It was carried by the Christians of the fourth and following centuries to a great extent ; and hence it is extremely difficult to distinguish the spurious works of the fathers from the true.

PSEU'DO (*pseudēs*, false : *Gr.*), a prefix used in the composition of many words, to denote *false* or *spurious ;* as, a *pseudo*-prophet, or false prophet, &c.

PSEUDOBLEP'SIS (*pseudēs*, false ; and *blepo*, I see: *Gr.*), in Medicine, a defect of vision, in which specks, network, colours, and imaginary bodies, float or dance before the eyes. Distorted and double vision are its most ordinary accompaniments. Sometimes it depends on nervous irritation ; at others, on organic derangement.

PSEUDODIP'TERAL (*pseudēs*, false ; and *dipteros*, having a double peristyle : *Gr.*), in Architecture, a building in which the distance from each side of the cell to the columns on the flanks is equal to two intercolumniations, the intermediate range of columns being omitted.

PSEUDOISODO'MUM (*pseudēs*, false ; and *isodomos*, built in equal courses : *Gr.*), in Ancient Architecture, masonry in which the height, thickness, and length of the courses are different.

PSEU'DO-METAL'LIC (*pseudo-metallikos : Gr.*), in Mineralogy, an epithet for a kind of lustre, which is perceptible only when held towards the light.

PSEUDOMORPH'OUS (*pseudēs*, false; *morphē*, shape : *Gr.*), a term applied to a mineral which owes its form to some extraneous cause, not to crystallization.

PSEU'DOSCOPE (*pseudēs*, false; and *skopeo*, I view : *Gr.*), a name given to the stereoscope when employed to produce 'conversions of relief.' The pseudoscope consists of two reflecting prisms, placed in a frame with adjustments, so that, when applied to the eyes, each eye may separately see the reflected image of the projection which usually falls on that eye. The instrument being directed to an object, and adjusted so that the object shall appear of its proper size and at its usual distance, the distances of all other objects are inverted, all nearer objects appearing more distant, and all more distant objects nearer; and it constitutes the conversion of relief.

PSIT'TACUS (*Lat.; from psittakos : Gr.*) [See PARROT.]

PSO'AS MUS'CLE (*psoai*, the loins : *Gr.*), a large muscle, on the fore part and sides of the lumbar vertebræ. Its use is to bend the thigh forward, and assist in turning it outwards.

PSYCHOL'OGY (*psuchē*, the soul; and *logos*, a discourse: *Gr.*), the doctrine of the nature and properties of the soul; or a treatise upon it. In a more extended sense, it is *mental philosophy*.

PSY'CHOMANCY (*psuchē*, the soul; and *manteia*, prophecy: *Gr.*), a kind of divination, in which the spirits of the dead were supposed to appear and communicate desired information.

PTAR'MIGAN (*tarmachan: Gael.*), the *Lagopus mutus*, called also the *white grouse*. It is the smallest species of British grouse. The colour of its plumage is a pale brown or ash, elegantly marked with dusky spots or minute bars; the bill is black, and the belly and wings are white. It is occasionally seen on the summits of mountains in Scotland, but it has ceased to be an inhabitant of England. It is abundant in the northern parts of Scandinavia, whence a great number are sent to the English markets.

PTERODAC'TYLUS (*pteron*, a wing; and *daktulos*, a finger: *Gr.*), a genus of reptiles whose remains have been found in oolitic strata. They were flying lizards, the bones of the fore legs being much elongated, and connected by skin with the hind legs, as amongst the bats.

PTEROP'ODA (*pteron*, a wing; *poda*, feet: *Gr.*), a class of mollusca which live in the open sea both of the tropics and colder latitudes, affording food to whales and sea birds. The chief characteristic by which they are separated from other mollusca is the possession of a pair of fins, one at each side of the mouth or neck. Their shells, when present, are glassy and translucent, differing greatly in shape. The northern *Clio*, the chief food of the right-whale, is a pteropod.

PTOLEMA'IC SYS'TEM, the system of astronomy invented by Claudius Ptolemæus, a celebrated astronomer and mathematician of Pelusium, in Egypt, who lived in the beginning of the second century of the Christian era. It supposes that the earth is fixed in the centre of the universe, and that the sun, moon, planets, and stars revolve around it, from east to west, once in twenty four hours. This theory was received for ages; astronomers having no notion of any other system but that of which our sun is the centre, nor of any other world but the earth on which we live. They imagined that all the fixed stars were contained in one concave sphere, and that the *primum mobile* was circumscribed by the empyreal heaven, the blissful abode of departed souls. [See ASTRONOMY.]

PTY'ALISM (*ptualismos*, from *ptualon*, spittle: *Gr.*), in Medicine, an unnatural or copious flow of saliva; *salivation*.

PUBES'CENCE (*pubescens*, downy: *Lat.*), in Botany the hairy or downy substance growing on certain vegetable productions: hence a *pubescent* plant.

PUB'LICAN (*publicanus: Lat.*), among the Romans, a farmer of the taxes and public revenues. The inferior members of this class were looked upon as oppressors, and were consequently regarded by the Jews and other tributary nations with no small degree of detestation.——Under the modern term of *publicans* are comprised inn-keepers, hotel-keepers, alehouse-keepers, keepers of wine vaults, &c.

PUB'LICIST (*publicus*, pertaining to the state: *Lat.*), a writer on the laws of nations.

PUD'DING-STONE, a conglomerate, consisting of oblong and rounded pebbles of flint, about the size of almonds, imbedded in a hard siliceous cement. The pebbles are usually black, and the cement a light yellowish brown. It is capable of receiving a very high polish, and is used in ornamental works. It is found chiefly in Essex.

PUDD'LING, a process in the manufacture of iron effected by stirring the melted metal with an iron rod in order to bring it into contact with the air and free it from carbon.

PUER'PERAL FE'VER (*puerperus*, pertaining to childbirth: *Lat.*), in Medicine, a fever attended by peritoneal inflammation, which comes on about the third day after delivery. It is a dangerous disease, is most common in the autumn, and seems infectious. It sometimes assumes a typhoid character.

PUG MILL, an apparatus used in the preparation of clay, with a view to increase its plasticity and fit it for manufacture into earthenware, bricks, and other articles.

PU'LEX (*Lat.*), the flea. [See FLEA.]

PUL'LEY (*poulie: Fr.*), one of the six mechanical powers, consisting of a small wheel with a grooved edge and turning on an axis.

PUL'MONARY or PULMON'IC (*pulmo*, the lungs: *Lat.*), pertaining to the lungs; as, a *pulmonary* disease.

PULSE (*pulsus*, a beating: *Lat.*), a motion of the blood-vessels, produced by the alternate dilatation and contraction of the arteries, arising from the impulse given to the blood by the action of the heart. The average rate of pulsation in a healthy infant, for the first year, is from 120 to 108 strokes per minute; for the second year, from 108 to 90; for the third, from 100 to 80; from the seventh to the twelfth, about 70. In febrile diseases, the pulse sometimes reaches to 140, and is then difficult to count. Its range in a healthy adult is between 60 and 80; but it is extremely capricious, and is modified by slight mental affections, indigestion, &c., so that the peculiarities of individuals must be carefully considered before conclusions can be drawn from it. Certain modifications of it are termed *hard*, *soft*, *full*, *wiry*, &c.——PULSE, in Botany, the seed of leguminous plants, as beans, peas, &c.

PULSE GLASS, a tube about a quarter of an inch in diameter, and five or six inches long, with a bulb at each end; and about half filled with spirit of wine, the air having been carefully removed from it before it was hermetically sealed. When held in an inclined position, one of the bulbs being grasped in the hand, the expansion of the vapour which is generated there, and afterwards condensed at the other end, causes the liquid to rise and fall in the tube—to *pulsate*; a snapping noise being produced.

PUL'VINATED (*pulvinatus*, cushion-shaped: *Lat.*), an Architectural term, expressive of a swelling in any portion of an order; as, for example, in the modern Ionic frieze.

PU'MA, the *Felis concolor*, a rapacious quadruped, called sometimes the American lion. When mature it is about five feet long and of a fawn colour. It ranges from the forests under the equator to Tierra del Fuego. It preys on horses, cattle, deer, and other wild animals, usually springing upon the shoulders and pulling the head back by one of its paws, until the vertebræ are broken. After eating its fill, says Darwin, the puma covers the carcass with large bushes, and lies down to watch it. This habit is often the cause of its being discovered; for the condors whirling in the air every now and then descend to partake of the feast, and, being angrily driven away, rise all together on the wing. It is then known that a 'lion' is watching its prey, and men and dogs hurry to the chase. It is described as being very crafty; when pursued it turns on its former track, and then, suddenly making a spring on one side, waits there until the dogs have passed by.

PUM'ICE-STONE (*pumex: Lat.*), a porous volcanic product, composed chiefly of silica and alumina, with traces of potash, soda, and oxide of iron. It floats on water, is hardly acted on by the acids, and may probably be looked on as stony froth. It is found in almost all volcanic countries; and is known to be produced especially by Etna, Vesuvius, and Hecla, during the eruptions of which it is thrown up in great abundance. It is used for polishing ivory, wood, marble, metals, glass, &c., as also skins and parchment.

PUMP (*pompe: Fr.*), an hydraulic engine for raising water by exhausting the incumbent air from a tube or pipe; in consequence of which, the water rises in the tube by means of the pressure of the air on the surrounding water. There are *suction-pumps*, *forcing pumps*, *air-pumps*, &c. A *chain-pump* consists of a chain which is furnished with a sufficient number of flat pistons at proper distances; these, working on two wheels, pass down through one tube and up through another, carrying up the water along with them. The chain-pump is well adapted for ships; it acts merely mechanically, and is not liable to be choked by sand, &c.

PUMP'KIN or POM'PION, the fruit of plants belonging to the genus *Cucurbita*, nat. ord. *Cucurbitaceæ*, which see.

PUN, a play upon words, the wit of which depends on the resemblance between the sound and syllables of two or more words, which have different and even opposite meanings. [See PARONOMASIA.]

PUNCTUA'TION (*punctum*, a point: *Lat.*), in Grammar, the discriminating use of certain marks adopted to distinguish the clauses of a period; sometimes with reference to the sense, and at others to the grammatical construction. Thus, a full point (.) closes a perfect sentence; a colon (:) divides parts of a sentence, separated by semicolons; a semicolon (;) distinguishes the more important members of a sentence, as when one is an inference from, qualification, illustration, or explanation of another; and a comma (,) separates parts subordinate to the semicolon. A paragraph, which may include several periods, includes a branch of the subject or argument. A question is indicated by (?); an exclamation by (!); and it is sometimes convenient to include a collateral circumstance in a parenthesis ( ). There are other marks not so easily defined. The ancients were scarcely acquainted with *punctuation*.

PUNCTURA'TION (*punctura*, a pricking: *Lat.*), in Surgery, a piercing of the skin, &c., with needles, to relieve the painful diseases arising from tension, obstruction, &c.

PUN'DIT, in Hindostan, a learned Brahmin; one versed in the Sanscrit language, and in the science, laws, and religion of the country. The term is used ironically with us, to designate one who makes a show of learning without possessing its reality.

PU'NIC, pertaining to the Carthaginians, or their language; as the *Punic wars*, contests carried on between the Romans and Carthaginians for more than three centuries, and which ended in the destruction of Carthage, B.C. 147.——Also, a term implying treacherous, deceitful; as *punic* faith.

PUN'ISHMENT (*punio*, I punish: *Lat.*), the infliction of pain or personal suffering, according to law, for crimes; intended as an example to deter others, and a means of correcting the offender

PUN'KAH, an apparatus employed in India to cause the air to circulate through the rooms of the houses and thereby keep down the temperature.

PU'PA (a puppet: *Lat.*), in Entomology, the second stage of an insect's life, intermediate between the maggot or larva and the perfect insect. In the case of butterflies the names of chrysalis and aurelia are given to this metamorphosis. In the pupa state the insect is covered with a tough skin which more or less conceals the organs; and it remains quite helpless, without power to move, until the time arrives for its next metamorphosis, when it becomes the complete insect. When the larva is about to change its form, it seeks out some place of concealment, sometimes in the earth, and often about walls. Some species attach themselves by a few threads to their hiding-place; others envelope themselves entirely in a cocoon of silk. The length of time for continuing in this mummy-like condition varies with the species; but in this country most insects pass the winter in the pupa form.——PUPA, a genus of small land snails; so called from their resemblance to the *pupa* of an insect.

PU'PIL (*pupula*, literally a *dim.* of *pupa*, a puppet: *Lat.*), in Anatomy, the round aperture in the middle of the iris. It is so called because it reflects the diminished image of the person who looks into it.

PUPIP'ARES (*pupa*; and *pario*, I bring forth: *Lat.*), a term applied to insects, such as the *Hippobosca equina*, or forest fly, which bring forth their young in the condition of a *pupa* or *nymph*.

PUPIV'ORES (*pupa*; and *voro*, I devour: *Lat.*), a tribe of hymenopterous insects, comprehending those of which the larvæ live parasitically in the interior of the larvæ and pupæ of other insects.

PURA'NAS. These are metrical compositions in Sanscrit, embracing a collection of legends and traditions touching the origin and history of the holy places of India, or of the religious sects. They were intended to be read publicly to the people assembled at great festivals. The existing Puranas have been formed out of much older compositions, which have been lost.

PURGA'TION (*purgatio*, from *purgo*, I make clean: *Lat.*), the act or operation of clearing oneself of a crime; a mode of trying persons accused of any crime, which was formerly in practice.

PUR'GATORY (*purgatorius*, cleansing: *Lat.*), a supposed place or state after death, where, according to the Roman Catholics, the souls of the faithful are purified from the sins which they carry with them out of this life, before they are admitted to a state of perfect bliss. It is assumed to differ from hell in little except that its pains are not eternal, and that they may be shortened, or even terminated, by masses, indulgences, &c.

PURIFICA'TION (*purificatio*, from *purifico*, I make clean: *Lat.*), the act or operation of cleansing ceremonially, by removing any pollution or defilement. Purification by washing was common to the Hebrews and to pagans; and the Mohammedans always use it previous to devotion.

PU'RIM, among the Jews, the *feast of lots*, instituted to commemorate their deliverance from the machinations of Haman.

PU'RITAN, a name formerly given to dissenters from the church of England, who professed to follow the pure word of God, in opposition to all traditions and human institutions.

PUR'LIN, in Architecture, a piece of timber extending from end to end of a building or roof, across and under the principal rafters, to support them in the middle.

PUR'PURA (purple: *Lat.*), in Medicine, an eruption of small purple specks and patches, produced by extravasation of blood under the cuticle.——In Zoology, the generic name of the univalve gasteropod which secretes the purple fluid that formed the base of the Tyrian dye.

PUR'PURE (*pourpre*, purple: *Fr.*), in Heraldry, one of the five colours of armorial bearings, compounded of gules and azure, bordering on violet. It is represented in engraving by diagonal lines from right to left.

PUR'PURIC A'CID, in Chemistry, an acid produced by the action of nitric upon uric acid. It forms, with most bases, a deep red or *purple* compound.

PUR'SER, in the Navy, an officer on board a man-of-war, whose principal duty is to keep the ship's accounts; but who takes charge of the provisions, and attends to their preservation and distribution among the officers and crew.

PUR'SUIVANT (*poursuivant: Fr.*), in Heraldry, the lowest order of officers at arms. The pursuivants are properly attendants on the heralds when they marshal public ceremonies. They are a kind of probationers, in the heralds' college, and are styled *Portcullis*, *Rouge Dragon*, *Blue Mantle*, and *Rouge Croix*.

PUS (*Lat.*), the white or yellowish matter issuing from a sore, which usually precedes the healing; and in such cases is termed healthy or good pus. Examined in a microscope, it is found to consist of globules, and a transparent colourless fluid. Its specific gravity is greater than that of water; exposed to heat, it evaporates to dryness, but does not coagulate.

PUT'CHOCK, the root of a plant that grows abundantly in Sinde. When burned, it yields a thin smoke, and a grateful and diffusive smell. The Chinese beat it into a fine powder, which they burn as incense in the temples of their gods.

PUTREFAC'TION (*putrefacio*, I make rotten: *Lat.*), the spontaneous decomposition of organic substances, accompanied by the evolution of fœtid and noxious gases. It is a species of *fermentation*. Animal matter, containing more nitrogen, gives rise to more offensive products than vegetable: unless nitrogen is present, putrefaction will either not take place, or it will progress very slowly. Most animal substances generate ammonia or ammoniacal compounds: the other results of putrefaction are various combinations of hydrogen, particularly carburetted hydrogen, along with complicated and dangerous compounds, in some of which sulphur and phosphorus are present; all of them, however, are decomposed and rendered harmless by chlorine. The production of putrefaction requires a number of conditions: it cannot take place without a certain temperature, and hence does not occur below the freezing point; it requires moisture, and hence is prevented by substances that absorb or remove water, which explains the efficacy of salt, sugar, alcohol, &c.; it is prevented also by those—such as the tanning principle—which form new combinations with the organic matter: it requires access of oxygen, and, therefore, exclusion of the air prevents it. Vitality hinders putrefaction: as soon as the body or a part of it dies, *mortification*, that is, putrefaction, sets in. The ancient Egyptians seem to have been well acquainted with many of the means required to prevent putrefaction, as is proved by their mummies remaining perfect for so many hundred years.——*Antiseptic processes.* In curing provisions, the ordinary means employed are, drying, smoking, salting, and pickling. Grain of all kinds, as well as flour, may be kept for an indefinite length of time, if they are kiln-dried, put up in vessels or chambers free from damp, and excluded from the air. Well-dried grain is not liable to the depredations of insects. Fruits may be preserved in various ways. Pears, apples, plums, &c., should be gathered in a sound state, altogether free from bruises, and plucked in dry weather before they are fully ripe. One mode of preservation is to expose them in an airy place, to dry a little, for eight or ten days, and then to lay them in dry sawdust or chopped straw, spread upon shelves in a cool apartment, so as not to touch each other. Another method consists in surrounding them with fine dry sand in a vessel which should be made air-tight and kept in a cool place. Herbs, cabbages, &c., may be kept a long time in a cool cellar, provided they are covered with dry sand. Tuberose and other roots are preserved better in an airy place where they may dry a little without being exposed to the winter's frost. A partial drying is given to various vegetable juices by evaporating them to the consistence of a syrup, called a *rob;* in which so much of the water is dissipated as to prevent them from running into fermentation. The fruits are to be crushed, and squeezed in bags to expel the juices; which must then be inspissated either over the naked fire, or in a water or steam bath, in the air or *in vacuo:* sometimes a small proportion of spices is added, to prevent mouldiness.

PUT'TY (*potée: Fr.*), a kind of cement, made of whiting and linseed-oil ground together into a paste, which is used by glaziers in fastening the panes of glass, and by painters in stopping crevices.——Also, a fine cement, made of lime only, used by plasterers; it differs from *fine stuff* in containing no hair.

PUZZOLA'NO, a volcanic rock, yielding an excellent cement, which resists moisture. It is found at *Puzzuoli*, near Naples, &c.

PYC'NITE (*puknos*, compact: *Gr.*), in Mineralogy, the *schorlous topaz:* it usually appears in long irregular prisms or cylinders, longitudinally striated, and united in bundles.

PYC'NOSTYLE (*puknostulos:* from *puknos*, close; and *stulos*, a column: *Gr.*), in Ancient Architecture, a species of building in which the columns stand very close to each other, only one diameter and a half of the column being allowed to each intercolumniation.

PYG'MY (*pugmaios*, from *pugmē*, a measure of length—the distance from the elbow to the knuckles, about 13½ inches: *Gr.*), an appellation given by the ancients to a fabulous race of beings, said by some authors to have lived in India, by others in Ethiopia, &c., and to have waged perpetual war with the cranes, by whom they were ultimately destroyed. The fable, no doubt, had its origin in the stunted growth of particular races, on account of a severe climate or great privations. The term *pygmy* is now restricted to a species of ape, the *Simia Troglodytes*, and to a *dwarf*.

PYLO'RUS (*pulōros*, from *pulē*, an entrance; and *ouros*, a guard: *Gr.*), in Anatomy, the right or lower orifice of the stomach, which is connected with, and, as it were, guards the entrance into the intestines.

PY'RACIDS (*pur*, fire: *Gr.*), acids, generated by that process of decomposition which several vegetable acids undergo when subjected to the action of heat. Thus, gallic acid, in such circumstances, yields *pyrogallic acid;* tartaric acid, *pyrotartaric acid*, &c.

PYRAL'LOLITE (*pur*, fire; *allos*, another; and *lithos*, a stone: *Gr.*), a mineral which undergoes various changes of colour when heated. It is greenish, and occurs both massive and in crystals.

PYR'AMID (*puramis: Gr.*), a solid body standing on a triangular, square, or polygonal base, and terminating at the top in a point termed the apex. Its lateral surface consists of three or more plane triangles. The *Pyramids of Egypt* are noble monuments of Egyptian grandeur. They are forty in number, and are situated near Memphis. The largest is 480 feet in height, that is, 43 feet higher than St. Peter's at Rome, and 136 feet higher that St. Paul's in London. It covers more than thirteen acres, and, if solid, would contain more than three million cubic yards of stone, that is, six times as much as what is contained in Plymouth breakwater. According to the information given by the priests to Herodotus, 100,000 men were twenty years constructing it.

PYRAM'IDOID (*puramis*, a pyramid; and *eidos*, form: *Gr.*), in Geometry, a solid figure, formed by the rotation of a semi-parabola about one of its ordinates. It is called also a *parabolic spindle*.

PYR'ENITE, a mineral of a greyish-black colour, found in the Pyrenees, and considered as a variety of *garnet*.

PYRETOL'OGY (*puretos*, a fever; and *logos*, a discourse: *Gr.*), the doctrine of fevers; or a treatise on their nature, effects, &c.

PYRI'TES (*purites*, from *pur*, fire: *Gr.*), in Mineralogy, sulphurets of copper and iron. *Copper pyrites* is the principal ore of copper, and *iron pyrites* is a most abundant ore of iron; it is of a brass-yellow colour. Iron pyrites, exposed to the air, particularly when heated, absorbs oxygen, and yields sulphate of iron or *green vitriol*. These minerals have obtained their name either from igniting spontaneously, or because they are sufficiently hard to strike fire with steel. They occur massive, disseminated, and frequently crystallized.

PYRO-ACET'IC SPI'RIT, in Chemistry, a liquid obtained by subjecting to dry distillation the acetates of copper, lead, alkalis, and earths. It is very combustible, and burns with a brilliant flame, without smoke. It is used for dissolving the gum-resins with which the bodies of hats are stiffened, and is now called *acetone*, which see.

PYROLIG'NEOUS A'CID, in Chemistry, an acid obtained from beech and other woods by destructive distillation. It is a liquid of the colour of white wine, of a strongly acid and slightly astringent taste. It is an antiseptic, and serves instead of wood smoke, of which it is the most active constituent, for preserving animal substances. It is an impure acetic acid, or vinegar.

PYROL'OGY (*pur*, fire; and *logos*, a discourse: *Gr.*), the natural history of heat; or a treatise on that subject.

PYROM'ALATE, in Chemistry, a compound of pyromalic acid and a salifiable base.

PYROMAL'IC A'CID, in Chemistry, a substance obtained from the distillation of malic acid.

PYROM'ETER (*pur*, fire; and *metron*, a measure: *Gr.*), an instrument for measuring high temperatures, or degrees of heat above those indicated by the mercurial thermometer. Wedgewood's pyrometer consists of porcelain, and is founded on the principle that clay progressively contracts in its dimensions in proportion as it is exposed to higher degrees of heat. But its indications cannot be depended on, since they are due not only to the temperature to be tested, but to that at which the porcelain was originally baked. If made at a very high temperature, all the water will be driven off, and it will contract no further, whatever the heat to which it may be subsequently exposed. Other kinds of pyrometers have been used, but one of unquestionable excellence has not yet been invented.

PYRO'PHANE (*pur*, fire; and *phaino*, I make to appear: *Gr.*), a mineral which, in its natural state, is opaque, but by means of heat is rendered transparent.

PYROR'THITE (*pur*, fire: *Gr.;* and *orthite*), a scarce mineral, resembling *orthite* in appearance; but is very different in reality, for it burns in the flame of the blow-pipe like charcoal, whereas orthite melts.

PY'ROSCOPE (*pur*, fire; and *skopeo*, I examine: *Gr.*), an instrument for measuring the intensity of heat radiating from a fire.

PYRO'SIS (*purōsis*, from *puroō*, I burn: *Gr.*), a disease of the stomach, which causes a burning sensation, and the throwing up of a quantity of saline or sour fluid. It is a variety of *heartburn*, and is termed also *waterbrash*, and *blackwater*.

PYROS'MALITE (*pur*, fire; *osmē*, an odour; and *lithos*, a stone: *Gr.*), a Swedish mineral of a brown or greenish colour, occurring in six-sided prisms, of a lamellar structure. It is a native subchloride of iron; and, when heated, exhales the odour of chlorine.

PYROSO'MA (*pur*, fire; and *sōma*, a body: *Gr.*), the generic name of certain compound *ascidians*, animals allied to the mollusca. These ascidians form a hollow cylinder 10 to 12 inches long, which is only met with in the open ocean. The *Pyrosoma* is remarkable for the brilliant light which it emits.

PY'ROTARTARIC ACID, in Chemistry, is formed by subjecting crystallized tartaric acid to destructive distillation, or of cream of tartar. Its salts are termed pyrotartrates.

PY'ROTECHNY, or PYROTECH'NICS

(*pur*, fire; and *technê*, an art: *pur*, fire; and *technikos*, artistic: *Gr.*), the art of constructing fireworks intended to be let off on the ground, in the air, or under water. The materials principally employed consist of nitre, sulphur, and charcoal; with the addition of substances to produce colour, &c. Iron filings give bright red and white sparks. Copper filings impart a greenish tint to the flame: zinc, a fine blue; sulphuret of antimony, a less greenish blue, and much smoke; amber, colophony, or common salt, a yellow. Lamp-black, with gunpowder, gives a red, but with nitre in excess, a pink colour; and is used also to produce golden showers. Yellow sand, or glistening mica, communicate to fireworks a golden radiation; verdigris, sulphate of copper, and sal ammoniac, each a shade of green. Camphor gives a very white flame, and an aromatic odour. Some other substances are used to mask a bad smell. Lycopodium seed gives a rose-colour and splendid flame; it is used in theatres to represent lightning, &c.

PY'ROXENE, in Mineralogy, *augite*. According to some mineralogists, it is a general term under which augite, diallage, and hypersthene rank as varieties of the same species.

PYROXYL'IC SPIR'IT (*pur*, fire; and *xulon*, wood: *Gr.*), one of the products of the destructive distillation of wood. It is inflammable, burning with a blue flame, and may be used instead of alcohol in lamps, being often sold for the purpose, under the name of wood naphtha. When rectified, its spec. grav. is 0·804; it boils at 150°. [See METHYL.]

PYRRHO'NIANS, or PYRR'HONISTS, a sect of ancient philosophers, so called from Pyrrho, a native of Elis, in Peloponnesus, who flourished about 300 years B.C. Their opinions are known only through their enemies, and they are said to have been so sceptical as not to put even so much confidence in the senses as was necessary for the preservation of life. But this is refuted by their founder having lived to the age of ninety. They were believed to be always in search of truth without ever acknowledging that they had found it; hence the art of disputing upon all things, without ever going further than suspending our judgment, is called *pyrrhonism*.

PYTHAGORE'ANS, a sect of ancient philosophers, so called from being the followers of Pythagoras of Samos, who lived in the 6th or 7th century B.C. [See PHILOSOPHY.]——*Pythagorean system*, the system of astronomy taught by Pythagoras, which was founded on the hypothesis that the sun was a sphere situated in a centre, round which the planets revolved. This is now called the Copernican system, because it was revived by Copernicus. [See ASTRONOMY.]

PYTH'IA, or PYTH'ONESS, in Antiquity, the priestess of Apollo, who delivered oracular answers at Delphi in Greece.

PYTH'IAN GAMES, games celebrated in the neighbourhood of Delphi, at first every eighth, but afterwards at the end of every fourth year, in honour of Apollo, as the conqueror of the *Python*; which, according to the mythological history, was a dreadful dragon that sprang from the mud left by the flood of Deucalion. The contests were the same as those at Olympia.

PY'THON (*puthôn*, the serpent said to have been slain by Apollo: *Gr.*), a genus of large non-venomous snakes in which the hinder pair of limbs are developed under the skin, but not visible externally except that a terminal spur or nail projects at each side of the vent. One species grows to the length of 30 feet, and is capable of killing a buffalo. The Pythons are natives of the old world, and are allied to the boas of the new.

PYX (*puxis*, a box, especially of boxwood: *Gr.*), the box in which the consecrated wafer is kept by Roman Catholic priests.

Q

Q (*queue*, a tail: *Fr.*—because it is an O with a tail), the seventeenth letter of the English alphabet, is not to be found either in the Greek, old Latin, or Saxon alphabets; is never sounded alone, but in conjunction with *u*, and never ends any English word. For *qu* in English, the Dutch use *kw*, the Germans *qu*, and the Swedes and the Danes *qv*. It appears, in short, that *q* is precisely *k*, with this difference in use, that *q* is always followed by *u* in English, and *k* is not. The Romans used it for an abbrevation for Quintus, que, &c. Thus S. P. Q. R. *senatus populusque Romanus* (the senate and Roman people). And, as a numeral, for 500; but, with a dash over it, for 500,000. With us, Q is used as an abbreviation for *question;* also for quantity, or *quantum*, as *q. pl.*, *quantum placet* (as much as you please), and *q. s.*, *quantum sufficit* (as much as is necessary). Among mathematicians, Q. E. D. stands for *quod erat demonstrandum* (that which was to be demonstrated), and Q. E. F., *quod erat faciendum* (that which was to be done).

QUADRAGES'IMA (*quadragesimus*, the fortieth: *Lat.*), Lent; so called because it consists of forty days.

QUAD'RANGLE (*quadrangulum*: from *quatuor*, four; and *angulus*, an angle: *Lat.*), in Geometry, a figure consisting of four sides and four angles.——In Architecture, any range of houses or buildings with four sides in the form of a square.

QUAD'RANS (*Lat.*), the fourth of a Roman *As*, or three ounces, when the as was its full weight.——A farthing or fourth part of a penny. Before the reign of Edward I. the smallest coin was a sterling or penny, marked with a cross, by means of which it might be cut into halves and quarters. But, to avoid the frauds of unequal cuttings, that king coined halfpence and farthings in distinct round pieces.

QUAD'RANT (*quadrans*, a fourth part: *Lat.*), in Geometry, an arc of a circle, containing its fourth part, or ninety degrees; also, the space or area included between this arc and two radii drawn from the centre to each extremity.——QUADRANT, in Astronomy and Navigation, an instrument for taking the altitudes of the sun and stars; as also for taking angles in surveying heights, distances, &c. Quadrants are of different forms, but the most common is Hadley's, which consists of an octant, or the eighth part of a circle, an index, a speculum, two horizontal glasses, two screens, and two sight-vanes. Though its arc is only 45°, it measures angles of 90°, being constructed on the principle that 'when a ray of light is twice reflected, the angle made by its first and last directions is double that made by the mirrors.' [See OCTANT.]——There is also the *gunner's quadrant*, used for elevating and pointing cannon, mortars, &c.——QUADRANT OF ALTITUDE, a slip of brass, in length equal to a quadrant, graduated and attached to the artificial globe. It serves as a scale in measuring altitudes, azimuths, &c.

QUADRAN'TAL TRI'ANGLE (*quadrantalis*, containing the fourth part: *Lat.*), in Trigonometry, a spherical triangle, having for one of its sides an arc of 90°.

QUAD'RATE or QUAR'TILE (*quadrans*, a fourth part; *quartus*, the fourth: *Lat.*), in Astrology, an aspect of the heavenly bodies, in which they are distant from each other ninety degrees, or the quarter of a circle.

QUADRAT'IC EQUA'TIONS (*quadratus*, squared: *Lat.*), in Algebra, those in which the unknown quantity is found in the square or second power. If it is found only in the second power, the quadratic is *simple* or *pure:* if found *both* in the first and second powers, it is *complete* or *adfected:* $x^2 = a$, is a pure quadratic; $x^2 + x = b$, is a complete quadratic.

QUAD'RATRIX (*quadro*, I make square: *Lat.*), in Geometry, a mechanical line by means of which we can find right lines equal to the circumference of circles, or other curves, and their several parts.

QUAD'RATURE (*quadratura*, from *quadro*, I make square: *Lat.*), in Astronomy, the position of the moon, when she is 90° from the sun, or at one of the two points of her orbit, which are equidistant from conjunction and opposition.——In Geometry, the finding of a square equal in area to that of a curve. The *quadrature of the circle* is a very ancient and celebrated problem. As the area of a circle is equal to the product of the radius and half the circumference, it depends on the ratio of the diameter to the periphery. And as this ratio and its square are irrational numbers, the quadrature of the circle is not possible, except by the *geometrical* construction of a straight line equal to a circle of a given radius. The fraction $\frac{148}{167}$ gives a close approximation to the side of a square equal in area to a circle of which the diameter is unity. Only those who have an imperfect knowledge of geometry, at the present time, even attempt the *quadrature of the circle;* just as those only who have an imperfect knowledge of mechanics endeavour to find the *perpetual motion.*

QUADRIDEC'IMAL (*quatuor*, four; and *decem*, ten: *Lat.*), in Crystallography, an epithet for a crystal whose prism has four faces and two summits, containing together ten faces.

QUADRIDEN'TATE (*quatuor*, four; and *dens*, a tooth: *Lat.*), in Botany, an epithet denoting that there are four teeth on the edge.

QUAD'RIFID (*quadri-fidus*, split into four parts: *Lat.*), in Botany, an epithet designating anything cut into four segments.

QUADRI'GA (*Lat.:* from *quatuor*, four; and *jugum*, a yoke), in Antiquity, a car or chariot drawn by four horses. On the reverses of medals, we frequently see the emperor, or Victory, in a quadriga, holding the reins of the horses; whence these coins are, among numismatologists, called *nummi quadrigati* and *victoriati.*

QUADRIJU'GOUS (*quatuor*, four; and *jugum*, a pair: *Lat.*), in Botany, an epithet for a pinnate leaf with four pairs of leaflets.

QUADRILAT'ERAL (*quadrilaterus*, four-sided: *Lat.*), in Geometry, an epithet for a figure whose perimeter consists of four right lines, making four angles; it is called also quadrangular. Quadrilateral figures are either a parallelogram, trapezium, rectangle, square, rhombus, or rhomboid.

QUADRILL'E (*Fr.;* from *quadra*, a square: *Lat.*), a graceful kind of dance, consisting of parties of four. Also, a game of cards played by four persons with forty cards, the four tens, nines, and eights being discarded.

QUAD'RILOBATE (*quatuor*, four: *Lat.;* and *lobos*, a lobe: *Gr.*), in Botany, an epithet for a leaf having four lobes, or divided to the middle into four distinct parts with convex margins.

QUADRILOC'ULAR (*quatuor*, four; and *loculus*, a compartment: *Lat.*), in Botany, having four cells, as a *quadrilocular* pericarp.

QUADRINO'MIAL (*quatuor*, four; and *nomen*, a name: *Lat.*), in Algebra, a root which consists of four terms or parts.

QUADRIPH'YLLOUS (*quatuor*, four; *Lat.;* and *phullon*, a leaf: *Gr.*), in Botany, having four leaves.

QUADRIRE'MIS or QUAD'RIREME (*quadriremis: Lat.*), a species of the *navis longa*, or ship of war, used by the Romans and also by the Greeks; being a galley with four benches or banks of rowers.

QUADROON', the name given by the South Americans to the offspring of a mulatto woman by a white man.

QUAD'RUMANA (*quadrumanus*, four-handed: *Lat.*), an order of mammals established by Cuvier for the reception of the apes, baboons, monkeys, and lemurs, animals whose hind limbs are better suited for prehension than walking, the first toe being opposable to the others as the thumb is to the fingers. They are vegetable feeders, and chiefly dwell on trees, some of them being aided in their progress from branch to branch by their prehensile tails. They are natives of warm climates. Some species approach man in their structure. [See PRIMATES, APE, BABOON, MONKEY.] As to the geographical distribution of the quadrumana, it is remarkable that Australia and New Guinea do not contain a single species, whilst in Madagascar only the lemurs, the most lowly organized of all, are to be found. The gibbons are confined to south-eastern Asia, and the dog-faced baboons to Africa. In America every monkey has three premolar teeth (false molars), whilst in the rest of the world not a single monkey has more than two. Only one species has established itself in Europe, and that is the North African *Innuus sylvanus*, which has found a home on the rock of Gibraltar.

QUAD'RUPED (*quadrupes*, fourfooted: *Lat.*), any animal having four feet, as a horse, a lion, a dog, &c.

QUAD'RUPLE (*quadruplus*, fourfold: *Lat.*), an epithet for whatever is fourfold, or four times any given quantity.

QUÆ'RE (endeavour to obtain information: *Lat.*), a term expressive of doubt, and calling for further inquiry.

QUÆS'TOR (*Lat.*, from *quæro*, I search for), an officer among the Romans originally found in two departments. In one, the quæstor performed, to some extent, the duties of a public prosecutor; in the other, he had charge of the revenues. The *quæstorship* was the first office any person could fill in the commonwealth.

QUAG'MIRE (i.e. quakemire), soft wet land, the surface of which is firm enough to bear a person, but which shakes or yields under the feet.

QUAIL (*caille: Fr.*), the name given to birds of the genus *Coturnix*, allied to the partridge. The common quail (*C. dactylisonans*), a smaller bird than the partridge and less prolific, comes to us in May and leaves again in October for the north of Africa. In performing their migrations quails arrive at Malta so exhausted by fatigue, and in such prodigious multitudes, that the inhabitants pick them up with facility and in the greatest abundance. After resting one night, those that escape being taken proceed to Syria and Arabia, and spread over Asia and Africa. Quails were formerly much prized for their pugnacious propensities: quail-fighting was as common at Athens and Rome as cock-fighting has been in modern times, and it is still practised in some parts of Italy. In the east also, and especially in China, quails are pitted against each other, after having been armed with artificial spurs.

QUA'KERS or FRIENDS, a religious sect which made its first appearance in England during the protectorate of Cromwell. Their founder was George Fox, a native of Drayton in Leicestershire. He proposed but few articles of faith, insisting chiefly on moral virtue, mutual charity, the love of God, and a deep attention to the inward motions and secret operations of the Spirit. He required a plain simple worship, and a religion without ceremonies, making it a principal point to wait in profound silence the directions of the Holy Spirit. Although at first the Quakers were guilty of some extravagances, these wore off, and they settled into a regular body, professing great austerity of behaviour, a singular probity and uprightness in their dealings, a great frugality at their tables, and a remarkable plainness and simplicity in their dress. They were subjected for a long time to constant persecution; and their refusal to take oaths or pay tithes was a source of great suffering to them. But, since the time of William III., their affirmation has been received instead of an oath; and an alteration in the mode of levying tithes has satisfied their scruples on that point. Their system or tenets are laid down by Robert Barclay, one of their members, in a sensible, well-written 'Apology,' addressed to Charles II. Their principal doctrines are —that God has given to all men, without exception, supernatural light, which being obeyed can save them; and that this light is Christ, the true light, which lighteth every man that cometh into the world: that the scriptures were indeed given by inspiration, and are preferable to all the other writings in the world; but that they are no more than secondary rules of faith and practice, in subordination to the light or Spirit of God, which is the primary rule: that immediate revelation has not ceased, a measure of the spirit being given to every one: that all religious ceremonies of mere human institution ought to be laid aside: that, in civil society, the saluting one another by pulling off the hat, bending the body, or other humiliating posture, should be abolished: and that the use of the singular pronoun *thou* when addressing one person, instead of the customary *you*, should be strictly adhered to. They further laid it down as a solemn obligation, not to take an oath, encourage war, engage in private contests, nor even carry weapons of defence. On a most vital question of Christian faith, one of their body has lately thus written: 'Although "Friends" do not call the Holy Scriptures the Word of God, but apply this epithet exclusively to the Lord Jesus Christ, yet they believe that these sacred writings are the *words* of God, written by holy men as they were moved by the Holy Ghost; that they are profitable for doctrine, for reproof, for correction, for instruction in righteousness, that the man of God may be perfect, thoroughly furnished unto all good works; and that they are able to make wise unto salvation through faith which is in Christ Jesus. They also hold them to be the most perfect and authentic declaration of Christian faith, and the only fit outward standard in all religious controversies: and that whatever, either in doctrine or practice, any profess or do, though under pretence of the guidance of the Holy Spirit, if it be contrary to or inconsistent with the testimony of the Holy Scriptures, is to be esteemed a delusion and error.'—The society is governed by its own code of discipline, which is enacted and supported by meetings of four degrees, for discipline; namely, preparative, monthly, quarterly, and yearly meetings. The preparative digest and prepare the business for the monthly meetings, in which the executive power is principally lodged, subject however to the revision and control of the quarterly meetings, which are subordinate and accountable to the yearly meeting; and subject to its supervision and direction. Its authority is paramount, and it possesses the sole power to make or amend the discipline. There are at present ten yearly meetings, namely, London, Dublin, New England, New York, Philadelphia, Baltimore, Virginia, North Carolina, Ohio, and Indiana, which include a total of about 150,000 members; but their numbers are supposed to be decreasing. In this country they are most numerous in Yorkshire, Lancashire, Durham, Cumberland, and Essex.

QUALIFICA'TION (*qualis*, having a certain quality: and *facio*, I make: *Lat.*), any natural endowment, or any acquirement, which fits a person for a place, office, or employment. Also any property or possession which gives one a right to exercise the elective franchise, or furnishes one with any legal power or capacity.

QUAL'ITY (*qualitas: Lat.*), in Physics, some property of bodies. *Essential Quality*, some property which is necessary to constitute a thing what it is. *Sensible Quality*, one that affects the senses, such as figure, taste, &c.

QUAN'TITY (*quantitas: Lat.*), in Grammar, the measure of a syllable, or that which determines the time in which it is pronounced.——In Mathematics, anything which can be multiplied, divided, and measured.——In Physics, anything capable of estimation or measurement, which being compared with another thing of the same nature, may be said to be greater or less than, equal or unequal to it.——In common usage, *quantity* is a mass or collection of matter of indeterminate dimensions: thus we say, a *quantity* of earth, a *quantity* of timber, &c. But when we speak of an assemblage of individuals or separate beings, we say a *number*: as a *number* of men, of horses, &c.

QUAN'TUM (*Lat.*), as much as. Thus *Quantum meruit* (as much as he deserved), in Law, an action grounded on a promise that the defendant should pay to the plaintiff for his service as much as he should deserve.——*Quantum sufficit* (as much as is sufficient), a very common expression.——*Quantum valebat* (as much as it was worth), in Law, an action to recover of the defendant for goods sold, as much as they were worth.

QUAQUAVER'SAL (*quaqua versum*, every way: *Lat.*), a term applied by geologists to strata which dip to every point of the compass, like those surrounding a volcano.

QUAR'ANTINE (*quaranta*, forty: *Ital.*), the restraint of intercourse, to which a ship arriving in port is subjected, on the presumption that she may be infected with a malignant contagious disease. This is either for forty days, or for any other limited term, according to circumstances. A ship thus situated is said to be *performing quarantine*. The term has been adopted, because it was generally supposed that if no infectious disease break out within forty days, or six weeks, no danger need be apprehended from the free admission of the individuals under quarantine. During this period all the goods, clothes, &c., that might be supposed capable of retaining the infection, are subjected to a process of purification, which is a most important part of the quarantine system.——In Law, the period of forty days, during which the widow of a man dying possessed of land, has the privilege of remaining in the principal messuage or mansion house.

QUA'RE IM'PEDIT (why does he hinder: *Lat.*), in Law, a writ lying for one who has a right of advowson, against one who hinders or disturbs him in his right to present a clerk when the living is vacant

QUAR'RY (*carrig*, a stone: *Irish*), a pit where stones for building, &c., are dug from the earth; as a freestone quarry, or a marble quarry.——QUARRY (*quérir*, to fetch *Fr.*), in Falconry, the game which a hawk is pursuing, or has killed.——Among hunters, a part of the entrails of the beast taken given to the hounds.

QUAR'TAN (*quartanus*, from *quartus*, the fourth: *Lat.*), in Medicine, an intermitting ague, that occurs every fourth day.

QUARTA'TION (*quarta*, the fourth part: *Lat.*), in Chemistry, the operation by which the quantity of one constituent is made equal to the fourth part of the whole mass. It is specially applied to the act of rendering the quantity of silver, in a combination consisting of silver and gold, one fourth of the entire that the silver may be soluble in nitric acid. If the gold exceeds this proportion, it protects the silver, and thus prevents the separation of the two metals by the solution of one of them.

QUAR'TER (same *deriv.*), the fourth part of anything, the fractional notation for which is ¼.——QUARTER, in Astronomy, the fourth part of the moon's period, or monthly revolution. Thus, from the new moon to the quadrature is the first quarter; from this to full moon, the second quarter, &c. ——QUARTER, in Naval Architecture, that part of a ship's hull which lies from the steerage to the transom.——ON THE QUARTER indicates the bearing or position of an object seen between aft and abeam.——QUARTER, in Weights, is generally used for the fourth part of a hundred-weight avoirdupois, or 28lb.——QUARTER also signifies the sparing of men's lives in battle when they are no longer able to defend themselves.——QUARTER-DECK, that part of the deck of a ship which extends from the stern to the mainmast.——QUARTER-GALLERY, a sort of balcony on the quarters of a ship. ——QUARTER-MASTER, in the army, an officer whose business is to attend to the quarters of the soldiers, their provisions, &c. In the navy, an officer who assists the mates in their duties, attending the steerage, &c.——QUARTER-MASTER-GENERAL, a military officer, whose duty is to mark the marches and encampments of an army, and procure supplies of provisions, forage, &c. ——On ship-board, QUARTERS signifies the stations or places where the officers and men are posted in action.——QUARTERS, in War, is used in various senses: thus to indicate the place allotted to a body of troops to encamp upon, &c.——HEAD-QUARTERS, the place where the general of an army resides, which is generally near the centre of the army.——WINTER-QUARTERS, the places in which the troops are lodged during the winter, or their residence in those places.

QUAR'TER DAYS, the days which begin the four quarters of the year, and on which rents, &c., usually become due in this country, namely, the 25th of March, or Lady-day; the 24th of June, or Midsummer-day; the 29th of September, or Michaelmas-day; and the 25th of December, or Christmas-day.

QUAR'TERING, in Heraldry, partitions of the escutcheon according to the number of coats that are borne in it, or the several divisions that are made when the arms of more than one family are borne by the same person.

QUAR'TER SES'SIONS, a court of justice, held quarterly, before magistrates of a county or borough, to try minor offences by jury, after bills found by a grand jury. The legal powers of these are often very great; but the questions may, in many cases, be removed to superior courts. Two justices at least must be present.

QUARTETT' (*quartetto: Ital.*), in Music, a piece for four voices or four instruments.

QUAR'TO (*quartus*, the fourth: *Lat.*), in Printing, &c., a size of books, produced by twice folding a sheet, which then makes four leaves. Also a book so folded.

QUARTZ (*Ger.*), in Mineralogy, a species of silicious stone of various colours, commonly amorphous, and frequently crystallized. The name is usually applied, in scientific language, to the purer varieties of silica, particularly to *rock crystal*. Quartz is abundantly spread throughout the globe. Its varieties are numerous: differences of colour being produced by different metals. Thus, *amethyst*, or purple quartz, is tinged with a little iron and manganese. *Rose quartz*, or false ruby, derives its colour from manganese. *Aventurine* is a beautiful variety of quartz, of a rich brown colour, which, from a peculiarity of texture, appears filled with bright spangles. Small crystals of quartz, tinged with iron, are found in Spain, and have been termed hyacinths of Compostella. Flint, chalcedony, carnelian, onyx, sardonyx, and bloodstone, or heliotrope, and the numerous varieties of agates, are principally composed of quartz, with various materials from which they derive their particular hue.

QUAS, a liquor commonly drunk in Russia. It is prepared from pollard, meal, and bread, or from meal and malt, by an acid fermentation.

QUASH'ING (*casser*, to crush: *Fr.*), in Law, the overthrowing and annulling of anything.

QUA'SI CON'TRACT, in the Civil Law, an act which has not the strict form of a contract, but yet has the force of one. Thus, if one person does another's business in his absence without his procuration, and it has succeeded to the other person's advantage, the one might have an action for what he has disbursed, and the other to obtain an account of the administration: which amounts to a *quasi-contract*.

QUAS'SIA, in Botany, a genus of tropical plants: nat. ord. *Simarubaceæ*. The wood of the root of the *Quassia* tree is intensely bitter, and a decoction from it is used in medicine. Brewers have been often charged with using it as a substitute for hops, but this is now prohibited under severe penalties. A strong infusion of quassia, sweetened with brown sugar, is a safe and effective poison for flies. The plant yields an alkaloid called *quassine*, which crystallises in small white prisms.

QUATREFOIL (*quatre*, four; and *feuille*, a leaf: *Fr.*), in Heraldry, a four-leaved plant, a frequent bearing in coat armour.

QUA'VER, in Music, a measure of time equal to half a crochet, or an eighth of a semibreve. Also a shake or rapid vibration of the voice.

QUEEN (*cwen*, a wife: *Ang. Sax.*), a woman who holds a crown singly; or, by courtesy, one who is married to a king. The former is distinguished by the title of *queen regnant;* the latter by that of *queen consort*. A queen consort is a subject; though as the wife of the king she enjoys certain prerogatives. The widow of a king is called *queen dowager*.

QUEEN ANNE'S BOUNTY, funds vested in Trustees called Governors, arising from the first year's income (according to the valuation in the King's books), of newly appointed incumbents in the Church of England, and one tenth of that sum annually paid by them afterwards. These funds are applied to the augmentation of small livings. The first fruits were formerly paid to the Crown, until Queen Anne ordered them to be applied in the manner stated.

QUERCIT'RON, the bark of the *Quercus tinctoria*, or yellow oak, a tree growing in North America. It is used in dyeing yellow, the colour being developed from it by a solution of alum.

QUER'CUS (*Lat.*), in Botany, a genus of amentaceous trees. [See OAK and CORK.]

QUES'TIO (*Lat.;* from *quæro*, I inquire), in Logic, the third proposition in a syllogism, which contains the question to be proved.

QUES'TION (*quæstio*, from *quæro*, I seek: *Lat.*), the application of torture to prisoners under criminal accusation. It was customary in France before the revolution. One kind was intended to make him confess his own guilt: the other to make him confess his accomplices. From the earliest times it was perceived that disclosures made under the influence of torture could not be relied on; yet the practice was very prevalent, wherever the principles of the Civil Law have been adopted. The rack is the only instrument of torture which was employed in England. It was introduced, or at least first commonly used in the minority of Henry VI. The *peine forte et dine*, however, was recognized by the law: and its cruel details were diffused in the reign of Henry IV. The prisoner who refused to plead was laid on the ground in a dark room; as many weights as he could bear, *and more*, were laid on him; and no sustenance being allowed but a morsel of the worst bread, and a draught of the worst water, on alternate days, he was to so remain, until he pleaded or died. This torture was inflicted until the beginning of the last century; and until so lately as the commencement of the reign of George III., prisoners were forced to plead, by squeezing their thumbs and other cruelties. In the reign of George III. it was enacted that any one who stood mute, or did not answer directly to the arraignment should be held to plead guilty.

QUEST'MEN (*queste*, a search: *Fr.*), in Law, persons chosen to inquire into abuses and misdemeanours, especially such as relate to weights and measures.

QUES'TUS (*quæstus*, an acquiring: *Lat.*), in Law, land which does not descend by hereditary right, but is acquired by one's own labour and industry.

QUICK-LIME, any calcareous substance deprived of its carbonic acid: as chalk, limestone, oyster-shells, &c., calcined.

QUICK-MATCH, a combustible preparation used by artillerymen; being formed of cotton strands dipped in a boiling composition of vinegar, saltpetre, and mealed powder.

QUICK'SILVER. [See MERCURY.]

QUID PRO QUO (one thing for another: *Lat.*), an equivalent, or the mutual consideration and reciprocal performance of both parties to a contract.

QUI'ETISTS, in Ecclesiastical History, a sect of mystics, originated by Molinos, a Spanish priest, who maintained that religion consists in the internal rest and meditation of the mind, wholly employed in contemplating God and submitting to his will. This doctrine was termed *Quietism*: and was held by a number of persons in France, the most celebrated of whom were Madame de la Motte Guiyons, and Fénélon. The writings of the latter on the subject were condemned by Innocent XII.; and he acquiesced without a murmur in their condemnation. Quietists existed in early times among the monks of Mount Athos; the sect being called *Hesychastæ* (from *hēsuchia*, repose: *Gr.*).

QUINCE, the fruit of the *Cidonia vulgaris*, so named from Cydon, a town of Crete, famous for abounding with this fruit. It is now cultivated throughout Europe, and when boiled and eaten with sugar, or made into marmalade, is much esteemed.

QUIN'CUNX (*Lat.*), the dispositions of any five objects, so that four of them shall be at the corners, and one in the middle of an imaginary square.——In Gardening, the disposition of trees, in this order; which may be repeated, so as to form a regular grove or wood, that presents equal rows and parallel alleys. Sir Thomas Browne wrote a curious treatise, 'The Garden of Cyrus, or the Quincuncial Lozenge,' in which he points out how frequently the number five occurs in nature: 'quincunxes,' says Coleridge, 'in heaven above, quincunxes in earth below, quincunxes in the mind of man, quincunxes in tones, in optic nerves, in roots of trees, in leaves, in everything.'

QUINDEC'AGON (*quindecim*, fifteen: *Lat.*; and *gōnia*, an angle: *Gr.*), in Geometry, a plain figure with fifteen sides and fifteen angles.

QUINDECEM'VIR, or QUINDECEM'VIRI (fifteen men: *Lat.*), in Roman Antiquity, a college of fifteen priests: originally but ten, five chosen from the patricians, and five from the Plebeians; Julius Cæsar increased their number to sixteen. They were the interpreters of the Sibylline books, which, however, they never consulted without an express order of the Senate; and it was their duty also to celebrate the games of Apollo, whose priests, indeed, they were considered to be.

QUINI'NE, an alkaloid of inestimable value in the form of a sulphate, as a tonic, and febrifuge. It is extracted from the bark of several species of small trees belonging to the genus *Cinchona*, which grow in Peru and Ecuador, and named in honour of the Countess of Chinchona, wife of a viceroy of Peru, who was cured of a fever by the use of the bark, and who introduced it into Europe. For many years the medicine was taken in the form of powdered bark, which being sent to Europe by the South American Jesuits, was commonly known as Jesuits' bark, or Peruvian bark The tree was called *Quina-quina*, or bark of barks, by the Indians, by whom its virtues were communicated to the Spaniards. Vast numbers of trees having been improvidently destroyed during a long series of years, the medicine grew gradually dearer, and it became highly desirable that the plant should be cultivated in other parts of the world. Mr. Markham has lately succeeded in obtaining a quantity of seeds and young trees, in spite of the opposition of the Peruvians, and they have been planted in India, where the young trees thrive so well that no fear of the supply of quinine failing need now be entertained. Thirty-nine species of cinchona have been described, but only a few of these are considered deserving of cultivation. No fewer than four alkaloids having more or less similar qualities have been obtained from Peruvian bark, the best known of these being quinine, which was first discovered by two French chemists, Pelletier and Gaventon, in 1820. It is in these alkaloids that the medicinal virtues of the bark reside. To show the great consumption of quinine, notwithstanding its high price, it may be mentioned that the Indian government has sometimes expended upwards of 50,000*l.* in a single year in the purchase of this drug.

QUINQUAGES'IMA (*quinquagesimus*, the fiftieth: *Lat.*), the seventh Sunday, and therefore about the fiftieth day before Easter, whence its name.

QUINQUENNA'LIA (*Lat.*, from *quinquennium*, a period of five years), in Antiquity, Roman games, celebrated every five years. They were instituted by the Emperors in commemoration of different events in their respective reigns.

QUIN'QUEREME (*quinqueremis*, having five banks of oars: *Lat.*), in Antiquity, a galley having five seats or rows of oars. When Regulus was sent to Africa, A.U.C. 498, the Romans had 330 of these vessels, and the Carthaginians 350, each furnished with 300 rowers and 120 soldiers, which would give 140,000 men for those of the Romans, and 150,000 for those of the Carthaginians; numbers that would be incredible did they not rest on the highest authority.

QUIN'SEY, or QUIN'SY (*esquinancie: Fr.*), in Medicine, inflammation of the tonsils, the common inflammatory sore throat; it is not infectious. It has proved fatal, by causing suffocation, but it generally terminates by suppuration.

QUINTES'SENCE, a term used by the older chemists to express alcoholic tinctures; made by digestion, at common temperatures, or by the sun's heat.——In a more general sense, an extract of anything containing the most essential part.

QUIN'TILE (*quintus*, the fifth: *Lat.*), in Astronomy, the aspect of planets when distant from each other the fifth part of the zodiac, or 72 degrees.

QUIN'TILIS (*Lat.*), in Chronology, the month of July; so called because it was the fifth month of Romulus's year, which began in March. It received the name of July from Marc Antony, in honour of Julius Cæsar, who reformed the calendar.

QUIN'TIN (*quintaine: Fr.*), in ancient martial sports, an upright post on the top of which turned a cross piece, on one end of which was fixed a broad board, and on the other a sand-bag. The play was to tilt or ride against the broad end with a lance, and pass without being struck by the sand-bag behind.

QUIRINA'LIA, in Antiquity, a feast celebrated among the Romans in honour of Romulus, who was called *Quirinus*. It was held on the 17th of February.

QUIRI'TES, in Antiquity, a name given to the citizens of Rome, as distinguished from the soldiery. It is said to have originated in their having admitted into their city the Sabines, who, inhabiting the town of Cures, were called *Quirites;* and the appellation was thenceforward given to both nations indiscriminately.

QUI-TAM (who as well: *Lat.*), in Law, a term for an action brought, or information exhibited, at the suit of the king, on a penal statute, in which half the penalty is directed to fall to the suer or informer. The plaintiff describes himself as A. B., 'qui tam pro domino rege quam pro seipso (who sues as well for the king as himself).'

QUIT'RENT (*quietus redditus*, quiet rent: *Lat.*), in Law, a small rent payable by the tenants of most manors, and by which they are freed from all other services.

QUIT'TER-BONE, in Farriery, a hard round swelling on the coronet, between the heel and the quarter, usually on the inside of the foot.

QUOAD HOC (*Lat.*), a term used frequently in law reports to signify that 'as to the thing named,' the law is so, &c.

QUODLIBET (what you please: *Lat.*), in the language of the schoolmen, a term applied to questions which were miscellaneous ——In French, a jeu d'esprit, a pun, &c.

QUOIN, or COIN (*coin: Fr.*), in Architecture, the external or internal corner of any building or any part of a building.——In Artillery, a loose wedge of wood, placed under the breech of a cannon to adjust its elevation.

QUOITS (*coete*, thrown: *Belg.*), a kind of exercise or game very similar to the one known among the ancients under the name of *discus*. It consists in pitching or throwing a flat iron ring at a fixed object.

QUO'RUM, in Law, a word frequently mentioned in our statutes, and in commissions both of justices of the peace and others. By it is generally understood that among the number of justices necessary for the transaction of business, certain individuals must necessarily be present, otherwise the business cannot proceed. The term is derived from the words of the commission, *quorum* A. B. *unum esse volumus* (of whom we will that A. B. be one: *Lat.*). For example, where a commission is directed to seven persons, or to any three of them, whereof A. B. and C. D. are to be two, these are said to be of the *quorum*, because the rest cannot proceed without them.

QUO'TA (*quot*, how many: *Lat.*), the part which each member of a society is bound to contribute, or is to receive, in making up or dividing anything.

QUOTID'IAN (*quotidianus*, daily: *Lat.*), in Medicine, an intermitting fever, or ague, of which the paroxysm or fit returns every day.

QUO'TIENT (*quoties*, how often: *Lat.*), in Arithmetic, the number which arises, by dividing the dividend by the divisor; or, in other words, the number resulting from the division of one number by another.

QUO-WARRAN'TO (by what authority: *Lat.*), in Law, a writ filed in the Court of King's Bench, by the Attorney-General, or some one in his name, calling upon a person to show by what title he holds an office, franchise, &c. The proceedings under this writ were attended with so many difficulties, that it has been superseded by what is termed, an information in the *nature of a quo warranto*, in which the person usurping is considered in the nature of an offender, and consequently punishable by fine.

R

R, the eighteenth letter of our alphabet, is numbered among the liquids and semi-vowels, and is sometimes called the *canine* letter. Its sound is formed by a guttural extrusion of the breath, which in some words is through the mouth, with a sort of quivering motion or slight jar of the tongue. In words which we have received from the Greek language we follow the Latins, who wrote *h* after *r*, as the representative of the aspirated sound with which this letter was pronounced by the Greeks; as in *rhapsody*, *rhetoric*, &c.; otherwise it is always followed by a vowel at the beginning of words and syllables. As an abbreviation, R was used by the Romans for Roma; as, R. C., *Romana Civitas* (the Roman State). For Rei; as, R. G. C., *Rei Gerendæ Causa* (for the sake of carrying on the affairs). For Recte; as, R. F. E. D., *Recte Factum et Dictum* (rightly done and spoken). For Res, or Romani; as, R. P., *Respublica* (the republic), or *Romani Principes* (the Roman Chiefs). ——In English, it stands for Rex, as, G. R., *Georgius Rex* (King George). And for Regina; as, V. R., *Victoria Regina* (Queen Victoria). In Medicinal Prescriptions it is put for *recipe* (take). And, as a numeral, for 80, and with a dash over it, for 80,000.

RAB'BET (*rabattre*, to pare down: *Fr.*), in Carpentry, a deep groove or channel cut in a piece of timber longitudinally, to receive the edge of a plank, or the ends of several planks, that are to be fastened in it.——*Rabbeting*, the paring down the edge, or cutting channels or grooves in boards, for the purpose of lapping one over the other. In Ship-carpentry, it signifies the letting in of the planks of the ship into the keel.

RAB'BI, or RAB'BIN (*rebee*, master: *Heb.*), a title assumed by the Pharisees and Doctors of the law among the Jews. There were several gradations before they arrived at the dignity of a rabbin; but it does not appear that there was any fixed age or previous examination necessary; when, however, a man had distinguished himself by his skill in the written and oral law, and passed through the subordinate degrees, he was saluted a rabbin by the public voice. In their schools the rabbins sat upon raised chairs, and their scholars at their feet: thus St. Paul is said to have studied at the feet of Gamaliel. Such of the doctors as studied the letter or text of scripture were called *Caraites*, those who studied the cabballa, *Cabbalists*; and those whose study was in the traditions or oral law, were called *Rabbinists*. The customary duty of the *Rabbins*, in general, was to pray, preach, and interpret the law in the synagogues. Among the modern Jews, the learned men retain no other title than that of *Rabbi*; they have great respect paid them, have the first places or seats in their synagogues; determine all matters of controversy; and frequently pronounce upon civil affairs.

RAB'BIT, in Zoology, the *Lepus cuniculus*, a well-known rodent animal, which feeds on grass or other herbage and grain, and burrows in the earth. It is very prolific, and is kept in warrens for the sake of its flesh.

RAB'DOMANCY, or RHAB'DOMANCY (*rhabdos*, a rod; and *manteia*, prophecy: *Gr.*), in Antiquity, a sort of divination by means of rods. The divining rod is the branch of a tree, generally hazel, forked at one end, and held in a particular way by the two ends. It is supposed to indicate the presence of the substance sought, by bending towards it with a slow rotatory motion; the diviner being, in modern times, in contact with some metallic or magnetic substance. It is used by the credulous, most usually, for the discovery of metals and water.

RACCOON', an American plantigrade carnivorous animal belonging to the bear family. It is the *Procyon lotor* of zoologists. It is somewhat of the shape of a beaver, with hair like that of a fox; its head, too, resembles the fox, except that the ears are shorter, roundish, and naked; its tail is longer than its body, and not unlike that of a cat, with annular streaks of different colours. It lodges in a hollow tree; its fur is valuable.

RACE (*race*: *Fr.*, from *radix*, a root: *Lat.*), the lineage of a family, or the series of descendants indefinitely continued.

RACEME' (*racemus*, a bunch of grapes: *Lat.*), in Botany, a species of inflorescence, consisting of a peduncle with short lateral branches. It may be either simple or compound, naked or leafy, &c.——*Racemous*, growing in clusters. *Racemiferous*, bearing racemes or clusters; as, the racemiferous fig-tree.

RACES (*ræs*, to run: *Sax.*), a public trial of speed, in horses. Among the ancients, horse-races were performed either by single horses, or by two horses, on one of which they performed the race, and leaped upon the other at the goal. Chariot-races were performed by one, two, three, four, five, or more horses joined together in chariots. How great soever the number of horses might be, they were all ranged abreast, or in one front, being coupled together in pairs. Clisthenes, the Sicyonian, introduced the custom of coupling the two middle horses only; the rest he governed by reins. The principal part of a charioteer's skill consisted in dexterously avoiding the *metæ*, or goals; a failure in this point overturned his chariot, which was an event that was attended not only with imminent danger, but also with great disgrace. Nero, at the Olympic games, made use of a *decemjugis*, or chariot drawn by ten horses. He also used camels in the Roman circus; and Heliogabalus introduced elephants instead of horses. The most remarkable circumstance relating to the Roman chariot-races was the factions of the charioteers, which divided into parties the whole city of Rome. In modern times, at Rome, the race-horses have no riders; they run through the *Corso*, a street of considerable length, which derives its name from being thus used. The spectators range themselves at each side. Contrivances which goad the horses are attached to them. Races were customary in England in very early times, and are mentioned by Fitz-Stephen in the reign of Henry II. In queen Elizabeth's reign they appear to have been carried to such excess as to have injured the fortunes of the nobility. At that time, however, the matches were private, and gentlemen rode their own horses. In the reign of James I. public races were established; but it was not till after the restoration of Charles II. that they were particularly encouraged by royalty; when 'his majesty's plate,' a cup or bowl worth 100 guineas was first given, in lieu of which that sum of money is now paid. The usual trial of speed, in English racing, is a single mile; of continuance or bottom, four miles; but the true test of thorough blood in a racer is continuance. There is a great deal of fraud practised in the whole business of racing; and, as in every other species of gambling, the wealthy who addict themselves to the sport generally in the end become the victims of a host of black-legs and their confederate jockies.

RACHI'TIS (*rachitis*, a spinal complaint: *Gr.*), in Medicine, the rickets, which see.

RACK (*rakke;* from *rekken*, to extend: *Belg.*), a horrid engine of torture, furnished with pullies and cords, &c. for extorting confession from criminals or suspected persons. Its use is entirely unknown in free countries.

RACK'ET (*raquette: Fr.*), a bat to strike the ball with at tennis. It usually consists of a net-work of catgut strained very tight in a circle of wood, with a handle.

RA'DIAL (*radius*, the exterior bone of the fore arm: *Lat.*), in Anatomy, pertaining to the *radius* or fore-arm of the human body; as, the *radial* artery or nerve. The *radial muscles* are two muscles of the fore-arm, one of which bends the wrist, the other extends it.——*Radial Curves*, in Geometry, curves of the spiral kind, whose ordinates all terminate in the centre of the including circle, and appear like so many semi-diameters.

RA'DIANT HEAT (*radio*, I emit beams: *Lat.*). Rays of heat are emitted in all directions, from a body whose temperature is higher than that of the airs, and bodies which surround it. These rays are either reflected, absorbed, or transmitted. *Reflection* of heat may be illustrated by throwing the heat from a fire on the face by means of a piece of bright tinned iron. *Absorption* of heat may be shown by roughening the surface of the tins; when it will become hot and scarcely any heat will be reflected. *Transmission* of heat is exhibited by the atmosphere, which allows the sun's rays to pass through it, without having its temperature raised by them, the heat it receives being due to reflection from and contact with the heated surface of the earth; and glass will not intercept solar heat, but it will intercept heat emanating from a body at a comparatively low temperature: thus from hot water, or even from a common fire. And the lower the temperature of the heated body the less of its heat will be transmitted by the glass.

RADIA'TA (*radius*, a ray: *Lat.*), in Zoology, a division of the animal kingdom, containing several classes [ACALEPHA, ECHINODERMATA, ZOOPHYTES, INFUSORIA], in all of which the species are characterized by a radiating form of body, or of some portion of it; for example, a star-fish, a sea anemone, and a medusa.

RA'DIATE, or RA'DIATED, in Botany, a term applied to such flowers as have several semi-floscules set round a disk, in form of a star: those which have no such rays are called *discous* flowers.

RADIA'TION (*radiatio: Lat.*), the act of a body emitting or diffusing rays of light, &c., all round, as from a centre.——*Radiating point*, in Optics, any point of an object from whence rays proceed.

RAD'ICAL (*Fr.;* from *radix*, a root: *Lat.*), in Chemistry, radicals are either simple or compound. *Simple* radicals consist of but one elementary substance; thus sulphur, the radical of sulphuric acid, is simple. A *compound* radical consists of two or more elementary substances combined, the combination simulating the deportment and exercising the functions of an elementary substance; thus cyanogen, the radical of hydrocyanic or prussic acid, is compound, consisting of carbon and nitrogen. Chemists speak of several theoretical compound radicals, such as ethyl, consisting of four equivalents of carbon and five of hydrogen. This is assumed to exist in alcohol and ether.——In Grammar, the appellation *radical* is given to primitive words, in contradistinction to compounds and derivatives.——*Radical quantities*, in Algebra, those whose roots may be accurately expressed in numbers.

RAD'ICAL SIGN, in Algebra, $\surd$, the symbol which denotes that a root is to be extracted: it is $\surd$, a modification of the letter ℞. Thus $\sqrt{a}$ means the square root of a; $\sqrt[3]{d}$, the cube root of d; $\sqrt[8]{16}$, the eighth root of 16. Fractional exponents are often used instead of the radical sign; thus $a^{\frac{1}{2}}$, instead of $\sqrt{a}$; $d^{\frac{1}{3}}$ instead of $\sqrt[3]{d}$; $16^{\frac{1}{8}}$, instead of $\sqrt[8]{16}$. A radical sign and an exponent may be used together: thus $\sqrt[5]{a^2}$, or $a^{\frac{2}{5}}$, the fifth root of *a* square.

RADICA'TION (*radix*, a root: *Lat.*), in Botany, the disposition of a root of a plant, with respect to the ascending and descending caudex, and the radicles.

RAD'ICLE (*radicula*, a small root: *Lat.*), in Botany, that part of the seed of a plant which, upon vegetating, becomes the root.

RA'DIUS (*Lat.*), in Geometry, a right line extending from the centre of a circle to the periphery; and hence the semidiameter of the circle.——In Trigonometry, the *radius* is the sine of 90 degrees.——In Anatomy, the exterior bone of the fore-arm, descending along with the ulna from the elbow to the wrist. It is so called from its supposed resemblance to the spoke of a wheel.——In Botany, the outer part or circumference of a compound radiate flower, or radiated discous flower.

RA'DIUS-VEC'TOR (*radius*, a radius; and *vector*, a carrier: *Lat.*), in Astronomy, a straight line drawn from the centre of force to the point of the orbit where the body is supposed to be. When a body is projected in space, and subjected to the action of gravity, whose effect varies inversely as the square of the distance, a conic section, having a focus at the centre of force, is described. The conic section, traversed by the planets, is an ellipse, the sun being in one of its foci, and the spaces described by the radius-vectors, respectively, are always equal in equal times [see PLANET]. The Algebraic expressions for the radius-vectors of the different conic sections are termed the *Polar equations* of these curves.

RADIX (a root: *Lat.*), in Algebra, the root of a finite expression, from which a series is derived.——In Botany, a root, or that organ of a vegetable through which it draws its nourishment. [See BOTANY.]——In Etymology, a primitive word, from which spring other words.——In Logarithms, that number whose logarithm is unity.

RAFT (*rafte*: *Dan.*, from *ratis*: *Lat.*), a sort of float, consisting of boards fastened together side by side: sometimes used for saving persons who lose their vessel at sea.——Also, a quantity of timber, fastened together by chains for the purpose of being more conveniently floated down a river.

RAFT'ERS (*ræfter*: *Dan.*), pieces of timber extending from the wall of a building, so as to meet in an angle at the top, and form the roof.

RAG'STONE, a local name for certain rocks. The Kentish ragstone is a calcareous rock, now much used for building purposes, which forms a division of the lower greensand. The Coral Rag, an oolitic limestone, containing abundant remains of corals, is well developed in Oxfordshire. It is a member of the middle oolite.

RAGU'LED, or **RAG'GED**, in Heraldry, an epithet for any bearing that is ragged or uneven, like the trunk or limb of a tree lopped of its branches, so that only the stumps are seen.

RAIL, a name given to several wading birds. The land rail, *Crex pratensis*, comes to us in the summer, and derives its name of corncrake from its call note. It frequents grassy places in the neighbourhood of rivers, and fields of green corn. It is much esteemed by epicures. The spotted crake is a prettily marked bird of the same genus, but much rarer than the last. The water rail, *Rallus aquaticus*, remains with us through the year, haunting the rank vegetation of marshes. The bill and the middle toe are much longer than in the land rail.

RAILWAYS, or **RAILROADS**. Among the most wonderful features which mark the progress of science in the nineteenth century is the vast and increasing extent of the substitution of mechanical for animal power—ingenious in most operations, exciting our admiration in many, but excelling all in its application to the purposes of travelling.

Nearly two centuries before the introduction of the locomotive, wooden rails were used at the collieries, in the north of England; their upper surfaces being, at a later period, covered with a plate or bar of iron, to render them more durable; and about the year 1776, flanges being added to them to keep the waggons from running off. The imperfections of *plate*, or as they were also called *tram* rails, led about the year 1801 to the adoption of *edge rails*, or those at present exclusively used; and, soon after, cast iron was supplanted by wrought iron, in their manufacture. The use of locomotives, instead of animals, was suggested, in 1794; but no locomotive seems to have been constructed until 1805. At first cogged wheels, and various kinds of *propellers*, were employed with locomotives, from an erroneous supposition that there would not be sufficient friction between the driving wheels and rails to prevent the former from turning round, without the production of progressive motions; but in 1814, plain wheels were tried and found perfectly efficient. The locomotive did not come into practical use until the opening of the Liverpool and Manchester Railway in 1830; although the first railway Act received the sanction of the British legislature in 1801, by the incorporation of the Surrey iron railway company. This was indeed a comparatively trifling enterprise, for it extended only from Wandsworth to Croydon, and was merely applicable for the carriage of coals, lime, &c., the moving power being derived from horses alone.——The *rails*. The breadth of an *edge rail* does not in general exceed two inches, and the carriage is kept on the line by means of flanges on the outer part of the rim of the wheel. These flanges ought never to touch the rail on account of the great resistance they cause; and they are in ordinary circumstances prevented from doing so, by the wheels being bevelled on the rim, so that the exterior diameter is less than the interior. The rails are formed in bars, fixed at each end, and at intermediate points, in cast iron *chairs*, which rest on sleepers, for which wood has been found the best material. They are now straight: those rails which are *fishbellied*, or thicker underneath at the centre, being more expensive and not so convenient, nor of greater practical strength. Cast iron rails are at first much cheaper than malleable iron ones, but not in the end; for not only are malleable rails more durable than those made of cast iron, but malleable rails when in use are less susceptible to the deteriorating action of the atmosphere.——*Inclined planes*. Where the inclination of the road is greater than that for which the ordinary power is calculated the ascent must be effected by means of an additional power, the amount of which can be readily computed, since in those parts no additional friction is to be provided for, and only the additional resistance arising from gravity is to be overcome. If, for instance, the additional inclination is one in ninety-six, or fifty-five feet in a mile, the additional power must be to the weight as one to ninety-six, or as fifty-five to the number of feet in a mile, namely, 5280. In descending planes so much inclined that the gravity would move the carriages too rapidly for safety, the velocity is checked by means of a break, which consists of a piece of wood of the same curvature as the rim of the set of wheels, upon which it is pressed by means of a lever, so adjusted as to be within reach of the conductor, in his position on the carriage.——*Curves.* Deviations from the straight line, or railways, can be made only by curves, angles being incompatible with speed. In passing along a curve, centrifugal force tends to throw the carriages off the line; this has been to a certain extent counteracted by raising the outer rail and giving a conical form to the wheel. The friction of the flanges against the rails is lessened, as curves of different radii are described with wheels, practically of a different size: for centrifugal force throws the larger parts of one set of wheels on the outer rail, and the smaller parts of the other on the inner rail; thus the wheels are not kept on the rails altogether by the flanges, as they have a natural tendency not to move in a straight line, but in a curve.——*Gauge of the line.* The determination of the gauge, or width between the rails, is a matter of great importance. Three different widths are used in England:—4 feet 8½ inches, 5 feet, and 7 feet; two in Scotland, 4 feet 6 inches and 5 feet 6 inches; and one differing from all these, in Ireland, 6 feet 2 inches.——*Slopes, Cuttings,* and *Embankments.* The cuttings and embankments must, if possible, balance each other. The quantity of material removed is sometimes enormous, amounting occasionally in a single cutting to 600,000 cubic yards.——*Bridges* and *Viaducts.* These form a most important portion of the construction of railways, and often are most serious items in their cost. In the 'high level' bridge at Newcastle, the roadway is 1380 feet in length, and the bridge 112½ feet from high water line. It is estimated that, in Britain, for every mile of railway, there are on an average from two to four bridges, many of them viaducts hundreds of feet in length. It is not necessary here to enter into the details of the great tubular bridge, over the Menai Straits, or that still more wonderful work, the great tubular bridge, about two miles in length, at Montreal in Lower Canada; they show, however, the vast undertakings often involved in the construction of a railway.——*Power.* Where the road is sufficiently and uniformly descending in one direction, gravity may be relied upon as a motive power in that direction; but on railroads generally, some other power must be resorted to in each direction. It was at first a great question as to whether stationary or locomotive steam-engines should be used, but after various experiments locomotives were preferred; and the opinion in favour of this kind of power on roads of which the inclination does not exceed about thirty feet in a mile, has become pretty fully established. Stationary power can be used to advantage only on lines of very great transportation, as the expense is necessarily very great, and almost the same whether the traffic be greater or less. Another objection to the use of stationary power is, that its interruption, in any part, breaks up the line for the time, which is not necessarily the case with a locomotive. The alternative, accordingly, is between the use of locomotive steam-engines or horses; and the fact seems well established, that where the transportation is sufficient for supplying adequate loads for locomotive engines, where the road is so constructed that they can be advantageously used, and where fuel is not exceedingly expensive, they afford much the most economical motive power. In England, France, Belgium, Italy, Germany, nay, over the whole of the European continent, and on an infinitely more extended scale in the United States of America, Canada, &c., railroads are everywhere in progress. With regard to America, many circumstances conspire to assist in the construction of railways in that country—the alluvial plains, which often present a dead level for a hundred miles together, the great plenty of timber, and, more than all, the non-appropriation of the ground, which enables the projectors to buy it for a trifle, and, in the majority of cases, to get it for nothing. They have pushed these roads into the very bosom of the wilderness. Like the military roads of the Romans, they hold steadily and straight on through plain and morass, through lane, forest, and river, across the rugged Alleghanies, and the wild woods that skirt the banks of the Mohawk. Many of these roads have been finished for less than 5000 dollars a mile; the very best of them, made of English iron, and laid down on stone sleepers, have been completed for 29,000 dollars a mile, or about 6000*l.*, which is only one-seventh the cost of the Liverpool and Manchester line. The same method and dexterity which marks their steamboat travelling is seen here also; the engines are nearly all of American construction, having superseded those imported from England, and the engineers seem to have them under better control. There is no unnecessary expense about these railroads. The sleepers are often not filled up, and frequently, in passing a deep chasm, or rushing torrent, the bridge is only just wide enough for the rails. Most of these railroads are at present single tracks, which occasion delay when trains meet. The carriages are larger than ours, they are sometimes fifty feet long, and have a deck with verandahs; they are warmed by stoves in winter, are well ventilated, and being commodious, are fitted with washing apparatus, &c., and often furnished with a convenient means of changing them at night into comfortable sleeping apartments. The American engineers seem more dexterous than the English; the trains are stopped more rapidly and with apparently greater facility. The American engine carries a machine in front, which removes any obstacle from the rails, and is capable even of taking up cattle if they happen to get into the way; wood is burned in most of the engines. A traveller may pass with the greatest ease and convenience from any of the cities of Canada to New York in less than twenty-four hours, taking Niagara in his way, if he please. There are railroads throughout all the New England States to every town of importance, and some thousands of miles are in progress in the south and west. There is the least improvement in the slave states. In no other country may such vast tracts be traversed in so short a time as in America, and the facilities are every day increasing. The Ohio already joins the Delaware, by a railroad 350 miles long, and in a few years a traveller may be able to pass from the gulf of Newfoundland to the gulf of Mexico—from icebergs to orange groves—in a very few days.

RAILWAY, Atmospheric or Pneumatic.—This invention consisted in exhausting a tube lying between the rails, in front of a piston to which the carriages were attached by a convenient air-tight apparatus. The pressure of the air behind the piston forced it on, and consequently the carriages in connection with it. The exhaustion was effected by powerful air pumps, worked by a steam engine at the terminus. The contrivance seemed to answer very well; but it was not, in practice, found so economical as traction by locomotives. Something similar is being adapted, for the transmission of parcels underground, from one part of London to another; as the tube in this instance has no longitudinal opening for the purpose of connection with anything external, there is less complication and less leakage.

RAIN (*rægn: Sax.*), in Meteorology, vapour precipitated upon the earth in the form of drops of water. *Rain* is the return to the earth, in condensed drops, of the aqueous vapours which are continually rising into the atmosphere by evaporation: the condensation being occasioned by a change in the general temperature, by a collision produced by contrary currents, or by a cloud passing into a cold stratum of air. The power of the air to hold water in solution increases in a much higher ratio than the temperature. Hence, when two masses of air, saturated with moisture, and of different temperatures, are mixed, the resulting compound is not capable of holding the whole water in solution, and a part is, in consequence, precipitated as *rain*. As the whole atmosphere, when saturated, is calculated not to hold in solution more water than would form a sheet five inches in depth, while the mean annual deposit of rain and dew is probably from 35 to 40 inches, it is obvious that the supply of atmospheric moisture must be renewed many times in the course of a year. [See Air, Fog, &c.] The quantity of rain precipitated from the atmosphere depends upon a variety of circumstances—on the previous hygrometric state of the unmixed portions of air, their difference of heat, the elevation of their mean temperature, and the extent of the combination which takes place. When the deposition is slow, and the electricity set free by *change of state* [see Cloud] is not suddenly removed, the very minute aqueous globules remain suspended, and form clouds; but if the deposition be rapid and copious, and the electricity is more or less suddenly carried off, those particles conglomerate, and produce, according to the temperature of the medium through which they descend, rain, mist, snow, or hail.

RAIN'BOW, in Meteorology, an arch or semicircle exhibited in a rainy sky, and some similar situations, opposite to the sun, adorned with the prismatic colours, and formed by the refraction of the rays of light in spherical drops of water. The inner bow is produced by a refraction at the entrance of the drop, a reflection from its back, and a refraction at its exit, or by two refractions and one reflection. The outer bow by two refractions and two reflections within the drop; and, since much of the light is dispersed by the two reflections, the outer bow is fainter than the inner. As all the drops in a shower are affected at the same time, so all the colours of light are visible anywhere to a spectator whose back is to the sun, in circles which are from 54 to 51 degrees and from 42 to 40 degrees from the eye; but in the two bows the colours are reversed. A line passing from the sun through the eye of the spectator goes to the centre of the bow, so that the height of the bow is inversely as the height of the sun; and, if the sun is more than 42 or 54 degrees high, there can be no bow. Of course, as it is a mere optical effect, depending on the position of the eye, no two persons can see the same bow. An *artificial rainbow* may be produced in sunshine by scattering drops of water in any convenient way to a sufficient height in the air, and the spectator standing between them and the sun, with his back to the latter. Magnificent rainbows are often produced also by the mist and spray which rise from waterfalls.——Lunar Rainbow. The moon sometimes also exhibits the phenomenon of an Iris, by the refraction of her rays in drops of rain in the night time. The lunar bow has all the colours of the solar, but much fainter.——Marine Rainbow, a phenomenon sometimes observed in an agitated sea, when the wind carrying the tops of the waves aloft, and the sun's rays falling upon them, are refracted.

RAIN-GAUGE, or PLUVIOM'ETER (*pluvia*, rain; and *metron*, I measure: *Lat.*), an instrument to measure the quantity of rain which falls at any place in a given time. A very simple and convenient rain-gauge consists of a strong cylindrical vessel of copper terminated above by a funnel, having an opening which is some multiple of the sum of the areas of the copper vessel and of a glass tube of equal height, so fixed into one side of it that water in one will rise to the same height in the other; a graduated scale is attached to the glass tube. Suppose that the area of the opening of the funnel is ten times the area of the vessel and glass tube taken together, one tenth of an inch of rain will show an inch on the graduated scale attached to the tube. In fixing one of these gauges care must be taken that the rain may have free access to it; hence the tops of buildings are usually the best places. When the quantities of rain collected in them at different places are compared, the instruments ought to be fixed at the same heights above the ground at both places, because it is found that, at different heights, the quantities are always different, even at the same place.

RAI'SINS (*grapes: Fr.*), grapes perfectly ripe, and dried either in an oven or by the heat of the sun; in the latter case they are richer and sweeter. The best raisins come from Spain, Portugal, Calabria, and other places in the south of Europe; there are also very fine ones brought from Smyrna, Damascus, and Egypt; their quality, however, in a great measure depends upon the method of their cure. The finest are those *of the sun*—the plumpest bunches are left to ripen fully upon the vine, after their stalks have been half cut through. [See GRAPE.]

RA'JAH (*Sanscrit*), a title given to the native princes of India, their dominions being termed *raj*. The words are connected with the Latin *rex, regis*, king.

RAKE, the nautical language to *incline*. The word is applied to masts, sterns, sternposts, &c. Masts generally rake aft: some few of them rake forward. The rake of the mast has considerable influence on the rate of sailing; its chief effect seems to be the diminishing that tendency which all sails have, to depress the ship's head.——*To rake a ship*, is to fire into her head, or stern, in the direction of her length, or along her decks; so as to sweep them from end to end, and thus, probably, cause great slaughter. It is similar to what is termed *enfilading* by engineers.

RALLENTAN'DO, in Music, an Italian term, implying that the time of the passage over which it is placed is to be gradually rendered slower.

RAL'LUS, in Ornithology, the *Rail*, which see.

RAM (*Sax.*), in Zoology, the male of the sheep or ovine genus; in some parts of England called a *tup*.——*Ram*, in Astronomy [See ARIES]. See also BATTERING RAM.

RAM'ADAN, or RHAM'ADAN, the great fast or lent of the Mohammedans. It begins with the new moon of the ninth month of the Mohammedan year; and ends the day preceding the *Bairam*. During the Ramadan, the day is spent in devotion; and the night also, by the more rigid. But, generally speaking, the arrival of sunset is the commencement of indulgence in the pleasures of the table. The Mahometans call this month holy, and believe that as long as it lasts the gates of paradise are open, and those of hell shut.

RAMEN'TUM (*scrapings or chips: Lat.*), in Botany, the loose scales that are frequently found on the stalks of the fronds of ferns.

RAMIFICA'TION (*ramus*, a branch; and *facio*, I make: *Lat.*), any small branch issuing from a large one, particularly the very minute branches issuing from the larger arteries.——In Botany, the manner in which a tree produces its branches or boughs.

RA'MOUS (*ramosus*, branching: *Lat.*), in Botany, having lateral divisions or being full of branches.

RAMP (*rampe*, a slope: *Fr.*), in Architecture, a concave bend, or slope, in any upper member.

RAM'PANT (*Fr.*), in Heraldry, an epithet for a lion, leopard, or other beast, when it stands on its hinder legs, and rears up its fore feet in the posture of climbing, showing only its profile. It is different from *salient*, in which the beast seems to be springing forward.——*Rampant gardant*, is when the animal stands on its hinder legs, looking full-faced; *Rampant regardant*, when it stands on its hinder legs, but looks behind.

RAM'PART (*rempart: Fr.*), in Fortification, an elevation or mound of earth round a place, capable of resisting the cannon of an enemy; and formed into bastions, curtains, &c. It is made of earth, taken out of the ditch; and the lower part of its outward slope is usually formed of masonry. The advantage of earth is that balls bury themselves in it, instead of splintering the works and rebounding, to the great injury of the besieged. It is, therefore, more durable than stone or bricks. The rampart is generally about eighteen feet in height.

RA'NA (a frog: *Lat.*), in Zoology, a genus of batrachian reptiles, including the frogs.

RANGE, in Gunnery, the horizontal distance to which a shot or shell is projected. But for the resistance of the air the path of a projectile would be a *parabola;* and the greatest range would be obtained by discharging the projectile at an angle of 45°. But the path actually described is very different from a parabola; and the angle producing the greatest range can be found only by experiment.——RANGE, among Mariners, a quantity of cable, equal to the depth of the water, laid on deck, that when the anchor is cast loose from the bow it may receive no check before it reaches the bottom.

RA'NGER (*ranger*, to place: *Fr.*), an officer whose duty it was to walk through the forest, and present all trespassers at the next forest court. The rangerships of the royal forests are honorary offices, with salaries attached.

RANK (*ranc: Sax.*), the degree of elevation which one man holds in respect to another. This is particularly defined with regard to the nobility, to all officers of state, and all officers of the army and navy.——RANK, in military tactics, the straight line which the soldiers of a battalion or squadron make as they stand side by side.——RANK AND FILE, a name given to the men carrying firelocks, and standing in the ranks, in which are included the corporals.

RAN'SOM (*rançon: Fr.*), money paid for redeeming a captive, or for obtaining the liberty of a prisoner of war.

RAN'TERS, a sect which took its rise in

a secession from the Wesleyan connection, on the ground that too much attention was paid to order in conducting religious worship; and too little zeal was displayed in field preaching. The Ranters parade the streets and fields, singing hymns and preaching. And, unlike all other Methodists, they allow females to address a congregation. They hold camp meetings annually, and differ from the parent stock in many of the outward ceremonies. They are most numerous in America.

RA'NULA (*Lat.*: a *dim.* of *rana*, a frog), in Medicine, a tumour under the tongue, supposed to bear some resemblance to a frog. It generally arises from some obstruction of the ducts of the salivary glands; and usually results in a troublesome ulcer.

RANUNCULA'CEÆ, a natural order of exogenous polypetalous plants, for the most part herbs. The calyx and corolla differ considerably in the different genera, amongst which are to be found the well-known buttercups (RANUNCULUS) ANEMONES, CLEMATIS, COLUMBINE, HELLEBORE, LARKSPUR, MONKSHOOD (ACONITUM), and PEONY. The stamens and seeds are usually numerous. The plants abound in cold damp climates, and possess narcotico-acrid properties, many being poisonous.

RANUN'CULUS (*Lat.*: a *dim.* of *rana*, a frog, because many of the species inhabit moist places), in Botany, a perennial much cultivated in gardens, bearing a flower of a globular shape. Also the systematic name of a genus of plants, of which the globe ranunculus, the crowfoot, and the buttercup, are species.

RANZ DES VACHES, in Music, airs among the Swiss shepherds, played while they tend their flocks and herds. It consists of a few simple intervals, is adapted to their instrument (the *Alpenhorn*, horn of the Alps), and has an uncommon effect in the echoes of the mountains. This effect becoming intimately associated with the locality of Switzerland, explains the many anecdotes of the home-sickness caused by the sound of the *Ranz des Vaches*, when heard by Swiss in foreign countries.

RAPE, a division of a county; it sometimes means the same as a hundred, and at other times includes several hundreds: thus Sussex is divided into six *rapes*, every one of which, besides its hundreds, has a castle, a river, and a forest belonging to it. Similar districts in other counties are called tithings, lathes, or wapentakes.——In Botany, a biennial plant, the *Brassica rapa* of botanists. Rape is cultivated in many parts of England, partly on account of its seed, which is crushed for oil, and partly for its leaves as food for sheep.——RAPE-CAKE is the adhering masses of the husks of rapeseed, after the oil has been expressed; they are reduced to powder by a malt-mill or other machine, and are used either as a top-dressing for crops of different kinds, or are drilled along with turnip seed.

RAPH'ANUS (*Lat*: from *raphanos*; *Gr.*), in Botany, a genus of plants, nat. ord. *Cruciferæ*, containing the radish, of which many varieties are in cultivation.

RA'PHE (*raphē*, a line: *Gr.*), in Anatomy, a term applied to any parts which appear as if they had been sewed together, a distinct seam being observable.——In Botany, the vascular cord connecting the nucleus of an ovule and the placenta, in those cases where the base of the former is removed from the hilum.

RAPH'IDES (*raphis*, a needle: *Gr.*), in Botany, the needle-like crystals frequently found in the cells of plants. They are of microscopic minuteness and usually consist of phosphate and oxalate of lime.

RAPHID'IA (*raphis*, a needle: *Gr.*), in Etymology, a genus of neuropterous insects. The head is of a horny substance and depressed; the tail is armed with a slender horny weapon, not bifid at the extremity. They are common in the neighbourhood of woods and streams in July; and from the facility with which they turn the front of the body, they have been called *snake flies*.

RAP'IDS (*rapidus*, swift: *Lat.*), the part of a river where the velocity of the current is very considerable, owing to a descent of the earth, not sufficient to occasion such a fall of the water as is deemed a cascade or cataract.

RAREFAC'TION (*rarefacio*, I make thin: *Lat.*), in Physics, the act or process of expanding or distending bodies; so that, the intervals between their particles being augmented, they occupy more room, or appear under a larger bulk without accession of any new matter. Rarefaction is opposed to *condensation*. It has been proved, by experiments with the air pump, that air may be so rarefied as to occupy a space 13,000 times greater than in ordinary circumstances. [See AIR, ATMOSPHERE, &c.]

RASO'RES (scratchers: *Lat.*), an order of birds, synonymous with the *Gallinæ*, and including those which have strong feet, provided with obtuse claws for scratching grains, &c., such as the pheasants, grouse, and barn-door fowl.

RAS'PBERRY, the fruit of a bramble, or species of *Rubus*. Several varieties are cultivated, differing in the size and colour of the fruit, which is either red, flesh-coloured, or yellow. A light soil is best suited to the culture of the raspberry, and an eastern or western exposure, slightly shaded. It is generally propagated by suckers.

RAT (*Fr.*), a well known quadruped of the genus *Mus*, which infests houses, stores, and ships; an animal equally troublesome and destructive. The species at present common in this country, called the Norway rat (*Mus decumanus*) was introduced from Asia forty or fifty years ago, and has entirely extirpated the *black rat* (*M. rattus*), or old British species.

RATAFI'A, a liquor made by steeping the kernels of apricots, cherries, &c. in brandy. In France, *ratafia* is the generic name of all *liqueurs* compounded with alcohol, sugar, and the odoriferous or flavouring principles of vegetables.

RATCHET, in Horology, &c., an arm, moving on a centre at one extremity, and abutting at the other against the teeth of the *ratchet* wheel, which it allows to turn in one direction, but not in the others, in which case it is called also a *detent*. Sometimes a ratchet is jointed freely to a reciprocating driver, for the purpose of giving continuous motion to a wheel; it is then called a *click* or *paul*. The teeth of the detent wheel are cut like those of a saw.

RATCH'IL, among Miners, fragments of stone.

RATE (*ratus*, calculated: *Lat.*), an assessment by the pound for public purposes; as, for the poor, the highways, church repairs, county expenses, &c.

RATE OF A SHIP, in the Navy, the order or class of a ship, according to its magnitude or force. There are three classes of ships: *rated ships*, commanded by captains; *sloops* and *vessels*, by commanders; and *third class*, by lieutenants. Rated ships are divided into six classes:—1st, three-deckers; 2nd, two-deckers, having at least 700 men; 3rd, ships having from 600 to 800 men; 4th, ships having from 400 to 600 men; 5th, ships having from 250 to 400 men; 6th, ships having less than 250 men.

RATH' OFFICE, in Mineralogy, a kind of garnet found in Sweden. Its colour is a dingy brownish black, and it is accompanied with calcareous spar and small crystals of Hornblende.

RATIFICA'TION (*ratus*, established; and *facio*, I make: *Lat.*), the solemn act by which authority is given to an instrument, &c. It is most usually applied to the sanctions given by government to treaties contracted by their representatives.

RA'TIO (*Lat.*), in Mathematics, the relations between two quantities; an *arithmetical ratio* consists in their difference, and a *geometrical ratio*, in their quotient. Thus, the arithmetical ratio between 8 and 6 is 8 − 6, or 2, which added to the less will make the greater; or taken from the greater will make the less. The geometrical ratio between 6 and 2 is $\frac{6}{2}$ or 3, and the less being multiplied by 3 will make the greater; or the greater divided by 8 will make the less. Ratio is expressed by two dots, thus $a : b$, or 6 : 4. Ratios are susceptible of various changes in form, without alteration of value. Thus the same quantity may be added to or taken from each term of an arithmetical ratio, &c. Each term of a geometrical ratio may be multiplied or divided by the same number. The first term of a ratio is termed the *antecedent*, the second the *consequent*, the equality of ratios constitutes *proportion* [which see]. Ratios are compounded by multiplying the antecedents together, and the consequents together, and this is the foundation of the rule of compound proportion. Duplicate ratio is the ratio of the squares of two quantities thus $a^2 : b^2$ is the duplicate ratio of $a : b$. Triplicate ratio is the ratio of the cubes of two quantities: thus $a^3 : b^3$ is the triplicate ratio of $a : b$.—*Prime* and *ultimate ratio*, the relation which two variable quantities bear to each other when they are first supposed to be generated, and are indefinitely small, hence called *prime*; or the relation of two variable quantities to each other at the instant of vanishing, or becoming indefinitely small, and hence called *ultimate* ratio.

RA'TION (*ratio*, a computation: *Lat.*), the proportion or fixed allowance of provisions, drink, forage, &c. assigned to each soldier for his daily subsistence. Seamen in the navy also have *rations* of certain articles.

RATIONA'LE (*ratio*, a theory: *Lat.*), the account or solution of any phenomenon, explaining the principles on which it depends.

RA'TIONALISTS (*ratio*, the reason: *Lat.*), a term used to denote those who consider all the events recorded in the Scriptures as events happening in the ordinary course of nature; and who consider the statements and morality of the sacred writings as subject to the test of human reason.

RAT'LINES, in a ship, lines which make the ladder steps for going up the shrouds and ascending to the mast-head.

RATOON', a sprout from the root of the sugar-cane, which has been cut.

RATTAN', a slender cane obtained from several species of *Calamus*, plants belonging to the order of palms, and growing in India and the Indian archipelago. The walking sticks imported under the name of Penang lawyers are a kind of rattan. Immense quantities are consumed in India and Europe, but more particularly in China. For cane work they should be chosen long, of a bright pale yellow colour, well glazed, of a small size, and not brittle.

RAT'TLESNAKE, the common name for certain poisonous snakes inhabiting America, and belonging to the genus *Crotalus* (*krotalon*, a rattle: *Gr.*), from three to eight feet in length, with several horny cells at the tail, which, when moved, produce a loud rattling noise. The head is broad, triangular, and flat; the eyes brilliant, the mouth large, and the tongue forked. The sound of the rattle is said to be audible at the distance of twenty yards, and is thus useful in giving warning of the approach of the reptile. Its bite is attended with frightful consequences. There are two species, the *Crotalus horridus* of the United States, and the *Crotalus durissimus* of Guiana. They are sluggish, move slowly, and bite only when provoked, or to kill their prey. They feed chiefly on birds, squirrels, &c., which they are supposed to have the power of fascinating.

RAT'TLESNAKE ROOT, a North American plant, the *Polygala senega* of botanists. It is a stimulant, and is believed to be serviceable in case of the bite of a rattle-snake.

RAV'ELIN, in Fortification, a detached work composed of two faces, forming salient angles, and raised before the counterscarp. When used to cover the approach to a bridge, it is called a *tête du pont*. It is employed also in field fortification.

RA'VEN (*hræfn*: *A. Sax.*), the *Corvus corax* of ornithologists, a well known bold and sagacious British bird, the largest of the genus with us. It builds in high trees or rocks; is long lived, feeds on all sorts of carrion, and has an exquisite sense of smell.

RAY (*raie*: *Fr.*; from *radius*: *Lat.*), in Optics, a beam of light, propagated from a radiant point; said to be *direct*, if it comes immediately from the point; *reflected*, if it first strike upon any body, and is thence transmitted to the eye. The mixed solar beam contains: 1st. *calorific rays*, producing heat, but not vision and colour; 2nd. *colorific rays*, producing vision and colour, but not heat; 3rd. *chemical rays*, producing certain effects on the composition of bodies, but neither heat, vision, nor colour. A ray of white light is compounded of several colours [see COLOUR]; and it is divisible into two rays of white light, having different properties. [See POLARISATION.]——In Botany, the outer part or circumference of a compound radiate flower.——In Ichthyology, a bony or cartilaginous ossicle in the fins of fishes, serving to support the membrane.

RAY'-FISH, the common name for fishes with cartilaginous bones, belonging to the genus *Raia* of ichthyologists. They are distinguished by their flattened and broad dish-shaped body, that chiefly consists of immense pectoral fins, the rays of which support a broad duplicature of the skin, which is continuous anteriorly with that of the side of the flattened head. The mouth is on the underside of the body, where also are the gill openings in two rows of fins. The genus *Raia* includes the Skates and the Thornback. The sting ray and the eagle ray belong to allied genera; whilst the electric ray is a torpedo.

RAY'AH, the non-Mahomedan subjects of the Turkish Government, who pay the capitation tax.

RAYONNA'NT, in Heraldry, an epithet for any ordinary that darts forth rays like the sun when it shines.

RE, in Grammar, a prefix or inseparable particle at the beginning of words, to repeat or otherwise modify their meaning; as in *re*-action, *re*-export, &c.

REACH, that part of the length of a river in which the stream maintains the same direction.

REAC'TION (*re*, back; and *actio*, an acting: *Lat.*), in Physics, the resistance made by all bodies to a change from motion to rest or from rest to motion. It is in reality due to the necessity of a body at rest receiving motion, before it can move; or a body in motion losing motion, before it can stop, both of which require time.

REA'GENT (*re*, back; and *ago*, I act: *Lat.*), in Chemistry, the name given to such bodies as serve to detect others.

REAL (*res*, property: *Lat.*), in Law, pertaining to things permanent and immovable; as *real* estate, consisting of lands, tenements, and hereditaments, and opposed to *personal* or *movable* property. *Real assets*, assets consisting in real estate, or lands and tenements descending to an heir, sufficient to answer the charges upon the estate created by the ancestor.

REAL'GAR, red sulphuret of arsenic. It is either native or factitious.

RE'ALISM, in Philosophy, the opposite of *Idealism:* that philosophical system which conceives external things to exist independently of our conceptions of them. Realism becomes materialism if it considers matter, or physical substance, as the only original cause of things, and the soul itself as a material substance. As opposed to *Nominalism*, it is contrary to the theory which asserts that *general terms* have no corresponding reality, either in or out of our minds, being mere words, and nothing more.

REALM (*royaume*, a kingdom: *Fr.*), a royal jurisdiction, or the extent of a king's dominions.

REAL PRES'ENCE, in the Roman Catholic church, the supposed actual presence of the body and blood of Christ in the eucharist, the bread and wine being supposed to be converted into the real body and blood of Christ by the priest.

REAM (a bundle: *Sax.*), a certain quantity of paper. Twenty quires of twenty-four sheets each make a ream of writing paper; but the *printer's ream*, or *perfect* ream of printing paper, consists of 21½ quires, or 516 sheets. Two reams make what is termed a *bundle*.

REAR (*arrière: Fr.*), a military term for behind.——*Rear-guard*, a body of men that marches in the rear of the main body to protect it.——*Rear-rank*, the last line of men that are drawn up two or more deep.——The *rear* is also a naval term applied to the squadron which is hindmost.

RE'ASON (*raison: Fr.*), a faculty of the human mind by which it distinguishes truth from falsehood, and good from evil, and which enables the possessor to deduce inferences from facts or from propositions. Reason differs from *understanding*, which is the faculty of reflection and generalization; and from *instinct*, which is a mere natural impulse, by which animals are directed to certain actions, necessary for the preservation of the individual or the species. Instinct has nothing to do with reflection or experience; the wasp, in whatever solitude it may be reared, puts a food which it does not use itself, along with its eggs, into a hole; and just enough of it to support the larva, which it will never see, until it is able to provide for itself.

RE'ASONING, or RATIOCINA'TION (*ratiocinatio: Lat.*), an operation of the mind, deducing some unknown proposition from others that are evident and known. Every act of reasoning necessarily includes three distinct judgments; two, in which the ideas whose relation we want to discover are severally compared with the middle idea; and a third, in which they are themselves connected, or disjoined, according to the result of that comparison. Now, as our judgments when put into words are called Propositions, so the expressions of our reasonings are termed Syllogisms. And hence it follows that as every act of reasoning implies three several judgments, so every syllogism must include three distinct propositions. [See SYLLOGISM.]

RE'BATE (*rabattre*, to abate: *Fr.*), in Architecture, the groove, or channel, sunk on the edge of any material.——In arithmetic, *Discount*, which see.

RE'BEC. An instrument like a violin, having three strings tuned in fifths, and played with a bow. It was introduced by the Moors into Spain.

REB'EL (*rebellis: Lat.*), one who revolts from the Government to which he owes allegiance, either by openly renouncing its authority, or by taking arms and openly opposing it.

REBEL'LION (*rebellio*, a renewal of war by a conquered people: *Lat.*), an open and avowed renunciation of the authority of the government to which allegiance is due. It differs from *Insurrection*, which may be a rising in opposition to a particular act or law, without a design to renounce wholly all subjection to the government, and which may lead to, but is not necessarily in the first instance rebellion. Rebellion differs also from *Mutiny*, which is an insurrection of soldiers or sailors against the authority of their officers.

RE'BUS, an enigmatical representation of some name, &c., by using figures or pictures instead of words. Camden tells us the rebus was in great esteem among our forefathers.——In Heraldry, a coat of arms which bears an allusion to the name of a person.

REBUT'TER (*rebuter*, to repulse: *Fr.*), in Law, the defendant's answer to the plaintiff's sur-rejoinder. The fifth stage of the proceedings in an action if an issue has not been previously come to.

RECEIPT' (*receptus*, received: *Lat.*), in Commerce, an acquittance or discharge in writing for money received, or other valuable consideration.

RECE'IVER (*recevoir*, to receive: *Fr.*), in Law, one who takes stolen goods from a thief, knowing them to be stolen, and incurs the guilt of partaking in the crime. Also, one appointed to receive the rents, &c., accruing from the estate of an embarrassed person, for the benefit of his creditors.——In Pneumatics, a glass vessel for containing that on which an experiment is to be made with the air-pump.

RE'CENT (*recens*, lately: *Lat.*), a Geological term applied to whatever is of a date posterior to the introduction of man; all formations since that period being so termed. The word is also used in Natural History, in contradistinction to *extinct*.

RECEP'TACLE (*receptaculum*, a place into which anything is received: *Lat.*), in Botany, the expanded summit of the flower stalk upon which numerous florets are seated. In the order of *Compositæ* the receptacle is flat, convex, or conical; in the Fig order the receptacle is fleshy and hollow; it is the part we eat, and contains the seeds within, where the small flowers originally were.

RE'CIPE (take: *Lat.*), a Medical prescription; or directions for preparing any mixture or compound. *R*, at the head of a medical prescription, signifies *recipe*.

RECIP'ROCAL (*reciprocus*, alternating: *Lat.*), in general, something that is mutual, or which is returned equally on both sides, or that affects both parties alike.——*Reciprocal figures*, in Geometry, are those which are of the same kind—triangles, for example, prisms, &c.; and so related that two sides of one form the *extremes* of a proportion, of which two corresponding sides of the other form the *means*.——*Reciprocal proportions*, is when of four terms, taken in order, the first is to the second, as the fourth is to the third: or when the first is to the second, as the reciprocal of the third is to the reciprocal of the fourth. It is often termed *Inverse proportion*.——*Reciprocal quantities*, or *reciprocals*, are the terms of the fractions representing the quantities inverted: thus the reciprocal of $\frac{3}{4}$ is $\frac{4}{3}$; the reciprocal of 5, or $\frac{5}{1}$, is $\frac{1}{5}$. A quantity multiplied by its reciprocal gives unity; thus $\frac{3}{4}$ multiplied by $\frac{4}{3}$, is equal $\frac{12}{12}$ or 1; and $\frac{5}{1}$ multiplied by $\frac{1}{5}$, is equal to $\frac{5}{5}$ or 1.——*Reciprocal terms*, in Logic, are those which have the same signification; and consequently are convertible and may be used for each other.

RECITATI'VE (*recito*, I recite: *Lat.*), a kind of musical pronunciation, in which the composer and the performer endeavour to imitate the inflections, accent, and emphasis of speech; such as that in which the several parts of the liturgy are rehearsed in cathedral churches, or that of actors on an operatic stage when they relate some event or reveal some design.

RECK'ONING (*recan*, to reckon: *Sax.*), in Navigation, an account of the ship's course and distance: the course being determined by the compass, and the distance by the log books, and no aid being had from observation.——*Dead reckoning*, is the *reckoning*, allowance being made for drift, lee-way, currents, &c.

REC'LINATE (*reclinis*, leaning back: *Lat.*), in Botany, bent downwards, so that the point of the leaf is lower than the base.

RECLINA'TION (*reclino*, I lean back: *Lat.*), in Dialling, the number of degrees which a dial-plane leans backwards from an exactly upright or vertical plane; that is, from the zenith.

RECOGN'IZANCE (*recognosco*, I recognize: *Lat.*), in Law, a bond or obligation acknowledged in some court, or before some judge, with condition to do some particular act, as to appear at the assizes, to keep the peace, &c. The person who enters into such bond is called the *recognizor*; the person to whom he is bound is the *recognizee*.

RECOIL' (*reculer*, to go back: *Fr.*), in Gunnery, the retrograde motion made by any piece on being discharged. This term is particularly applicable to pieces of ordnance, which are always subject to a recoil, according to the sizes and the charges which they contain. To lessen the recoil of a gun, the platforms are generally made sloping towards the embrasures.

RECONNOI'TRE (to discover: *Fr.*), in Military language, to learn by ocular inspection of the situation of an enemy, or the nature of a piece of ground. It is one of the most important duties of a general, and must precede every considerable movement. Reconnoitering not unfrequently brings on engagements: for large bodies of troops march out to cover the reconnoitering party, and to make prisoners if possible, in order to obtain information from them.

RECORD (*recordor*, I call to mind: *Lat.*), in Law, the authentic written testimony of the judgment of a superior court, contained in rolls of parchment and preserved in a court of record.

RECORD'ER (same *deriv.*), the chief judicial officer of a borough or city, exercising within it, in criminal matters, the jurisdictions of a court of record—whence his title. Recorders are now selected by the Crown, and must be barristers of at least five years' standing.

RECOV'ERY, or COMMON RECOVERY (*recouvrer*, to recover: *Fr.*), in Law, a mode of conveyance, by means of a fictitious action [see FINE], which gave the recoverer a fee simple absolute. Common recoveries are now abolished, and a new mode of conveyance for the use of the tenant in tail substituted. [See ESTATE TAIL.]

RECT'ANGLE (*rectus angulus*, a right angle: *Lat.*), a figure whose sides are perpendicular to each other. The term is also sometimes used, but incorrectly, for the product of two quantities.

RECTIFICA'TION (*rectus*, right; and *facio*, I make: *Lat.*), in Chemistry, the process of refining by repeated distillation or sublimation, in order to render the substance purer.

REC'TOR (a director: *Lat.*), a term applied to the possessors of several official situations; as, 1. A clergyman who has the charge and cure of a parish, and the property of the tithes, &c.; 2. The chief elective officer in several universities; 3. The head master of large public schools in Scotland; 4. The governor in several convents; 5. The superior of a seminary or college of the Jesuits, &c.

REC'TUM (*rectus*, straight: *Lat.*), in Anatomy, the third and last of the large intestines: so called by the older anatomists, from an erroneous idea that it was straight.

REC'TUS (straight: *Lat.*), in Anatomy, a name common to several pairs of muscles, so called on account of the straightness of their fibres.

REC'TUS IN CU'RIA (right, in the eye of the court: *Lat.*), in Law, one who stands at the bar, no person objecting anything against him. Also, one who has reversed an outlawry, and can therefore partake of the benefit of the law.

RECUR'RENT VERSES (*recurro*, I return: *Lat.*), in Poetry, verses that read the same backwards as they do forwards.

RECUR'RING (same *deriv.*), or **CIRCULATING DECIMALS**, those decimals which arise from the divisions of the numerator of a fraction by its denominator; when the denominator includes, as factors, one or more prime numbers, different from 2 or 5, and not included in the numerator, the digits in such a case are repeated, *ad infinitum*. If only a single digit is repeated, it is a *repetend*; if two or more digits, a *periodical*; if there is also a finite part, that is one or more digits before the repeated part, it is a *mixed*, otherwise it is a *pure circulate*.

RECUR'VATE (*recurvo*, I bend backwards: *Lat.*), in Botany, bowed or curved downwards.

RECU'SANT (*recuso*, I refuse: *Lat.*), in English History, one who refuses to acknowledge the kingly supremacy in matters of religion.

RED, in Physics, one of the simple or primary colours of natural bodies, or rather of the rays of light. It has different shades or hues, as scarlet, crimson, vermillion, orange-red, &c.——The Greeks called the Arabian gulf the *Erythrean* or *Red* sea, probably from Edom or Idumea; improperly applying the meaning of Edom (red) to the sea, which improper application has been continued to the present time. It is, however, conjectured by some that the name was given on account of the vast quantity of red animalcules which the sea contains.

RED BOOK, a book containing the names of all persons in the service of the state.——RED BOOK OF THE EXCHEQUER, an ancient record, in which are set down the names of all who held lands *per baroniam*, in the time of Henry II.

RED'BREAST, the *Erythaca* (or *Sylvia*) *rubecula* of ornithologists, a well-known bird. Its fame has arisen from its habit of seeking the aid of man, and fearlessly visiting his dwelling, during the winter season.

REDEMP'TION (*redemptio*; from *redimo*, I buy back: *Lat.*), in Law, the liberation of an estate from a mortgage.——In War and in Commerce, the act of procuring the deliverance of persons or things from the possession and power of captors by the payment of an equivalent; as, the *redemption* of a ship and cargo.——In Theology, the ransom or deliverance of sinners from the bondage of sin, and the penalties of God's violated law, by the atonement of Christ.

RED LEAD, *Minium*; an oxide of lead, intermediate between the protoxide and peroxide.

REDOUBT' (*redoute*, from *redouter*, to fear: *Fr.*), in Fortification, almost any kind of work, used to fortify a military position, as those constructed within others, to prolong a defence; or detached works, to secure a piece of ground, useful to the besiegers.

REDPOLE, a name given to two species of the genus *Linota*, or linnet; namely, the mealy redpole (*L. canescens*), and the lesser or common redpole (*L. linaria*), both of which are winter visitors to our islands. The latter is easily tamed, and its lively habits and easy confidence render it a favourite.

RED SAN'DAL, or RED SAN'DERS. The wood of leguminous trees growing in Ceylon and other parts of India, belonging to the genus *Pterocarpus*. It is of a garnet-red colour, and extremely hard. The old wood only is employed as a dye stuff, and the colouring matter which it yields is by chemists known as *santaline*.

RED'START, the *Phœnicura rutacilla*, a beautiful bird, about five inches in length, which comes to this country about the middle of April, and leaves it in the beginning of October. The tail is of a reddish hue, whence the name, start being an old English word for tail.

REDUC'TIO AD ABSURDUM (a reducing to an absurdity: *Lat.*), in Logic, a mode of argument by which the truth of a proposi tion is proved by showing the absurdity of the contrary.

REDUC'TION (*reductio*, a restoring: *Lat.*), in Arithmetic, the change of a quantity from one denomination to another.——REDUCTION, the conversion of a metallic compound into a metal. It is sometimes effected by heat alone, oxygen being driven off; but it generally requires along with heat, some deoxidising agent, charcoal being most commonly used for that purpose, on the large scale.

REDUC'TION OF EQUA'TIONS (*reductio*, a bringing back: *Lat.*), in Algebra, reducing them to the simplest state, or clearing them of all superfluous quantities, by separating the known from the unknown, till the unknown quantity is found on one side, and the known ones on the other.

REDUPLICA'TION (*re*, again; and *duplicatio*, a doubling: *Lat.*), in Logic, a kind of condition expressed in a proposition; indicating or assigning the manner in which the predicate is attributed to the subject.

REED (*reod: Sax.*), the common name of many aquatic plants. In general, it denotes a kind of long, hollow, knotted grass that grows in fens and watery places.——REED, in Music, the small elastic plate which, by its vibration, produces the sound of certain instruments.

REEF, amongst Australian gold-miners, a vein of quartz, penetrating rocks of siluvian age, and varying in thickness from a few inches to forty or fifty feet, with a considerable extent as to length and depth. Gold is frequently found disseminated in such reefs, and is extracted by crushing the quartz to powder and treating it with mercury.

REE'FING (*reef*, a part of a sail taken in: *Dut.*), a nautical term for the taking up a sail in a great gale of wind, so as to diminish its surface.——REEF-TACKLE, a tackle upon deck, communicating with its pendant, passing through a block at the top-mast head, and through a hole in the top-sail yard-arm, and attached to a cringle below the lowest reef. It is used to pull the skirts of the top-sails close to the extremities of the yards, to lighten the labour of reefing.

REENTERING ANGLE, in Fortification, the angle of a work which points inwards, towards the place to be defended.

REFEC'TION (*refectio*, a refreshment: *Lat.*), among certain Ecclesiastics, a spare meal or repast just sufficing for the support of life; hence the hall in convents, and other communities, where the monks, nuns, &c. take their refections or meals in common, is called the *refectory*.

REFEREE' (*refero*, I consult: *Lat.*), one to whose decision a thing is referred; particularly, a person appointed by a court to hear, examine, and decide a cause between parties, pending before the court.

REF'ERENCE (same *deriv.*), in Law, the act of referring a matter in dispute to the decision of an arbitrator. Also, in the court of chancery, the referring a matter to a chief clerk, taxing master, &c., to examine and certify the result.——REFERENCE, in Printing, a mark in the text of a work referring to a similar one in the side or at the bottom of the page.

REFI'NING (*raffiner*, to purify: *Fr.*), in general, is the art or practice of purifying a thing; including not only the assaying or refining of metals, but likewise the clarification of liquors.

REFLEC'TION, or REFLEX'ION (*reflecto*, I bend back: *Lat.*), in Mechanics, the rebound of one body from the surface of another.——REFLECTION OF LIGHT, the turning of a ray from a body against which it has impinged; a reflecting is necessarily a polished surface. Light and heat, in reflections, follow the law of perfectly elastic bodies; that is, 'the angle of incidence is equal to the angle of reflection.' This enables us to ascertain with ease the path of a reflected ray; and to explain how it is that: 1. Plane mirrors alter the apparent position but not the size of an object; 2. Concave mirrors bring rays to a focus, and either increase or diminish the apparent size of an object, according as it is in one or other of the conjugate foci; and 3. convex mirrors disperse rays, and diminish the apparent size of an object.

RE'FLEX (*reflexus*, bent back: *Lat.*), in Painting, a term used to denote those places in a picture which are supposed to be illuminated by a light reflected from some other body, represented in the same piece.——REFLEX VISION, that performed by means of reflected rays, as from mirrors.

REFORMA'TION (*reformatio*; from *reformo*, I amend: *Lat.*), the term applied by Protestants universally, to denote the change from the Roman Catholic to the Protestant religion, which was first begun effectually in Germany, by Luther, A.D. 1517, but had commenced in England one hundred years earlier by Wickliffe. No one anticipated the quarter whence the first blow would be struck. Leo X. was created pope in 1513; and, little affected by the universal desire for reformation in the church—a desire expressed in the strongest terms by the most eminent Roman Catholic writers of the time, who in unmeasured terms inveigh against the universal corruption of morals from the very head of the church down to its most humble members, he seemed placed at its head merely to employ its revenues in the gratification of his princely tastes. Albert, elector of Mentz and archbishop of Magdeburg, a prince of a similar character, received from Leo, in 1516, under the pretence of raising money for the erection of St. Peter's at Rome, permission to sell *indulgences* within his own jurisdiction, on condition of sharing the profits with the pope. In this traffic, Albert employed, among others, John Tetzel, a Dominican monk of Leipsic, who went about from place to place, carrying on his trade with the most unblushing assurance. Luther, an Augustine monk of Erfurt,—a man of powerful mind, and distinguished more for his ardent piety and strong love of truth than for deep erudition,—set his face against this abuse, first in his sermons, and afterwards in ninety-five theses, or questions, which he affixed to the door of the church, Oct. 31, 1517. This led to several public disputations, in which he had such a decided advantage over his antagonists, that he, who was hardly known before, became the public champion of all who lamented the degeneracy of the church. The Franciscans were intrusted with the sale of indulgences in Switzerland; and executed their commission with equal zeal and imprudence. They were successfully opposed by Zuinglius, who was not inferior to Luther himself in courage and determination. The disputes between the Roman Catholic and reformed churches were long a source of many calamities; arising from the attempts to arrest the progress of reformation; until they were terminated in Germany, by the peace of Augsburg in 1555. In this country the Reformation triumphed from the very beginning, with the exception of the interval of Mary's reign, and has remained permanent.

REFRAC'TION (*refractus*, broken: *Lat.*), in Optics, the deviation of a ray of light from a right line in entering a medium of different density. The great law of refraction, which holds with regard to all bodies and all mediums, is, that a body passing obliquely out of one medium into another in which it meets with less resistance, is refracted or turned towards the perpendicular; and, on the contrary, in passing out of one medium into another in which the resistance is greater, it is refracted or turned from the perpendicular.——The ratio of the lines of the angles of incidence and refraction is called the *index* of refraction: it is different in different media, and is obtained, for each, by experiment—being that which is obtained when light passes from a vacuum into the medium. It enables us to ascertain the path of a ray, passing through any medium, or any number of media; to ascertain the foci of convex media, and the amount of divergences produced by those which are concave. Whatever the number or kind of media through which a ray of light may pass, its path is the same, from whichever of its extremities it begins its motions.——*Astronomical refraction*, the apparent angular elevation of the celestial bodies above the true places; caused by the passage of light through the atmosphere of the earth. Since the refractive power of an æriform fluid is found to be proportional to its density, and the density of the air continually diminishes, as its distance from the earth increases, the path of a ray which traverses the atmosphere obliquely must be a curve. The existence of atmospheric refraction was known at a very early period. It is clear that the place of distant or elevated terrestrial objects must be affected by refraction due to the atmosphere: this effect is called *terrestrial refraction*.——*Double refraction*. Certain substances have the power of decomposing a ray of white light into two others, which are refracted at different angles, and are found to possess very different properties. [See DOUBLE REFRACTION and POLARIZATION.]

REFUGEE' (*refugio*, I take refuge with; *Lat.*), in Political History, a term applied to the French Protestants, who, on the revocation of the edict of Nantes, fled from the persecution of France. The same term was also applied to the French priests and other royalists who sought an asylum in this country at the commencement of the revolution, towards the end of the last century They were also styled *émigrés*.

REGA'LIA (things pertaining to the king: *Lat.*), in Law, the rights and prerogatives of the sovereign power; also the ensigns of royalty, the crown, sceptre, &c. worn by our kings and queens at their coronation. They consist of the Crown used at the coronation of Queen Victoria [see CROWN]. *St. Edward's Crown*, of gold embellished with diamonds and other precious stones, made for the coronation of Charles II., and used at all subsequent coronations except the last. It was stolen by Blood from the Tower in May, 1761. The *Prince of Wales' Crown*, of pure gold without jewels. *The Queen Consort's Crown*, of gold set with diamonds, and other stones. *The Queen's Diadem*, made for the queen of James II.; it is adorned with diamonds and pearls. *St. Edward's Staff*, of beaten gold four feet seven inches long, surmounted by an orb, containing, according to tradition, a part of the true cross. This is carried before the sovereign at a coronation. The *Royal Sceptre*, or sceptre with the cross, 2 feet 9 inches long, made of gold, the pommel embellished with rubies, emeralds, and diamonds; the cross with various jewels, and a large table diamond in the centre. This is placed in the sovereign's right hand at the coronation by the officiating archbishop. The *Rod of Equity*, or sceptre with the dove, made of gold enriched with diamonds. This is placed in the sovereign's left hand at a coronation. The *Queen Consort's Sceptre*, of gold adorned with precious stones. The *Ivory Sceptre*, made for the queen of James II. bearing a dove of white onyx. A *Sceptre* thought to have been made for Mary queen of William III. The *Curtana*, a pointless sword of mercy, made of steel adorned with gold. Two *Swords of Justice*, temporal and ecclesiastical, which are carried before the sovereign at a coronation. *Armillæ*, or bracelets; *Spurs;* the *Ampulla*, or anointing vessel, and *Spoon* for receiving the sacred oil from the ampulla;—all these objects being used at a coronation. The *Golden Salt Cellar*, shaped like a castle. The *Baptismal Font* employed at the christening of the royal children, and a service of sacramental plate. All these articles are preserved in the Tower of London, where the public is permitted to see them. *Regalia of the church*, are the rights and privileges which cathedrals, &c., enjoy by royal grants. This term is particularly used for such lands and hereditaments as have been given by different sovereigns to the church.

REGAR'DANT (*Fr.*), in Heraldry, looking behind; used for a lion, &c. with the face turned towards the back in an attitude of vigilance.

REGAT'TA, a name given to yacht and boat races on different parts of the coast, or on large rivers. The word is adopted from the *Regatta* in Venice, where boats containing one person only, contend for prizes on the canals that intersect that city.

REGELA'TION (freezing again: *Lat.*), a term applied to a property possessed by ice. If two pieces of it are brought into contact, even in hot water, they will be frozen together.

RE'GENT (*regens*, governing: *Lat.*), one who governs a kingdom during the minority, absence, or incapacity of the rightful monarch.——In English universities, a master of arts becomes a *regent*, after a short period, and therefore a member of the governing body of the university; having a vote in convocation and congregation, at Oxford, and in the senate at Cambridge.——A member of a board or corporate body in the state of New York, which has power to grant acts of incorporation for colleges, and to visit and inspect all colleges, academies, and schools in the state.

REG'IMEN (a guiding: *Lat.*), the regulation of diet, or in a more general sense, of all the non-naturals, with a view to preserve or restore health.——In Grammar, that part of syntax, or construction, which regulates the dependency of words; and the alterations which one occasions or requires in another connected with it.

REG'IMENT (*Fr*, from *rego*, I govern: *Lat.*), in Military affairs, a body of troops, either horse, foot, or artillery; the infantry consisting of one or more battalions, and commanded by a colonel or lieutenant-colonel.——*Regimentals*, the uniform clothing of the army.

RE'GION (*regio*; from *rego*, I govern: *Lat.*), in Geography, a large extent of land inhabited by many people of the same nation and inclosed within certain limits or bounds.

REG'ISTER (*registre*: *Fr.*), an official account of the proceedings of a public body, or a book in which are entered and recorded memoirs, acts, and minutes, for the purpose of preserving them, or making them easily accessible for reference.——*Register*, in printing, such an accurate arrangement of the lines and pages, that those printed on one side of the sheet shall fall exactly on those of the other.——Among letter-founders, the inner part of the mould in which the printing types are cast.——*Register*, in chemistry and the arts, an aperture with a lid, stopper, or sliding plate, in a furnace, stove &c., for regulating the admission of air, and thus increasing or diminishing the heat of the fire.——*Parish Register*, a book in which are recorded the baptisms of children, and the marriages and burials in a parish.——*Register ship*, a ship which obtained permission from the King of Spain, or the Council of the Indies, to trade to the Spanish West Indies; and was registered before sailing.

REGISTRATION OF DEEDS, the obligation, by law, which exists in certain places, of registering certain deeds. Its intention was to give notice to purchasers of incumbrances existing on estates. But a party actually or constructively aware of incumbrances not registered, is bound by such knowledge.

RE'GIUM DO'NUM (a royal gift: *Lat.*), an annual grant of public money in aid of the maintenance of the Presbyterian clergy in Ireland. It was first given by William III. in 1690, and the grant was remodelled in 1790.

RE'GIUS PROFES'SOR (a royal professor: *Lat.*), in Literature, a title given to five readers or lecturers in the university of Oxford; so called from these professorships having been founded by Henry VIII. In the Scottish universities this name is given to professors for whom a chair has been created with an endowment from the crown.

REG'LET, or RIG'LET (a *dim.* of *regle*, a rule: *Fr.*), in Architecture, a flat narrow moulding, used chiefly in panels and compartments, to separate the parts or members from each other, and to form knots, frets, and other ornaments.——In Printing, a ledge or thin slip of wood exactly planed, used to separate lines and make the work more open.

REGRA'TER (*regrattier*, to forestall: *Fr.*), one who buys and resells in the same fair or market. He differs from a *forestaller*, who is one that buys on the road to the market.

REG'ULA (a rule: *Lat.*), in Archæology, the book of rules, &c. of a monastery.

REG'ULAR BODIES, in Geometry, those which are comprehended by like equal and regular plane figures, whose solid angles are all equal.

REG'ULAR FIGURES, in Geometry, equilateral and equiangular polygons. Circles can be described within and about such figures.

REG'ULARS, in Military affairs, that part of the army which is entirely at the disposal of government.——In ecclesiastical history, *regulars* are such as live under some rule of obedience, and lead a monastic life. In this sense the *regular* differs from the *secular clergy* of the Roman Catholic Church, which performs parochial duties, as a matter of course.

REG'ULATOR (*regulo*, I direct: *Lat.*), in Machinery, any contrivance which produces a uniform movement; thus, a Fly, Fly-wheel, Governor, &c.——In Horology, an apparatus attached to the hair-spring of a watch, which, by *practically* lengthening or shortening the spiral spring attached to the balance, causes the watch to go slower or faster; in modern watches, it is generally a mere index; in those of older date, it is a pinion and segment. In each case, one end of the spring passes freely, but, in contact, through an aperture in a small piece which is movable along the spring.

REG'ULUS (a little king: *Lat.*), a term formerly employed by chemists, to denote metallic matters when separated from others by fusion. This term was used, because the alchemist expected to find gold, the king of metals, collected at the bottom of the crucible. Thus, *regulus of antimony*, *of bismuth*, &c.——REGULUS, or the Lion's Heart, a star of the first magnitude in the Lion; a constellation of the northern hemisphere; it is the α *Leonis* of astronomers.——*Regulus*, in Ornithology, a genus of birds belonging to the family of *Sylviadæ*, of which two species are found in this country. The crested wren is about the size of the common wren; the head, neck, and back are of a mixed green and gray colour; its breast and belly of a pale gray, and its wings variegated with black and yellow. The head of the male is ornamented with an orange-coloured crest or crown; whence the name *regulus*.

REIN'-DEER (*rennthier: Ger.*), the *Tarandus rangifer* of zoologists, the caribou of the Canadians, is a cervine quadruped which inhabits the northern regions of Europe, Asia, and America. It varies a good deal in size and colour, but in winter its coat is always white. It carries a pair of large antlers, which are shed annually. In America this animal is only known as a beast of chase, being hunted for food by the Indians and Esquimaux; but in Lapland and amongst the Ichukches, a people dwelling in the corner of Asia abutting on Behring's Straits, the rein-deer has been domesticated. It serves the Laplanders in place of horse, ox, and sheep, providing them with milk, cheese, flesh meat, and clothing, whilst yoked to a sledge it draws its master over snow many miles in a day. Its chief food in the wild state is the lichen, called reindeer moss, which grows luxuriantly in cold regions.

REINFO'RCE (*renforcer*, to strengthen: *Fr.*), in Artillery, the part of the gun which is nearest the breech; it is made stronger, to resist the explosive force of the powder. ——*Reinforce rings*, flat hoop-like mouldings, on the reinforce, next the breech. There are generally two, the first of which is the larger.

REI'TERS (*reiters*, riders: *Ger.*), German cavalry of the 14th and 15th centuries; they served on the Protestant side in the religious wars in France.

REJOIN'DER (*rejoindre*, to join: *Fr.*), in Law, the defendant's answer to the plaintiff's replication; it is the fourth stage in the pleadings in an action.

RELA'TION (*relatio: Lat.*), in Logic, one of the ten predicaments or accidents belonging to substance.——*Relation, inharmonical*, in Music, a term to express that some harsh and displeasing discord is produced in comparing the present note with the preceding chord.

REL'ATIVE (*relativus: Lat.*), in general, a term signifying not absolute, but considered as belonging to or respecting something else.——*Relative*, in Grammar, a word which relates to or represents another word, called its antecedent, or to a sentence or member of a sentence, or to a series of sentences, which constitutes its antecedent. —*Relative terms*, in Logic, terms which imply relation, as guardian and ward; husband and wife; master and servant.

RELAY' (*relais: Fr.*), a supply of horses ready on the road to relieve others, in order that a traveller may proceed without delay. In hunting, a *relay* signifies a fresh set of dogs, or horses, or both, placed in readiness, in case the game comes that way.

RELE'ASE, in Law, is a discharge or conveyance of a person's right in lands or tenements, to another who has some former state in possession. The words generally used in it are, 'remised, released, and for ever quit-claimed.'——Also, a release of a right of action which may be pleaded in bar. A release 'of all demands' discharges of all sorts of actions, rights, &c.

REL'ICS (*reliquiæ: Lat.*), in the Roman Catholic church, the remains or supposed remains of saints, martyrs, or other holy persons, or something appertaining or belonging to them, devoutly preserved in honour of their memory. At first these objects were only held in high esteem; but on the return of the crusaders from the East, relics greatly multiplied, and eventually superstition ascribed to them miraculous powers.

RELIE'F, in Feudal Law, a fine formerly paid to the king by every one who came to an inheritance of land held *in capite*, or military service.——*To relieve guard*, in military tactics, to bring fresh men for the relief of those that were on guard before.

RELIE'VO, or **RELIEF** (*rilievo: Ital.*), in Sculpture, the prominence of a figure that rises from the ground or plane on which it is formed. There are three degrees of relievo: alto, basso, and mezzo. The *alto relievo*, called also *haut-relief*, or high-relief, is that in which the figure projects according to the natural proportions. *Basso-relievo*, *bas relief*, or low-relief, is that usual on medals; and *mezzo relievo*, *demi-relief*, or half-relief, is where one half of the figure rises from the plane.

RELI'GION (*religio*, a system of divine worship: *Lat.*), any system of worship of a Being superior to man. Religion is different from *theology*, inasmuch as the latter is speculative and the former practical. Religion is a system of duties; theology a system of opinions. Theology inquires into the nature of the power or powers to whom all visible things are in subjection; religion is the sentiment which springs from that inquiry. History informs us that religion has ever had a powerful influence in moulding the sentiments and manners of men. In one region or age it has been favourable to civilization and refinement; in another it has been so directed as to fetter genius or warp the human mind. That, however, depends on the purity of the doctrine, and the liberality of its teachers.

RELIGIOUS HOUSES, different establishments or habitations for priests, still existing in Roman Catholic countries, and before the Reformation abounding in England. They consisted of abbeys, monasteries, priories, hospitals, friaries, and nunneries, supported by a vast amount of land and enormous bequests left them by zealous and wealthy individuals. Nearly the whole, more than 3000 in number, were dissolved, and their wealth seized, by Henry VIII.; the monks, nuns, and officers being allowed pensions.

RELIQ'UIÆ (*Lat.*), in Roman Antiquity, the ashes and bones of the dead, remaining after their bodies were burned, and gathered up for the purpose of being put into urns, which were deposited in tombs.

REMAIN'DER (*remaneo*, I remain: *Lat.*), in Arithmetic, what is left, when one quantity is subtracted from another. Also, what is left, when the dividend does not exactly contain the divisor. Sometimes it is an integer: thus, if 7 is divided by 3, the quotient will be 2, and 1 will be left. It is not correct to consider ⅓ also as the remainder in this case, for ⅓ is part of the quotient, since 2⅓ is the *exact* third of 7. ——*Remainder*, in law, an estate in lands, tenements, or rents, not to be enjoyed till after a term of years or another person's decease. There is this difference between a *Remainder* and a *Reversion*; in case of a reversion, the estate granted, after the limited time, reverts to the grantor or his heirs; but by a remainder it goes to some third person or a stranger. Unlike a reversion, a remainder does not arise by operations of the law, but by the act of parties.

REMINIS'CENCE (*reminiscens*, recalling to mind: *Lat.*), that faculty of the mind by which ideas formerly received into it, but forgotten, are recalled or revived in the memory.

REMIS'SION (*remissio*, a letting down: *Lat.*), in Medicine, the abatement of a disorder which does not entirely leave the patient; in distinction from *intermission*, when it goes entirely away for a time.

REMON'STRANCE (*re*, against: and *monstro*, I point out: *Lat.*), a strong representation of reasons against a measure, either public or private. When addressed to a public body, a prince, or magistrate, it may be accompanied with a petition or supplication for the removal or prevention of some evil or inconvenience.

REMON'STRANTS (same *deriv.*), in Ecclesiastical History, the appellation given to the Arminians who remonstrated against the decisions of the synod of Dort, in 1618.

REM'ORA (*Lat.*, literally, a delay; because the ancients imagined it had the power of stopping a ship by attaching itself to the rudder). In Ichthyology, the *sucking-fish*, a species of *Echeneis*.——In Surgery, an instrument for setting a broken bone.

REN'ITENCE, or **REN'ITENCY** (*renitor*, I struggle against: *Lat.*), a term formerly used in physics to express the effort of matter to resume the place or form from which it has been driven by the impulse of other matter; the effect of elasticity, or the resistance of a body to pressure.

REN'NET, or **RUN'NET** (*rinnen*, to curdle: *Ger.*), the liquor prepared by steeping the inner membrane of a calf's stomach in water; or the membrane itself. Either is used for coagulating milk, or converting it into curd in the making of cheese.

RENT (*rente*: *Fr.*, from *reditus*: *Lat.*), in Law, a sum of money issuing yearly from lands and tenements; a compensation or return, in the nature of an acknowledgment, for the possession of a corporeal inheritance.——*Rack-rent*, a rent of the full value of the tenement, or near it.——A *fee-farm rent*, is a rent-charge issuing out of an estate in fee, of at least one-fourth of the value of the lands at the time of its reservation.

RENT'AL, a schedule in which the rents of manors are set down. It contains the lands let to each tenant, with their names, and the several rents arising.

RENT CHARGE, in Law, a charge of rent upon land, with a clause of distress in case of non-payment.

RENVERS'E, (*renversé*, overturned: *Fr.*), in Heraldry, set with the head downwards, or contrary to the natural posture.

REPAND' (*repandus*, bent backwards: *Lat.*), in Botany, an epithet for a leaf, the rim of which is terminated by angles having sinuses between them, inscribed in the segment of a circle; or which has a bending or waved margin without any angles.

REPEAT' (*repeto*, I recommence: *Lat.*), in Music, a character showing that what was last played or sung must be repeated.

REPEAT'ER, a kind of watch, which, by means of a spring, is made to repeat or strike the hour.

REPEL'LENTS (*repello*, I drive back: *Lat.*), medicines which drive morbid humours from the part where they have settled; or which prevent such an afflux of fluid to a part as would raise it to a tumour.

REPENT'ANCE (*repenter*, to repent; from *peniteo*, I am sorry: *Lat.*), in a religious sense, sorrow or deep contrition for sin, as an offence and dishonour to God, and a violation of his holy law; but to render it acceptable, it must be followed by amendment of life. Repentance, excited by the fear of penalties, may exist without an amendment of life.

REP'ERTORY (*repertorium*, from *reperio*, I find: *Lat.*), a place in which things are disposed in an orderly manner, so that they can easily be found, as the index of a book, a common-place book, &c.

REPLEV'IN, in Law, a remedy granted on a distress, by which a person, whose effects are distrained, has them restored to him on his giving security to the sheriff that he will pursue his action against the party distraining, and return the goods if the taking them shall be adjudged lawful. [See DISTRESS.]

REPLICA'TION (*replicatio*, literally a folding back: *Lat.*), in Law, the plaintiff's answer to the defendant's plea. It is the third stage in the pleadings in an action. ——In Logic, the assuming or using the same term twice in the same proposition.

REPRESEN'TATIVE (*repræsento*, I make present again: *Lat.*), one who lawfully represents another for the performance of any duty, according to the wishes of the other and to his own honest judgment. A member of the house of commons is the *representative* of his constituents, and of the nation. In matters concerning his constituents only, he is supposed to be bound by their instructions; but in the enacting of laws for the nation, he is supposed not to be bound by their instructions, as he acts for the whole nation. Any other construction of his duty would be derogatory to him as a free and independent member of the senate.——REPRESENTATIVE FORMS, races or species of animals or plants in one locality which take the place of allied races or species in another locality.

REPRIE'VE (*re*, again; and *privo*, I release: *Lat.*), in Law, a warrant for suspending the execution of a malefactor.

REPRODUC'TION (*reproduire*, to reproduce: *Fr.*), in Physiology, the production, from a plant, or an animal, of a being like itself.——Also, and more properly, the power of an organized being to form anew parts which have been cut off. Some annuals possess this faculty in an eminent degree; thus, the *Hydra viridis*, or fresh water polype, when divided into many pieces, reproduces the necessary organs in each piece, so as to form from it a perfect hydra. Snails can produce new horns, and even a part of their heads; lobsters and spiders new legs: newts and lizards new tails.

REP'TILES (*reptilis*, creeping: *Lat.*), in Zoology, a class of cold-blooded vertebrate animals, all of which have lungs and a heart composed of two auricles and one ventricle. That division of reptiles which have gills during the whole or a part of their lives are placed by some naturalists in a separate class, that of amphibia. Reptiles in a zoological scale are ranked between birds and fishes. Their bodies are destitute of hair and feathers, nor do they possess teats. Muscular energy is less than that of quadrupeds, and in cold or temperate climates most of them pass the winter in a state of torpor. The smallness of their pulmonary vessels allows the aquatic species to suspend respiration, without arresting the course of the blood, and to dive with more facility, and remain under water longer than the mammalia or birds. Reptiles are either oviparous or ovoviparous; in the former case they never hatch their eggs. They may be divided into scaly reptiles and shielded reptiles, the former comprising snakes and lizards, the latter tortoises, crocodiles, and amphisbænians. In former geological ages there lived larger reptiles than any now existing. [See ICHTHYOSAURUS, IGUANODON, MEGALOSAURUS, PTERODACTYLUS, &c.]

REPUB'LIC (*respublica*: *Lat.*), in Politics, a state in which the exercise of the sovereign power is lodged in the people. If it is an *aristocracy*, like what the republic of Venice was, the authority is vested in a few privileged individuals; if a *democracy*, it is vested in rulers chosen by and from the whole population, or in representatives selected by it. Sometimes, as in Switzerland, aristocracy and democracy are combined. In modern usage it differs from a state, in which the people exercise the powers of sovereignty in person; yet the democracies of Greece are often called *republics*.——*Republic of letters*, the collective body of learned men.

REPULLULA'TION (*repullulo*, I sprout again: *Lat.*), in Botany, the act of budding again.

REPUL'SION (*repulsio*; from *repello*, I drive back: *Lat.*), in Physics, that property in bodies by which they mutually fly from each other. On account of repulsion, a fine needle will lie on water without touching it; and drops of water will roll over a cabbage leaf without leaving the least trace behind.

REQUESTS, COURT OF, in Law, an ancient Court of Equity inferior to Chancery, in which the lord privy seal was chief judge. Also the court of conscience in London, and several local courts throughout the country. But the establishment and extension of county courts, for the recovery of debts under 50*l.*, has, with few exceptions, abolished all such courts.

RE'QUIEM, in Music, a prayer in the Roman Catholic Church, which begins with *Requiem æternam dona eis Domine* (give them eternal rest, O Lord: *Lat.*); whence, 'to sing a *requiem*,' is to sing a mass for the repose of the souls of deceased persons.

RERE'DOS (*arrière*, behind; *dos*, the back: *Fr.*), in Architecture, the screen or wall behind an altar in a church; also, the back of a fireplace.

RE'SCRIPT (*rescriptus*, written in reply: *Lat.*), the answer of an emperor when consulted on some difficult question. This answer serves as a decision of the question, and is therefore equivalent to an edict or decree.

RES'CUE, in Law, the forcible retaking of a lawful distress from the distrainor, or from the custody of the law; also, the forcible liberation of a defendant from the custody of the officer.

RESERVA'TION (*reservo*, I keep back: *Lat.*), in Law, a clause or part of an instrument by which something is reserved, not conceded or granted.——*Mental reservation*, is the withholding of something that affects a proposition or statement, and which if disclosed would materially vary its import.

RESER'VE (same *deriv.*), or *Corps de reserve*, in Military affairs, the third or last line of an army drawn up for battle; so called because they are reserved to sustain the rest, as occasion requires, and not to engage but in case of necessity.

RES'ERVOIR (*Fr.*; from *same*), a place where water is collected and reserved, in order to be conveyed to distant places through pipes, or to supply a fountain, &c.

RES'IDENCE (*resideo*, I reside: *Lat.*), of clergymen, on their benefices is obligatory, except in certain cases. An incumbent is considered non-resident, if absent for one or more periods, exceeding in the whole three calendar months, in each year. Licence for non-residence may sometimes be given by the bishop; and there are statutory exceptions, in favour of several officers of cathedral and collegiate churches, &c. The penalties for non-residence are fixed on a graduated scale, depending on the value of the benefice.

RESIDEN'TIARY (same *deriv.*), a canon or other ecclesiastic installed into the privileges, &c., of residence.

RESID'UAL FIGURE (*residuus*, that remains over: *Lat.*), in Geometry, the figure remaining after subtracting a lesser from a greater.

RESID'UAL ROOT (same *deriv.*), in Algebra, a root composed of two parts or members, connected together by the negative sign.

RESID'UARY LEGATEE'. [See RESIDUE]

RESI'DUE (*Fr.*; from *residuum*, what is left behind: *Lat.*), in Law, the remainder of a testator's estate, after the payment of debts and legacies. If this residue is bequeathed to any one he is the *residuary* legatee. *A lapsed* legacy, that is one bequeathed to a person who dies before the testators, falls into the residue.

RESIL'IENCE (*recilio*, I leap back: *Lat.*), the property or act of leaping or springing back, or the act of rebounding; as, the *resilience* of a ball, or of sound.

RES'IN, or **ROS'IN** (*resina*: *Lat.*), inflammable substances exuding from trees: as the common resin, or turpentine, from Pines, mastich from the Pistacia; sandarach from the Thuya, &c. Pure resins are soluble in alcohol, and are generally separable into two portions, by acting on them with both cold and hot alcohol. They differ from *gums*, which are soluble in water, and from *gum resins*, which are partially soluble in water, and partially in alcohol. Almost all resins are translucid, not often colourless, but generally brown. When heated they melt more or less easily into a thick viscid liquid. The common resin of commerce is the solid product left after distilling turpentine.——*Resinous electricity*, is that electricity which is excited by rubbing bodies of the resinous kind, and which is generally *negative*.

RESIST'ANCE (*resisto*, I withstand: *Lat.*), or RESISTING FORCE, any power which acts in an opposite direction to another, or which prevents the effect of another power; the *resistance* of wood to a cutting instrument; that of air to the motion of a cannon-ball; or of water to the motion of a ship.——We use the term *resisting medium*, when we speak of a substance which opposes the passage of a body through it.

RESIST'ANCE OF FLUIDS. The resistance of fluids to bodies moving in them is, at least within certain limits, as the square of the velocity—that is, doubling the velocity—renders the resistance four times as great, trebling it nine times as great, and so on. It varies directly as the surfaces of bodies; that is, those which have twice as great a surface will experience twice as great resistance. And when the incidence of the resisting fluid is oblique to the surface, the resistance varies as the square of the sine of the angle of incidence. But these laws are modified by the form of the body; by the adhesion of the molecules of the fluid which is greatest, when the motion is slow; by the depth to which the body remains under the fluid, for it is sometimes more or less raised out of the fluid by the velocity of transit; moreover the pressure of the fluid increases as we descend, and by the quantity of fluid dragged along by the body, &c.

RESOLUTION (*resolutio*, literally, an untying: *Lat.*), the operation or process of separating the parts which compose a complex idea or a mixed body.——The determination or decision of a legislative body; or a formal proposition offered for legislative determination.——In Chemistry, the reducing a body to its component parts.——In Mathematics, a method by which the truth or falsehood of a proposition is discovered.——In Surgery, the dispersing of tumours.——RESOLUTION OF FORCES, in Mechanics, the dividing any force or motion into others which act in other directions; but which, taken together, shall have the same effect as the single one.

RESPIRA'TION (*respiratio*, from *respiro*, I breathe back: *Lat.*), an important function of the animal body, consisting in the alternate inhalation and exhalation of air, by which the lungs and chest are alternately dilated and contracted. Respiration changes the dark *venous* into red *arterial* blood, carbon being removed from it. Hence the oxygen of the air leaves the lungs in the form of carbonic acid. This colour will be given to blood by the atmosphere, even when it has been removed from the body; and hence, meat which when freshly cut is dark, becomes very soon of a bright red. A man breathes about twenty times in a minute, during which time he inhales about eighteen pints of air.

RES'PIRATOR (*respiro*, I breathe back: *Lat.*), an instrument made of a series of extremely thin perforated metal plates, or of fine wire, fitted to cover the mouth, over which it is fastened by bandages; its object being to warm the *inspired air*, before it enters the lungs, with the heat it received from that which was *expired*. Persons afflicted with asthmatic complaints, or lungs diseased from other causes, have received benefit from its use.

RESPOND'ENT (*respondeo*, I reply: *Lat.*), in Law, one that answers in a suit.——In the Schools, one who maintains a thesis in reply, and whose province is to refute objections or overthrow arguments.

RES'TORATION (*restauratio*: *Lat.*), renewal; revival; reestablishment. In England, the return of king Charles II. in 1660, is, by way of eminence, called the Restoration; and the 29th of May was kept as an anniversary festival, in commemoration of the re-establishment of monarchy.

RESULT'ANT, in Mechanics, a force which is the combined effect of two or more forces, acting in different directions.

RESU'PINATE (*resupinus*, bent back: *Lat.*), in Botany, reversed. A *resupinate leaf* is when the upper surface becomes the lower, by the twisting of the stalk.

RESUSCITA'TION (*resuscitatio*: from *resuscito*, I revive: *Lat.*), the restoring of persons apparently dead to life; chiefly confined to the restoring of those who appear to be dead from being immersed in water or from hanging. In the efforts made by a drowning person, or animal, to draw in air, the water rushes into the mouth and throat, which parts immediately contract in such a manner as to shut up the passage into the lungs. The contracted state continues as long as the muscles retain the principle of life, upon which the power of muscular contraction depends; when that is gone, they become relaxed, and the water enters the windpipe, and completely fills it. As soon as the body is taken out of the water, it should be stripped of any clothes it may have on, and be immediately well dried. It should then be wrapped in dry, warm blankets, or in the spare clothes taken from some of the by-standers, and be removed as quickly as possible to the nearest house, in which a fire is ready or can be made. Whatever mode of conveyance be adopted particular care should be taken that the head be neither suffered to hang backwards, nor to bend down with the chin upon the breast. When arrived at the house, the body should be laid on a mattress, or a double blanket, spread upon a low table, or upon a door supported by stools, the head and chest being elevated by pillows. The greatest aid to recovery lies in the æration of the blood, by the artificial introduction of fresh air into the lungs; for the purpose of restoring the function of respiration. After hanging, the vessels of the brain often require to be unloaded, by venesections in the jugular vein. Electricity is sometimes tried in those cases; but rarely with any effect. No time should ever be lost, nor should hope of restoring suspended animation ever be abandoned, until unequivocal signs of death appear.

RETAINER (*retenir*, to retain; from *retineo*: *Lat.*), in old English Law, a servant not employed in any particular office, but wearing the badge and livery of his master. It was a relic of the times of private warfare; and was forbidden by many statutes. The latter have been repealed, but the custom has nearly ceased.——RETAINER, or RETAINING FEE, in the language of the Bar, a fee given to counsel, to retain his services, or according to some, merely to prevent his being employed by the opposite party. It is either special or general. A *special* retainer is for a particular case; a *general*, for any case that may come on in the court which that council attends. A general retainer prevents the acceptance of a brief from the opposite party, until after twenty-four hours' notice that such a brief has been offered, when it may be accepted, if no brief or special retainer has been received from the party by whom the general retainer was paid.

RE'TE MUCO'SUM (the mucous net: *Lat.*), in Anatomy, a membrane between the epidermis and the cutis, which is one part of the skin, and the principal seat of colour in the human species.

RET'ICENCE, or RET'ICENCY (*reticentia*, literally a keeping silence: *Lat.*), in Rhetoric, a figure by which a person really speaks of a thing, while he makes a show as if he would say nothing on the subject.

RETIC'ULATE (*reticulatus*, net-like: *Lat.*), in Natural History, having distinct veins crossing like net-work; as, a *reticulate* petal or corolla.

RET'IFORM (*rete*, a net; and *forma*, a form: *Lat.*), composed of crossing lines and interstices, like a net; as, the *retiform* coat of the eye.

RET'INA (a *dim.* of *rete*, a net: *Lat.*), in Anatomy, the expansion of the optic nerve on the internal surface of the eye, where the sense of vision is first received, and of which it is the true organ.

RET'INITE, or RET'INASPHALTUM (*rētinē*, resin; and *asphaltos*, bitumen: *Gr.*), in Mineralogy, a native pitch, of a resinous appearance, and of various colours, rarely homogeneous, and often containing crystals of feldspar and scales of mica. Digested in alcohol it yields some resin, and asphalt remains; which has led some to suppose that bitumens are of resinous origin.

RETIRA'DE (*retirer*, to retire: *Fr.*), in Fortification, a kind of retrenchment in the body of a bastion or other work, which is to be disputed inch by inch, after the defences are dismantled.

RETIRED FLANK, in Fortification, a flank having an arc of a circle, with its convexity turned towards the place to be defended.

RETORT' (*retortus*, bent back: *Lat.*), a chemical vessel used in distillation. Any substance intended to be acted upon by heat being put into it, is exposed in it over a lamp, or other fire, and on being vapourized or volatilized, passes through the end into any other vessel adapted to receive it. It is of the shape of an egg placed on one end, and having its upper end drawn out into a tube, which is turned downwards. If there is a small neck for a cork, or ground glass stopper, placed at its highest part, it is termed a *tubulated retort*. It is an extremely convenient apparatus for distilling, and a great number of other purposes.

RETRAX'IT (he has withdrawn: *Lat.*), a legal term signifying a proceeding in an action by which a plaintiff withdraws from the prosecution of it. It is a bar to any future action for the same cause.

RETRENCH'MENT (*retranchement*; from *retrancher*, to intrench: *Fr.*), in the art of war, any kind of work raised to cover a post and fortify it against the enemy, such as fascines loaded with earth, gabions, sand-bags, &c.

RE'TRO (backwards: *Lat.*), a prefix to many words, as in retrocession, retrogradation, &c.; implying a going backward.

RETROCES'SION OF THE EQ'UINOXES, (*retrocessus*, a going backwards: *Lat.*), in Astronomy, the going backwards of the equinoctial points. [See PRECESSION OF THE EQUINOXES.]

RET'ROFLEX (*retroflecto*, I bend back: *Lat.*), in Botany, bent in different directions, usually in a distorted manner; as, a *retroflex* branch.

RET'ROFRACT, or RETROFRACT'ED (*retro*, backwards; and *fractus*, broken: *Lat.*), in Botany, bent back towards its insertion, as if it were broken; as a *retrofract* peduncle.

RETROGRADA'TION (*retrogradion*, I go backwards: *Lat.*), in Astronomy, an apparent motion of the planets by which they seem to go backwards in the ecliptic, and to move contrary to the order and succession of the signs.

RETURN' (*retourner*, to return: *Fr.*), in Architecture, a moulding, wale, &c., continued in a different, or opposite direction.——In Law, a certificate from sheriffs and bailiffs of what is done in the execution of a writ.——*Return days*, certain days in term time for the return of writs.——In Military and Naval affairs, an official account, report, or statement rendered to the commander; as, the *return* of men fit for duty; or the *return* of provisions, ammunition, &c.——*Returns*, in commerce, that which is received for merchandise sold.——*Returns of a mine*, in fortification, the windings and turnings of a gallery leading to a mine.

REVE'ILLE (awake: *Fr.*), in Military affairs, the beat of drum about break of day, to give notice that it is time for the soldiers to rise, and for the sentinels to forbear challenging.

REVELA'TIONS, BOOK OF. [See APOCALYPSE.]

REV'ENUE (*Fr*)., in a general sense, is an annual or continual income, or the yearly profit that accrues to a man from his lands or possessions; but in modern usage, *revenue* is generally applied to the annual produce of taxes, excise, customs, duties, &c. which a nation or state collects or receives into the treasury for public use.——The *royal revenue* is that which the British constitution has vested in the sovereign, to support the regal dignity and power. This is either *ordinary* or *extraordinary*. There was a period when the ordinary revenue of the crown was sufficient to defray the expenses of government, without recurrence to taxes; but much of this is, at the present day, in the hands of lords of manors and other subjects, to whom it has been granted from time to time by the kings of England. From this cause, the crown has become almost dependent on the people for its ordinary support and subsistence; and though at first sight it might seem desirable that now, as heretofore, the executive power were in possession of an hereditary estate and hereditary claims, adequate to the burdens of the community, without the assistance of imposts; yet the least reflection convinces us that the security of political liberty consists in the reverse. The ordinary revenue of the crown is now, as above remarked, but trifling: the *extraordinary*, which includes the whole amount of the taxes yearly voted by parliament, is that which is applied to the expenses of government, and out of which the *civil list*, or more immediate revenue of the crown, is granted. Out of the civil list are paid the salaries of the ministers, judges, &c.; and only a comparatively small part really belongs to the personal expenditure of the sovereign.

REVER'BERATORY FUR'NACE (*reverbero*, I beat back, *Lat.*), is one of such a construction that the flame is reflected or reverberated upon the bottom where the material to be acted on is placed.

REV'ERIE (*Fr.*), the wandering thoughts of a person in a dreamy frame of mind.

REVER'SION (*reversio*, a turning back: *Lat.*), in Law, is when the possession of an estate which was parted with for a time returns to the donor or his heirs. Also the right which a person has to any inheritance or place of profit, after some event; such as the decease of another.

REVET'MENT, in Fortification, a strong wall on the outside of a rampart, intended to support the earth and increase the difficulty of escalade.

REVIEW, BILL OF, in Chancery, a bill where a cause has been heard; but some errors in law appearing, or some new matter being discovered after the decree was made, this bill is given for a fresh examination into the merits of the cause.——*Review*, in Literature, a critical examination of a new publication. Also a periodical publication containing critical examinations and analyses of new works. The person who performs this duty is called the *reviewer*.——*Review*, in Military tactics, the display of a body of troops, for the purpose of exhibiting the state of their appearance and discipline before some superior officer or illustrious personage.

REVI'SE (*revisus*, seen again: *Lat.*), a second proof-sheet of a work, for the revisal or re-examination of the errors corrected.——The act of *revising* a book or writing for publication is termed a *revision*.

REVI'VOR; in the court of Chancery an abated suit may be revived by an *order of revivor*. In the courts of common law it may become necessary to revive a judgment, in which case the person entitled to execution must sue out a *writ of revivor*.

REVO'KE (*revoco*, I call back: *Lat.*), to reverse or repeal. A law, decree, or sentence is revoked by the same authority which enacted or passed it. A devise may be *revoked* by the devisor, a use by the grantor, and a will by the testator.——A law may cease to operate without an express *revocation*.——To *revoke* at cards is not to play to suit when it is possible to do so; to play a trump, for instance, at whist, instead of the suit which was led, when the player has some of that suit in his hand.

REV'OLUTE (*revolutus*, rolled back: *Lat.*), in Botany, rolled back or downwards; as, *revolute* leaf, when the sides of the leaf in the bud are rolled spirally back or towards the lower surface.

REVOLUTION (*revolutio: Lat.*), in Politics, a material or entire change in the constitution of government. Thus the *revolution* in England, in 1688, consisted in the abdication of king James II., the establishment of the house of Orange upon the throne, and the restoration of the constitution to its primitive state. In like manner, though with very different consequences, the *revolution* in France in 1792 effected an entire change of constitution: *Revolution*, in Physics, the circular motion of a body on its axis; as, the *revolution* of a wheel, &c.——*Revolution*, in Astronomy, the motion of any heavenly body in its orbit until it returns to the same point again.

REX SACRO'RUM (king of sacred things: *Lat.*), among the Romans, a person appointed to preside in certain sacred duties. He generally performed such office as the kings of Rome were supposed to have reserved to themselves, before the abolition of their power. He was chosen, at the command of the consuls, by the college of Pontiffs; and inaugurated by the Augurs. The office was instituted at the establishment of the commonwealth, that the name of king might not be wholly extinct; and he was not permitted to have the least share in civil affairs.

RHAP'SODY (*rhapsōdia;* from *rhapto*, I sew together; and *ōdē*, a song: *Gr.*), a collection of passages, composing a new piece; but without necessary dependence or natural connection.

RHE'IN, an inodorous, bitterish matter, obtained by gently heating powdered rhubarb with nitric acid of a certain strength; evaporating to the consistence of syrup, and diluting with water.

RHET'ORIC (*rhētorikē:* from *rhētōr*, a public speaker: *Gr.*), the art of speaking with propriety, elegance, and force; or, as Lord Bacon defines it, the art of applying and addressing the dictates of reason to the fancy, and of recommending them there so as to affect the will and desires. Rhetoric and oratory differ from each other as the theory from the practice; the rhetorician being the one who describes the rules of eloquence, and the orator he who uses them to advantage. The parts of rhetoric are, *invention*, *disposition*, and *elocution*. The forms of speech by which propriety and elegance are produced are denominated *tropes* and *figures*. The general manner in which the orator employs his words for the formation of his speech is called *style*, which is variously distinguished. Rhetoric divides an oration or speech into five parts; the Exordium, Narration, Confirmation, Refutation, and Peroration. The *Exordium* is the part in which the speaker prepares the minds of the auditors for what he is about to advance. It ought to be expressed with considerable care and perspicuity, and the matter and manner should be to the purpose, brief, and modest. The *Narration* is the recital of facts or events; and should have the qualities of clearness, probability, brevity, and consistency. The *Confirmation* establishes the proofs of a discourse, and arranges them in the manner best adapted to enforce conviction. The *Refutation*, or anticipation, furnishes arguments to answer the assertions that may be opposed to the narration. The *peroration*, or conclusion, should recapitulate the whole with condensed force and energy.

RHEUM (*rheuma: Gr.;* from *rhes*, I flow), in Medicine, an inflammatory action of the mucous glands, attended with increased discharge and an altered state of their secreted fluids.——*Rheum* (*rheo*, I flow: *Gr.*, because it causes purging), in Botany, a genus of plants inhabiting Asia and Africa.

RHEUM'ATISM (*rheumatismos;* from *rheuma*, a catarrh: *Gr.*), in Medicine, a painful disease affecting the muscles and joints of the body, chiefly the larger joints, as the hips, knees, shoulders, &c. It may arise at all times of the year, when there are frequent vicissitudes of the weather, from heat to cold; but the spring and autumn are the seasons in which it is most prevalent. It is sometimes accompanied by fever, in which case it constitutes *acute rheumatism* or *rheumatic* fever; the joints are then much swollen and very painful. In this form of the disease its translation to the heart is not unusual.——*Chronic rheumatism*, leads occasionally to permanent distortions of the joints; and affects the periosteum, tendons, and ligaments; it is most common when the health has been broken by previous disease, or over exertion of body or mind.

RHINO'CEROS (*rhin*, a nose; and *keras*, a horn: *Gr.*), in Zoology, a genus of pachydermatous mammalia. The rhinoceros is only exceeded in size by the elephant; its nose is armed with a horny substance, which projects, in the full grown animal, from two to three feet, and is a weapon of defence that secures him from almost every attack. Even the tiger, with all his ferocity, is but rarely daring enough to assail him. The skin of the rhinoceros is in some parts so thick that it is scarcely penetrable by the sharpest sabre or even a musket-ball. He is not ferocious unless provoked, runs with great swiftness, and rushes through brakes and woods with an energy to which everything yields. The rhinoceros delights in retired places near lakes and streams, and appears to derive one of his greatest pleasures from rolling in the mud. The African rhinoceros has two horns.

RHINO'CEROS-BIRD, in Ornithology, a bird of the genus *Buceros*, having a reverted horn of large size attached to the base of the upper mandible.

RHIZOM'E (*rhizoma*, that which has taken root: *Gr.*), in Botany, a rootstock, a horizontal stem more or less under ground, which sends out roots from its under side, and leaf buds from its upper side.

RHO'DIUM (*rhodon*, a rose: *Gr.*, from the colour of some of its salts), in Mineralogy, a metal discovered among the grains of crude platinum by Dr. Wollaston. It is of a whitish colour; when pure is brittle, and requires a much higher temperature for its fusion than any other metal, unless perhaps iridium. It readily alloys with every other metal, except mercury, and is insoluble in all acids. Certain of its alloys are, however, soluble. Its spec. grav. is about 11.

RHODODEN'DRON (*rhodon*, a rose; and *dendron*, a tree: *Gr.*), in Botany, a genus of shrubs, nat. ord. *Ericaceæ*, which have their head-quarters in North America and the Himalayas.

RHO'DONITE (*rhodon*, a rose: *Gr.*), a mineral of a reddish hue and splintery fracture, occurring compact or fibrous in parts of Germany. It is a silicate of manganese.

RHOM'BOID (*rhombos*, a rhombus; and *eidos*, form: *Gr.*), in Geometry, a quadrilateral figure whose opposite sides and angles are equal, but which is neither equilateral nor equiangular.

RHOMB-SPAR, a mineral of a grayish white colour, and crystallized in rhomboids; occurring massive, and imbedded in chlorite slate, limestone, &c. It consists chiefly of carbonates of lime and magnesia.

RHOM'BUS (*rhombos: Gr.*), in Geometry, an oblique angled parallelogram, or a quadrilateral figure whose sides are equal and parallel two and two: but the angles unequal, two of the opposite ones being obtuse, and two acute.——RHOMBUS, in Ichthyology, a genus of flat fishes including the turbot, brill, and whiff.

RHOPAL'IC VERSES (*rhopalon*, a club:

Gr.), are verses each line of which begins with a word of one syllable; then comes a word of two syllables, then a word of three, and so on to the end.

RHU'BARB (*rha barbara*, foreign rheum: *Gr.*), a valuable medicinal root growing in China, Turkey, and Russian Tartary, of which that from Turkey is the most esteemed. It is the produce of plants belonging to the genus *Rheum*, of which the species are numerous; as the palmated or true Chinese rhubarb; the compact or Tartarian; the undulated, or waved-leaf Chinese rhubarb; and the currant rhubarb of Mount Libanus. There is also a well-known species cultivated in our gardens.

RHUMB, a circle on the earth's surface, making a given angle with the meridian of the place, and marking the direction of an object through which it passes.——Also, one of the divisions on the compass card.

RHUMB LINE, in Navigation, the track of a ship, which cuts all the meridians at the same angle. It is called, also, the *Loxodromic curve*. Being the simplest curve, it is the route usually pursued at sea; but a ship sailing on it never looks direct for her port until it comes in sight.

RHUS (*rous: Gr.*), in Botany, a genus of plants, nat. ord. *Anacardiaceæ*, including the sumach and the Japanese varnish tree.

RHYME (*rhuthmos*, literally a measured motion: *Gr.*), in Versification, the correspondence of sound between the last syllable or syllables of one verse, and the last syllable or syllables of a verse succeeding immediately, or at no great distance. To constitute this correspondence in single words or in syllables, it is necessary that the *vowel* and the *final* articulations or consonants, should be the same, or have nearly the same sound. The *initial* consonants may be different, as in *hope* and *rope*, *live* and *give*, &c. When only the last syllables correspond it is a *male rhyme*; when the two last, it is a female rhyme; when the three last, it is an Italian form of rhyme, termed *sdrucciolo*—never allowed in English, except in burlesque poetry. In Arabian and Persian poetry, the correspondence sometimes extends through the entire lines. When the consonants of the last syllables are identical, the rhyme, in English, is faulty. Two syllables may rhyme, though spelled very differently, thus *woo*, and *pursue*; and two syllables may not rhyme, though spelled the same way, thus *gone* and *alone*.

RHYTHM (*rhuthmos: Gr.*), the consonance of measure and time, in poetry, prose, music, and even in dancing. Each verse or period is to be considered as a whole; within which, with certain limited variations, the rhythm is perfect. The parts which are to receive the stress are termed *arsis* (elevation), and the remainder constitute the *thesis* (depression). The former, particularly in words whose pronunciation may not be known, is often remarked by an '. A long syllable should have double the time of a short one. The poetical rhythm requires a succession of motions of regular duration, which, variously interrupted, must yet be obvious, and combined so as to form an harmonious whole.

RI'AL, a gold coin which was current in the reign of Henry VI. for 10*s.*, and in that of Elizabeth for 15*s.*

RIB (*ribbe: Sax.*), in Anatomy, a bone which forms a part of the frame of the thorax. In the human body there are twelve ribs on each side, proceeding from the spine to the sternum, or towards it, and serving to inclose and protect the heart and lungs. In the language of comparative anatomy, the ribs are the pleurapophyses of the centrum. In man, only seven of them form a complete hoop, by connecting the centrum with the hæmal element, the breast bone or sternum.——In Naval Architecture, a piece of timber which forms or strengthens the side of a ship.——In Botany, the continuation of the petiole along the middle of a leaf, and from which the veins branch out.

RIB'BON (*ruban: Fr.*), a narrow web of silk, worn either as a badge or as an ornamental part of dress. Ribbon-weaving is an important branch of manufacture, giving employment to numerous hands, and displaying much taste and skill. Coventry is the chief seat of the ribbon manufacture.——RIBBON, in Naval Architecture, a long narrow flexible piece of timber, nailed upon the outside of the ribs, from the stem to the sternpost, so as to encompass the ship lengthwise.

RICE (*oryza: Lat.*), a cereal plant, the fruit of which forms an article of very extensive consumption. It is cultivated in many parts of Europe, and in most warm countries throughout the world. With the husk on the grain, it is called *Paddy*. The plant belongs to the order of grasses, and is the *Oryza sativa* of botanists. Some varieties are grown on moist soils, others on mountain slopes.

RICE PAPER, a material employed for various fancy articles, is the pith of a water plant growing in China, the *Aralia papyrifera* of botanists, belonging to the nat. ord. which includes our common ivy. The pith is cut round and round from the outside towards the centre with a sharp knife, and it is then made flat by pressure. The name originated in a mistake

RICK'ETS, or RACHI'TIS (*rachitis*, from *rachis*, the spine: *Gr.*, the part chiefly affected), in Medicine, a disease which affects children, and in which the joints become knotted, and the legs and spine grow crooked. It appears to arise from a deficiency of the salts of lime in the bones, and is frequently symptomatic of a scrofulous state of the glands and viscera. It sometimes disappears to a great extent, as the growth advances. Where the bones are inclined to bend, the weight should as much as possible be kept off of them.

RICO'CHET FIRING, in Gunnery, the firing of guns, mortars, or howitzers with small charges, and elevated a few degrees, so as to carry the balls or shells just over the parapet, and cause them to roll or slightly rebound along the opposite rampart. The term *ricochet* is derived from the French, and signifies the bounding of a ball along the mound which it strikes at intervals.

RIDE, a term made use of in a variety of senses with reference to a ship's position or motion

RIDEAU' (a curtain: *Fr.*), in Fortification, a rising ground commanding a plain; also a trench covered with earth in form of a parapet, to shelter soldiers.

RI'DER, or **RI'DER-ROLL**, in Law, a schedule, or small piece of parchment, often added to some part of a record or act of parliament.

RI'DING (corrupted, according to Blackstone, from *trithing*, third), one of the three jurisdictions into which the county of York is divided; anciently under the government of a reeve.

RIDOT'TO, (literally, a retreat: *Ital.*), a favourite amusement in Italy, consisting of music and dancing.

RIFACIMEN'TO, (reestablishment: *Ital.*), a remaking or furbishing up anew. Its most usual application is to the process of recasting literary works, so as to adapt them to a somewhat different purpose, or to a changed state of circumstances.

RI'FLE, a gun having several spiral grooves or channels cut in the barrel. The object is, to give the ball a rotatory motion, about the axis of progression; which prevents any inconvenience from irregularity in the position of its centre of gravity, or from its friction against only one side of the gun. Such friction would make the ball revolve, so as to have its path seriously *deflected*, and in a direction which could not be provided against, in taking aim, as it could not be previously known at what side its friction would occur. Various forms have been recently given to the ball, to facilitate and steady its passage through the air, and to cause expansion against the surface of the grooves, so as to fill them more perfectly &c. The *Enfield rifle* has three spiral grooves; its bullet is *cylindro-conoidal*, and has recessed into its back end a tapering piece of box, which being forced by the explosion farther into the bullet, causes the sides of the latter to expand, until the lead completely fills the grooves at their breech ends. With the *Minie rifle*, a *cylindro-conic* bullet, which easily enters the barrel, is used; it has a conical opening behind, into which a little cup of sheet iron is driven by the explosion so as to press the lead forcibly into the grooves. Circular channels round the outside, at the back or larger end, were supposed to steady the flight; but when our government adopted this rifle, they were discarded, not only as of no use, but as actually lowering the velocity; also, the bullets were rendered of more uniform density, and therefore less likely to deviate from the proper direction, by being made mechanically instead of being cast. Other kinds of rifled firearms have been invented. And cannon balls are propelled from rifled artillery with a certainty of aim, a power, and a range far exceeding anything attained in former times. Indeed, such have been the the late improvements, that the mode of carrying on war, particularly at sea, is being entirely remodelled. Thus, on account of the alterations made in artillery, and those in the construction of steam vessels, the finest ships of an older construction have been rendered almost worthless; and the navy, with all its equipments, has to be created anew.

RI'GEL, a star of the first magnitude in the constellation Orion; the *β Orionis* of astronomers.

RIG'GING, the ropes belonging to a ship, by which the masts are sustained and ascended, and the sails managed. The *rigging* is of two kinds, *standing* rigging, as the shrouds and stays, and *running* rigging, as braces, sheets, halliards, &c.

RIGHT (*rigt: Sax.*), in Geometry, sometimes means straight; as, a *right line*, but, more generally, it is opposed to oblique; thus, a *right angle* is one formed by two lines meeting perpendicularly; a *right prism*, one whose sides are perpendicular to the base.——*Right ascension*, in Astronomy, the angle at the pole of the equator, formed by two great circles, one of which passes through the first point of Aries, and the other through a celestial body; and measured, therefore, by the arc of the equator intercepted between these circles. *Right ascension* and *declination* are the two coordinates, to which the positions of heavenly bodies are referred.——*Right sphere*, in Geography, the position of the sphere, when the equator cuts the horizon at right angles.

RIGID'ITY (*rigiditas*, stiffness: *Lat.*), in Mechanics, resistance to a change of form. The rigidity of cordage causes the effective and the calculated mechanical effects to be extremely different

RIMO'SE (*rimosus*, full of cracks: *Lat.*), a zoological term, denoting that the surface of any part possesses numerous minute narrow excavations, running into each other, so as to resemble the bark of a tree.

RIN'FORZANDO (strengthening: *Ital.*), or *crescendo*, in Music, a direction given to the performer, that the sound is to be increased This is indicated also by an angle, having its point turned to the left; the *Diminuendo*, or opposite change, being represented by an angle turned in the opposite direction.

RING-BONE, in Farriery, a callus growing in the hollow circle of the little pastern of a horse, just above the coronet.

RING'DOVE, the largest of the European species of pigeons. [See DOVE.]

RIN'GENT (*ringor*, I open the mouth wide, to show the teeth: *Lat.*), in Botany, an epithet applied to an irregular monopetalous labiate corolla, when the upper lip is arched, and a distinct gap separates it from the lower lip

RING'WORM, in Medicine, a disease which appears in circular patches on the neck, forehead, or scalp. It begins with clusters of little pustules, which form scales, leaving a red pimply surface, and destroying the roots of the hair as it spreads over the head. It is very contagious, and is so capricious that what will effect a cure in one case is found quite ineffective in another.

RI'OT, in a general sense, means a tumultuous assembling of three or more persons, who do not disperse upon proclamation.——*Riot Act*, an act of parliament prohibiting riotous or tumultuous assemblies, which being read by a magistrate or peace officer to the mob, obliges all persons to disperse within an hour, on pain of being apprehended as rioters.

RIPO'SO (*Ital.*), a name given in art to the subject of the Holy Family resting on the way during their flight to Egypt.

RITE (*ritus*: *Lat.*), a formal act of religion or other solemn duty; the manner of performing divine service as established by law or custom.

RITORNEL'LO (a return: *Ital.*), in Music, a short repetition, such as that of an echo or the last words of a song; particularly, if it is made after a voice by one or more instruments. It is, however, a term now used to express all symphonies, played before the voices begin, and seeming to prelude or introduce what follows.

RIT'UAL (*ritualis*, relating to religious rites: *Lat.*), a book containing the rites, or directing the order and manner to be observed in celebrating religious ceremonies, and performing divine service in the church.

RIV'ERS (*rivus*, a brook: *Lat.*), large streams of water flowing through channels, or low parts of the surface of the earth, and pursuing their course towards the sea. They have from the very infancy of civilization been always considered of the highest importance, as a means of fertilizing the land; and effecting an easy communication between different regions. Hence they were deified, and held in the greatest veneration, by the ancients; and their importance has been greatly increased in modern times, on account of the facilities for navigating them afforded by steam. Most large rivers have their sources in mountains, or high table lands; and nearly all are higher at one part of the ocean than others. This swelling generally happens in winter; but when it is due to the melting of the snows, as in those rivers which have their origin in very lofty mountains, it takes place towards the autumn. The time at which it occurs is modified also by the period at which rainy seasons happen. These, within the tropics, begin about the time the sun passes the Meridian towards the tropics; and continue till his return to the same place. No river has been so celebrated for the regularity and importance of its annual increase as the Nile. On its inundation has ever depended whether there should be the greatest abundance or the most disastrous famine in Egypt. The largest rivers in the world are the Amazon and La Plata, in South America; the Mississippi, Missouri, and St. Lawrence, in North America; the Kian Kiou, the Hoanho, the Lena, the Ganges, the Indus, and the Euphrates, in Asia; the Nile, in Africa; and the Volga, the Danube, and the Rhine, in Europe. Many of the largest rivers mingle with the sea by means of a single outlet, while others before their termination divide into several branches. This circumstance will depend upon the nature of the soil through which a river flows. A *delta*, of greater or less magnitude, is found at the mouth of most rivers; it arises partly from the water becoming comparatively still, on account of the meeting of the tidal current and the river; and partly from the diminished velocity due to increase in width; both which cause the matters mechanically suspended in the waters, or rolled forward by it, to come to a state of rest, and, in certain circumstances, to accumulate so as to form patches of dry land, which thus multiply the channels by which the river discharges itself into the sea. In this way, the mouths of the Nile were formed, and have been multiplied even within the period of historical record. The earth, gravel, &c., which is thus deposited, is naturally shaped by the current at each side of it into a *Delta*, or Greek Δ, that is, a triangle whose vertex points up the stream. The following are the lengths of some of the most important rivers.

	Miles.
EUROPE.	
The Thames	180
The Rhine	810
The Danube	1750
ASIA.	
The Euphrates	1750
The Ganges	1800
The Kang-tse, in China	3870
AFRICA.	
The Nile	2330
AMERICA.	
The Mississippi	3420
The St. Lawrence, including the Lakes	4050
The Amazon, not including the Araguay	4095

RIX-DOL'LAR (a corruption of *reichsthaler*, a dollar of the empire: *Germ.*), a silver coin in Germany, Denmark, and Sweden; it is of different values in different countries. In Prussia it is worth about 3s.

ROACH (*reohche*: *Ang. Sax.*), the *Leuciscus rutilus* of Ichthyologists, a river fish belonging to the carp family, and known by the red colour of its pectoral, ventral and anal fins.——Also, the curve or arch generally cut in the foot of some square sails, from one clue to the other, to keep them clear of stays and ropes.

ROADS (*rad*: *Sax.*) for wheeled carriages are now principally made by stones, broken up into small pieces, and bound together with the earth, which is called macadamizing, from the name of the person with whom the plan originated. The formation of good roads gives the greatest facility to commerce, and contributes in an eminent degree to the progress of civilization; for wherever the means of internal communication are deficient the people are ill supplied with many of the necessaries, as well as the luxuries, of life. The Romans were so well acquainted with the importance of good roads that, on subduing a country, the first care was to furnish it with a mode of communication between its different parts

They considered this indispensable, even in a military point of view. Hence many vestiges of their roads are found in the most distant portions of their empire; and some remains of them in this island, even at the present day. Their labours and skill in this department would bear comparison with the greatest efforts of modern times. It is only recently that good roads have been constructed in this country, or that their advantages were appreciated; in 1763 there was but one coach between Edinburgh and London; it started once a month from each place, and took a fortnight to perform the journey. Though good roads are still of great utility, the construction of railways has diminished their importance.——ROAD, or ROADSTEAD (*rade: Fr.*), a place fit for anchorage, at some distance from the shore.

ROAST'ING (*rosten*, to roast: *Germ.*), in Metallurgy, the separation of volatile bodies from those which are more fixed, by the combined action of air and fire; and is generally the first process in the reduction of metals. The ores are kept for some time at a temperature below their fusing points, which drives off the sulphur, arsenic, carbonic acid, water, &c.

ROBIN'IA, a genus of handsome leguminous trees and shrubs, mostly deciduous and natives of North America. Some of the species are well known on our lawns, under the erroneous name of acacia.

ROC'AMBOLE, the *Allium scorodoprasum* of botanists, a wild garlic, with a purple flower, a native of Denmark. Cultivated forms of it are eaten.

ROCHEL'LE SALT, the popular name of the tartrate of potash and soda; it is employed as a purgative, being one of the ingredients of seidlitz-powder.

ROCH'ES MOUTONNES (*Fr.*), in Geology, a term for protuberances of hard rock with a smooth rounded or dome-shaped outline, such as are seen on the borders of glaciers.

ROCH'ET (*Fr.*), a kind of surplice worn by dignitaries in the Roman Catholic church; at mass the alb is placed over it.

ROCK. Geologists give the name rock to those distinct mineral masses which form the crust of the globe, whether composed of hard or soft materials, clay and sand being included in the term. With reference to their origin rocks may be classed as:—1. Aqueous or sedimentary, the result of deposition in water These are stratified, that is arranged in layers or beds, and most of them are fossiliferous. 2. Volcanic rocks, those that have been produced at the surface of the earth by the action of subterranean heat. BASALT and TRACHYTE belong to this class. 3. Plutonic rocks, those that have been produced by subterranean heat deep within the earth and under great pressure, such as GRANITE and SYENITE. Metamorphic rocks, those that were originally sedimentary, and still retain more or less the marks of stratification, but have been made to assume a crystalline structure by the action of heat. To this type belong GNEISS and mica schist. The rocks of the last two classes seldom contain fossils, and those of the second only occasionally and by accident. Rocks may be studied palæontologically, that is with reference to the organic remains imbedded in them; or lithologically, that is with reference to their mineral structure. [See GEOLOGY.]

ROCK-CRYS'TAL, in Mineralogy, one of the forms of quartz consisting, when pure, entirely of silica, but frequently coloured with other matter. Its most usual form is that of hexagonal prisms, surmounted by hexagonal pyramids.

ROCK'ET (*rochetto: Ital.*), in Pyrotechny, an artificial firework, consisting of a cylindrical case of paper, filled with a composition of combustible ingredients. This being tied to a stick and fired, ascends into the air and bursts, presenting a shower of stars, coloured according to the nature of the composition. [See CONGREVE ROCKET, and PYROTECHNY.]——ROCKET, the popular name of ornamental plants, belonging to the genus *Hesperis*, nat. ord *Cruciferæ*.

ROCK'ING-STONES, called also *Loggan* or *Laggan stones*. There are several of these among the picturesque barriers of the British coast. They consist of an immense mass, with a slightly rounded base resting on a flat surface of rock below, which is so nearly balanced, that an individual can move or rock it. These stones have been variously accounted for by antiquarians, and there are many traditions connected with them

ROCK'-SALT, fossil or mineral salt, dug from the earth. [See SALT.]

ROD (*ræde: Belg.*), a measure of length, containing 5½ yards, or 16½ feet. In many parts of England the word *Rod* is universally used for *Pole* or *Perch*: four rods make a *Gunter's chain*.

RODENTS (*rodo*, I gnaw: *Lat.*), or *Glires*, an order of clawed mammals. They have two long chisel-shaped incisors in each jaw; between the incisors and molars there is a vacant space without canines, and the lower jaw is so articulated as to allow a horizontal motion only from back to front. To this order belong the beaver, hare, squirrel, rat and porcupine.

RO'EBUCK, in Zoology, the *Capreolus capræ*, a species of deer with erect cylindrical branched horns, forked at the summit. This animal is remarkable for its elegant shape and activity; is one of the smallest of the cervine genus: and, like the goat, prefers a mountainous country. It was formerly common in our island.

ROGA'TION (*rogatio*; from *rogo*, I ask), in the Roman jurisprudence, a demand made by the consuls, or tribunes of the people, when a law was proposed to be passed.——*Rogatio* is also used for the decree itself made in consequence of the people giving their assent to this demand, to distinguish it from a *senatus consultum*, or decree of the senate.

ROGA'TION DAYS (same *deriv.*), the Monday, Tuesday, and Wednesday next before Ascension-day. The public supplications, or litanies, were anciently termed *rogations*.

ROGUES' YARN, a yarn of a different twist and colour from the rest, inserted in the royal cordage, to render its identification easy if stolen.

ROLL (*role: Fr.*), an official writing; a list, register, or catalogue; as a muster *roll*, a court *roll*, &c.——In Law, a schedule of parchment, that may be turned up with the hand, in the form of a pipe. All pleadings, memorials, and acts of court are entered on rolls; and being filed with the proper officers, become records of the court.——**ROLL CALL**, the calling over the names of the men who compose any part of a military body. ——**ROLLS OF PARLIAMENT**, the manuscript registers, or rolls of the proceedings of our ancient parliaments; which, before the invention of printing, were all engrossed on parchment, and proclaimed openly in every county. In these *rolls* are also contained decisions of points of law.

RO'LLER, the *Coracias garrula* of ornithologists, a handsome African bird allied to the bee-eaters and kingfishers, which sometimes finds its way into Britain. Great numbers cross the Mediterranean into Europe in the spring, and return to Africa in the autumn.——**ROLLER**, a piece of wood, iron, brass, &c. of a cylindrical form, used in the construction of several machines, both in husbandry and the arts.——In Surgery, a long and broad bandage, usually of linen cloth, to be rolled round any part of the body.——A name given by seamen to unusually heavy waves that set on a coast without wind.

RO'LLING-MILL, a machine for working metals into plates, or bars which are required of an even thickness. Rolling-mills are chiefly used for drawing out iron bars after they have been manufactured into bar iron by the forge hammer.

RO'LLING-PRESS, in Mechanics, an engine consisting of two cylinders, by which cloth is calendered, waved, &c.——A machine or press for taking impressions from steel or copper-plate engravings. There are also a variety of rolling-presses used in other branches of manufacture.

ROLLS, MASTER OF THE. [See MASTER.]

ROMA'IC, the language of modern Greece.

RO'MAN, a member of the Christian church at Rome, to which St. Paul addressed an epistle; and which consisted of converts from Judaism or Paganism.——In Literature, the ordinary printing character now in use, in distinction from the *Italic*.

RO'MAN CATH'OLICS, that society of Christians whose members acknowledge the pope as visible head of the church. [See CATHOLIC.]

ROMAN'CE (*roman: Fr.*), in Literature, a tale or fictitious history of extraordinary adventures. The *Romance* differs from the *Novel*, as it treats of great actions and extravagant adventures, soaring beyond the limits of fact and real life. [See NOVEL.] Romances have of late years given way to *historical novels*; and even such as are occasionally published are very different from those of the olden time.

ROMAN'CE LAN'GUAGES. These are the modern languages derived from the ancient Roman or Latin. They are six in number, the languages of Spain, Portugal, France, Italy, Wallachia, and the Swiss Grisons. These are all corrupt forms of Latin mingled with many words of the ancient dialects of the country. [See PROVENÇAL.]

ROMANES'QUE, in Architecture, a style that arose in the north of Italy about the tenth century, to which the East contributed the cupola and the symbol of the cross, whence it is sometimes termed Byzantine. In the Rhine country, at a later date, various modifications were made. A spire was added, but the apse was retained, and round-headed arches continued to be used. There are many beautiful specimens of this style at Cologne, Bonn, and other Rhenish towns.

RON'DEAU (*Fr.*), a species of poetry, usually consisting of thirteen verses: of which eight have *masculine* and five *feminine* rhymes, or *vice versâ*. [See RHYME.] The two or three first words of the first verse serve as the burden, and recur in that shape after the eighth and thirteenth verses.

RON'DO, in Music, either vocal or instrumental. This generally consists of three strains; the first of which closes in the original key; while each of the others is so constructed as to reconduct the ear in an easy and natural manner to the first strain. It is sometimes spelled *Rondeau*.

ROOF (*hrof: Sax.*), in Architecture, the timber-work which sustains the slates, tiles, lead, &c., that form the coverings of buildings. The elevation of a roof depends on the climate; the more northern the country the greater its pitch should be. It is supposed that, considering the inclination of a roof at the equator to °, or *Zero*, we may add three degrees of inclination for every climate, that is, every 2° 42′ 30″ of latitude, and this gives very nearly the inclinations used by the ancients in different places. In its simplest form it consists merely of two *rafters*, whose lateral thrust against the walls on which they rest is counteracted by tying them together with a *collar*, placed some way up the lengths; and if necessary, by a *tie beam* placed at their feet. Beyond certain lengths it is clear that the tie beam itself will have a tendency to sink down in the middle; it must then be suspended at its centre, from the junctions of the rafters, by a *king post*. If the rafters are long, they also have a tendency to sink in the middle; which must be prevented by *struts*, or oblique pieces, abutting against the sides of the lower extremity of the king post. The whole now would form a frame called a *truss*. Sometimes the upper ends of the rafters, instead of abutting against each other, abut against the extremities of a horizontal piece, called a *collar*, which is placed between them, to keep them apart. Instead of the king post there are then two vertical pieces, called *queen posts*, which hang from the extremities of this collar, and support, at their lower ends, struts tending in various directions, for the sustaining of various points. *Purlines* are strong pieces placed across the principal rafters to steady them, and to support the *common* rafters, which are fixed at the ordi nary small distances apart. Some roofs are very complicated and ingenious; but the principles on which they are constructed can always be easily understood, from what has been said. When sufficiently long beams cannot be obtained in one piece, two or more pieces are *scarfed* together; that is, their extremities are entangled in each other, by the way they are cut and notched; and they are kept together by iron bolts. The various parts of a frame roof, also, are kept united by iron straps and bolts.

ROOK (*hroc: Ang. Sax.*, the *Corvus frugilegus* of ornithologists, a bird that differs from the crow by his gregarious habits, in feeding on insects and grain, not carrion, and in having the base of the bill covered with a rough scabrous skin, the latter however being the result of the bill being thrust into the ground in search of worms and larvæ. Rooks are very destructive of corn, especially of wheat; and it behoves the husbandman to keep a watchful eye on his newly-sown fields; for if neglected three or four days, when the blade first appears, a good crop may be destroyed in embryo; the good they do, in destroying grubs and noxious insects, is supposed greatly to exceed the mischief.

ROOT (*rot: Goth.*), in Botany, that part of a plant which is under ground and serves to support it in an erect position; while by means of its fibrils it imbibes from the earth a nourishment which ascends to the stem, branches, and fruit.——*Root*, in Arithmetic, a number or quantity which, multiplied by itself, produces a higher power: thus, 2 is the square root of 4, and the cube root of 8.

ROPE (*rap: Ang. Sax.*), a large kind of cordage, formed by the twisting of several strands of yarn together; the smallest sort of rope is called *Cord*, and the larger kinds *Cable*. Large ropes are distinguished into two main classes, viz. the *cable-laid* and *hawser-laid*. The former are composed of nine strands, while the latter consist only of three. Ropes of from one inch to two inches and a half in circumference are usually hawser laid; those from three to ten inches, are either hawser or cable-laid; but when more than ten inches, they are always cable-laid.——*Rope making*, the process of twisting yarn into ropes, by means of a wheel or other machinery.——*Rope-walk*, a long covered walk, or a long building where ropes are manufactured.

RORQUAL, the *Balænoptera rostrata* of zoologists, a marine mammal allied to the whales, and the largest of living animals. The throat and belly are wrinkled with deep folds of skin. As the rorqual yields little oil it is not sought after by whalers.

ROSA'CEÆ (*rosa*, a rose: *Lat.*), a natural order of exogenous polypetalous plants, consisting of herbs and shrubs. Amongst British wild plants the dog rose, bramble, strawberry, potentilla, agrimony, and meadow-sweet belong to this order, which may be recognised by the five petals, the numerous stamens arising from the calyx just within the petals, and the superior ovary.

RO'SARY (*rosarium*, a rose garden: *Lat.*), in the Roman Catholic church, a string of beads, or a chaplet consisting of five or fifteen decades of beads. It is used for counting the *Ave Marias*, or prayers addressed to the Virgin Mary: one *paternoster*, or Lord's prayer, is said for every ten *ave Marias* or hail Mary's. The chaplet is considered to contain only five decades, the *rosary* fifteen; but this distinction does not seem to be always observed. Other sects also use chaplets, for counting repeated prayers. [See CHAPLET.]

ROSE (*rosa, Lat.*), in Architecture, an ornament cut in the form of that flower, chiefly used in cornices, friezes, vaults of churches, &c., and particularly in the middle of each face in the Corinthian abacus.——*Rose*, the flower of plants belonging to the botanical genus *Rosa*, of which many species are in cultivation. A great number of varieties have been produced by crossing the species. The ancient poets say, that the first rose was brought into the world by the hands of the god of love; and the occasion was, a desire to bribe Harpocrates, the god of silence, to an engagement that he would discover none of the secrets of Venus. Hence it became a custom to place a *rose* in rooms devoted to mirth and entertainment, as a symbol in the presence of which all restraint might be laid aside; accordingly the proverb '*under the rose*,' denotes secrecy and inviolable silence. The rose is also from the same cause the direct *emblem* of silence. Besides being used at the feasts and convivial meetings of the ancients, the rose was frequently laid upon the tombs of the dead: either to signify the silence of death, or an offering grateful to the deceased.——*Rose*, in Politics, a badge of distinction formerly assumed by the houses of York and Lancaster, the former of whom took the white rose, and the latter the red. On the union of the two houses by the marriage of Henry VII. with Elizabeth, daughter of Edward IV., the two roses were united in one, which became the royal badge of England.——ROSE OF JERICHO, the name of a cruciferous plant, the *anastatica hierochuntina* of botanists, the withered stems of which roll up into a ball during the dry season, and are blown about the deserts of Syria for years, only unfolding in a time of rain.

RO'SEMARY (*rosmarinus*, literally seadew: *Lat.*), an evergreen shrub of the genus *Rosmarinus*, nat. ord. *Labiatæ*. It is a native of the maritime districts of the Mediterranean. The flowers are of a dull leaden hue, or even white. It is used in an infusion, as a remedy for the headache; and is employed in the manufacture of Hungary water. The leaves have a fragrant smell, and a warm pungent flavour.

ROSE-NOBLE, an ancient English gold coin, stamped with the figure of a rose; first struck in the reign of Edward III. and current at 6*s*. 8*d*. Another larger coin, sometimes so called, passed for 16*s*.

ROSET'TA STONE, a block of stone found near Rosetta, in Lower Egypt, and preserved in the British Museum. It bears three inscriptions: namely, one in hieroglyphics, another in the ancient vernacular language of Egypt, called enchorial, and the third in Greek, all recording the services rendered by Ptolemy V. to his country. This stone has acquired much celebrity from its having afforded Dr. Young a key to the interpretation of Egyptian characters. It was one of the objects collected by the French when they invaded Egypt, and came into the possession of the British army in consequence of the capitulation of Alexandria in 1801.

RO'SE-WOOD, a fragrant wood used by cabinet makers; is the produce of some Brazilian leguminous trees belonging to the genus *Trioptolomea*.

ROSICRU'CIANS (*rosa*, a rose; and *crux*, a cross: *Lat.*), from their device; which was a rose issuing out of a cross, the same as Martin Luther's device.——A name assumed by a sect of heretical philosophers, who first appeared in Germany, as is generally supposed, about the beginning of the 17th century, though they claimed a higher antiquity. They made great pretensions to science, and to be masters of many important secrets, particularly that of the philosopher's stone. Their origin and designs have been the subject of much discussion.

ROS'TRUM (*Lat.*), in Roman Antiquity, the prow of a ship. It was a most important part of vessels of war, which were hence called *Naves rostratæ;* was made of wood and brass; was fastened to the prow to annoy the enemy's vessels. The first *rostra* were long and high; but they were afterwards short and strong, and placed so low as to pierce the enemy's ships under water. Some ships of war, constructed recently by ourselves, are furnished with a similar apparatus, and for the same purpose.——The term *Rostrum* was applied metaphorically to the pleading place or pulpit, in the Roman Forum: because decorated with the beaks of vessels taken at Antium. The Rostrum was transferred by Cæsar to a corner of the Forum.

ROT (*rotan*, to rot: *Sax.*), a fatal disease incident to sheep in wet seasons and moist pastures. It is extremely difficult to prevent the rot, if the year prove very wet, especially in May and June. Salt marshes, and lands where broom grows, are the best places for the animals so affected. The livers of sheep dying of the rot are found to be infested with worms called *flukes*, which see.——ROT, in timber work [see DRY ROT].

RO'TA, the name of an ecclesiastical court at Rome, composed of twelve prelates. This is one of the highest tribunals in Rome; taking cognizance of all suits in the territory of the church, by appeal; and of all matters beneficiary, and patrimonial.

ROTA'TION (*rotatio*, from *rota*, a wheel: *Lat.*), the act of turning, like a wheel or solid body on its axis, as distinguished from the progressive motion of a body revolving round another body or a distant point. Thus the daily turning of the earth on its axis, is a *rotation;* its annual motion round the sun, is a *revolution*.——In Geometry, the term is applied to the circumvolution of any surface round a fixed and immovable line, which is called the axis of its rotation.——ROTATION, in Agriculture, a change of crops; which is useful chiefly by allowing more of the substance which a certain crop has exhausted to be liberated from the soil, before it is grown again.——ROTATION also implies the course by which persons filling official situations leave their places at certain times, and are succeeded by others.

ROTA'TOR (one who causes to revolve: *Lat.*), in Anatomy, the two apophyses in the upper part of the thigh-bone, otherwise called *trochanters*, which are distinguished into *major* and *minor*.

ROTATO'RIA (same *deriv.*), or ROTI'FERA (*rota*, a wheel; *fero*, I carry: *Lat.*), *Wheel Animalcules*, a tribe of microscopic animals forming a section of those denominated INFUSORIA. They all live in water, through which they move with great rapidity, and are usually found in great numbers wherever there is organized water in a state of decay. The majority have cilia so disposed on the anterior part of the body as to afford the appearance of revolving wheels when in motion. These animals are as yet imperfectly known. They belong to the class of ANNELIDA amongst ARTICULATA.

ROT'TEN-STONE, in Mineralogy, a soft kind of stone found in Derbyshire; which is used for all sorts of finer grinding and polishing, for cleaning metallic substances, and sometimes for cutting stones. It resembles *Tripoli*.

ROTUN'DA, or ROTUN'DO (*rotundus*, round: *Lat.*), a name given to any building that is round both on the outside and inside; but more particularly to a circular building at Rome, which was anciently called the *Pantheon*, which see.

ROUE' (*Fr.*), a term applied to a person, in the fashionable world, who, regardless of moral principle, devotes his life to sensual pleasures; but whose conduct, externally at least, is not so gross as to exclude him from society.

ROUGE (*Fr.*), a red paint extracted from the safflower, a plant called by botanists *carthamus tinctorius*. It is used for painting the cheeks; and is the only cosmetic which can be applied to this purpose without producing ultimate injury to the complexion.

ROUGH'-CASTING, a kind of plastering, with mortar containing gravel, and sometimes even very small stones; and used as a covering for external walls. It is thrown on roughly, instead of being plastered on.

ROUND'-HEADS, in British History, a name given, during the civil war, to the puritans or members of the parliamentarian party, from the practice which prevailed among them of cropping the hair close.

ROUND'ROBIN (*rond ruban*, round ribbon: *Fr.*), a term applied to a memorial or remonstrance drawn up by any body of men (though the practice is almost entirely confined to the army and navy), who have determined to stand by each other in making a statement of their common grievances to the government, or some person high in authority. The term was adopted on account of the signatures being written round the remonstrance, or in a circular form, so that it cannot be seen who signed it first.

ROYAL, among seamen, a small sail spread immediately above the top-gallant-sail; sometimes termed the *top-gallant royal*.——Royal Academy of London, a corporation instituted by George III. for the advancement of drawing, painting, engraving, sculpture, modelling, and architecture.——Royal Institution, a corporation erected in the year 1800; the great object of which is to render science applicable to the comforts and conveniences of mankind.——Royal Society, a society incorporated by Charles II. under the name of 'The President, Council, and Fellows of the Royal Society, for the Improvement of Natural Philosophy.'

ROYALS, the name given to the *first* regiment of foot: supposed to be the oldest regular corps in Europe.

ROW-PORT, a small square hole in the side of light vessels of war, near the surface of the water, for the use of an oar for rowing in a calm.

RUB'BLE, loose angular gravel; or slightly compacted brecciated sand-stone.——Rubble Work, masonry, in which the stones are used without being squared.

RU'BEFACIENT (*rube-facio*, I make red: *Lat.*), in Medicine, an external application which produces redness of the skin, not followed by a blister.

RU'BELLITE (*rubellus*, reddish: *Lat.*), in Mineralogy, *red shorl* or *red tourmalin*, a siliceous mineral of a red colour of various shades. It occurs in accumulated groups, with straight tube-like striæ. In a red heat it becomes white.

RUBE'OLA (*rubeo*, I am red: *Lat.*), the *Measles*, which see.

RU'BICEL, in Mineralogy, a variety of the ruby, of a reddish colour, from Brazil.

RU'BIDIUM (*ruber*, red: *Lat.*), one of the metals lately discovered by means of spectrum analysis. The German chemist Bunsen first detected it in some mineral water, in which it formed only a two-millionth part of the weight of the water. It has since been found in extremely minute quantities in beet-root, and in the ashes of tobacco, tea leaves, and coffee berries. Its name was suggested by its dark red colour.

RU'BIGO (*Lat.*), in Botany, a kind of mildew which appears on the leaves and stems of many plants, and has been found to consist of a small fungus, supposed to arise from moisture.

RU'BLE, a Russian silver coin, value about 3*s.* 2*d.*

RU'BRIC (*rubrica*; from *ruber*, red: *Lat.*), any writing or printing in red ink. The date and place on a title page, being frequently in red ink, and many books printed in one place having the name of another upon them, the word rubric has been sometimes used to signify the false name of a place on a title page. But the word is most usually applied in Ecclesiastical matters to signify the directions printed in red letters in missals, &c.; and hence, is often used to express the liturgy itself.

RU'BY (*rubis*: *Fr.*; from *ruber*, red: *Lat.*), a precious stone, next to the diamond in hardness and value. Its constituents are alumina, magnesia, and chromic acid—its colour being due to the latter. The most esteemed, and, at the same time, rarest colour, of the oriental ruby, is pure carmine, or blood red of considerable intensity, forming, when well polished, a blaze of the most exquisite and unrivalled tint. It is, however, usually more or less pale, and mixed with blue in various proportions; hence it occurs rose-red and reddish white, crimson, peach-blossom red, and lilac blue—the latter variety being named oriental amethyst. A ruby, perfect both in colour and transparency, is much less common than a good diamond, and when of the weight of three or four carats, is even more valuable than that gem. The king of Pegu, and the monarchs of Siam and Ava, monopolize the rarest rubies; the finest in the world is in the possession of the first of these kings; its purity has passed into a proverb.

RUDD, or RED EYE, the *Leuciscus erythrophthalmus* of ichthyologists, a river fish belonging to the *Cyprinidæ*, with a deep body like the bream, but thicker, a prominent back, and small head. The scales are of a golden-coppery tint, and the iris is orange-red.

RUD'DER (*rother*: *Sax.*), in Navigation, part of the helm of a ship; consisting of a piece of timber hung on hinges at the stern-posts, which by being turned either way directs the course of the vessel. It is managed by means of the tiller or wheel. In vessels drawing much water, the middle is deep and narrow; in others, shallow and broad; in Chinese vessels, it is broad, to give it leverage; but pierced with holes to diminish resistance from the water.

RU'DIMENTS (*rudimenta*; from *rudis*, in the natural state: *Lat.*), the first elements or principles of any art or science.

RUDOL'PHINE TA'BLES, a celebrated set of astronomical tables, constructed by Kepler, and thus entitled in honour of the emperor Rudolphus II., at whose expense they were made. They were published in 1627, and were the first ever calculated on the supposition that the planets move in elliptical orbits. They contributed greatly to the progress of Astronomy.

RUFF, the *Machetes pugnax* of ornithologists, a bird allied to the snipes, and deriving its name from the disposition of the long feathers of the neck, which stand out like the ruff formerly worn; it is, however, only the male that is furnished with this appendage, which he does not obtain till the second year. Ruffs are birds of passage, appearing at certain seasons of the year in great numbers in the north of Europe. They are generally taken in large nets. When fattened they are dressed like the woodcock, and their flesh is highly esteemed. Their pugnacious disposition is so strong, that when they are kept for the purpose of fattening, their place of confinement must be dark, for the moment any light is admitted they attack each other with fury.

RULE (*regole*, *Sax.*; from *regula*: *Lat.*), that which is established as a principle, or settled by authority for guidance and direction. Thus, a statute or law is a *rule* of conduct for the citizens of a state; precedents in law are *rules* of decision to judges. ——In Grammar, an established form of construction, in a particular class of words. ——*Rule*, in Monasteries, Corporations, or Societies, a law or regulation to be observed by the society and its particular members.

RULE OF THREE, in Arithmetic, a rule which directs, when three terms are given, now to find a fourth, which shall have the same ratio to the third term as the second has to the first. It is an application of the doctrine of *proportion* [which see], being called also the *rule of proportion*.

RUM, a well known spirituous liquor, distilled from molasses and the refuse of the cane juice, in the West Indies, whence it is imported in large quantities. Rum of a brownish transparent colour, smooth oily taste, strong body and consistence, good age, and well kept, is the best; and that from Jamaica obtains a decided preference. It is customary in some of the West India islands to put sliced pine-apples in puncheons of rum; this gives the spirit the flavour of the fruit; and hence the designation 'pine-apple rum.'

RU'MEN (*Lat.*), in Comparative Anatomy, the paunch, or first stomach of such animals as chew the cud, thence called *ruminating* animals. The only true ruminating are the cloven-footed quadrupeds, as oxen, sheep, &c.

RU'MINANTS (*rumino*, I chew the cud: *Lat.*), the name given by Cuvier to an order of hoofed mammals, feeding exclusively on vegetables, and including those having a complicated stomach of four cavities disposed so as to allow rumination, and a cloven hoof. The ox, deer, giraffe, and camel, belong to this order.

RU'MINATION (same *deriv.*), the act by which food, chewed and swallowed, is submitted a second time to mastication. Coarsely masticated food passes into the *rumen*, or paunch, or first cavity of the stomach; water, with which the second cavity, called the *reticulus*, is almost exclusively filled, is gradually mixed with the food in the rumen; after which, a portion of the mass is moulded into a ball, in the muscular canal, at the termination of the *œsophagus;* and by an inverted action of the muscles is driven into the mouth, where it is more fully masticated, and mixed with saliva, before it is again swallowed. It then passes into the *psalterium*, or third stomach, where the superfluous moisture, which might dilute the gastric juice too much, is absorbed; after which it passes gradually into the *abomasus*, or fourth stomach, in which digestion is really effected. In the camel, there are water cells at the sides of the rumen; and the psalterium is not separated from the abomasus.

RUN'CINATE (*runcina*, a large saw: *Lat.*), in Botany, a leaf is said to be runcinate when each side is coarsely divided into triangular lobes more or less directed towards the base; as in the leaf of the dandelion.

RU'NIC, a term applied to certain ancient characters, the earliest of which were found upon monumental stones. They were employed by both Scandinavians and Germans, but whence derived is not known. Some have suggested the Phœnician alphabet as their source. Their number was originally sixteen. Their great antiquity is much doubted, since they cannot be clearly traced back beyond the end of the twelfth century. They have been the subject of much debate amongst antiquarians; mystery and superstition are supposed to have been connected with them.

RUN'NER, in Sea Language, a rope belonging to the garnet, and to the two bolt-tackles. It is reeved in a single block, joined to the end of a pennant, and is used to increase the mechanical power of the tackle.

RUPEE', a coin current in British India. The gold rupee is worth about 2*s* sterling. Of the silver rupees, the new and the old are of different values.

RUP'TURE (*ruptio*, a breaking: *Lat.*). [See HERNIA.]

RUSH (*rusc: Sax.*), a name given to different plants. The common rush belongs to the genus *Juncus*, of which several species grow in watery places. The pith was formerly used for the wicks of lamps. The *bullrush*, which also grows in wet situations, belongs to the genus *Typha*. The *flowering rush* belongs to the genus *Butomus*, and is found by the sides of rivers and ditches.

RUS'SIA COM'PANY, a company for conducting the trade with Russia. It was incorporated by charter of Philip and Mary, and sanctioned by act of parliament, in 1566.

RUS'SIA LEATH'ER, the tanned hides of oxen, manufactured in a manner peculiar to the Russians; and much esteemed as a material for binding books and making many articles where a superior kind of durable leather is required. One of the best tests of genuine Russia leather is its throwing out a strong odour of burnt hide upon being rubbed.

RUST (*Sax.*), the oxide of a metal. Hence metals become rusty when exposed to air or water, by abstracting the oxygen; but grease and varnish protect them, because they prevent contact with moisture and the atmosphere.——RUST, the *Uredo rubigo* of botanists, a minute fungus in the shape of an orange powder which infests grain plants.

RUS'TIC-WORK (*rusticus*, rural: *Lat.*), in Architecture, a term used when the stones, &c. in the face of a building, or the groins, &c., are hacked or indented, so as to be rough.

RU'TA BA'GA, the Swedish turnip.

RUTH, BOOK OF, a canonical book of the Old Testament, being a kind of appendix to the book of Judges, and an introduction to those of Samuel. Its title is derived from the person whose story it principally contains.

RU'TILITE (*rutilus*, red: *Lat.*), in Mineralogy, an oxide of titanium, of a red or brownish red colour. It occurs massive, disseminated, membranous, and in crystals.

RYE (*ryge: Sax.*), the *Secale cereale* of botanists, an esculent grain that in its growth resembles wheat. It is easily cultivated, and in many parts of the continent, as well as in the north of England, is made into bread; but much coarser than that of wheat flour. All soils will produce rye, provided they are not too moist; and many barren lands which are unsuitable to the cultivation of wheat may be sown with this grain to advantage.

RY'E-GRASS, a species of strong grass, of the genus *Lolium*.

RY'OT (a subject: *Arab.*), in Hindostan, a renter of land by a lease which is considered as perpetual, and at a rate fixed by ancient surveys and valuations.

S

S, the nineteenth letter and fifteenth consonant of our alphabet, is a sibilant articulation, the sound being formed by driving the breath through a narrow passage between the palate and the tongue elevated near it, together with a motion of the lower jaw and teeth towards the upper. It is a kind of semivowel, for it can be pronounced, though imperfectly, without the aid of a vowel. The sound of this letter varies, being soft in some words, as in *this*, *thus*, &c., and like *z* in words which have a final *e*, as *muse*, *wise*, &c. It is generally doubled at the end of words. In a few words it is silent, as in *isle* and *viscount*. As an abbreviation, S was used by the ancients for Senatus; thus S.P.Q.R. *senatus populusque Romanus* (the Senate and Roman people). *Sp.* for *spurius*, &c. We use it for Sanctæ, thus S.T.P. *Sanctæ Theologiæ Professor* (Professor of Sacred Theology.) For Ship: as H.M.S. *Her Majesty's Ship*. For Sigilli: as L.S. *locus sigilli* (the place of the seal). For Style: as N.S. *new style*. For *socius*, *societas*, *south*, &c., as S.E. for *south-east*, S.S.E. for *south-south-east*, &c. In Music, for *Solo*.

SABÆ'ANS, or **SA'BIANS** (*zaba*, Lord: *Heb.*, whence *Sabaoth*), idolators of the East, who in all ages, whether converted in part to Judaism, Christianity, or Mohammedanism, or unacquainted with either, have worshipped the sun, moon, and stars. Some of the Sabæans, who acknowledge the name of Christ, are distinguished by the title of 'Christians of St. John,' on account of their attachment to the baptism of that forerunner of the Messiah. Sabæanism bears the marks of a primitive religion; to the adoration of the stars it joins a strong inculcation of respect for agriculture.

SAB'AOTH, a Hebrew word signifying *armies*.

SABBA'TARIANS, in Church History, sects which at various periods insisted on the observance of the Jewish sabbath, as obligatory on Christians. The name is particularly applied to a subdivision of the Anabaptists, in the sixteenth century.

SAB'BATH (rest: *Heb.*), the seventh day of the week, a day appointed by the Mosaic law for a total cessation from labour, and for the service of God, according to the command, 'Remember that ye keep holy the Sabbath day,' &c. Christians observe the first day of the week as the day of rest.

SABBAT'ICAL YEAR, in the Jewish economy, every *seventh* year, in which the Israelites were commanded to suffer their fields and vineyards to *rest*, or to lie without tillage. The first *sabbatical* year celebrated by the children of Israel was the fourteenth year after their coming into the land of Canaan; because they were to be seven years in making themselves masters of it, and seven more in dividing it amongst themselves.

SABEL'LA, in Natural History, a genus of marine annelides, inhabiting cases which are usually of a leathery texture. There are many species.

SABEL'LIANS, a sect of Christians founded by Sabellius, at Ptolemais, in the third century. Their doctrine was, that the Father was the sole person of the Trinity; the Son and Holy Ghost being merely attributes, or emanations from Him.

SA'BLE, the *Martes zibellina* of naturalists, an animal of the weazel family, a native of the north of Europe and Asia. It is equal to the polecat in size. In summer the colour is brown, in winter it becomes much darker, and the fur is then much prized. The Russian or crown sable obtained in Siberia is the most valuable, but this is nearly monopolized by the Imperial Family. The Hudson's Bay sable is lighter in colour and is dyed darker. The animal burrows in the earth or under trees; in winter and summer subsisting on small animals, and in autumn on berries.——SABLE, in Heraldry, the tincture of black; represented in engraving, by perpendicular and horizontal lines.

SAC'BUT, or **SACK'BUT**, a musical wind instrument; a kind of trumpet so contrived that it can be drawn out or shortened according to the tone required.

SACCA'DE (a jerk: *Fr.*), in the Menage, a sudden and violent check of a horse, by drawing or twitching the reins on a sudden, and with one pull.

SACCHAR'IC ACID (*saccharum*, sugar: *Lat.*), in Chemistry, an acid formed along with oxalic acid, when sugar is oxidized with nitric acid. It crystallizes in long colourless needles.

SACCHAR'OID (*saccharon*, sugar: *Lat.*; and *eidos*, appearance: *Gr.*), a term applied to rocks which have a texture resembling that of loaf sugar.

SACCHAROM'ETER (*saccharon*, sugar: *Lat.*; and *metior*, I measure: *Lat.*), an instrument for determining the specific gravity of brewers' and distillers' worts, the density of which is almost exactly proportional to the quantity of sugar they hold in solution—on which, also, depends the quantity of spirit that will be formed by the subsequent fermentation.

SACCHOLAC'TIC ACID (*saccharon*, sugar; and *lac*, milk: *Lat.*), in Chemistry, the acid obtained by digesting sugar of milk with nitric acid. It is identical with that obtained from gum, and termed *mucous acid*.

SACK, a wine much esteemed by our ancestors. It was brought from Spain, and is supposed to have been very similar to sherry; Falstaff calls it *Sherris Sack*. Its name is derived by some from *sec* (dry: *Fr.*), because it was a dry wine; by others, from the *sacks* made of skin, in which the Spaniards usually carried it.——Among our rude ancestors, a kind of cloak of a square form, worn over the shoulders and body, and fastened in front by a clasp or thorn. It was originally made of skin, afterwards of wool.——*To sack*, is to plunder or pillage a town when taken by assault.

SACON'TALA, a Sanscrit drama of great celebrity in Indian literature, written by Calidasa, who died in 56 B.C. It has been translated into English, French, and German. The plot turns upon a ring.

SAC'RAMENT (*sacramentum*, a sacred thing: *Lat.*), in Christian ritual, an outward sign of a spiritual grace, annexed to its use. The Roman Catholic church recognises seven sacraments; baptism, confirmation, the eucharist, penance, extreme unction, ordination, and marriage. The Sabæan Christians admitted four; the eucharist, baptism, ordination, and marriage. The Protestant churches acknowledge only two, the eucharist or Lord's supper, and baptism; but they agree with the Roman Catholic church in styling the eucharist, pre-eminently, the *holy sacrament*. The eucharist is also known among Roman Catholics by the name of 'the host.'

SACRAMENTA'LIA (same *deriv.*), in Ecclesiastical history, certain sacramental offerings formerly paid to the parish priest at Easter, &c.

SACRAMEN'TUM MILITA'RE, in antiquity, the name of the oath taken by the Roman soldiers, after the levies were completed.

SAC'RIFICE (*sacrificium*: *Lat.*), a solemn act of religious worship, consisting in the dedication or offering up something animate or inanimate on an altar, by the hands of the priest; either as an expression of gratitude to the Deity for some signal mercy, or to acknowledge our dependance on him, and conciliate his favour. The Jews had two sorts of sacrifices, taking the word in its most extensive signification: the first were offerings of tithes, first-fruits, cakes, wine, oil, honey, &c., and the last, offerings of slaughtered animals. Their principal sacrifices consisted of bullocks, sheep, and goats; but doves and turtles were accepted from those who were not able to offer the others; and whatever the sacrifice might be, it must be perfect and without blemish. The rites of sacrificing were various, all of which are very minutely described in the Pentateuch.

SAC'RILEGE (*sacrilegium*: *Lat.*), the crime of violating or profaning sacred things; or the alienating to laymen or to common purposes what has been appropriated or consecrated to religious persons or uses.

SA'CRUM, or OS SACRUM (the sacred bone: *Lat.*), in Anatomy, a portion of the vertebral column, consisting in man of five bones, which in the adults become soldered together. The sacrum is strongly united on each side to the hip bone, the *ilium*; and below it is the COCCYX. [See VERTEBRÆ.]

SAD'DUCEES, a sect among the ancient Jews, esteemed as free-thinkers, rather than real Jews; though they assisted at all the ceremonies of worship in the Temple. Their origin and name is derived from Sadoc, who flourished in the reign of Ptolemy Philadelphus, about 250 years B.C. They denied the immortality of the soul and the existence of all spiritual and immaterial beings. They acknowledged, indeed, that the world was formed by the power of God, and superintended by his providence; but that the soul at death suffered one common extinction with the body, rewards and punishments being altogether confined to this life. They held the scriptures alone to be of divine authority, and obligatory upon men as a system of religion and morals; and paid no regard to those traditionary maxims and human institutions which the Jews in general so highly extolled, and the Pharisees reverenced even more highly than the scriptures themselves.

SAFE-CON'DUCT, a pass or warrant of security given by a sovereign to any person guaranteeing his safe coming into and passing out of his kingdom. Generally speaking, passports have superseded the use of special safe conducts.

SA'FETY LAMP, a lamp invented by Sir Humphry Davy for the use of miners in the coal-mines, to prevent the fatal explosions which have arisen from the use of common lamps. It consists of a lamp surrounded by a wire-gauze, which, by confining the flame from the fire-damp, enables the miners to work in safety. Flame is merely vapour, at a white heat; when cooled down, as it is by the wire gauze, it ceases to be flame; and, at the same time, ceases to be capable of exploding the mixed gases. A flame may be hot, and at the same time not luminous: thus, that of hydrogen. Its heat will be rendered evident by throwing into it particles of lampblack, or holding within it a platinum wire; they will become white hot. The higher the temperature of the flame the more difficult to intercept it with wire gauze, because the more difficult to cool it down; hence the flame of burning hydrogen will pass through gauze, when that of a candle or coal gas will not. The inflammable gas enters the lamp through the gauze, and is gradually consumed. When the external air is safe there is no change in the flame; but on the approach of fire-damp it becomes more or less enlarged; and when the mixture is highly explosive, the interior of the lamp seems filled with a blue lambent flame, its own flame being for the time apparently extinguished, and rekindled when the air again becomes pure; but if the fire-damp greatly predominates, it is put out entirely. The miner, however, having been put on his guard, has time to escape.

SA'FETY-VALVE, a valve by means of which a boiler is preserved from bursting by the force of steam. It is loaded, according to its surface, with a certain weight, being the number of pounds to the square inch, to the pressure of which it is intended to expose the boiler; as soon as this pressure is exceeded the steam lifts the valve, and some of it escapes. That a safety-valve may be relied on, it must be frequently examined; as it is liable to adhere to its seat. This greatly increases the steam pressure required to open it; and in many cases to a degree which the boiler is unable to bear, and which, therefore, may cause an explosion.

SAF'FLOWER, or **BAS'TARD SAF'FRON**, a deep red fecula, separated from orange-coloured flowers, particularly those of the *Carthamus tinctorius*. The flowers which are sometimes sold under the name of *saffranon* are the only parts employed in dyeing. The fine rose colour of safflower, extracted by crystallized soda, precipitated by citric acid, then slowly dried, and ground with the purest talc, produces the beautiful rouge known by the name of *rouge végétale*. [See ROUGE.]

SAF'FRON (*safran: Fr.;* from *saphar: Arab.*), a sort of filamentous cake, prepared from the stigmas, with a proportion of the style, of a perennial bulbous plant, the *Crocus sativus*. It contains a yellow matter called *polychroite*, a small quantity of which is capable of covering a great body of water. It is grown in some of the eastern counties of England; and is also imported from Sicily, France, and Spain. Saffron is used to tinge confectionary articles, liqueurs, and varnishes; and sometimes in colouring butter and cheese. It was also formerly employed extensively in medicine, as well as in the arts; but is not much used at present. It is often adulterated with the petals of other plants, particularly those of the marigold.

SAGAPE'NUM (*sagapēnon: Gr.*), in Pharmacy, a gum-resin brought from the East, in granules and masses. It is of a compact substance, heavy, of a reddish colour, with small whitish or yellowish specks. Its odour is something like that of assafœtida, but weaker. It is occasionally used in medicine, as a nervine and stimulating expectorant.

SAGIT'TA (*Lat.*), in Astronomy, the *arrow* or dart, one of Ptolemy's forty-eight constellations, in the northern hemisphere, near the eagle.——In Trigonometry, the versed sine of an arc so called by the older writers, because it is like a dart or an arrow standing on the chord of the arc.

SAGITTA'RIA (*sagittarius*, pertaining to an arrow: *Lat.*), in Botany, a genus of aquatic perennial plants, nat. ord. *Alismaceæ*. One species, the arrow head, grows in Britain.

SAGITTA'RIUS (the Archer: *Lat.*), in Astronomy, the tenth of the twelve signs of the Zodiac.

SA'GITTATE (*sagitta*, an arrow: *Lat.*), in Botany, an epithet for a leaf, stipule, or anther, whose shape is triangular, and hollowed at the base, like the head of an arrow.

SA'GO, an article of food consisting of nearly pure starch; is chiefly obtained from the pith of several species of palm, especially those belonging to the genus *Sagus*, indigenous in the Indian Archipelago. After the fecula has been washed clear of the woody fibre, and has been roasted, it becomes the *pearl sago* of commerce. Further treatment converts it into *tapioca*. Sago is largely consumed by the natives of the Eastern Archipelago. 'To see sago manufactured by the natives is an extraordinary sight. A whole tree, trunk about twenty feet long and five feet in circumference, is by a few days' labour converted into human food. A good sized tree will produce thirty bundles of raw sago, weighing about thirty pounds each bundle, and when baked yielding about sixty cakes of three to a pound. Two of these cakes are a meal for a man, or about five cakes a day; and as a tree produces 1800 cakes, it gives food for one man for about a year. The labour to produce the raw sago, by breaking up and washing the pithy substance of the trunk, is about ten days for one man, which labour provides him with food for a year.'—A. R. WALLACE. In Japan and elsewhere sago is obtained from the interior of the stems of some species of *Cycas*.

SAHA'RA, or **ZAHARA** (desert: *Arab.*). The great Sahara, in the north west of Africa, is more than equal to the area of Europe. The Arabs style deserts 'seas without water,' and the camel 'the ship of the desert.'

SAH'LITE, in Mineralogy, a variety of *Augite*, from the silver mine of *Sahla*, in Sweden.

SAICK (*saica: Ital.*), a Turkish or Grecian vessel, very common in the Levant; a kind of ketch which has no top-gallant-sail, nor mizen-top-sail.

SAIL (*segl: Sax.*), in Navigation, a large piece of canvas composed of several breadths sewed together, which when extended, by means of lines, is fitted to receive the impulse of wind by which a ship is driven.——*To make sail*, is to spread an additional quantity of sail for the sake of increasing a ship's speed. *To set sail*, to expand the sails; and hence, to begin a voyage. *To strike sail*, is to lower the sails suddenly, as in saluting, or in sudden gusts of wind.

SAIL'ING, properly denotes the art of navigating and working a ship, or of causing her to observe such motions and directions as are assigned by the navigator; in which latter sense sailing differs from the art of navigation, and must be learned by practice on shipboard.——*Sailing* also denotes a particular method of navigation; in which sense we say, *Mercator's* sailing, *plane* sailing, *parallel* sailing, *middle latitude* sailing, and *great circle* sailing. [See NAVIGATION.]

SAINT (*Fr:* from *sanctus*, holy: *Lat.*), in a limited but the most usual sense of the word, signifies certain individuals whose lives were deemed so eminently pious that the church of Rome has authorized the rendering of public worship to them. The doctrine of saints, and the ideas and usages which grew out of it, form one of the main points of difference between the Protestants and Roman Catholics.

SAL'AMANDER (*salamandra: Gr.*), in Zoology, a genus of Batrachian reptiles, now limited to the terrestrial species of the longtailed Caducibranchiate Batrachians; or those which lose their gills before arriving at maturity, but retain their tails. The female brings forth her young alive; they are hatched in the oviduct. The salamander is a harmless animal, which dwells in cold damp places, among trees or hedges, avoiding the heat of the sun; yet ignorance and superstition have ascribed to it the power of resisting fire.

SAL AMMO'NIAC, in Chemistry, *Muriate of Ammonia*, or, perhaps more correctly, *Chloride of Ammonia*, a salt found originally near the temple of Jupiter Ammon in Lybia, and hence its name. It is made abundantly in Egypt from the soot of camel's dung, which is burnt in Cairo instead of wood; and in every part of Egypt, but especially in the Delta, peasants are seen driving asses loaded with bags of that soot, on their way to the sal ammoniac works. Various animal offals develop, during their spontaneous putrefactive fermentation, or their decomposition by heat, a large quantity of free or carbonated ammonia among their volatile products; and upon this principle many sal ammoniac works have been established. It is made in large quantities from *gas liquor*, which contains the carbonate and other compounds of ammonia. These are changed into muriates or chlorides by hydrochloric acid; are then separated by concentration and crystallization, and resulting sal ammoniac is purified by sublimation. The best sal ammoniac is in white semi-transparent spheroidal cakes, each weighing about a quarter of a cwt. It is principally used in tinning of cast iron, wrought iron, copper, and brass; and for making the various ammoniacal preparations of pharmacy.

SAL'ARY (*salaire: Fr.*, from *salarium*, literally, the money given to soldiers for salt: *Lat.*), the stipend or remuneration paid to a man for his services—usually a fixed annual sum; in distinction from *wages*, which is for day labour; and *pay*, which is for military service.

SAL'EP, or SALOP', in the materia medica, the dried root of the *orchis mascula*. It consists chiefly of a modification of gum, resembling *tragacanth*, with a small quantity of starch, and is sometimes used as food. That which is imported from India is in white oval pieces, hard, clear, pellucid, and without smell; as an article of diet, it is said to be light and nutritious.

SAL'IC, or SAL'IQUE LAW, the Law of the Ripuarian Franks, governing those who lived between the Rhine and the Loire. Some believe the name derived from the river Saale, in Saxony, on the banks of which it is supposed that these people originally lived. This body of law was reformed and republished by Charlemagne; according to it 'no portion of *Salic land* can fall to females;' but what was meant by *Salic* land has been the subject of endless discussion among French antiquaries. The Salic law, which excluded females from the throne of France, was supposed to be derived from this ancient code. It was the subject of long wars between England and France, when, in opposition to it, Edward III. claimed the sovereignty of France by a title prior to that of Philip of Valois. It has been recognised in all countries of which the crown has devolved on the royal family of France; and formed the foundation of the pretensions of Don Carlos to the crown of Spain. It was observed with reference to the great fiefs which had been granted to princes of the blood royal, by way of appanage; and hence, on the death of Charles Duke of Burgundy, without a male heir, that dukedom reverted to Louis XI. Hanover, which was so long united to the crown of England, ceased to be so on the accession of Queen Victoria; as its succession is regulated by the Salic law.

SAL'ICINE (*salix*, the willow: *Lat.*), an alkaloid obtained from the bark of the white willow (*Salix alba*), and some others, from that of the aspen-tree and some poplars. It is employed as a febrifuge, and its crystals form a beautiful polarising object for the microscope.

SA'LIENT (*saliens*, leaping: *Lat.*), in Heraldry, an epithet applied to a lion or other beast, represented in a leaping posture, with his right foot in the dexter point, and his hinder left foot in the sinister base of the escutcheon: by which it is distinguished from *rampant*.——COUNTER-SALIENT is when two beasts on the same escutcheon are salient, the one leaping one way, and the other in an opposite direction, so that their bodies cross.

SA'LIENT ANGLE, in Geometry, and Fortification, the angle of a polygon, which projects outwards from the figure. All the angles of any regular figure are salient. An angle which points to the interior of the figure, is *reentering*.

SALIFI'ABLE BASES (*sal*, salt; and *facio*, I make: *Lat.*), in Chemistry, substances which, when combined with acids, form salts.

SALINOM'ETER, an apparatus connected with the boilers of steam engines, for the purpose of ascertaining the density of the water therein when salt water is employed. When of more than a certain density, the water is 'blown off,' as its further use would be attended with danger.

SALI'VA (*Lat.*), the fluid secreted by certain glands, by which the food is moistened before it is conveyed into the stomach. Those glands which secrete the saliva are termed salivary, and are situate in the mouth.

SALIVA'TION (*salivatio: Lat.*), in Medicine, an increased secretion of saliva, the result of the exhibition of certain medicines.

SA'LIX (*Lat.*), in Botany, a genus of plants, nat. ord. *Salicaceæ*. All the species of *Salix* are either trees or bushes, and are known as willows, very hardy, remarkably fast growers, and several of them attain a considerable height when permitted to run up to standards. Some equal large forest trees, thus the *Salix alba;* while others, like the *Salix herbacea,* are so small as to be lost in the grass in which they grow. They are generally the most abundant, and of most prosperous growth, in watery situations.

SAL'LY (*saillie: Fr.*), in the Military art, the issuing out of the besieged from a town or fort, and falling upon the besiegers in their works, in order to cut them off, or harass and exhaust them.——'To cut off a *sally,*' is to get between those that made the sally and their town.

SAL'LY-PORT, in Fortification, a postern gate, or a passage under ground from the inner to the outer works; such as from the higher flank to the lower, or to the communication from the middle of the curtain to the ravelin. Sallyports are called also, *postern gates.*——SALLY-PORT, a doorway on each quarter of a fire-ship, out of which the men make their escape into the boats, as soon as the train is fired.

SAL'MON (*salmo: Lat.*), the *Salmo salar* of ichthyologists, a fish without spines in the fins, with abdominal ventral fins, and with a rudimentary fin behind the first dorsal. It is found in the seas washing the shores of Europe, Asia, and America; ascending the rivers for spawning in spring, and penetrating to their head streams. It is remarkably strong, and will even leap over considerable falls which lie in the way of its progress. It generally varies from about 12 to 24 pounds in weight; but sometimes salmon are taken weighing from 50 to upwards of 80lbs. It furnishes a delicious dish for the table, and is an article of commerce. The process of spawning frequently occupies more than a week: during which the eggs deposited by a single fish sometimes amount to 20,000. The spawning season extends from the end of October to the beginning of February. The eggs of the salmon remain in the gravel for several months, exposed to the influence of running water. In the course of the month of March the fry are evolved. When newly hatched they are scarcely an inch in length, of the most delicate structure, and for a while connected with the egg. Upon leaving the spawning bed, the fry betake themselves to the neighbouring pools, where they speedily increase to two or three inches in length. In April, May, and June they migrate towards the sea, keeping near the margin, or still water, in the river; and when they reach the estuary, they betake themselves to a deeper and more sheltered course, and escape to the unknown haunts of their race, to return shortly after as *grilses,* along with the more aged individuals. All these seaward migrations of the parent fish and the fry are influenced, and greatly accelerated, by the occurrence of the floods in the rivers.——The London market, where the consumption is immense, is principally supplied from the Scotch rivers. The Tweed fishery is the first in point of magnitude of any in the kingdom; and such is its abundance, that several hundreds have been frequently taken by a single sweep of the net. When the season is at its height, and the catch greater than can be disposed of fresh, it is salted, dried, or pickled, for winter consumption at home. [See FISHERIES.]

SALOON' (*salone: Ital.*), in Architecture, a lofty spacious hall, vaulted at the top, and generally comprehending two stories, with two ranges of windows. In Italy, it is used as a state room in palaces, for the reception of ambassadors and other visitors.

SAL'PA (*Lat.*), a genus of small animals which swim freely in the ocean, and belong to the *Tunicata.*

SALSES, small mud volcanoes, which may be considered as phenomena intermediate between thermal springs and eruptions of larva. On their first outbreak they are generally accompanied by flames.

SAL'SOLA (*salsus,* salt: *Lat.*), in Botany, a genus of plants, nat. ord. *Chenopodiaceæ,* often called saltworts, from the large yield of soda.

SALT (*sealt: Sax.*), in the popular sense, is a saline crystallization, used to season or preserve meats. This is usually called common salt, which is procured by evaporating sea-water, or the water of salt springs; or is dug in mines. White salt and bay salt are of the former kind; and fossil or rock salt of the latter. In sea salt prepared by rapid evaporation, the insoluble portion is a mixture of carbonate of lime with carbonate of magnesia, and a fine silicious sand; and, in the salt prepared from Cheshire brine, it is almost entirely carbonate of lime. The insoluble part of the less pure pieces of rock salt is chiefly of a marly earth, with some sulphate of lime. In Caramania, in Asia, Chardin tells us, rock salt is so abundant, and the atmosphere so dry, that the inhabitants use it as stone for building their houses. This mineral is also found on the whole elevated table land of Great Tartary, Thibet, and Hindostan. Extensive plains in Persia are covered with a saline efflorescence. Rock salt has also been found in New South Wales. The principal deposit of this substance in Great Britain is in Cheshire. The beds alternate with clay and marl, which contain gypsum. It occurs also at Droitwich in Worcestershire. The salt mines in the neighbourhood of Northwich are very extensive. They have been wrought since 1670; and the quantity of salt obtained from them is greater, probably, than is obtained from any other salt mines in the world. The Cheshire salt, in its solid form when dug from the mine, is not sufficiently pure for use. It is purified by solution in sea water, from which it is afterwards separated by evaporation and crystallization. The beds or masses of rock salt are occasionally so thick, that they have not been yet bored through, though mined for many centuries; but it is sometimes disseminated in small masses or veins among the calcareous and argillaceous marls which accompany or overlie the greater deposit. In the places where there are salt springs, and salt works are carried on at them, the work-house where the salt is made is always called the *wych-house;* it is supposed that *wych* was an old British word for salt, as all the towns in which salt is made end in *wych*: as *Namptwych*, *Droitwych*, *Middlewych*, &c.—There are places in America where the sea occasionally overflows; and the water evaporating leaves the salt behind. These are called *licks*, and are the resort of vast crowds of different quadrupeds. Salt is next in importance to bread. And the most serious disturbances have occasionally occurred in countries where a comparatively heavy tax has been laid upon it. The annual consumption in Great Britain alone, without including Ireland, is 180,000 tons. 300,000 tons are exported.——*Salt*, in Chemistry, has a more extended sense; and includes all compounds of an acid and a base, such as *sulphate of potash*; or of the radical of the acid and the base of the oxide, as *iodide of potassium*. A salt consisting of an oxacid and an oxide is termed an *oxysalt*; one consisting of the radical of the acid and the base of the oxide a *haloid* salt. There are *acid*, *alkaline*, and *neutral* salts. In the first the acid, in the second the alkali, and in the third neither predominates. Salts assume various other designations, depending on the acid, the base, or both. [See CHEMISTRY.] Sometimes a salt is *hydrous*; that is, contains water in combination; sometimes *anhydrous*, containing no water.

SALT'IRE (*saltiere*: *Fr.*), in Heraldry, one of the eight greater ordinaries; a *St. Andrew's cross*. Charges such as swords, batons, &c. placed in the direction of Saltire, are said to be borne *saltire-wise*.

SALTPE'TRE. [See NITRE.]

SALU'TE (*saluto*, I greet: *Lat.*), in Military discipline, a testimony or act of respect performed in different ways, according to circumstances. In the army, the officers salute by dropping the point of the sword; also by lowering the colours and beating the drums. In the navy, salutes are made by discharges of cannon, striking the colours or top-sails, or by volleys of small arms. Ships always salute with an odd number of guns. The vessel under the wind of the other fires first.

SAL'VAGE (*salvo*, I save: *Lat.*), in Commerce, a recompense allowed to such persons as have assisted in saving goods from fire, loss at sea, or ships from shipwrecks, &c.

SALVATEL'LA, in Anatomy, the vein which runs along the arm, and terminates in the little finger; so named from *salus*, health, because the opening of it was formerly thought to be of singular use in hypochondriacal affections.

SAMAR'ITAN, an inhabitant of Samaria, or one that belonged to the sect which derived their appellation from that city. After the fall of the kingdom of Israel, the people remaining in its territory, and consisting of the tribes of Ephraim and Manasseh, mingled with some Assyrian colonists, were called Samaritans by the Greeks, from the city of Samaria, around which they dwelt. When the Jews, on their return from captivity, rebuilt the temple of Jerusalem, the Samaritans desired to aid in the work; but their offers were rejected by the Jews, who looked upon them as unclean, on account of their mixture with heathens; and the Samaritans revenged themselves by hindering the building of the city and temple. Hence the hatred which prevailed between the Jews and Samaritans, which, in the time of Jesus, when the latter were confined to a narrow strip of country between Judea and Galilee, prevented all intercourse between them, and still continues. In their religious opinions and usages they resemble those Jews who reject the Talmud, and differ from the rabbinical Jews, in receiving only the Pentateuch, and in rejecting all the other portions of the Bible, as well as the Talmud and rabbinical traditions; but in their manners, rites, and religious ceremonies, they adhere strictly to the Mosaic law.

SA'MIAN EARTH and STONE (from the isle of *Samos*), the name of a species of marl, formerly used in medicine as an astringent; and by goldsmiths, for brightening and polishing gold.

SA'MIEL (*Turk.*), the name for a hot, suffocating wind of the desert of Arabia. It blows in the months of July and August, and approaches the very gates of Bagdad, but is said never to affect a person within its walls. It frequently passes with the velocity of lightning, and there is no way of avoiding its dire effects, but by falling on the ground, and keeping the face close to the earth. Those who are negligent of this precaution experience instant suffocation. It is identical with the *Simoon* of the Arabians; it derives its qualities from blowing over parched and sandy deserts.

SAM'PHIRE (*Saint Pierre*: *Fr.*), an umbelliferous plant, the *Crithmum maritimum* of botanists. It grows on rocks near the seashore, where it is washed by the salt water. It is used for pickling.

SAM'SHOO, the name of a spirit obtained from rice, and largely consumed by the Chinese.

SAM'UEL, THE BOOKS OF, two canonical books of the Old Testament, so called, as being usually ascribed to the prophet Samuel. The books of Samuel and the books of Kings are a continued history of the reigns of the kings of Israel and Judea.—The first book of Samuel comprehends the transactions under the government of Eli and Samuel, and under Saul the first king; and also the acts of David while he lived under Saul. The second book is wholly occupied in relating the transactions of David's reign.

SAN-BEN'ITO, a kind of linen garment, painted with hideous figures, and worn by persons condemned by the Inquisition. Also a coat of sackcloth used by penitents on their reconciliation to the church.

SANC'TUARY (*sanctuarium*: *Lat.*), in a general sense, any sacred asylum; but more especially, THE SANCTUM-SANCTORUM, the most retired part of the temple at Jerusalem, called also the *Holy of Holies*; in which was kept the ark of the covenant, and into which no person was permitted to enter except the high-priest, and he only once a year, to intercede for the people.——SANCTUARY, in the Roman Catholic church, that part of the church immediately round the altar. Also, certain churches and shrines, to which criminals might fly for shelter. They were originally intended to preserve them from sudden and revengeful punishment. In England, anyone who fled to a sanctuary, and within forty days gave signs of repentance, was secure from punishment, if he subjected himself to banishment. [See REFUGE, CITIES OF.]

SAND, fine particles of stone, particularly of the silicious kind, ,but not reduced to powder or dust. Sand is of great use in the glass manufacture, the white writing sand being employed for making the white glass, and a coarse greenish looking sand for the green glass.——*Sands*, in the plural, tracts of land, consisting of sand, like the deserts of Arabia and Africa.

SAN'DAL (*sandalon: Gr.*), in Antiquity, a kind of costly slipper, worn by the Greek and Roman ladies; made of silk or other precious stuffs, and ornamented with gold or silver.

SAN'DAL-WOOD, or **SAN'DERS-WOOD**, the wood of the *Pterocarpus santalinus*, a large tree, growing on the coast of Coromandel, and other parts of India, especially of Ceylon. It is of a red colour, has little taste or smell, and is principally used as a colouring drug. Other kinds of sandalwood were used by the Oriental nations, for burning in their houses, and thus producing a fragrant odour; also for the manufacture of a powder, of which they form a paste, used in anointing their bodies.

SAN'DARACH, or **GUM SAN'DARACH**, a resinous substance exuding from the *Callitris quadrivalvis*, a coniferous tree that grows in Barbary. It is used in powder under the name of *pounce*, to prevent ink from spreading on paper.

SAND'BAGS, bags fitted for holding sand or earth, and used in preparing breaches in fortifications, &c.

SAND'-BOX, a West Indian tree, the *Hura crepitans*, nat. ord. *Euphorbiaceæ*. It is said that the pericarp of the fruit will burst in the heat of the day with a loud report, and throw the seeds to a distance.

SAN'DEVER, or **SAN'DIVER** (*sandever: Fr.*), a whitish salt which is cast up from the materials of glass in fusion, and, floating on the top, is skimmed off. A similar substance is thrown out in eruptions of volcanoes. It is used in the fusion of certain ores, and is also employed in medicine.

SAND'PIPER, in Ornithology, wading birds of the genus *Tringa*, subgenus *Totanus*, and of various species, many of which are widely diffused.

SAND'STONE, in Mineralogy, masses of stone, composed of agglutinated grains of sand, which may be either *calcareous* or *silicious*. Sandstones usually consist of the materials of older rocks, as granite, broken up and comminuted, and afterwards deposited again.

SANG FROID (*Fr.*), freedom from agitation or excitement of mind.

SAN'GIAC, or **SAN'JAK**, a governor of a district in Turkey, forming part of a Pashalic. Before the loss of Greece and the Caucasus, there were 290 sangiacates in the Turkish empire.

SAN'GUINE (*sanguineus*, blood-coloured: *Lat.*), in Heraldry, an epithet for a dark red colour; represented in engraving by lines hatched across one another diagonally.

SAN'HEDRIM (*Heb.*), a word said to be derived from the Greek, and signifying the great public council, civil and religious, of the ancient Jewish republic or hierarchy. This council consisted of seventy-one or seventy-two members, and was composed of chief priests, elders, and scribes. They received appeals from other tribunals, and had power of life and death.

SA'NIES (*Lat.*), in Medicine, a thin, unhealthy purulent discharge from wounds or sores.

SAN'SCRIT, the ancient language of India, now extinct, from which most of the languages there spoken are derived. It belongs to the Aryan or Indo European group of tongues. It was declared by Sir William Jones to be more perfect than the Greek, more copious than the Latin, and more refined than either. The literature is abundant. The earliest existing work is the VEDAS. These, and the PURANAS, are religious writings, but there are also Epic poems, dramas, and philosophical compositions. The Sanscrit has been much investigated of late years, not only on account of its literature, but with reference to the history and connection of the whole group of languages to which it belongs. The literal meaning of the word Sanscrit is said to be 'polished'; in India the language is called *Sura Cani*, or the language of the heavenly regions. It is now publicly taught at several of the German universities, as well as at Oxford, Cambridge, and London.

SANS-CULOTTES (*sans*, without; *culottes*, breeches: *Fr.*), the name given in derision to the popular party, by the aristocratical, in the beginning of the French revolution of 1789; but though in the first instance applied by way of contempt, yet when the fiercest principles of republicanism prevailed, *sans-culottism* became a term of honour; and some of the bravest generals, in their dispatches announcing their victories, gloried in the name.

SAP (*sæpe: A. Sax.*), the juice of plants, which is absorbed from the earth by the roots; rises through the tissue of the stem, dissolving the secretions it meets with in its course, and thus acquiring new properties; it is conveyed thence to the leaves, where it is assimilated and altered; and from the leaves to the bark. In its crude state it consists of little more than water, holding earthy and gaseous matter, particularly carbonic acid, in solution. It passes, in its upward motion, through all the tissue of the stem which is permeable; and probably through all the tubes and vessels of the wood, and their intercellular passages. The sap is to the tree what the blood is to the animal; it supplies all that is required for sustenance or growth.——*Sap*, in Fortification, a trench or approach made under cover of gabions, &c.

SAPONA'RIA (*sapo*, soap: *Lat.*), in Botany, a genus of plants, nat. ord. *Silenaceæ*, including the *S. officinalis*, or soapwort, a

British plant, of which a decoction is used to cleanse and scour woollen cloths; the poorer people in some countries use it instead of soap for washing.

SAPPAN-WOOD, the produce of a leguminous tree growing in India, the *Cæsalpinia Sappan* of botanists; it is employed in dyeing.

SAPPHIC, pertaining to Sappho, a Grecian poetess; as *Sapphic* odes, &c. The *Sapphic verse* consists of eleven syllables in five feet, of which the first, fourth, and fifth, are trochees, the second a spondee, and the third a dactyl, in the first three lines of each stanza, and a dactyl and spondee in the fourth line.

SAP'PHIRE (*sappheiros*: *Gr.*), a very hard gem, consisting of alumina. It is of various colours, the *blue* being generally called the sapphire; the *red* the oriental ruby; and the *yellow* the oriental *Topaz*. Sapphires are found in various places; as Pegu, Calicut, Cananor, and Ceylon, in Asia; and Bohemia and Silesia, in Europe. The *asterias*, or star-stone, is a very beautiful variety, in which the colour is generally of a reddish violet, with an opalescent lustre.

SAP ROLLER, in Siege operations this consists of two concentric gabions placed one inside the other, each six feet long, the space between them being filled with logs of hard wood. When a sapper is engaged at the head of an approach or trench in pushing the work towards the enemy, a sap roller is employed to protect him.

SAR'ABAND (*Span.*), a dance and a tune used in Spain, said to be derived from the Saracens.

SAR'COCOL, or SAR'COCOLLA (*sarx*, flesh; and *kolla*, glue: *Gr.*), a gum resin brought from the northern parts of Africa, in small grains of a light yellow or red colour. It is obtained from the *penda sarcocolla*; it resembles gum-arabic, but is soluble in alcohol; and its aqueous solution is precipitated by tannin.

SAR'COLITE (*sarx*, flesh; and *lithos*, a stone: *Gr.*), a species of Zeolite, of a flesh colour.

SARCOL'OGY (*sarx*, flesh; and *logos*, a discourse; *Gr.*), that part of Anatomy which treats of the soft parts of the body; as the muscles, fat, intestines, vessels, &c.

SARCO'MA (*Gr.*; from *sarx*, flesh), any fleshy excrescence on an animal body.

SARCOPH'AGUS (*sarkophagos*, from *sarx*, flesh; and *phagein*, to eat: *Gr.*), a species of limestone of which ancient coffins were made; and which, according to Pliny, had the power of destroying within forty days the corpses put into them. This quality brought the stone into very common use; and thus the name came to be applied to all coffins of stone, though often used for a contrary purpose to that which the name expresses. Of the great number of *sarcophagi*, which have come down to us, several are known by particular names; as, the sarcophagus of Homer, in the Besborodko gardens at St. Petersburg; and that of Alexander the Great, in the British Museum, once in the Mosque of St. Athanasius at Alexandria. It was taken by the British from the French, during their memorable campaign in Egypt.

SARDON'IC LAUGH (*risus sardonicus*), so called from the herb *sardonia*, which grows in Sardinia, and, being eaten, is said to cause a deadly convulsive laughter, or spasmodic grin.

SAR'DONYX (*sardonux*, the Sardinian onyx: *Gr.*), a genus of semi-pellucid gems, of the onyx structure, zoned or tabulated; and composed of the matter of the onyx, variegated with that of the red or yellow carnelian. It is often blood red, by *transmitted* light.

SARGASSO SEA. In the middle of the Atlantic ocean, and to the west of the Canaries and the Cape Verde Islands there is a large tract of quiet water many hundred square miles in extent, covered with floating seaweed, of which that called Sargasso is the principal Another species, the *Macrocystis pyrifera* of botanists, has stems more than a thousand feet long, but only of the thickness of a finger, while it branches into thread-like divisions. This vast oceanic meadow is the abode of myriads of small crustaceans, and minute organisms. Vessels avoid this calm tract, but Columbus was entangled in it on his first voyage, and imagined when he first met with it that he was in the neighbourhood of land.

SARMEN'TOUS (*sarmentosus*, full of twigs: *Lat.*), in Botany, an epithet for a stem that is filiform and almost naked; or has leaves only in branches at the joints or knots, where it strikes root.

SARSAPARIL'LA, the roots of plants growing in South America and the West Indies; species of *Smilax*, valued in Medicine for their mucilaginous and demulcent qualities.

SARTORIUS MUSCLE (*sartor*, a patcher: *Lat.*), a muscle of the thigh, which bends the leg obliquely inwards, when the thighs are crossed, as those of tailors usually are.

SAS'SAFRAS, a tree of the genus *Laurus*, whose bark has an aromatic smell and taste, and is used in medicine.

SAS'SOLINE, in Chemistry, native *Boracic acid*, found in saline incrustations on the borders of hot springs near Sasso, in the territory of Florence.

SAS'TRA, among the Hindoos, a book containing sacred ordinances. The six great *Sastras*, in the opinion of the Hindoos, contain all knowledge, human and divine. These are called the Veda, Upaveda, Vedanga, Purana, Dherma, and Dersana.

SAT'ELLITE (*satelles*, an attendant: *Lat.*), in Astronomy, a small planet revolving round another. [See ASTRONOMY, PLANET, &c.] A secondary, which revolves round a primary planet. The earth has one satellite, the moon; Jupiter has four; Saturn, eight; Uranus, four; and Neptune, probably two.

SAT'IN (*Fr.*), a soft closely woven silk, with a glossy surface. In the manufacture of other silken stuffs, each half of the warp is raised alternately; but in weaving satin, the workman only raises the fifth or the eighth part of the warp; in which way it acquires that lustre and brilliancy which distinguish it from most other kinds of silks. The chief seats of the satin manufacture are Lyons in France, and Genoa and Florence in Italy.

SAT'IRE (*Fr.; from satira: Lat.*), in Literature, a species of writing, the object of which is always castigation. It presupposes not merely much natural wit, but also acute observation, and familiarity with varied life and manners to call this wit into exercise.

SATURA'TION (*saturatio*, a satisfying: *Lat.*), in Chemistry, that point at which a body ceases to have the power of dissolving or combining with another; thus when nitric acid has dissolved lime to its fullest extent, it is said to be saturated with lime.

SAT'URDAY, the last day of the week. It was dedicated by the Romans to Saturn, and hence called *dies saturni* (Saturn's day). The Scandinavians, and from them the Saxons, had a deity named *Seater*, from whom some believe the English name is derived.

SATURE'IA (*Lat.*), in Botany, a genus of plants, nat. ord. *Labiatæ*. The species are garden herbs, well known by the name of *savory*.

SA'TURN, in Astronomy, a conspicuous planet, though not so brilliant as Jupiter, Venus, or even Mars. Its diameter is about 76068 miles; and his volume nearly 1000 times that of the earth. He revolves at the distance of about 890 millions of miles from the sun, and the period of his sidereal revolution is about 29½ years. His orbit is nearly circular; and, at the beginning of the present century, it was inclined to the ecliptic at an angle of 2° 29′ 35″, that eccentricity being subject to a decrease of 0·155″ annually. He rotates about his axis, in 10h. 29m. 16·8s; this rapid motion produces great centrifugal force; and hence he is very much flattened at the poles. Unlike any other planet of the solar system, Saturn has three rings—one having been discovered lately; they lie in the same plane, and are concentric with the planet and each other. The exterior ring is 21146 miles in width; the next 34351 miles; they are 1791 miles from each other; and the inner one 19090 miles from the planet; they are not more than 250 miles in thickness. The third ring is very faint and dusky; but there is no doubt of its existence. These rings consist of solid matter, as appears from the shadow they cast; and they revolve round their centres.

SATURNA'LIA (*Lat.*), in Antiquity, feasts in honour of Saturn. The Saturnalia are by some supposed to have had their origin in Greece; but by whom they were instituted or introduced among the Romans is not known, as their origin is lost in the most remote antiquity. They were celebrated with such circumstances as were thought characteristic of the golden age; particularly the overthrow of distinction and rank. Slaves were reputed masters during the three days they lasted; were at liberty to say what they pleased; and, in fine, were served at table by their owners. These festivities, in which men indulged in riot without restraint, were held annually towards the end of December.

SA'TYR (*saturos: Gr.*), in Heathen Mythology, a sylvan deity

ed as a monster,

having horns on hi

the feet and tail of a goat. Satyrs are usually found in the train of Bacchus, and have been distinguished for lasciviousness and riot.

SAU'CISSE (a sausage: *Fr.*), in the art of war a long pipe or bag, made of cloth well pitched, or of leather; filled with powder, and extending from the chamber of the mine to the entrance of the gallery. It serves to communicate fire to mines, caissons, bomb-chests, &c.

SAUCISSON'S (same *deriv.*), in Fortification, faggots, or fascines, made of great boughs of trees bound together; their use being to cover men, or to make epaulements, &c.

SAU'RIAN (*sauros*, a lizard: *Gr.*), an epithet applied to reptiles of the lizard tribe.

SAUS'SURITE, in Mineralogy, a variety of *Nephrite*: so called in honour of Saussure, who discovered it on the banks of the lake of Geneva.

SAVAN'NA, or SAVAN'NAH, an extensive open plain, destitute of trees; found on the banks of the Missouri and Mississippi.

SAX'IFRAGE (*saxifragus*; from *saxum*, a stone; and *frango*, I break: *Lat.*—on account of its supposed effect on stone in the bladder), in Botany, a genus of plants of many species. Also, a medicine that has the reputation of being a solvent for the stone.

SCA'BIES (*Lat.*), in Medicine, a disease of the skin, accompanied by itching, caused by insects breeding in the parts affected.

SCABIO'SA (*last*: because supposed to cure it), in Botany, a genus of plants, nat. ord. *Dipsaceæ*. The species are nearly all perennials, as the Alpine scabious, &c.

SCAGLIO'LA (*Ital.*), in Architecture, a composition which is an excellent imitation of marble. It is composed of gypsum, or sulphate of lime, calcined and reduced to a fine powder, and made into a paste with water, when the colour to be coated has been prepared with a surface of lime and hair; the calcined gypsum, previously passed through a sieve, is mixed with glue and isinglass, and laid on with wooden moulds, the proper colours being put in during the operation. When set it is smoothed with a pumice stone, and at the same time washed with a sponge and water; it is then polished with tripoli, &c., and finished with pure oil.

SCALE (*scala*, a flight of steps: *Ital.*), in Music, a series of sounds, rising in acuteness, or falling in gravity, through degrees into which all the harmonic intervals are conveniently divided.——*Scale*, in Arithmetic, the order of progression on which any system of notation is founded; as the *binary decimal*, &c.——*Scale*, in Mensuration, a line or rule of a definite length, divided into a given number of equal parts; for the purpose of measuring other linear magnitudes. The scales of thermometers are graduated from some arbitrary point in degrees, which are also arbitrary.——*Scale*, in Zoology, small thin plates, which grow out of and defend the skin of fishes. They appertain to the system of the *rete mucosum* beneath the true epidermis. The so called scales of serpents and other reptiles are modifications of the epidermis itself.

SCA'LE-STONE, or SCHAAL'STEIN, a rare mineral, of a grayish or pearly white colour, tinged with green, yellow, or red. It is also called *Tafel-spath*, and *tabular spar*; and is composed of thin laminæ collected into large prismatic concretions.

SCAL'LOP (*escallop*: *Fr.*), a species of Pecten. The scallop shell was worn by Roman Catholic pilgrims.

SCAL'PEL (*scalpellum*: *Lat.*), in Surgery, a knife used in anatomical dissections and surgical operations.

SCAM'MONY (*scammonia*: *Gr.*), gum-resin, obtained from a plant of that name. It is of a blackish gray colour, a strong nauseous smell, and a bitter and very acrid taste. It is a strong and efficacious purgative. The best scammony comes from Aleppo, in light spongy masses, easily friable.

SCANDALUM MAGNATUM (a slander against persons of rank: *Lat.*), in Law, a defamatory speech or writing made or published to the injury of a person of dignity, It is not necessary that it should be such as would be actionable at common law, in the case of a person of inferior station. This action has not been brought for a long period; the last instance of it seems to have been in the eighth year of Queen Anne.

SCAN'NING (*scando*, I measure verses, literally, I climb: *Lat.*), in Latin poetry, the examining a verse by counting and examining the feet, to see if the quantities are duly observed; or, according to modern usage, to recite or measure verse by distinguishing the feet in pronunciation.

SCAN'SORES (*Lat.*, from *scando*, I climb), climbing birds. An order which includes those possessing the power to turn one toe back, so as to have two toes before. This order has been divided into four families: 1. *Ramphastidæ*, the toucans. 2. *Psittacidæ*, parrots. 3. *Picidæ*, woodpeckers. 4. *Cuculidæ*, cuckoos.

SCAPE (*skapos*, a stalk: *Lat.*), in Botany, a stem bearing the fructification without leaves, as in the narcissus and hyacinth.

SCA'PE-GOAT, in the Jewish ritual, a goat which was brought to the door of the tabernacle, where the high-priest laid his hands upon him, confessing the sins of the people, and putting them on the head of the goat; after which the goat was turned loose into the wilderness.—Levit. xvi.

SCA'PEMENT, in Horology, the manner of communicating the impulse of the wheels to the pendulum. Common scapements consist of the swing wheels and pallets only; but modern improvements have added other levers or detents.

SCAP'OLITE (*scapos*, a stalk; and *lithos*, a stone: *Gr.*), a mineral, the crystals of which are often collected in groups of parallel, diverging, or intermingled prisms, whence its name.

SCAP'ULA (*Lat.*), in Anatomy, the shoulder-blade: a bone which is fixed to the upper, posterior, and lateral part of the thorax, extending from the first to about the seventh rib. The uses of the scapula are to sustain the arms, and join them to the body; to serve for the insertion of several muscles; and to add somewhat to the defence of the parts contained within the thorax. It is of various shapes in different animals; and, in most fishes, is articulated to the back of the skull.

SCAP'ULAR (from *last*), in Ornithology, the name given to a feather which springs from the shoulder of the wing, and lies along the side of the back.

SCAP'ULARY (same *deriv.*), a part of the habit of certain religious orders in the Roman Catholic church; consisting of two narrow slips of cloth worn over the gown, covering the back and breast, and extending to the feet. Simon Stock, an Englishman, in the 13th century, under the authority of a vision, introduced the notion that the scapulary is a distinctive mark of devotion to the Virgin Mary; since which time a conviction has been very commonly entertained among devotees, that those wearing it at the hour of death are specially fortified against the consequences of their transgressions. The scapular worn by the laity on ordinary occasions consists of two small square pieces of stuff, united by pieces of tape, and having the symbol which indicates the Virgin's name, &c., embroidered upon them.

SCARABÆ'US (*Lat.*, from *skarabos*, *Gr.*), the name formerly given by entomologists to a genus of beetle now so numerous that they are divided into several genera.——SCARABÆUS, in Antiquities, a symbol anciently worn by the Egyptians and Etruscans, as an amulet. Amongst Egyptian carvings there are many representations of these sacred Scarabæus, the emblem of their deity, Phtha, or Vulcan, the god of eternal fire.

SCARF'-SKIN, in Anatomy, the first and outermost of the three layers of which the skin is composed. The *Cuticle* or *Epidermis*. [See SKIN.]

SCARIFICA'TION (*scarificatio*: *Lat.*), in Surgery, the operation of making several incisions in the skin, with a lancet or a cupping instrument.

SCARLATI'NA, in Medicine, the *scarlet fever*. It is a highly contagious disease, and assumes two forms. The one comes on with languor, chills, and the usual symptoms of fever. On the third or fourth day there appears a scarlet efflorescence on the skin, which ends, in three or four days, by the skin peeling off in brawny scales; the febrile symptoms, and sore throat, if there had been any, disappear; and the patient gradually recovers—a dropsical swelling, which lasts but a short time, sometimes following the disease. In the other form, the febrile symptoms are more serious; there is bilious vomiting; great soreness and ulceration of the throat; and the eruption, instead of mitigating the symptoms, is accompanied by their dangerous increase. The body becomes swollen, the nose and eyes inflamed, the breath fetid, and the inflammation of the throat terminates in greyish sloughs. If the patient recover, dropsical swellings and glandular tumours follow, and leave his state very precarious. This disease occasionally assumes a highly malignant form. Scarlet fever is known from *measles*, by the greater extent, and want of elevation, of the eruption; and by its not assuming the form of semilunar patches. Besides, there is no cough, nor the running from the eyes and nose, with which measles begin.

SCAR'LET-OAK, in Botany, the *Quercus coccifera*, or kermes oak, producing small glandular excrescences, called *kermes* or *scarlet-grain*, which are used for dyeing scarlet.

SCARP, in Fortification, the interior talus or slope of the ditch next the place at the foot of the rampart.——In Heraldry, the scarf which military commanders wear for ornament.

SCENE (*Fr.*, from *skēnē*: *Gr.*). In the drama this word has four significations: its first, or primitive, denotes a theatre, in accordance with its meaning (a tent, or booth); its second, the decoration of a theatre, as the painting exhibited between the acts; its third, a scene representing the place in which an action is performed, as a room or a garden; and its fourth, that portion of a drama which belongs to the same person or persons, in one place.

SCENOG'RAPHY (*skēnographia*; from *skēnē*, a scene; and *grapho*, I write: *Gr.*), in Perspective, opposed to Ichnography and Orthography. *Ichnography* is the ground-plan; *orthography*, the elevation or a flat view of a front of an object; and *scenography*, the perspective view, which takes several sides, and represents everything in its apparent proportions.

SCEP'TICISM (*skeptomai*, I examine: *Gr*) —called also *Pyrrhonism* from its founder Pyrrho, who lived under Alexander the Great —the doctrine of a sect of philosophers, who maintained that no certain inferences can be drawn from the senses, and who therefore doubted of everything [See PHILOSOPHY.]

SCEP'TRE (*skēptron*; from *skēpto*, I lean upon: *Gr.*), a short staff, the emblem of sovereign power. It is an ensign of royalty of greater antiquity than the crown. It was at first an unornamented staff, or baton; but became, afterwards, covered with ornaments in ivory, gold, &c. At present, the sceptre and ball form the two most important emblems of royal and imperial power.

SCHED'ULE (*Fr.*; from *schedula*, a small piece of paper: *Lat.*), in Law, a scroll of paper or parchment appended to a will or deed. Also a list of names or things.

SCHE'LIUM, or **SCHEE'LIN**, in Mineralogy, another name for *tungsten*; given to it in honour of Scheele, its discoverer. [See TUNGSTEN.]

SCHE'RIF (lord, or master: *Arab*), a title given, in the east, to those who are descended from Mahomet, through his daughter Fatima and son-in-law Ali. They are called also *Emir*, and *Seid*, and have the privilege of wearing green.

SCHERO'MA (*scheros*, dry: *Gr.*), in Medicine, a dryness of the eye, from a want of the lachrymal fluid.

SCHE'SIS (*Gr.*), in Medicine, an appellation designating the general state or disposition of the body or mind.——In Rhetoric, a figure of speech in which a certain affection or inclination of the adversary is feigned, on purpose to be answered.

SCHIL'LER-SPAR (*schillern*, to change colours: *Ger.*), a mineral of a pearly lustre, and changeable hues.

SCHISM (*schisma*; from *schiso*, to cleave: *Gr.*), in a theological sense, a division or separation in a church or society of Christians; or breach of unity among people of the same religious persuasion. Hence, one who separates from an established church or religious faith is termed a *schismatic*.

SCHIST (*schistos*, cloven: *Gr.*), in Geology, various rocks composed of crystalline materials, arranged in layers, are termed schists. The principal kinds are *Mica-schist*, a very abundant rock, composed of quartz and mica; *Hornblende-schist*, usually black, composed of hornblende and felspar, the former predominating; *Chlorite-schist*, a green slaty rock, abounding with foliated plates of chlorite; *Talcose-schist*, composed of talc and quartz, or talc and felspar. All these belong to what is called the metamorphic series [see GNEISS], and some of them are found in all mountainous regions, usually in the neighbourhood of granite and gneiss. A *schistose* rock means a rock that splits like slate in laminæ, more or less thin.

SCHOLAS'TICS (*scholastikos*; from *scholē*, leisure: *Gr.*), a class of philosophers or *schoolmen*, who arose in the middle ages, and taught a peculiar kind of philosophy; which consisted in applying the ancient dialectics to theology, and intimately uniting both. On account of the excessive subtility which prevailed in the scholastic philosophy, the expression *scholastic* has been used for the extreme of *subtility*. After the Reformation and the revival of letters, the system gradually declined, till it gave place to the enlightened philosophy of Lord Bacon and the great men who have followed in his track and carried out his principles.

SCHO'LIA (*scholion*, a comment; from *scholē*, leisure: *Gr.*), notes or annotations on an ancient author.——SCHOLIAST, one who writes *scholia*, for the purpose of illustrating ancient authors.

SCHOOL (*scole*: *Sax.*; from *scholē*: *Gr.*). In modern usage the word *school* comprehends every place of education, whether a college, an academy, a primary school, or a school for learning any single art or accomplishment. The changes which have taken place in science, and in the whole condition of modern nations, who are no longer dependent, like those of the middle ages, for their means of intellectual culture, on the remains of ancient civilization, necessarily make the character of school instruction very different from what it was formerly, when the whole intellectual wealth of Europe was contained in two languages; and though these noble idioms will always retain a high place in a complete system of education, yet their importance is comparatively less; while that of the natural sciences, history, geography, politics, &c. has very much increased. All this has had a great influence upon schools, and will have a still greater. The importance of education, moreover, is now set in strong relief by the general conviction, entertained in free countries, that a wide diffusion of knowledge is the only true security for well-regulated liberty, which must rest on a just sense of what is due from man to man. And few results can be attained by the student of history and of mankind more delightful than this of the essential connection of light and liberty; not that great learning necessarily leads to liberty; history affords many instances which disprove this; but that a general diffusion of knowledge always tends to promote a general sense and love of what is right and just, as well as to furnish the means of securing it.——SCHOOL, among painters, the style and manner of painting common to the great masters of the art at any particular period, as the Italian, Flemish, Dutch, Spanish, and English schools.——SCHOOL, in Philosophy, a system of doctrine delivered by particular teachers, as the *Platonic school*, the *school of Aristotle*, &c.——SCHOOL, in the middle ages, a seminary for teaching logic, metaphysics, and theology, characterized by academical disputations and subtilties of reasoning. Hence *school divinity* is the phrase used to denote that theology which discusses nice points, and proves everything by argument.

SCHOON'ER, a small sharp-built vessel, with two masts; of considerable length and rake; with small top masts, and fore and aft sails. It carries a square topsail, and top-gallant sail.

SCIAG'RAPHY, or SKIOG'RAPHY (*skia*, a shadow; and *grapho*, I write: *Gr.*), in Architecture, a profile or section of a building to exhibit its interior structure.——In Astronomy, the art of finding the hour of the day or night, by the shadows of objects, caused by the sun, moon, or stars.——In Painting, the art of delineating shadows on mathematical principles.

SCIAT'IC (*sciatique: Fr.; from ischion*, the hip-joint: *Gr.*) *Artery*, in Anatomy, a branch of the internal iliac.——*Sciatic Nerve*, a branch of a nerve of the lower extremity, formed by the union of the lumbar and sacral nerves.——*Sciatica*, a painful affection of this nerve.——*Sciatic Vein*, the vein which accompanies the sciatic artery in the thigh.

SCI'ENCE (*scientia; from scio*, I know: *Lat.*), the regular development of any branch of knowledge. The difference between science and art is, that the first is speculative, and the second practical. Science deals with principles, art with their application. Facts do not constitute science, though they are its foundation, and material science consists in the systematising of facts under general laws.

SCIL'LA (*skilla: Gr.*), in Botany, a genus of plants, nat. ord. *Liliaceæ*. The species are bulbous, and consist of the different varieties of the *Squill*.

SCI'ON (*Fr.; from scindo*, I cut asunder: *Lat.*), a graft or young shoot of a tree.

SCIOP'TICS (*skiæ*, a shadow; and *opsomai*, I shall see: *Gr.*), the science of exhibiting images of external objects received through a double convex glass in a darkened room.——*Scioptic*, a sphere or globe of wood with a hole in which is placed a lens, so constructed that it may be turned round every way, and used in making experiments with the camera obscura.

SCI'RE FA'CIAS (*Lat.*), a judicial writ founded on some matter of record, as judgments, and letters patent, on which it lies to enforce the execution of them or to set them aside. It is so called because the writ directs the sheriff that he give knowledge (*quod scire facias*) to the defendant respecting the matter in hand. The most usual application of this writ is for repealing letters patent, for enforcing judgments against individual shareholders of certain joint-stock companies when the assets of the company are insufficient to satisfy the debt.

SCIU'RUS (*Lat.; from skiouros; skia*, a shadow; and *oura*, a tail: *Gr.*—on account of its large tail), in Zoology, a genus of rodent mammalia, known as squirrels.

SCLAVO'NIAN, or SCLAVON'IC, pertaining to the *Sclavi*, or their language—a people that anciently inhabited the country between the rivers Save and Drave. Hence the word came to denote the language which is now spoken in Poland, Hungary, Bohemia, &c. The Sclavonic languages may be thus classed; in the east are the Russian, the Bulgarian, and the Illyrian, the last comprehending the Servian and Croatian dialects. The Bible was translated into the ancient Bulgarian in the middle of the ninth century, and this is said to be still the authorized version for the whole Sclavonic race. In the west we find the languages spoken in Poland, Bohemia, and Lusatia; the last spoken by the Wends.

SCLEROT'ICA (*skleros*, hard: *Gr.*), in Anatomy, one of the tunics or coats of the eye; it is hard, opaque, and extended from the cornea to the optic nerve; its anterior part, which is transparent, is called the *cornea*.——Medicines which harden and consolidate the parts to which they are applied are termed *sclerotics*.

SCOL'OPAX (*skolopax*, a woodcock: *Gr.*), in Ornithology, a Linnæan genus of birds, including the woodcock and the snipe.

SCOLOPEN'DRA (*Gr.*), the generic name for the *Centipedes*, a genus of carnivorous *Annulosa*, belonging to the *Myriapoda*. [See CENTIPEDE.]

SCOM'BER (*skombros: Gr.*), in Ichthyology, a genus of fishes including the *mackerel*, which see.

SCORE, in Music, the original draught of the whole composition, in which the several parts are distinctly marked.

SCO'RIÆ (*skōria: Gr.*), in Metallurgy, the dross of metals in fusion; or, more strictly speaking, that vitreous mass which is produced in obtaining metals from their ores, and which when cold is brittle, and insoluble in water. Hence, *scoriaceous*, pertaining to dross; and *scorification*, the operation of reducing a body into scoria.

SCOR'PIO (*Lat.; from skorpios: Gr.*), one of the signs of the zodiac. When it rises *Orion* sets; and hence the fable that Orion died by the sting of a scorpion.——*Scorpio*, the name of an ancient military engine, used chiefly in defending the walls of a town. It resembled the balista in form; consisting of two beams bound together by ropes, from the middle of which rose a third beam, called the *stylus*, so disposed as to be pulled up and let down at pleasure. On the top of this were fastened iron hooks.——*Scorpio* was the name also of a sort of scourge, which was furnished with small spikes that lacerated the body of the sufferer.

SCOR'PION (same *deriv.*), in Zoology, a genus of *Arachnida*, distinguished from spiders, by having the abdomen articulated, and the tail tenuated by a curved sting, beneath the extremity of which are two orifices that discharge a poisonous fluid. The scorpion is not unlike a lobster in appearance; it is found in the south of Europe, where it seldom exceeds four inches in length; but in tropical climates it grows to the length of five or six inches. The sting of the larger kinds is much dreaded; and is sometimes fatal to life.

SCOT (*sceat*, part or portion, in the sense of contribution: *Sax.*), an old word signifying a customary contribution, laid upon all subjects according to their ability: and found in several expressions; thus, *scot-free*, &c. In Law, paying 'scot and lot' is understood to mean paying parochial rates. Formerly persons assessed to any contribution, though not by equal portions, were said to pay scot and lot.

SCOTIA (darkness: *Gr.*), in Architecture, a hollow moulding, so called from the shadow which was formed by it, and seemed to envelope it in darkness. From its resemblance to a common pulley, it is sometimes called a *trochilus*.

SCOT'ISTS, a sect of school-divines and philosophers, thus called from their founder, Duns Scotus, a Cordelier; who maintained the immaculate conception of the Virgin, or that she was born without original sin, in opposition to Thomas Aquinas, and the Thomists. The present pope has settled the question, by making the opinion of Scotus an article of Roman Catholic faith.

SCREW (*écrou: Fr.*), one of the six mechanical powers, consisting of a spiral thread or groove cut round a cylinder. When the thread is on the outside it is a *male* or convex screw; but when it is cut along the inner surface of the cylinder it is a *female* screw, otherwise called a nut. The screw is reducible to an inclined plane; and its efficiency is increased by diminishing the distance between the threads, which is equivalent to diminishing the *height* of the plane; or by increasing its diameter, which is the same as increasing the length of the plane. [See INCLINED PLANE.]——ARCHIMEDEAN SCREW, in Hydraulics, a spiral tube arranged as a spiral and turned on an axis; it is employed for raising water; so called from its inventor Archimedes.——ENDLESS SCREW, a wheel turned by a screw, which, as it never ceases to be in contact with some of the teeth of the wheel, is practically endless.

SCREW PINES, a genus of tropical trees of remarkable appearance, more nearly allied to palms than to other plants. A mealy substance is obtained from the seeds, which is eaten. 'Wondering at the capricious vagaries of nature, the traveller contemplates these extraordinary trees, which have leaves arranged in spiral order, like the dragon trees, trunks like those of palms, fruit-cones like the conifers, and yet having nothing in common with any of these plants, so that they form a family by themselves (*Pandanaceæ*). On one of the Nicobar islands we saw some of these trees with slim smooth stems forty to fifty feet high, which are nourished by and supported upon a pile of aerial roots ten or twelve feet high, resembling a conical piece of wicker work. Many of the roots did not reach the soil. From the branches depended beautiful massy fruit cones, a foot and a half in length, by one in thickness, which when ripe are of a bright orange hue.'—*Voyage of the Novara.*

SCREW PROPEL'LER, sometimes, but improperly, termed an Archimedean screw. An instrument for propelling vessels. It consists of two or more blades, somewhat like the vanes of a windmill, fixed on an axis running parallel to the keel of a vessel, and revolving under water at the stern—a water-tight opening being made for its axis, or shaft, just inside the sternpost. It is driven by a steam engine, placed within the ship; and by screwing itself, as it were, into the water, presses the vessel before it. The threads of this screw must be greatly deeper than if it worked in metal or wood; and hence the blades are made of considerable width, and of a length nearly sufficient to react from the keel to the surface of the water. The latter is prevented from entering where the screw shaft passes out at the stern, by a *stuffing box.* Screw propellers are supposed to have been used by the Chinese for sculling vessels, from a very early period, and they were often proposed as a means of moving ships, in Europe, before they were actually used for that purpose. Different numbers, forms, and pitch of blades, have at various times been employed, but the most usual and simple propeller has only two blades. From experiments made on the subject, there is reason to believe that the screw is rather more advantageous than the paddle wheel, when the vessel is deep in the water; but the contrary when the immersion is light, or at a medium. Also, the *slip*, or backward motion of the water, which is so much power lost, is estimated at one-third of the distance run with paddle wheels; but at considerably less, with a propeller. Screw ships are not so well adapted to go *head to wind* as those with paddles; but they are more conveniently used as sailing vessels, should circumstances require them partly, or altogether, to depend on the wind; and they are less exposed to the violent effects of a storm or heavy sea. To be effective, the screw must revolve with considerable velocity. For let us suppose that the vessel is to move at the rate of ten miles per hour, or 880 feet per minute, with a propeller of twelve feet pitch, not taking the slip into account, it must make the twelfth part of 880, or 73 revolutions per minute, a speed much higher than that usually expected from marine engines. The velocity required is obtained either by increasing that which is derived from the engines, by means of a pinion on the screw shaft, and a wheel on the crank axle, or by suiting the construction of the engines to the attainment, at once, of the required speed—which seems the better mode of proceeding.

SCRIBE (*scriba:* from *scribo*, I write: *Lat.*), a principal officer in the Jewish law, whose business was to write and interpret scripture. Originally the scribes had their name from their employment, which was transcribing the law, and multiplying copies of it; but in time they exalted themselves into public ministers and expositors of it.

SCROPH'ULA (*Lat.*, literally a *dim.* of *scrofa*, a sow), in Medicine, a disease indicated by hard indolent tumours of the conglobate glands in various parts of the body, but particularly in the neck, behind the ears, and under the chin, which after a time suppurate and degenerate into ulcers. It was called by the Greeks *Choiras*, or swine's disease. It is not contagious, but hereditary; though, under favourable circumstances, it may be entirely dormant during a generation. It is most common among children of fair complexion, and inclined to rickets; and is favoured by damp and variable climates. It first appears between the third and seventh years, and rarely shows itself after puberty.

SCROPHULARIA'CEÆ, a nat. ord. of exogenous plants with monopetalous corollas and capsular fruit. Several of our well-known wild flowers belong to this order, for example, the foxglove, eyebright, toadflax, snapdragon, and mullein. It includes many handsome garden and conservatory plants, such as the species of Calceolaria, Antirrhinum, Pentstemon, Mimulus, Maurandya, and Veronica. Few of the species are of much use to man, but many contain a dangerous principle, which, however, in the case of the foxglove, is used medicinally under the name of Digitaline.

SCRU'TINY (*scrutinium*, a search: *Lat.*), in Law, an examination of suffrages or votes at an election, for the purpose of ascertaining whether they are good or not.——In the primitive church an examination of catechumens who were to receive baptism on Easter-day.

SCULP'TURE (*sculptura*, from *sculpo*, I carve: *Lat.*), the art of giving form and expression, by means of the chisel and other implements, to masses of stone or other hard substances, so as to represent figures of every description, animate and inanimate. It is supposed that sculpture had its origin from idolatry, as it was found necessary to place before the people the images of their gods to enliven the fervour of their devotion. But to form conclusions concerning the rise and progress of the arts and sciences, without the aid of historical evidence, by analogies which are sometimes accidental, and often fanciful, is a mode of reasoning which, at best, must ever be liable to suspicion. In whatever country the earliest attempts were made, the Egyptians were the first who adopted a certain style of art. Their works were gloomy and grave, but still they were full of deep sentiment, and connected, as would appear by the hieroglyphics which covered them, with poetry and history, and by the mummies, with the belief of immortality. Interesting as the subject would doubtless prove, it is far beyond our limited means to trace the progress of this beautiful art through all its stages in the classic days of Greece, till its decline in Rome, where, though all the treasures of the Grecian sculptors had been carried to deck the Roman capital, the art never became naturalized. During the long and gloomy interval of barbarism that succeeded the downfall of imperial Rome, sculpture, with the sister arts, lay dormant and forgotten. At length, however, through the genius of Michael Angelo Buonarotti, and the skill and perseverance of some of his distinguished successors, seconded by the patronage of the illustrious house of Medici, the treasures of antiquity were collected and modern art nobly tried to rival the grace and sublimity which existed in the ancient models. The sculptor's art, as Sir Joshua Reynolds observes, is limited in comparison of others, but it has its variety and intricacy within its proper bounds. Its essence is correctness; and when to correct and perfect form is added the ornament of grace, dignity of character, and appropriate expression, as in the Apollo, the Venus, the Laocoon, the Moses of Michael Angelo, and many others, this art may be said to have accomplished its purpose.

SCUP'PERS, or SCUPPER-HOLES (*Schæpen*, to draw off: *Belg.*), in a ship, channels cut through the water-ways and sides of a vessel at proper distances, and lined with lead for carrying off the water from the deck.——*Scupper-hose*, a leathern pipe attached to the mouth of the scuppers of the lower deck of a ship, to prevent the water from entering.

SCUR'VY (*scurf*, a dry scab: *Ang. Sax.*), in Medicine, a disease characterized by great debility, a pale bloated face, livid spots on the hands and feet, weakness in the legs, offensive breath, &c. The scurvy is a disease of a putrid nature, much more prevalent in cold climates than in warm ones; and it very generally arises from eating too much salt provisions. It has been found that in the cure of this disease much more is to be done by regimen than medicines. ——Fresh vegetables, farinaceous substances, brisk fermented liquors, good air, and proper exercise, have nearly banished it from the navy. The beneficial effect supposed to be caused by lemon juice and other acids has been rendered doubtful by recent researches.

SCUR'VY-GRASS, the *Cochlearia officinalis* of botanists, a British plant that grows on rocks near the sea, has an acrid, bitter taste, and, when eaten raw as a salad, is considered an excellent remedy for the scurvy.

SCU'TAGE (*scutum*, a shield: *Lat.*), in English history, a tax or contribution levied upon those who hold lands by knight-service.

SCUT'TLE (*scutella*, a nearly square salver: *Lat.*—which the lid of the hatchway resembles), a small hatchway or opening in the deck of a ship, large enough to admit a man, and with a lid for covering it; also a similar hole in the side of a ship, and through the covering of her hatchways, &c. ——To *scuttle the decks*, is to cut holes in them to let down water from them into the hold.——To *scuttle a vessel*, is to cut holes, for the purpose of sinking it.——*Scuttlebutt*, a cask of water, with a large hole in it, for the ship's use.

SCU'TUM (*Lat.*), in Antiquity, a sort of buckler of both a semicylindrical and an oval form; in the former case, it was termed *imbricatum*; in the latter, *ovatum*.

SCYL'LA (*Lat.*, from *skulla*: *Gr.*), a rock in the sea between Sicily and Italy, which was very formidable to the mariners among the ancients. It was opposite to the whirlpool Charybdis.

SCYTHE, an instrument for mowing. It consists of a thin steel blade attached at right angles to a handle of six or eight feet long. When used for cutting corn there is frequently an addition made to it, called a **cradle**.

SEA (*Sæ*: *Sax.*), in Geography, a term sometimes applied to the ocean, or that vast tract of water encompassing the whole globe; but, more properly, to a particular part or division of the ocean; as the Irish Sea, the Mediterranean Sea, the Red Sea, the Sea of Marmora, the Black Sea, the Baltic, &c. [See OCEAN.]

SEA-ANEMONES, the popular name of marine polypes belonging to the family of *Actinidæ*. They are of gelatinous or fleshy substance, more or less cylindrical in shape, with a base usually attached to a rock or other body. At the upper end is a disk, in the middle of which is the mouth leading to the stomach. The remains of the food, after digestion, are ejected again by the mouth. Upon this disk are placed rows of tentacles, threadlike bodies, capable of extension and contraction, by means of which these animals seize their prey. These tentacles somewhat resemble the stamina of a flower, and have suggested the popular name. They are furnished with weapons in the shape of minute darts, that seem to possess the property of poisoning, and these they can project at will. They have no special organs of sense, nor has any nervous system been discovered. Some of the sea-anemones increase by spontaneous division, others by budding. In some the sexes are united in one individual; in others they are separate. Their eggs, after having been hatched, have a resemblance to the infusoria, and are freely locomotive by means of cilia. In this state they usually issue from the body of the parent; but sometimes they are developed into perfect animals before they come forth.

SEA-CALF, in Zoology, the *seal*, which see.

SEA-DEVIL, a name given by seamen to a large cartilaginous fish, of the *Ray* kind. It is also applied to the Angler, the *Lophius piscatorius* of Linnæus. [See LOPHIUS.]

SEA-GULL. [See GULL.]

SEA-HEDGEHOG. [See ECHINUS.]

SEA-HOLLY, a British umbelliferous plant, *Eryngium maritimum*, which grows near the sea, and has blue flowers.

SEA-HORSE, in Zoology, the Morse or Walrus; also the *Hippocampus*, which see.

SEA-KAIL, or SEA-CALE, a plant of the genus *Crambe*. The whole plant is entirely smooth and glaucous; the stems are about two feet high and branching, bearing fleshy leaves, some pinnatifid, and others sinuate, undulate, and crisped. It is now very common, though its introduction into gardens as a culinary vegetable is but of recent date. It should be planted in a deep sandy soil, and blanched either by sand, ashes, litter, or by covering with flower pots. No plant is so easily forced; and, unlike asparagus, it yields produce the first spring after being raised from seed.

SEA-LION, the *Phoca jubata*, a species of seal, the male of which has a large mane on the neck.

SEAL (*sele*: *Sax.*), the *Phoca vitulina* of zoologists, a four-limbed marine mammal, found abundantly on the coasts of Labrador and Newfoundland; and not unfrequently on the British shores. The hind feet are placed at the extremity of the body, in the same direction with it, and serve the purpose of a caudal form; the fore feet also are adapted for swimming. The limbs would rather resemble fins than feet, if they had not sharp strong claws. Seals are from four to six feet in length; they are covered with short, stiff, glossy hair, with a smooth head without external ears, and the fore legs are deeply immersed in the skin. They are gregarious; and their companions come to their assistance if attacked. Their courage, however, only enables the fisherman to increase his booty The seal not only furnishes food for the Esquimaux's table, oil for his lamp, and clothing for his person; but even the bones and skin supply materials for his light portable boats and his summer tents. It has been remarked that the brain of this animal is of greater proportionate magnitude than that of any quadruped; and that not only does it exhibit in its countenance the appearance of sagacity, but its intelligence is in reality far greater than in most land animals. Dr. Harwood observes, that, aware of its disposition to become familiar, and its participation in the good qualities of the dog, it is astonishing that mankind have not chosen this intellectual and finely-organized quadruped, for aquatic services scarcely less important than some of those in which the dog is employed on land. There are several species of seal besides the one named above. The operation of taking seals and curing their skins is called *sealing*; and a voyage made for that purpose is called a *sealing-voyage*.

SEAL, in Law, the impression or device printed on wax, which is put to any deed by way of ratification. The *great seal* is the seal used for the united kingdom of England and Scotland, and sometimes of Ireland. The *privy seal* is that which the king uses to such grants, &c., as are to pass the great seal.——**SEAL**, a piece of metal having coats of arms or some other device engraven upon it; also the print in wax made by the seal.

SEAL'ING-WAX (*sigillum*, a seal: *Lat.*), a composition of gum lac, melted and incorporated with resin, to which some pigment is added to give it the required colour, as vermillion, ivory black, verditer, &c. Gold sealing-wax is made simply by stirring gold-coloured mica spangles into the melted resin. Sealing-wax is an article that is now comparatively but little used, on account of the very general adoption of adhesive envelopes.

SE'AMAN, one engaged in navigating ships or other vessels upon the high seas. An *able seaman* is one who is complete in his profession; an *ordinary seaman*, one who is less competent; and a *landsman*, one who is fresh from shore. Various regulations have been enacted with respect to the hiring of seamen, their conduct, and the payment of their wages.

SE'AMANSHIP, an acquaintance with the art of managing and navigating a ship; applicable both to officers and the men, and indispensably necessary in those who have the ship under their command.

SE'A-MEW, a name given to some of the gulls.

SE'A NEEDLE. [See GARFISH.]

SE'A-OTTER, the *Enhydra lutris*, a species of otter that has hind feet, resembling the seal. It feeds on shell-fish.

SE'A-PIE, the *Hæmatopus ostralegus* of ornithologists, a wading bird allied to the plover; called also the oyster-catcher, from its thrusting its beak into oysters when open, and taking out the fish.

SE'A-SERPENT. At various times, within the last quarter of a century, marvellous accounts have been published regarding an enormous marine animal seen on the coasts of America, of a size and length varying according to the opinions of those who assert that they have seen it; some describing it as 100 feet long, while others make it nearly as many yards. All accounts, however, agree as to the protuberances on its back, its vertical sinuosities, and its serpent-shaped head. It is highly probable that pieces of wrecks, seaweed, or some other objects, seen from a distance, have been mistaken for living bodies; and their size exaggerated by the fertile imagination of seamen. [See KRAAKEN.]

SEA-SICKNESS, a disorder incident to most persons on their first going to sea, occasioned by the agitation of the vessel. Though it continues in general only for the first day or two, it is extremely harassing to some people at intervals, especially on any increased motion of the vessel; and with many it lasts the entire voyage, however long, at least at any rising of the sea. No good remedy has yet been found for it; perhaps the most effective is lying on the back in a horizontal position; but this must not be too long persevered in, lest the sufferer become incapable of exertion during the voyage. After a day or two, the patient must exert himself, however difficult the effort may be at first; and then, with a little exposure to the fresh air, &c., comparative comfort will be generally secured for the rest of the time. The ancient writers recommend acid fruits, or bread and vegetables soaked in vinegar, after the stomach has been cleansed by vomiting, but not before. An old remedy for sea-sickness, and a very common one among sailors, is a draught or two of sea-water; which though disagreeable enough, particularly at such a time, has been found to produce the desired effect. But there are many simple remedies which prove useful enough in a short voyage, that are ineffective or inadmissible in a long one. Some do not during their entire lives, however trying the circumstances, experience the least tendency to this most painful and overpowering malady.

SE'ASONS (*saisons*: *Fr.*), the four divisions or portions of the year, namely, Spring, when the sun enters Aries; Summer, when he enters Cancer; Autumn, when he enters Libra; and Winter, when he enters Capricorn. Hence Spring is supposed to commence about the 21st of March; Summer, about the 22nd of June; Autumn, about the 23rd of September; and Winter, about the 23rd of December. The diversity of the seasons depends upon the oblique position of the sun's path through the heavens; in consequence of which this luminary rises to different heights above the horizon, making the day sometimes longer, and sometimes shorter, than the nights. When the sun rises highest at noon, its rays fall most nearly in the direction of a perpendicular, and consequently a greater number is received upon a given spot; their action also, at the same time, continues the longest. These circumstances make the difference between summer and winter. It is found that the sun does not rise so high in summer, nor descend so low in winter, at the present time as it did formerly; in other words, the obliquity of the ecliptic, which is half the difference between the sun's greatest and least meridian altitudes, is growing less and less continually. But there is no doubt that this diminution will never exceed a certain small quantity; and that after a period, not ascertained by astronomers, the obliquity will begin again gradually to increase. [See EQUATOR.]

SE'A-URCHIN. [See ECHINUS.]

SE'A-WOLF. [See WOLF-FISH.]

SEBA'CEOUS GLANDS (*sebum*, grease: *Lat.*), in Anatomy, small glands seated in the skin, which secrete a fatty matter.

SEBA'CIC ACID (same *deriv.*), an acid obtained by the destructive distillation of fatty substances. It forms small pearly crystals.

SEBES'TEN, the drupaceous fruit of some trees belonging to the genus *Cordia*, which grow in tropical Asia and Africa.

SE'CANT (*secans*, cutting: *Lat.*), in Geometry, a line that cuts another, or divides it into two parts. The *secant of a circle* is a line drawn from the circumference on one side, to a point without it on another.——In Trigonometry, a *secant* is a right line drawn from the centre of a circle, which, cutting the circumference, proceeds till it meets with a tangent to the same circle.

SEC'OND (*Fr.; from secundus*, subordinate: *Lat.*), in Geometry, Chronology, &c., the sixtieth part of a minute, whether of a degree, or of an hour; it is denoted by two small accents, thus (″).——In Music, an interval of a conjoint degree, being the difference between any sound and the next nearest sound above or below it.——*Second*, one who attends another in a duel to aid him, and see that all the proceedings between the parties are fairly conducted.——*Second terms*, in Algebra, those where the unknown quantity has a degree of power less than it has in the term where it is raised to the highest.

SEC'ONDARY ROCKS (*secundarius*, belonging to the second class: *Lat.*), in Geology, the series of formations which intervene between the primary rocks and the tertiary, including the Triassic or upper new red sandstone group (which rest upon the Permian or magnesian limestone group, the uppermost portion of the primary division), the liassic, oolitic, and cretaceous groups. There is so marked a difference between the fossils of this series, and those of the earlier and later series, as to induce geologists to believe that an indefinite series of ages elapsed between them.——*Secondary circles*, in Astronomy, circles passing through the poles of some great circle; thus the meridians and hour circles are secondaries to the equinoctial. There are also *secondaries* passing through the poles of the ecliptic, by means of which all stars are referred to the ecliptic.

SECOND SIGHT, a superstitious notion, prevalent in the Highlands of Scotland, by which certain persons are supposed to be gifted with a kind of supernatural sight; or the power of seeing future or distant events as if they really happened.

SEC'RETARY (*secretaire: Fr.; from secretus*, private: *Lat.*), an officer whose duty it is to write letters and other instruments, for and under the orders and authority of a public body or an individual.——*Secretary of State*, in British policy, an officer of the crown who transacts and superintends the affairs of a particular department of government. There are five principal secretaries of state. The secretary for the Home Department, the Colonial Secretary, the secretary for Foreign Affairs, the secretary for the War Department, and the secretary for India; each having a salary of 6000*l.* per annum. In each of these departments there are two under secretaries, one of whom remains in office when the ministry goes out. The principal secretaries are always ex officio cabinet ministers, and members of the privy-council; and have authority to commit persons for treason, and other offences against the state; being ex officio conservators of the peace at common law, or justices of the peace throughout the kingdom.

SECRE'TION (*secretio*, a separation: *Lat.*), the process by which a gland or set of vessels in the animal system changes a fluid of one quality into a fluid of another quality. The organs of secretion in the animal economy are of very various form and structure; but the most general are those denominated *Glands*, which see.

SECT (*secta; from seco*, I cut off: *Lat.*), a body of persons adhering to some philosophical or religious system. Most sects have originated in a particular person, who taught and propagated some peculiar notions in philosophy or religion, and who is considered to have been its founder.

SECTA'RIAN (same *deriv.*), one of a party in religion which has separated itself from the established church; or which holds tenets different from those of the prevailing denomination in a kingdom or state.

SEC'TILE (*sectilis*, that may be cut: *Lat.*), a term for a mineral that is soft enough to be easily cut.

SEC'TION (*sectio*, a cutting off: *Lat.*), in general, denotes a distinct part or portion of something which is divided; or the division itself. Such are the subdivisions of a chapter, called also paragraphs and articles.——*Section*, in Geometry, a side or surface of a body or figure cut off by another; or the place where lines, planes, &c., cut each other.——*Section*, in Drawing, the representation of the interior of a building or a machine, on the supposition that it has been cut through in some given direction.

SEC'TOR (*secteur: Fr.; from seco*, I cut off: *Lat.*), in Geometry, a part of a circle comprehended between two radii and the arch; or a mixed triangle, formed by two radii and the arch of a circle.——A mathematical instrument so marked with lines of sines, tangents, secants, chords, &c., as to fit all radii and scales; and be useful in finding the proportion between quantities of the same kind.

SEC'ULAR (*secularis*, pertaining to the age: *Lat.*), something that is temporal, in which sense the word stands opposed to *ecclesiastical*; thus we say, secular power, secular jurisdiction, &c. Among Roman Catholics, *secular* is more peculiarly used for an ecclesiastic who lives at liberty in the world, not confined to a monastery, nor bound by the special vows or subjected to the particular rules of any religious community; in which sense it stands opposed to *regular*. Thus we say, the *secular* clergy, and the *regular* clergy.——The act of rendering secular the property of the clergy is called *secularization*.

SEC'ULAR GAMES (*ludi seculares*), in Antiquity, solemn games held among the Romans, notwithstanding their name, at no stated period. They lasted three days and three nights, during which time sacrifices were performed, theatrical shows exhibited, with combats, sports, &c., in the circus. They are said to have been instituted at Rome by Valerius Publicola—the first consul created after the expulsion of the kings. At the time of the celebration of the secular games, heralds were sent throughout the whole empire, to intimate that every one might come and see those solemnities, which he never yet had seen, nor would ever see again.

SECUN'DUM AR'TEM (*Lat.*), according to the rules of art.——In Medicine, a term fre quently used in prescriptions to denote that the recipe must be made up with particular care.——*Secundum naturam*, according to the course of nature.

SECUTO'RES (*Lat.*; from *sequor*, I follow), in Antiquity, a description of gladiators among the Romans, who fought aganst the *retiarii*. The *secutores* were armed with a sword and a buckler, to keep off the net or noose of their antagonists; and they also wore a casque. This name was also given to such gladiators as took the place of those killed in the combat, or who fought the conqueror.

SED'ATIVES (*sedatio*, an assuaging: *Lat.*), medicines which have the power of diminishing animal energy without destroying life. They generally induce sleep; and diminish irritability.

SE DEFENDEN'DO (in self defence: *Lat.*), in Law, a plea used for one who is charged with the death of another, by alleging that he was under a necessity of committing the act in his own defence.

SEDGES (*secg*: *Sax.*), an extensive order of grass-like plants, the *Cyperaceæ* of botanists. They are easily distinguished from grasses by having the stem destitute of joints. The roots are perennial and fibrous; the leaves hard and rough on the edge. They are found in all soils, but the greater proportion grow in marshes. The papyrus of the Nile, and the cotton grass of Britain, belong to this order.

SEDI'TION (*seditio*: *Lat.*), in Politics, a more or less organized resistance to the laws, or the administration of justice, and in disturbance of the public peace. In general, it signifies a local or limited opposition to *civil* authority; a commotion of less extent than an *insurrection*, and consequently less than *rebellion*.

SED'LITZ, or SEID'LITZ WATER, a mineral water, obtained from a village of that name in Bohemia. The waters are saline and purgative, limpid, sparkling, and of a bitter and salt taste; being composed principally of the sulphates of magnesia and lime, and carbonic acid.——*Seidlitz powders* are intended to produce a similar effect, though their composition is different. They are generally sold in blue and white papers; a blue paper contains two drachms of tartrate of soda, with two scruples of bicarbonate of soda; the white paper thirty-five grains of finely powdered tartaric acid. The contents of the former are to be dissolved in half a pint of water, that of the latter in a separate wine glass full; the solutions are to be mixed, and the mixture taken while effervescing.

SEED, the fecundated mature ovule of a plant, containing the embryo, or germ of a new plant. In order that the ovule should become capable of producing a plant, its fertilization by means of the pollen is necessary. When this has been done certain changes take place, the ovule enlarges and hardens, until the seed is ripe. It may then be separated from the parent plant, and if placed in favourable circumstances its embryo grows into a new plant, capable in its turn of producing seeds. The seeds of the great majority of plants are enclosed in a seed-vessel or pericarp. Such plants are termed *angiospermous* (*aggeion*, a vessel; *sperma*, a seed: *Gr.*). Seed vessels have great variety of form. [See BACCA, CAPSULE, DRUPE, FOLLICLE, LEGUME, NUT, PEPO, SILIQUA]. There are, however, some plants, such as those of the coniferous order, which have seeds that are destitute of a covering vessel, and these are termed *gymnospermous* (*gumnos*, naked: *Gr.*). A seed consists of an external skin, separable into several membranes, and the embryo. The latter is frequently surrounded by a deposit of solid matter, consisting of starchy and nitrogennous compounds, and called albumen or perisperm, which varies in its nature, and sometimes is so loaded with oil that the latter is expressed as an article of commerce. The embryo is composed of the *plumule* or *gemmule*, which on expanding becomes the stem of the new plant, the *radicle* which descends into the soil and becomes the root, and the *cotyledons* or rudimentary leaves, which usually differ from those subsequently put forth. [See COTYLEDONS.] Seeds differ much in size and external appearance. Sometimes the skin is polished and prettily coloured, as in French beans; others are rough, or pitted, or hairy, as in the cotton; the hairs of the seeds, in this case, yielding the cotton of commerce. As to the vitality of seeds after a lapse of time, the statement of the germination of wheat obtained from Egyptian mummies is now generally doubted, the proof not being clear that the seeds experimented upon really came from the mummies. Professor Henslow says, that in the fens of Cambridgeshire, after the surface has been drained, and the soil ploughed, large crops of white and black mustard invariably appear. Millar mentions a case of *Plantago Psyllium* having sprung from the soil of an ancient ditch which was emptied at Chelsea, although the plant had never been seen in the memory of man. De Candolle says, M. Girardin succeeded in raising kidney beans from seeds at least 100 years old, taken out of the herbarium of Tournefort.

SEEL'ING (*ciller*, to wink: *Fr.*), in Falconry, the running of a thread through the eye-lids of a hawk when first taken; so that she may see very little, or not at all; to make her the better endure the hood.

SEG'MENT (*segmentum*; from *seco*, I cut off: *Lat.*), in Geometry, any part cut from a figure by a line or plane.——*Segment of a circle*, a part cut off by a chord, or that portion comprehended between an arc and a chord. Segments of different circles are semicircular, when their arcs contain the same number of degrees.

SEIGN'IORAGE (*seigneur*: *Fr.*, from *senior*, an elder: *Lat.*), a royal right or prerogative of the kings of England, by which they claim an allowance of gold and silver brought in the mass to be exchanged for coin.

SEIS'MOLOGY (*seismos*, an earthquake; *logos*, a discourse: *Gr.*), a science constructed from the study of earthquake phenomena.

SEISMOM'ETER (*seismos*, an earthquake; and *metron*, a measure: *Gr.*), an instrument for measuring the shock of earthquakes, and other violent concussions.

SE'IZIN, or **SE'ISIN** (*saisir*, to seize: *Fr.*), in Law, possession. Seizin in *fact*, or *deed*, is actual or corporal possession; seizin in *law*, is when something is done which the law accounts possession or seizin, as enrolment; or when lands descend to an heir, but he has not yet entered on them. In this case the law considers the heir as *seised* of the estate, and the person who wrongfully enters on the land is accounted a *disseizor*.

SELE'NIATE, in Chemistry, a compound of selenic acid with a base.

SEL'ENITE, in Mineralogy, foliated or *crystallized sulphate of lime*. There are two varieties, massive and acicular.

SELE'NIUM (*selēnē*, the moon: *Gr.*), an elementary substance, obtained from a copper-mine at Fahlun, in Sweden. It bears a strong resemblance to sulphur, with which it is found associated in some varieties of iron pyrites. It is brittle, and opaque, with an imperfect metallic lustre, tasteless and inodorous; somewhat of the appearance of lead, but, when reduced to powder, of a deep red colour. Its spec. grav. is about 4·3. It becomes soft and tenacious at 212°, perfectly liquid at 220°, boils and sublimes at 650°. It is not soluble in water, nor altered in air. Oxidized under the blow pipe, it emits a strong disagreeable odour. It forms three combinations with oxygen, two of them being acids.

SELENIU'RET, in Chemistry, the compound of selenium with some other substance.

SELENOG'RAPHY (*selēnē*, the moon; and *grapho*, I write: *Gr.*), a description of the surface of the moon; as geography is a description of that of the earth.

SELEU'CIDÆ, ÆRA OF, or the Syro-Macedonian æra, is a computation of time, commencing from the establishment of the Seleucidæ, a race of Greek kings, who reigned as successors of Alexander the Great, in Syria, as the Ptolemies did in Egypt. This era is mentioned in the book of the Maccabees, and on a great number of Greek medals, struck by the cities of Syria, &c. The Rabbins call it the *æra of contracts*, and the Arabs the *æra of the two horns*. According to the best accounts, the year 312 of the era of the Seleucidæ began on the 1st of September in the Julian year preceding the first year of our era. Hence, to reduce a Macedonian date to the common era, subtract 311 years and 4 months.

SELT'ZER WATER, or more accurately *Selters water*, a mineral water from Selters, about ten miles from Frankfort-on-the-Maine. It contains a quantity of free carbonic acid, with common salt, and the carbonates of lime, magnesia and soda.

SEMAPHORE (*sēma*, a sign; and *phero*, I bear: *Gr.*), a term nearly synonymous with *telegraph*.

SEME' (sown: *Fr.*), in Heraldry, a term used to indicate a field or charge powdered or strewed over with figures, such as stars, crosses, &c.

SEMEIOT'ICS, or **SEMEIOL'OGY** (*semeiōtikos*, portending; *sēmeion*, a sign; and *logos*, a discourse: *Gr.*), the doctrine of signs; terms used in medical science to denote that branch of it which teaches how to judge of all the symptoms in a human body, whether it is in a state of health or disease.

SEM'I (*Lat.*), a prefix, signifying *half*; as *semicircle*, half a circle, &c.

SEMI-AMPLEX'ICANT (*Lat.*), in Botany, embracing the stem half way, as a *semi-amplexicant leaf*.

SEM'IBREVE, half a *breve* (*semi*, half; and *amplexo*, I embrace: *Lat.*), in Music, the note by which all others are regulated. It contains the time of two minims, which are divided either into four crotchets, eight quavers, sixteen semiquavers, or thirty-two demi-semiquavers.

SEM'ICOLON (*semi*, half: *Lat.*; and *kolon*, the member of a sentence: *Gr.*), in Grammar and Punctuation, the point [;] the mark of a pause to be observed in reading, of less duration than the colon, double the duration of the comma, or half the duration of the period. [See PUNCTUATION.]

SEMI-COLUM'NAR, flat on one side, and round on the other; a term of botany, applied to a stem, leaf, or petiole.

SEMI-DIAM'ETER, in Geometry, a right line drawn from the centre of a circle or sphere to its circumference or periphery; a *radius*.

SEMI-DIAPA'SON, in Music, a defective octave, or an octave diminished by a minor semitone.

SEMI-DIATES'SARON, in Music, an imperfect or defective fourth.

SEM'I-DITONE, in Music, a lesser third.

SEM'I-METAL, a term applied by the older chemists to metals which were brittle, such as zinc, &c.

SEM'INARY (*seminarium*; from *semen*, seed: *Lat.*), in Gardening, a seed-plat, or place for raising plants, and keeping them till they are fit to be removed into the garden or nursery.——Any place of education, in which young persons are instructed in the several branches of learning.

SEMINA'TION (*seminatio*: *Lat.*), the natural manner of shedding and dispersing the seeds of plants, which is variously effected. Some are heavy enough to fall directly to the ground; others are furnished with a pappus, or down, by means of which they are dispersed by the wind; while others are contained in elastic capsules, which, bursting open with considerable force, throw out the seeds.

SEMI-PELA'GIANS, a sect of Christians, who differ from the Pelagians by holding that grace, necessary for the practice of virtue, may be obtained by an effort of the human will.

SEMI-QUAR'TILE, or **SEMI-QUAD'RATE**, in Astrology, an aspect of the planets, when distant from each other the half of a quadrant, or forty-five degrees.

SEM'IQUAVER, in Music, a note of half the duration of the quaver; being the sixteenth of the semibreve.

SEMI-SEX'TILE, in Astrology, an aspect of the planets when they are distant from each other the twelfth part of a circle, or thirty degrees.

SEMI'TIC, a term derived from Shem, the son of Noah, applied to a group of languages including the Chaldee, Syriac, Arabic, Hebrew, Samaritan, Phœnician, and Ethiopic.

SEM'ITONE, in Music, half a tone, being the smallest interval admitted in modern music. The *semitonic scale* consists of twelve degrees, or thirteen notes in the octave.

SEM'I-VOWEL, in Grammar, a half vowel, or consonant which, resembling a vowel, can be in some degree pronounced without the aid of another letter. The semivowels are *b*, *d*, *c*, *g*, *k*, *p*, *s*, *t*, *v*, *x*, and *z*.

SEN'ATE (*senatus*, from *senex*, an old man: *Lat.*), an assembly or council of senators: that is, a body of the principal inhabitants of a state, invested with a share in the government. The senate of ancient Rome was, of all others, the most celebrated; it appointed judges, either from among the senators or knights, to determine processes; it also appointed governors of provinces, and disposed of the revenues of the commonwealth, &c. Yet the whole sovereign power did not reside in it, since it could not elect magistrates; it did not, ordinarily, make laws, or decide on war and peace; in all which cases it was obliged to consult the people. The senate originally consisted only of patricians; its number, it is said, was at first 100, but was doubled on the addition of the Sabines, then increased to 300 by Tarquinius Priscus, on the incorporation of the Luceres. The older were distinguished from the last created, by their names: the former being termed *patres majorum gentium* (fathers of the greater houses); and the latter *patres minorum gentium* (fathers of the lesser houses). The senate was subsequently increased to 500 or 600; and ultimately, by the Emperors, to on one occasion, at least, 1000. The members were first chosen by the kings; afterwards by the consuls, military tribunes, and finally the censors; but certain offices gave a right to the privilege of belonging to the senate. At first the senate had supreme power; but this was lost when the right of *intercession*, or negativing their proceedings, was given to the tribunes of the people. Under the Commonwealth, however, it remained always very great. The senate subsisted till the occupation of Italy by the Goths. The provincial towns had senates, in imitation of that at Rome. —— In the United States of America, *senate* denotes the higher branch or house of legislature, viz. the upper house of congress; and in most of the states, also, the higher and least numerous branch of the legislature is called the senate.—— **SENATE-HOUSE**, a building in which the senate meets, or a place of public council.—— **SENATE**, in the university of Cambridge, is equivalent to the convocation at Oxford; it consists of all masters of arts, and higher graduates, being masters of arts, who have each a voice in every public measure, in granting degrees, in electing members of parliament, a chancellor, &c.

SENA'TUS AUCTOR'ITAS, a vote of the Roman senate, drawn up in the same form as a decree, but without its force; as having been prevented from passing into a decree by some of the tribunes of the people.

SENA'TUS CONSUL'TUM, a decree of the Roman senate pronounced on some question or point of law; which, when passed, made a part of the law.

SEN'EGA ROOT, the root of the *Polygala senega*, a North American plant. This root is woody, branching, and about half an inch in diameter. Its medicinal virtues, as a cure for the bite of a rattlesnake, have been greatly exaggerated, and also its efficacy as a remedy in pulmonary complaints. The plant grows to the height of about a foot, producing several herbaceous stems, and its blossoms resemble those of the pea.

SEN'ESCHAL (*Fr.*), in France, an office and dignity, derived from the middle ages, and answering to our *steward* and *high steward*. Originally seneschals were the lieutenants of the dukes, and were sometimes termed *Baillis*, or Bailiffs. When the dukedoms reverted to the French crown they were continued as judges and superintendents, but gradually lost their power, by encroachment of the sovereign. In Ireland the term is still employed to designate the stewards of baronies.

SEN'NA, the leaves of the *Cassia senna*, a leguminous shrub, which are imported here from Alexandria for medicinal use. They have rather a disagreeable smell, and a sub-acrid, bitterish, nauseous taste. They are in common use as a purgative, and are given as an infusion, tincture, or made into an electuary. Senna is often adulterated with the leaves of the *Cynanchum olei folium* or *Arghel*, from which, however, it may be known by being ribbed.

SENOC'ULAR (*seni*, six each; and *occulus*, an eye: *Lat.*), in Entomology, an epithet for such insects as have six eyes.

SENSE (*sensus*, from *sentio*, I feel: *Lat.*). The external organs of sense are usually classed under five heads, viz. those of sight, hearing, feeling, smell, and taste. The nerves and the brain are the organs of *sensation*. If the external organ be destroyed, no sensation can be produced; where there are no nerves there is no sensation; where the nervous branches are most numerous there is most sensation; if the nerve be destroyed, sensations cannot be produced from those parts to which the nerve belongs, which are further from the brain than the injured parts. The nerves of sensation terminate in the brain. If the brain is compressed, sensation is suspended; if the brain is considerably injured, sensation ceases. The accuracy and extent of the perception depends on the vividness and efficaciousness of the compound sensations and the number of them received from the same or similar objects in different situations, and through the medium of different senses. The object, therefore, of early education should be to invigorate the organs of sense.—— **COMMON SENSE**, is that power of the mind which, by a kind of instinct, or a short process of reasoning, perceives truth, the relation of things, cause and effect, &c., and hence enables the possessor to discern what is right and expedient, and adopt the best means to accomplish his purpose.——**Moral sense**, that mental faculty which has the power of distinguishing between right and wrong.

SENSIBIL'ITY (*sensibilis*, perceptible by the senses: *Gr.*), acuteness of perception, or that quality of the mind which renders it susceptible of impressions; delicacy of feeling; as *sensibility* to pleasure or pain, shame or praise.——In Physiology, the capability which a nerve possesses of conveying the sensation produced by the contact of another body with it.

SEN'SITIVE PLANT, a native of tropical America, but often seen in our greenhouses. It shrinks and folds up its leaves on the slightest touch. [See **Mimosa.**]

SENSO'RIUM, or SEN'SORY (*sensus*, the faculty of feeling: *Lat.*), the brain and nerves, the seat of sense. According to some writers, it not only denotes the different organs of sense, but also that living principle or spirit of animation which resides throughout the body, without being cognizable to our senses, except by its effects.

SEN'TENCE (*sententia*; from *sentio*, I perceive: *Lat.*), in Grammar, a number of words containing complete sense, and followed by a full pause; a period. A *simple* sentence consists of one subject and one finite verb; as, 'the man walks.' A *compound* sentence contains two or more subjects and finite verbs.——In Law, a judicial decision publicly and officially declared in a criminal prosecution. In civil cases, the decision of a court is called a judgment.

SEN'TIMENT (*Fr.*; from *sentio*, I feel: *Lat.*), in its primary sense, signifies a thought prompted by passion or feeling. Also, the decision of the mind, formed by deliberation or reasoning.——**Sentiments**, in Poetry, and especially the dramatic, are the thoughts which the several persons express; whether they relate to matters of opinion, passion, &c.

SEN'TINEL (*sentinelle*: *Fr.*; from *sentio*, I observe: *Lat.*), or SEN'TRY (*sentire*, to perceive: *Ital.*), in Military affairs, a private soldier placed in some post, to watch any approach of the enemy, to prevent surprises, and to stop such as would pass without order, or have no business where he is posted.

SE'PIA (*Lat.*; from *sēpia*: *Gr.*), in Zoology, a genus of Cephalopoda, to which the true cuttle fishes belong. Their internal shells form what is called cuttle bone. There is a very curious play of colours on the skin of the living animal, which may be seen after it is taken out of the water. The *sepiæ* possess a bag in which they secrete a thick fluid of an intense dark brown colour. This they eject on being alarmed, and thus make their escape whilst the water around them is discoloured. The pigment called sepia is prepared from cuttle fish ink. This matter has been found fossilized, and thus an animal that died a countless number of years ago might be painted with its own ink.

SE'POYS (a corruption of the Indian word *Sipahi*, a soldier), the name given to the native troops in India, of whom there were formerly nearly 200,000, chiefly infantry but including several regiments of cavalry and some companies of artillery. They were all disciplined after the European manner; and were considered, in some circumstances, as being good soldiers; but the great Indian mutiny has greatly diminished confidence in native troops. Their dress consisted of a red jacket, with a white cotton vest, trowsers reaching only half-way down the thighs, and a light turban.

SEPT (*septum*, an enclosure: *Lat.*), in Irish history, a clan, race, or family, proceeding from a common progenitor.

SEPTA'RIA (same *deriv.*), in Mineralogy, a name given to nodules or spheroidal masses of calcareous marl, whose interior presents numerous fissures or seams of some crystallized substance, which divide the mass. When calcined and reduced to powder, they furnish *roman cement*.

SEPTEM'BER (*Lat.*; from *septem*, seven), the seventh month of the ancient Roman year.

SEPTEMBRISA'DE, in Politics, a term in use during the revolutionary commotions in France for any horrid massacre like that which disgraced the 2nd and 3rd of September, 1792, and in which the state prisoners were murdered.

SEPTEN'NIAL (*septennium*, a period of seven years: *Lat.*), happening or returning every seven years, as *septennial* parliaments.

SEPTEN'TRIONAL (*septentrio*, a constellation near the north pole, consisting of seven stars: from *septem*, seven, and *trio*, a ploughing ox: *Lat.*), pertaining to the north, or northern regions of the globe.

SEP'TIC (*sēptikos*, putrefying: *Gr.*), in Chemistry, an epithet for any substance that promotes the putrefaction of bodies; as *antiseptic* is for whatever tends to preserve them from putrefaction.

SEPTUAGES'IMA (*septuagesimus*, the seventieth: *Lat.*), in the calendar, the third Sunday before Lent, about seventy days before Easter.

SEP'TUAGINT (*septuaginta*, seventy: *Lat.*), a Greek version of the books of the Old Testament; so called because the translation is supposed to have been made by seventy-two Jews, who, for the sake of round numbers, are usually called the *seventy interpreters*. It is said to have been made at the request of Ptolemy Philadelphus, king of Egypt, about 280 years before the birth of Christ. It is that out of which all the citations in the New Testament from the Old are taken. It was also the ordinary and canonical translation made use of by the Christian church in the earliest ages; and is still retained in the churches both of the east and west. According to the chronology of the Septuagint there were fifteen hundred years more from the creation to Abraham, than according to the present Hebrew copies of the Bible.

SEP'TUM (a partition: *Lat.*), in Anatomy, &c., a plate or wall which separates two adjoining cavities. Thus the *septum auris* or drum of the ear.——**Septum cerebelli**, a process of the *dura mater*, dividing the cerebellum into two equal parts.——**Septum**

CORDIS, the partition between the two ventricles of the heart.——SEPTUM NARIUM, the partition between the nostrils.

SEP'ULCHRE (*sepulcrum*, from *sepelio*, I inter: *Lat.*), a place destined for the interment of the dead. This term is chiefly used in speaking of the burying places of the ancients, those of the moderns being usually called *tombs*. Sepulchres were held sacred and inviolable, and the care taken of them has always been held a religious duty. Those who have searched or violated them have been thought odious by all nations, and were always severely punished. The Egyptians called sepulchres *eternal houses*, in contradistinction to their ordinary houses or palaces, which they called inns, on account of their short stay or pilgrimage on earth. The sepulchres of the Hebrews were sometimes hollow places dug out of rocks Thus Abraham is said to have buried Sarah his wife in the cave of Machpelah (Gen. xxiii. 19). In such sepulchres, also, the bodies of Lazarus and Jesus Christ were buried (John xi. 38, Matthew xxvii. 60). And the same custom prevails in the East to this day, according to the account of modern travellers.——KNIGHTS OF THE HOLY SEPULCHRE, a military order, instituted in Palestine about the year 1114. It was afterwards established in France by Louis VII., was united to that of Malta by Innocent VIII., and was taken under the protection of Louis XVIII. in 1814.

SEPULTU'RA (a burial; from *sepulto*, I keep buried: *Lat.*), in Archæology, an offering made to the priest for the burial of a dead body.

SE'QUENCE (*sequeno*, following: *Lat.*), in Music, a regular succession of similar sounds.——In Gaming, a set of cards immediately following each other, in the same suit, as a king, queen, knave, &c.; thus we say, a sequence of three, four, or five cards.

SEQUESTRA'TION (*sequestratio*; from *sequestro*, I give up for safe keeping: *Lat.*), in Chancery, a prerogative process, addressed to certain commissioners, empowering them to enter upon the defendant's real estates, and sequester the rents thereof, and also his goods and chattels, and personal estate, until he clears himself of his contempt. Also, a species of execution for debt, in the case of a beneficed clergyman, issued by the bishop of the diocese, on receipt of a writ for the purpose; the profits of the benefice are paid over to the creditors until his claim is settled.

SE'QUIN, or ZE'CHIN (*zecchino*, from *zecca*, a mint: *Ital.*), a gold coin of Venice and Turkey, of different values in different places; but generally about 9s.

SERAG'LIO (*Ital.*; corrupted from *Serai*, an oriental word), the palace of the Turkish sultan in Constantinople. Its principal gate is that of Babi Humayun, or *Sublime Gate*; whence is derived the title *Sublime Porte*, to signify the Sultan's ministry. In this building are also kept the females of the harem. [See HAREM.]

SERA'I, a large building for the accommodation of travellers, common in the East. In Turkey they are called *khans*; in Persia, *caravanserais*, which we write *caravansaries*; but in Tartary and India, simply *serais*.

SER'APH (to purify: *Heb.*), a spirit of the highest rank in the hierarchy of angels; thus called from their being supposed to be most inflamed with divine love, or holy zeal, owing to their more immediate attendance at the throne of God. The Hebrew plural is *seraphim*. They are almost always spoken of in connection with the *cherubim*, whom they resemble in rank and attributes.

SER'APHINE, a musical wind instrument: a kind of chamber organ.

SERAS'KIER (head of an army: *Pers.*), a Turkish general or commander of land forces.

SERENA'DE (*serenata*: *Span*; from *serenus*, clear: *Lat.*), music performed in the open air during the silence of night. It is generally instrumental, but the voice is sometimes added. Hence, an entertainment of music given in the night by a lover to his mistress under her window is styled a *serenade*.

SERF (*servus*: *Lat.*), a servant or, as is the case in some countries, a peasant slave, attached to the soil and transferred with it.

SERGE (*Fr.*), a kind of woollen quilted stuff.

SER'GEANT, or SER'JEANT (*sergent*: *Fr.*; from *serviens*, serving; *Lat.*), in Military affairs, a non-commissioned officer in a company of infantry or troop of cavalry, whose duty is to order and form the ranks, and see discipline preserved.——SERGEANT-MAJOR, a non-commissioned officer, who assists the Adjutant; he was formerly a field officer, of the same rank as *Major*.——COLOUR SERGEANTS, non-commissioned officers, appointed to attend those who have charge of the colours.——SERGEANT-AT-ARMS, officers whose duty is to attend the person of the King, and the Lord High Steward, when sitting in judgment on a traitor, &c. They are appointed by letters patent for life, and their number at present is eight; two of them, by royal permission, attend the houses of parliament during its sittings, and have large emoluments—particularly the one connected with the Commons. The one who attends in the court of Chancery is usually the Sergeant-at-arms of the House of Lords.——SERGEANTS-AT-LAW; these are gentlemen who have been advanced by the Lord Chancellor to this dignity, the highest at the bar, after ten years' standing. As the obtainment of the rank is attended with considerable cost, and as the sergeants have no longer exclusive audience in the court of Common Pleas, the dignity is not so much sought for as formerly. By way of distinguishing mark their wigs have a black patch on the crown, and in court they are always addressed as 'brother' by the Judges, as the occupants of the bench are invariably made sergeants if not previously of this dignity. On the appointment of a sergeant it is an ancient custom for him to distribute gold rings, bearing an appropriate motto, to the Sovereign, the Lord Chancellor, and the Judges. The Sergeants have an Inn to themselves.——COMMON-SERGEANT, an officer of the city of London, who attends the lord-mayor and court of aldermen on court-days; and is in council with them on all occasions.——KING'S SERGEANT, one or more of the Sergeants-at-Law, who are supposed to plead for the King, in causes of a public nature.——SERGEANTRY, in the old English law, is of two kinds. *Grand sergeantry* is a kind of knight service, by which the tenant was bound to do some special honorary service to the king in person; as to carry his banner or sword, or be his champion at his coronation, &c. *Petit sergeantry* was a tenure by which the tenant was bound to render to the king annually some small implement of war, as a bow, a sword, a lance, &c.

SE'RIES (*Lat.*; from *sero*, I plant), a continued succession of things in the same order——SERIES, in Mathematics, a number of terms, whether arithmetical or otherwise, increasing or decreasing according to a certain law.——SERIES, in Natural History, an order or subdivision of some class of natural bodies; comprehending all such as are distinguished from others of that class by certain characters, which they possess in common, and which the rest of the bodies of that class have not.——INFINITE SERIES, a series consisting of an infinite number of terms, at the end of which it is impossible ever to arrive; so that let the series be carried on to any assignable length, or number of terms, it can be carried still farther.

SERPENTA'RIUS (*serpens*, a serpent: *Lat.*), in Astronomy, a constellation in the northern hemisphere represented by the figure of a man grasping a serpent.

SER'PENTS (*Lat.*; from *serpo*, I crawl: *Lat.*), in Zoology, an order of reptiles which has been divided into two suborders:—1. *Viperina*, RATTLESNAKES and VIPERS, or those serpents which are poisonous. 2. *Colubrina*, BOAS, PYTHONS, and water snakes which are not poisonous. Serpents are vertebrate animals which are destitute of limbs, except occasionally in a very rudimentary form [see PYTHON]. The general form of their elongated tapering scaly bodies without a distinct neck is well known. The jaws are not articulated together, but are capable of being separated from each other when any large object is being swallowed. They advance along the ground by a sinuous motion, but when about to attack their prey, they usually erect their heads, and spring forward, the hinder part of the body serving as a fulcrum. The upper jaws of the poisonous serpents have moveable fangs, which are grooved on the outer edge, and along this groove the poison flows from a gland situate under the eye into the wound inflicted by the teeth. When not in use the fangs lie in a fold of the gums. Some serpents are oviparous, and of these some deposit their eggs in a sort of chain, leaving them to be hatched in a warm situation, whilst others, like the pythons, incubate their eggs. On the other hand, some serpents are viviparous, their eggs being hatched inside their bodies. The fascination which it has been often stated serpents exercise over other animals is perhaps nothing more than a stupefaction, the result of terror which their appearance excites.

SER'PENTINE, or **SER'PENTINE STONE**, in Mineralogy, a magnesian rock, of various colours, but usually greenish, sometimes speckled like the back of a serpent. Common serpentine will stand heat and is therefore sometimes made into cooking pots. When it veins limestone, it forms *verde antique*. Precious serpentine is translucent of a rich green colour.——*Serpentine verses*, in Poetry, verses which begin and end with the same words.

SERPI'GO (*serpo*, I creep: *Lat.*), in Medicine, a species of herpes; called in popular language, a *ringworm*.

SER'PULA (a little serpent: *Lat.*), a genus of marine worms, inhabiting twisted calcareous tubes, which are generally attached to shells or other objects. The animal has its aerating organs in the shape of threads arranged in two fans on the head, and it closes the mouth of its tube with a plug.

SER'PULITE (*serpula*, and *lithos*, a stone: *Gr.*), petrified shells or fossil remains of the genus *Serpula*.

SER'RATE, or **SER'RATED** (*serratus*; from *serra*, a saw: *Lat.*), in general, something notched or indented on the edge, like a saw.——In Botany, a leaf is said to be *doubly serrate* when the edges of the large serratures are again serrated with lesser indentings of the same kind.——A *serrate-ciliate* leaf is one having fine hairs, like the eye lashes, on the serratures. A *serrulate leaf* is one finely serrate, with very small notches or teeth.

SERRA'TULA (*Lat.*; from *serratus*, indented like a saw), in Botany, a genus of composite plants. The British species, *Serratula tinctoria*, is called saw-wort.

SERRICOR'NIA (*serra*, a saw; and *corun*, a horn: *Lat.*), a family of coleopterous insects, comprehending those which have serrated antennæ, a simple external lobe to the maxillæ, five jointed tarsi, and ample elytra.

SE'RUM (*Lat.*), that part of the blood in which the red globules are suspended. It consists of albumen, fibrin, and water. It coagulates at a temperature of from 150° to 170°.——Also *whey*, or the remainder of the milk after its richer parts have been taken away.

SER'VAL, the *Felis serval* of Zoologists, an animal resembling the lynx in form and size, and the panther in its spots. It is a native of India and Thibet.

SER'VICE (*servitium*; from *servus*, a servant: *Lat.*), in a general sense, labour, whether of body or mind, or of both united, performed in pursuance of duty, or at the command of a superior.——The duty which a tenant owes to his lord for his fee is called *personal service*.——The word *service* is also applied to the duty of naval or military men when serving their country; as *home service, foreign service, limited service*, &c.

SER'VICE-TREE (a corruption of *sorbus*: *Lat.*), the *Pyrus sorbus* of botanists.

nat. ord. *Pomaceæ*. The fruit of this tree is a powerful astringent, and therefore often used in cases of dysentery.

SER'VITOR (*Lat.*), an undergraduate at Oxford partly supported by college funds. Servitors are the same class as the sizers at Cambridge; they formerly attended on other students, whence their name.

SESAMOI'DEA OS'SA, or **SESAMOID BONES** (*sesamon*, a kind of seed, and *eidos*, form: *Gr.*), in Anatomy, little bones found at the articulations of the toes, so called from their supposed resemblance to the seeds of the sesamum.

SE'SAMUM (*Lat.; from sesamê: Gr.*), a genus of plants of the natural order *Pedaliaceæ*, supposed to have been originally natives of India, but now cultivated in many other countries. Their seeds are used as food; and yield a fine oil, constituting an extensive article of commerce in the East. The word *sesame* is well known to readers of the 'Arabian Nights' Entertainments.'

SESQUI (once and a half: *Lat.*), a term being commonly used in compound scientific terms, and signifying that a something is taken one and a half times.——In Geometry, the expression of a ratio, in which the greater term contains the less once, leaving a certain aliquot part of the less over; when the part remaining is half the less term, the ratio is called *sesquialtera;* when a third, *sesquitertia;* and so on. The word *sesquiduplicate* is used when, in a ratio, the greater term is twice and a half times the less.

SESQUIAL'TERAL (*sesquialter*, one and a half: *Lat.*), in Botany, a term applied to a large fertile floret, accompanied by a small abortive one.

SES'QUITONE, in Music, a minor third, or interval of three semitones.

SES'SILE (*sessilis*, sitting: *Lat.*), in Botany, an epithet for a leaf or a flower which issues directly from the stem or branch, without a stalk.

SES'SION (*sessio: Lat.*), in Law, a sitting of justices in court upon their commission, as the session of *oyer and terminer*, &c.——The session of a judicial court is called a *term:* a court may have two sessions annually. The term *sessions*, or *quarter sessions*, is applied to those quarterly meetings of justices of the peace, when minor offences are tried, or business performed which requires the sanction of two or more of them.——*Session of parliament*, the season and space between its meeting and its prorogation.

SES'TERCE (*sestertius*, contracted from *semis tertius*, the third minus a half, that is two asses and a half: *Lat.*), in Antiquity, a Roman coin, the fourth part of a denarius, and worth about twopence. It was of the value of two asses and a half; and hence was represented by L.L.S. (*libra, libra, semis*, a pound, a pound, and a half pound), or by the abbreviation H.S.——The sestertium, a contraction for *mille sestertionis*, contained one thousand sesterces; and a numeral adjective joined with it signified so many thousand sestertia: thus *decem sestertia*, ten sestertia, or ten thousand sesterces. A numeral adverb joined to it, or standing by itself, indicated so many hundred thousand: thus *decies* sestertia, or *decies*, ten hundred thousand sesterces. The sestertium in the time of Augustus was 8*l.* 17*s.* 1*d.*; and, after that, 7*l.* 16*s.* 8*d.*; and it may always be roughly estimated at 8*l.* One qualification of a Roman knight was the possession of estate of the value of four hundred thousand sesterces; that of a senator was double this sum.

SETA'CEOUS (*seta*, a bristle: *Lat.*), in Natural History, bristle-shaped; being in size and length like a bristle.

SET'-OFF, is a term used in law when the defendant acknowledges the plaintiff's demand, but makes a demand of his own, to *set-off* or counterbalance the debt either wholly or in part.——*Set-off*, in Architecture, a horizontal projection left in a wall, where the thickness diminishes.

SE'TON (*seta*, a bristle: *Lat.*), in Surgery, a sort of issue, generally in the neck; formed by means of horsehair or fine threads drawn through the skin by a large needle, by which a small opening is made and continued for the discharge of humours.

SETO'SE (*setosus*, covered with bristles: *Lat.*), in Botany, an epithet for a leaf or receptacle, the surface of which is set with bristles.

SETTEE, in the marine, a vessel of from 60 to 100 tons burden, with, generally, two masts, equipped with triangular or lateen sails. Settees are used in the Mediterranean for transporting cannon, stores, &c.——A kind of couch or sofa.

SETTLEMENT (*setol*, to settle: *Sax.*), in Law, the right acquired by an individual to parochial assistance. It is obtained by birth; bastard children follow the settlement of their mothers, until they are sixteen; legitimate children follow the settlement of their father, and after his death of their mother, until they become twenty-one years of age, or are married. A woman acquires the settlement of her husband, and, after his death, retains his last settlement, until she acquires a new one. A person bound apprentice, and inhabiting, under such apprenticeship, any town or parish during the last forty days, acquires a settlement in that town or parish. A person actually occupying and actually paying a rent of 10*l.* for at least one year, and dwelling forty days in the parish in which such tenement is situated, acquires a settlement in it, provided he has been rated to and paid the poor's rate for at least one year. A person, having an estate in lands or tenements, and having resided in the parish in which such an estate is situate for at least forty days, acquires a settlement; but no settlement is acquired by the purchase of property for which 30*l.*, at least, has not been really paid, and such right of settlement is retained no longer than the person resides within ten miles of the parish. The payment of parish taxes and levies, such as poor-rate, church-rate, or land-tax, with respect to a tenement worth 10*l.* per annum, gives a settlement. Poor people becoming chargeable to a parish in which they have no settlement may, by an order of two jus tices, be removed to that in which they have a settlement. A *certificate* is a written acknowledgment, by the churchwardens and overseers, that a particular person is legally settled in their parish.

SEXAGES'IMA (*sexagesimus*, the sixtieth: *Lat.*), the second Sunday before Lent, or the next to Shrove Sunday; so called, as being about the 60th day before Easter.

SEXAGES'IMAL ARITH'METIC (same *deriv.*), a mode of computing by sixtieths; such as the division of a degree into sixty minutes, and a minute into sixty seconds, &c.

SEXDE'CIMAL (*sex*, six; and *decem*, ten: *Lat.*), in Crystallography, an epithet used when a prism or the middle part of a crystal has six faces with two summits; and, taken together, ten faces.

SEXDUODECIMAL (*sex*, six; and *duodecim*, twelve: *Lat.*), in Crystallography, an epithet for a crystal when the prism has six faces with two summits; and, taken together, twelve faces.

SEX'TAIN (*sextaneus*, containing six: *Lat.*), in Poetry, a stanza containing six lines.

SEX'TANT (*sextans*, the sixth part: *Lat.*), in Mathematics, the sixth part of a circle, or an arc comprehending sixty degrees. Also, an astronomical instrument like a quadrant, except that it measures no more than sixty degrees. [See QUADRANT.]

SEX'TERY-LANDS, in Law, lands given to a church or religious house for the maintenance of the sexton or sacristan.

SEX'TILE (*sextilis*, pertaining to the sixth: *Lat.*), in Astrology, the position or aspect of two planets when distant from each other sixty degrees, or two signs—the sixth part of the ecliptic.

SEX'TILIS (*Lat.*), the sixth month of the early Roman year, but the eighth of a later period. It was under the protection of *Ceres;* and was afterwards called *August*, in honour of Augustus.

SEX'TON (corrupted from sacristan), an under officer of the church, whose business it is to take care of the vessels, vestments, &c., to attend the officiating clergyman, and perform other duties pertaining to the church. He was anciently called the *sacristan*—as he is still, in the Roman Catholic Church.

SFORZA'TO, in Music, an Italian term signifying that the note over which it is placed must be struck with force.

SHAB'RACK, a Military term, of Hungarian origin, used for the cloth furniture of a cavalry officer's troop-horse or charger.

SHAD'DOCK, the fruit of an Indian tree, the *Citrus Decumana*, nat. ord. *Aurantiaceæ*, and therefore allied to the orange and lemon trees. This fruit has a white, thick, spongy rind, and a red or white pulp; of a sweet taste mingled with acidity.

SHAD'OW, in Optics, a privation or diminution of light, by the interposition of an opaque body. *Shadow* differs from *shade*, as the latter implies no particular form, or definite limit; whereas a shadow represents in form the object which intercepts the light; as, the *shadow* of a man, of a tower, &c.——*Shading*, or *shadowing*, in Painting, the art of duly representing light and shade in a picture.——*To shadow*, to represent faintly, imperfectly, or typically.

SHAFT, in Architecture, the body of a column, between the base and the capital.——In Machinery, a strong bar, usually of a cylindrical form, employed to convey motion from the prime mover to the work.——In Mining, a pit, or long narrow vertical opening into a mine.

SHAGREE'N, in Commerce, a kind of grained leather, supposed formerly to be prepared from the skin of a species of shark. It is, however, now known that the material is the strong skin, cut along the chine, from the neck to the tail, of the ass or horse. The skin is first cut and scraped till it becomes scarcely thicker than a bladder. It is then, while wet and soft, fastened to a frame, the flesh side uppermost; and the upper or grain side is strewed over with the hard round seeds of a species of chenopodium; a felt is then laid over it, and the seeds are trodden deeply into the soft yielding skin. The frames are next placed in the shade till the skin becomes dry, and the seeds will shake out of their holes. After this the skin is rasped till the sides of the holes are worn down almost to a level with their bottoms; it is then soaked, first in water, and afterwards in an alkaline ley; and, as it becomes soft, those parts of the skin which were merely depressed by the seeds being forced down upon them, rise above the parts which had been rasped, presenting a granular or pustular surface. The skin is then stained superficially of a green colour by copper filings and sal ammoniac, and is afterwards allowed to dry; lastly, the grains or protuberances are rubbed down to a level with the rest of the surface, which thus presents the appearance of white dots on a green ground. Astracan is the seat of this manufacture, and vast quantities were imported into this country when it was the fashion to use it for watch and spectacle-cases, and a variety of other purposes.

SHAH (prince: *Pers.*), a name given by Europeans to the monarch of Persia, whose real title is *Padishah*, which see.

SHAKE (*sceacan*, to shake: *Sax.*), in Music, an embellishment, consisting of an alternate reiteration of two notes, comprehending an interval not greater than one whole tone, nor less than a semitone.

SHALE, in Geology, a species of schist, or slate clay, generally of a bluish or yellowish gray colour; but sometimes blackish or inclining to green. Its fracture is slaty, and in water it moulders into powder. It is often found in strata in coal mines, and commonly bears vegetable impressions.——*Bituminous shale* is a variety of argillaceous slate, which is impregnated with bitumen, and burns with flame.

SHAM'ANISM, a belief that certain individuals possess an influence over evil spirits entertained by some tribes of Finnish race in the old world, and by the Eskimos and some Indian tribes in the northern part of the new world. The individuals who claim such an influence are called *Shamans*, and they profess to have the sole power of communicating with the unseen world, of foreseeing deaths, and foretelling events. The evil spirits are propitiated through the shamans, and they are consulted if any untoward event occurs to one of the tribe. These sorcerers are consequently looked upon with respect and awe.

SHAM'MY (*chamois, Fr.*), a kind of leather prepared from the skin of the chamois, a species of antelope, inhabiting the mountains of Savoy, Piedmont, and the Pyrenees. It is dressed in oil or tanned; and much esteemed for its softness, pliancy, and the quality of bearing soap without injury A great part of the leather which bears this name is counterfeit, being made of the skin of the common goat, the kid, or even of sheep.

SHAM'ROCK (*scam rag: Irish*), the Irish name for a trifoliate plant, which some think is the trefoil, and others the wood-sorrel. According to legendary tradition, when St. Patrick landed near Wicklow, to convert the Irish, in 433, the Pagan inhabitants were about to stone him; but having obtained a hearing, he endeavoured to explain to them the Trinity in Unity; but they could not understand him, till, plucking a shamrock leaf from the ground, he said, 'Is it not as possible for the Father, Son, and Holy Ghost, as for these leaves, to grow upon a single stalk?' Upon which (says the legend) the Irish were immediately convinced.

SHARK, the name given to a tribe of voracious fishes which abound in all seas, several species having been taken on our coasts. They form the section *Squalidæ* of the order *Plagiostomi*, fishes with cartilaginous skeletons. Some of the species are small, others grow to a great size, and do not hesitate to attack man himself in the water. Such is the strength of the jaws and the sharpness of the teeth that the body of a man has been cut in two by a single bite. The most singular form is the Hammer-headed shark, which has a head like a hammer, with an eye at each end of the cross-piece.

SHARP'ING, in Archæology, a customary present of corn made about Christmas, by farmers in some parts of England, to the smiths; for sharpening their iron instruments of husbandry.

SHAS'TER, among the Hindoos, a sacred book containing the dogmas of the religion of the Bramins, and the ceremonies of their worship. It consists of three parts; the first containing the moral law of the Hindoos; the second the rites and ceremonies of their religion; the third the distribution of the people into tribes or classes, with the duties pertaining to each. [See SASTRA.]

SHAWL, (*châle: Fr.*), a garment used as a loose covering for the neck and shoulders. Shawls are made of various materials, as fine wool, silk, or wool and silk mixed, and of various sizes. They were originally manufactured in the heart of India, from the fine silky wool of the Thibet sheep; but the best shawls now come from Cashmere.——At Kilghiet, in the district of Soudah, twenty days' journey from Cashmere, is held the great mart for the worsted employed in the manufacture of the soft stuffs used as shawls. There are two qualities of worsted; that which is most readily dyed is white; the other species is of a light ash colour, which cannot, without some difficulty, be rendered sufficiently white, and is more frequently used of the natural colour. One goat rarely furnishes more than two or three pounds of worsted per year. When the shearing is finished, the two qualities are carefully separated; after which they undergo repeated washings in rice water. Great importance is attached to the operation of washing; and the Cashmerians attribute much of the delicacy of their unrivalled productions to the fine qualities of the waters of their valley. The form, size, and border of the shawls vary according to the different markets for which the manufacturer designs them.

SHAWM, in Antiquity, an instrument used in the sacred music of the Hebrews.

SHEATH'ING (*tchawme: Teut.*), in Naval Architecture, sheets of copper nailed all over the outside of a ship's bottom, to protect the planks from the pernicious effects of worms.

SHEAVE, in Mechanics, a solid wheel having a groove in its circumference, fixed in a channel, and movable about an axis. It is the wheel in which the rope works in a *block*, and is made either of wood or metal.——*Sheave-hole*, a channel cut in a mast, yard, or timber, in which to fix a sheave. [See BLOCK.]

SHEEP, a well-known animal, of which there are many varieties. They belong to the genus *Ovis* of zoologists, a member of the tribe of *Bovidæ*. In our island the breeding of sheep has received much attention, and the various breeds are well distinguished from one another. The points which are most looked to are the quality of the flesh for food, and the quality and abundance of the wool. Every part of the animal is of use. 'The dressed skin,' says Pennant 'forms different parts of our apparel, and is used for covers of books. The entrails, properly prepared and twisted, serve for strings for various musical instruments. The bones, calcined (like other bones in general), form materials for tests for the refiner. The milk is thicker than that of cows, and consequently yields a greater quantity of butter and cheese; and in some places is so rich, that it will not produce the cheese without a mixture of water to make it part from the whey. The dung is a remarkably rich manure. To conclude; whether we consider the advantages that result from this animal to individuals in particular, or to these kingdoms in general, we may, with Columella, consider this, in one sense, as the first of the domestic quadrupeds.'

SHEIK (*Arab.*), an elder or chief of the Arabic tribes or hordes. The Sheiks are very proud of their long line of noble ancestors; and some of them take the title of *Emir*. The Mohammedans also call the heads of their monasteries *sheiks*, and the

Mufti of Constantinople is called *sheik ulislam*, or chief of the true believers.

SHE'KEL (*Heb.*), a Jewish silver coin, worth about **2s. 7d.** The *Shekel of the Sanctuary* was used in calculating the offerings of the temple, and the sums connected with religion; the *royal*, or profane shekel, in secular matters; their relative values are not known.

SHEL'DRAKE, the *Tadorna vulpanser* of ornithologists, one of the most ornamental of our wild ducks.

SHELL (*scyll: Sax.*), in Gunnery, a hollow cast iron ball to throw out of mortars, &c., having a vent through which the powder is put that is to burst it; when it is filled, the fusee for setting fire to the powder is driven firmly into the hole. The fusee is a wooden tube filled with a composition consisting of sulphur, saltpetre, and mealed powder; and of such a length as to explode about the time that the shell reaches the ground. ——In ships, the *shell of a block* signifies the outer frame or case, in which the sheave or wheel is contained.——*To shell*, in the Veterinary art, is said of an aged horse that has the teeth completely bare and uncovered.

SHELLS, the protective envelopes of many mollusca. Three-fourths of these animals have univalve shells, the rest have chiefly bivalve shells, but some have shells of several pieces. Shells are usually external, but amongst the cephalopoda they are internal when present, and in some genera of other classes they are concealed by a mantle. They are composed of carbonate of lime with a little animal matter. The texture of shells has been expressed by the term porcellanous, which refers to the dull lustre some exhibit when broken, nacreous or pearly, fibrous, horny, and glassy. The peculiar play of light upon pearly shells arises from a minute undulating membrane which alternates with layers of carbonate of lime in their structure. In many shells there is a nacreous layer next the animal, and this furnishes the mother of pearl of commerce. The cellular structure of shells can only be made out in thin sections with the aid of the microscope. On the outside of a shell there is a membranous coat called epidermis, or *periostracum*, which is sometimes thin, sometimes thick, and extended into hairs. It is that part of the animal called the mantle, which is concerned in forming of the shell, which is being continually added to as the animal grows. Lines of growth may usually be perceived upon shells, and in some univalves the revolute mouth of the shell is not removed, but may be traced along the spire in the shape of ridges called *varices*. The forms of shells vary greatly, and being characteristic of families and genera are studied by conchologists. Their elegance, combined with beauty of colouring, has caused them to be sought for in all ages. The hardening principle of shell is generally carbonate of lime, almost pure; the animal principle, in porcellanous shells, a small quantity of soluble gelatine; in mother of pearl shells, albumen. Hence the latter, when steeped in dilute muriatic acid, leave a cartilaginous residue, while the former are entirely dissolved. The variety in the figure, colours, and other characters of sea shells, is almost infinite. The most beautiful come from the East Indies and the Red Sea. The sun, by the great heat that it gives to the countries near the line, heightens the colours of the shells produced there, and gives them a lustre and brilliancy which is wanting in those of colder climates. [See CONCHOLOGY, GEOLOGY, &c.]

SHEL'TIE, the appellation given to a small but strong horse in Scotland; so called from Shetland, where it is bred.

SHEPHERD KINGS: in Egyptian History these were kings styled Hyksos, who obtained possession of Egypt during the fifteenth, sixteenth, and seventeenth dynasties, driving the rightful sovereigns into Ethiopia. They came from the side of Syria about 2100 B.C., and were not expelled until after they had reigned 511 years. It is said that they then founded Jerusalem. According to tradition, they had red hair and blue eyes. There is much mystery about them, and various conjectures have been put forward, some supposing them to have been Scythians, others that they belonged to some Semitic nation, and were perhaps Jews.

SHER'BET (*sharbat: Arab.*), a drink composed of sugar, lemon juice, and water, sometimes with perfumed cakes dissolved in it, with an infusion of a small quantity of rose-water. Another kind is made with honey, the juice of raisins, violets, &c.

SHER'IFF (originally *shire reeve*, governor of the shire: *Sax.*), an officer in each county of England, annually nominated by the crown. He is invested with a judicial and ministerial power, and takes precedence of every nobleman in the county, during the time of his office. His judicial authority consists in hearing and determining causes in his county court (the judicial business of which, however, has been, for the most part, transferred to the *County Courts*), in superintending the election of knights for the shire, coroners, &c. He keeps the peace of the county, being by the common law the principal conservator of the peace there; for which reason he is to assist the justices, and raise the *posse comitatus* when occasion requires. As a minister, he is bound to execute all processes issuing from the king's courts of justice. In the commencement of civil causes he is to serve the writ, to arrest, and to take bail; when the cause comes to trial he must summon and return the jury; when it is determined he must see the judgment of the court carried into execution. In criminal matters, he also arrests and imprisons; he returns the jury; he has the custody of the accused; and he executes the judgment of the court. It is also his duty to preserve the rights of the crown; to seize all lands devolved thereto by attainder or escheat; to levy fines and forfeitures; to seize and keep all waives, wrecks, estrays, &c., if they fall immediately to the crown; and to collect the regal rents, if so commanded by process from the exchequer. To execute these various duties the sheriff has under him many inferior officers; an under-sheriff, who is always an attorney-at-law; bailiffs and gaolers; and the under-sheriff, in reality, transacts nearly the whole business here described. The duties performed by the sheriff himself are now merely of an honorary character; but he is responsible for the acts of those under him.

SHER'RY, a Spanish wine, made in the neighbourhood of Xeres de la Frontera, in the province of Andalusia, near Cadiz. Red and white grapes are used indiscriminately in its manufacture; that which we call dry sherry is the most esteemed. Sherry contains from 20 to 23 per cent. of alcohol; it is a wine much imitated and adulterated.

SHEW'-BREAD, in the Jewish rites, the loaves of unleavened bread which the priest placed on the golden table in the sanctuary. These loaves were twelve in number, representing the twelve tribes of Israel; and were to be eaten by the priest only.

SHIB'BOLETH (a flood: *Heb.*), a word which was made the criterion by which to distinguish the Ephraimites from the Gileadites, after the defeat of the former by Jephthah. The Ephraimites pronounced the word *sibboleth*. See Judges xii. Hence, when some characteristic or peculiarity of a party is observed, it is common to speak of it as the *shibboleth* or watch-word of that party.

SHIELDS, a broad piece of defensive armour, formerly borne on the left arm, as a defence against arrows, darts, lances, and other weapons. The shields of the ancients were of different shapes and sizes, and generally made of leather, or wood covered with leather. The surface, or as it is called in Heraldry, the *field*, of the shield, or escutcheon, appears to have been in all ages decorated with figures emblematical or historical, serving to express the sentiments, record the honours, or at least distinguish the person of the warrior.

SHIL'LING, an English silver coin, equal in value to twelve pence. The word is supposed, by some, to be derived from the Latin *sicilicus*, which signifies a quarter of an ounce or the 48th part of a Roman pound. In support of this etymology, it is alleged that the Saxon shilling was also the 48th part of the Saxon pound. At the time of the conquest, the shilling was worth fourpence. Afterwards the French *solidus* of twelvepence, which was in use among the Romans, was called by the name of *shilling*; and the Saxon shilling of fourpence took the Norman name of *groat* or *great coin*, because it was the largest English coin then known. It is supposed to have obtained its present relative value in the reign of Edward I. Many other countries have a coin of this name; the Hamburgh shilling is worth 1d. English.

SHIN'GLE (*schindel: Teut.*), in Architecture, a thin board used for covering sheds and other buildings.——SHINGLE, pebbles rounded by the sea on the beach.

SHIN'GLES (a corruption of *ceingle*, a belt: *Fr.*), in Medicine, an eruptive disease, which spreads round the body like a girdle. It is a troublesome, but not a contagious or dangerous disease; and probably arises from indigestion or suppressed perspiration.

SHIP, a general name for all large vessels which are built upon a peculiar principle, and adapted for the purposes of navigation; more particularly those equipped with three masts and a bowsprit, the masts being composed of a lower mast, top-mast, and top-gallant mast, each of which is provided with yards, sails, &c. They have gradually increased in bulk from the open galleys of the ancients of fifty or sixty tons to a ship of 5000 tons, and, as in the Great Eastern, to one of 20,000 tons. The *ballast* is placed on the bottom; it consists of iron pigs or stones, and is intended to steady the vessel when she is without cargo. Pieces of wood, called *dunnage*, rest on the ballast, and sustain the iron tanks on the casks containing the fresh water. The *hold*, in large ships, is divided into the fore, main, and after. The gunner's, boatswain's, and carpenter's store rooms, are in the *forehold* of a man-of-war; also, a powder magazine when there are two, water, wood for firing, coals, &c.; water, stores, chain cables, &c., are stowed in the *main hold*; provisions in the *after hold*, in which also is the *spirit room* and a *powder magazine*. In the shallow part behind is the *biscuit room*. The *sail room* is over the fore hold; the hemp cables are kept over the main hold; and also immediately over the holds are the *fore* and *after cockpits*: the whole of this deck being called in large ships, the *orlop deck*. The men mess and sleep on the *lower deck*, which is immediately above the orlop deck; in large ships, this is the *lower gun deck*. The largest ships carry three tiers of heavy cannon; the lowest being on the *middle deck*, the next on the *main deck*. The *upper deck* consists of the *forecastle* and the *quarter deck*, both furnished with guns. The deck over this, reaching from the after extremity to a little before the mizen mast, is called the *poop*; on the after part of these decks, from the mizen mast, are the cabins of the admiral, captain, and officers; that of the officers being called, in ships of the line, the *ward room*; and in frigates, the *gun room*. The length of a ship of the largest class is about 200 feet at the water line, her extreme breadth, 54 feet; her draught of water, about 26 feet; the height of her truck above water, 210 feet; her whole weight with crew, provisions, &c., 4600 tons, of which the hull weighs about one-half. But these dimensions are greatly exceeded by those of the Great Eastern. [See NAVIGATION.] The great power of rifled cannon, and the improvement of artillery, has introduced a new class of vessels, of great strength, having all, or nearly all, their exposed surface covered with plates of the very best iron 4½ inches in thickness, and supported interiorly by a great mass of the strongest wood.——SHIPPING, whatever relates to ships, including every sort of vessel employed upon the water, together with the laws, customs, and regulations connected therewith, &c.

SHIP'-BUILDING, the practical branch of naval architecture, or the art of constructing vessels for navigation, particularly ships and other vessels of a large kind, bearing masts; in distinction from *boat-building*. To give an idea of the enormous quantity of timber necessary to construct a ship of war, we may observe that 2,000 tons, or 3,000 loads, are computed to be required for a seventy-four. Now, reckoning fifty oaks to the acre, of 100 years' standing, and the quantity in each tree at a load and a half, it would require forty acres of oak-forest to build one seventy-four; and the quantity increases to an immense extent for the largest class of line-of-battle ships. A first-rate man-of-war requires about 60,000 cubic feet of timber, and uses 180,000 pounds of rough hemp, in the cordage and sails. The average duration of these vast machines, when employed, is computed to be fourteen years. Ship-building made but very slow progress until the introduction of the compass, when the application of astronomy to nautical purposes at once set the mariner free from the land. Thenceforward he was thrown upon the wide ocean, was brought into contact with unknown perils, to obviate which he was led to untried experiments. The art of navigation has since strode forward with giant steps. To the Italians, Catalans, and Portuguese, belong most of the advances in the earlier days of its revival; the Spaniards followed up the discovery of the new world with a rapid improvement in the form and size of their ships, some of which, taken by the cruisers of Elizabeth, carried 2000 tons. In modern times, to the British, French, and Americans, belong the credit of the progress which has been made in this important branch of art.

SHIP'-MONEY, in English history, an ancient impost upon the ports, towns, cities, boroughs, and counties of the realm, for providing ships for the king's service. This demand was revived by Charles I. in the year 1634; and, being laid by the king's writ under the great seal, without the consent of parliament, was held to be contrary to the laws and statutes of the realm, and subsequently abolished.——It was one of the chief causes which led to the great rebellion.

SHIP'S PAPERS, certain papers or documents, descriptive of the ship, its owners, the nature of the cargo, &c. They consist —1st, of the certificate of registry, licence, charter-party, bills of lading, bill of health, &c. which are required by the law of England; and, 2dly, those documents required by the law of nations to be on board neutral ships, to vindicate their title to that character.

SHIRE (*Scyr*; from *scyram*, to divide: *Sax.*). In English Topography, the same with *County*. Alfred is said to have made divisions which he called *Satrapias*; and which took the name of *Counties*, after *Earls*, *Comites*, or *Counts* were set over them. He also subdivided the Satrapias into *centurias* or *hundreds*; and these into *Decennas*, or *tenths* of *hundreds*, now called *Tithings*.

SHI'RE-MOTE, the ancient name in England for the county court.

SHIT'TIM-WOOD, in Scripture, a kind of precious wood of which the tables, altars, and boards of the tabernacle were made. It is said to be hard, smooth, and very beautiful.

SHIV'ER, in Mineralogy, a species of blue slate, schist, or shale.

SHI'VER-SPAR, in Mineralogy, a carbonate of lime; so named from its slaty structure; it is sometimes called *slate-spar*.

SHOAD-STONE, in Mineralogy the Cornish term for a small smooth stone, of a dark liver colour with a shade of purple. Shoad-stones are found in loose masses at the entrance of mines, sometimes running in a direct line from the surface to a vein of ore. They usually contain mundic, or marcasitic matter, and a portion of the ore of the mine.

SHOAL (*sceole*: *Sax.*), a shallow piece of water, or a shallow part of the sea near the coast, which often proves dangerous to navigation. Also, an immense multitude of fish, called *school* by the fishermen.

SHOE (*sceo*: *Sax.*), a covering for the foot, usually made of leather, the material for the sole being thick and hard, and that for the upper part soft. The finest sort of shoes is made in London; but the manufacture is carried on upon the largest scale in Northamptonshire and Staffordshire. In former times the people had an extravagant way of adorning their feet; they wore the beaks or points of their shoes so long that they encumbered them in walking, and were forced to tie them up to their knees; the fine gentlemen fastening theirs with chains of silver, or silver gilt, and others with laces. This ridiculous custom was in vogue from the year 1382, but was prohibited, under a penalty of 20s., and the pain of cursing by the clergy, in 1467.——The shoes of the Romans, like those of the Jews and Greeks, covered half of the leg, were open before, and tied with thongs called *corrigiæ*. Black shoes were worn by the citizens of ordinary rank, and white ones by the women. Red shoes were sometimes worn by the ladies, and purple by the coxcombs of the other sex. Red shoes were put on by the chief magistrates of Rome on days of ceremony and triumphs. The shoes of senators, patricians, and their children, had a crescent upon them which served for a buckle; these were called *calcei lunati*. Slaves wore no shoes; hence they were called *cretati* from their dusty feet.——The *shoe of an anchor* is a small block of wood, convex on the back, with a hole to receive the point of the anchor fluke. It is used to prevent the anchor from tearing the planks of the ship's bow, when raised or lowered.

SHOOT'ING STARS. [See FALLING STAR.]

SHORE, the coast or land adjacent to the sea or some large river; the sea-shore has been divided by some writers into three portions, the first of which is that tract of land which the sea just reaches in storms and high tides, but which it never covers; the second part of the shore is that which is covered in high tides, but is dry at other times; and the third is the descent from this.——**SHORE**, in Architecture, a piece of timber, placed to prop up a wall, &c.

SHORL, in Mineralogy, a substance usually of a black colour, found in masses of an indeterminate form, or in prisms of three or nine sides. The surface of the crystals is longitudinally streaked. The amorphous sort presents thin, straight, distinct columnar concretions, sometimes parallel, at other times diverging or stelliform. The mineralogists of the last century comprehended a great variety of substances under the name of *shorl*, which later observations have separated into several species, and which are now known as *actinolite, augite, leucite*, &c.

SHOR'LITE, a mineral of a yellowish green colour, found in irregular oblong masses or columns, inserted in a mixture of quartz and mica or granite.

SHOT, a general name for any missile discharged from cannon and firearms of all kinds. Shot used in war is of various kinds; as—1, *round-shot* or *balls*, those for cannon made of iron, those for muskets and pistols of lead; 2, *double-headed shot* or *bar shot*, consisting of a bar with a round head at each end; 3, *chain-shot*, being two balls fastened together by a chain; 4, *grape-shot*, consisting of a number of balls bound together with a cord in canvas on an iron bottom; 5, *case shot* or *canister shot*, by which is meant a great number of small bullets enclosed in a cylindrical tin box; 6, *langrel* or *langrage*, which consists of pieces of iron of any kind. Musket balls are called *small shot*; and those small globular masses of lead used by sportsmen in killing birds and other small game are known by the name of *shot*, of different numbers according to their size. In the manufacturing of this, the liquid metal is allowed to fall like rain from a great elevation into water, and the cohesive principle gives rotundity to the drops. In their descent they become truly globular, and before they reach the end of their fall are hardened by cooling. The truly spherical are separated from those which are imperfect, by causing all of them to roll down an inclined plane when those which are imperfect run off at the sides. The different sizes are separated by passing them through holes of various dimensions.——SHOT OF A CABLE, the splicing of two cables together, or the two cables thus united; thus, it is said, a ship will ride easier in deep water with one *shot of cable* thus lengthened than with three short cables.

SHOT'-RACKS, in a ship, wooden frames bolted to the crampings and head-ledges round the hatchways on the decks, to contain the different shot.——SHOT-LOCKER, a long piece of wood, pierced with holes like cups, in which shot are placed.

SHRAP'NEL SHELLS, in Gunnery, shells filled with musket balls which, when the shell explodes, are projected about 150 yards farther. They are fired from guns, mortars, &c.

SHREW, the *Sorex araneus* of Zoology, a small harmless animal resembling the mole in its long taper cartilaginous snout, and minute eyes, and in other parts the common mouse; it burrows in the ground, and feeds on corn, insects, &c.

SHRIKE, the *Butcher bird*, or *Lanius*, which see.

SHROUDS, a range of large ropes extending from the head of a mast to the right and left sides of a ship, to support the mast. There are *main shrouds, fore shrouds, mizen shrouds, bowsprit shrouds*, &c.

SHROVE-TU'ESDAY (*preterite* of *shrive*, to confess), the Tuesday after Quinquagesima Sunday, or the day immediately preceding the first of Lent; being so called from having been employed by the people in confessing their sins to the priest, and thereby, as was supposed, qualifying themselves for a more religious observance of the approaching fast.

SHRUB, a small woody plant between a herb and a tree.

SHUT'TLE, an instrument used by weavers for shooting the thread of the woof from one side of the cloth to the other, between the threads of the warp, in weaving.

SIAL'AGOGUE (*sialon*, saliva; and *agōgos*, a leading: *Gr.*), a medicine that promotes the salivary discharge.

SIB'ERITE, in Mineralogy, red tourmalin; the finest specimens of which have been found in Siberia.

SIB'YLS (*sibyllo*: *Lat.*), in Antiquity, certain women who pretended to be endowed with a prophetic spirit. They resided in various parts of Persia, Greece, and Italy, and were consulted on all important occasions. They delivered oracular answers, and, as it is pretended, wrote certain prophecies on leaves in verse, which are called *Sibylline verses*; but these Sibylline oracles seem to have been composed to answer political purposes. The number of *Sibyls*, according to Varro, was ten. The most celebrated were the Sibyl of Cuma, said to have been consulted by Æneas; and the Sibyl who offered her books to Tarquin the proud. The Romans kept these books with infinite care; and had recourse to them, on great occasions, with the utmost credulity.

SIDERA'TION (*sideratio*; from *sidus*, a constellation: *Lat.*), the blasting of trees with great heat and drought. It was supposed to be produced by the malign influence of the stars.

SIDE'REAL (*sidereus*, pertaining to the stars: *Lat.*), in Astronomy, pertaining to the stars. A *sidereal day* is the time in which any star appears to revolve from the meridian to the meridian again, which is 23 hours 56 minutes 4·09 seconds. The *sidereal year* is the time in which the earth performs a complete revolution, relatively to the fixed stars, in its orbit; which is 365·2563612 mean solar days, or 365 ds. 6 hrs. 9 min. 9·6 sec. It is 20 min. 19·9 sec. longer than the *Tropical year*.

SIDE'RITE (*siderites* of iron: *Gr.*), in Mineralogy, *sparry iron ore*, a native carbonate of iron.

SIDEROCAL'CITE (*sideros*, iron: *Gr.*; and *calx*, limestone: *Lat.*), in Mineralogy, brown spar.

SIDEROG'RAPHY (*sideros*, iron; and *grapho*, I write: *Gr.*), the art or practice of engraving on steel, by means of which impressions may be transferred from a steel plate to a steel cylinder, in a rolling-press constructed on a peculiar principle. Hence the term *siderographic* art, applied to steel plate engraving.

SIDE'ROSCOPE (*sidēros*, iron; and *skopeo*, I examine: *Gr.*), an instrument of French invention, for detecting small quantities of iron in any substance, mineral, animal, or vegetable. Its construction is founded on the supposition that the small quantity of magnetism they manifest is due to the presence of iron.

SIEGE (*Fr.*), in the art of War, the encampment of an army, before a fortified place, with a design to take it. A *siege* differs from a *blockade*, for in a siege the investing army approaches the fortified place, to attack and reduce it by force; but in a blockade the army secures all the avenues to the place, to intercept all supplies, and waits till famine reduces the besieged to surrender. The operations of a siege may be thus sketched. The engineers of the besieging party examine as well as they are able the different parts of the fortification to be attacked; they then make a plan of the work and the ground around it. The army, meanwhile, is employed in forming an encampment out of the range of the guns of the place, and in cutting timber and brushwood for the construction of the materials required for the siege, such as gun platforms, wood for lining galleries, &c., and especially GABIONS, SAP ROLLERS and FASCINES. Bags are filled with earth, to the number of many thousands. All being now ready, and the point of attack having been selected, a working party of men, each carrying a fascine, pickaxe, and shovel, and protected by an armed force, begin to dig with all speed a trench parallel to the fortification. This will probably have a length of 2000 yards, as planned by the engineers. With the earth taken out of the trench a bank is raised on the side next the enemy. This is the first parallel, and it is intended as a road along which men, guns, and munitions shall travel without being exposed to the fire, and out of the view of the enemy. Batteries are then erected on the side next the fortification. The besiegers will by this time have become aware what front of their work will be attacked. They therefore strengthen their defences, place a double line of palisades in the covered way [See FORTIFICATION], erect traverses to lessen the effect of the enfilade and ricochet fire of the besiegers, open fresh embrasures on the ramparts, drive mine galleries under the glacis, and so on. The attacking fire is of four kinds; direct, to batter down the walls of the place; enfilading, to rake along a line; ricochet, to send balls bounding down the faces of the ramparts, and damage the artillery; and vertical, from mortars, to destroy magazines, barracks, &c. within the enclosure. The firing having continued for some days, another trench is dug out of the first parallel towards the place, pursuing a zigzag direction, with the view of preventing the enemy obtaining any raking fire along the road thus formed. At a proper distance a second parallel is constructed, connected with the first by the zigzag road. New batteries are formed, from which a fresh fire is poured into and against the place. Another zigzag road is then made approaching still nearer to the fortification, and fresh lodgments, called demi-parallels, are effected at a distance of only 150 yards from the work to be reduced. In order to keep down the fire of riflemen, and to hinder the prosecution of repairs to the defences, stone mortars are placed in the wings of the demi-parallels, and these keep up a ceaseless discharge of balls, grenades, &c., upon the front, and this is replied to by small mortars, called royals and cohorns. Sapping is now employed to advance the approaches. The first workman, protected by a sap roller pushed in front, places a gabion between himself and the fortress. This he fills with earth from the trench as rapidly as he can. His comrades increase the size of the trench, and thus, when sandbags have been placed in the hollows between the gabions, a safe cover is obtained. A third parallel is in time formed at the foot of the glacis, and the besiegers endeavour to gain the covered way of the fortress, either by the slower process of sap and mine or by assault. If this should be won by the besiegers, breaching batteries are constructed and a hole made in the wall, the rubbish of which falls into the ditch and makes a slope for the assent of the assaulting party. The troops for this duty are brought up by a subterranean gallery leading from the trenches into the ditch. Should the garrison persist in defending the place, then mining is resorted to, whilst a system of countermining is adopted by the enemy. Supposing the besiegers to work their way onwards, globes of compression and surcharged mines are employed to blow up the enemy's works.——TO RAISE THE SIEGE, is to abandon the attack, and the works thrown up against a place.

SIER'RA, a term used for a hill, or chain of hills; particularly in Spain, the west coast of Africa, and the coasts of Chili and Peru.

SIGILLA'RIA (*Lat.*; from *sigilla*, a little image: *Lat.*), fossil plants, found in the coal formations.

SIGN (*signum*: *Lat.*), in a general sense, a visible token or representation of anything. Also, any motion, appearance, or event which indicates the existence or approach of something else.——SIGN, in Astronomy, the twelfth part of the ecliptic. On account of the precession of the equinoxes, the positions of the constellations in the heavens no longer correspond with the divisions of the ecliptic of the same name, but are now considerably in advance of them. [See ZODIAC.]

SIG'NA (*Lat.*), in Antiquity, standards or ensigns among the ancients; those of the Romans usually bore the figure of an eagle, but those of the Greeks the figures of various animals.
